Traditional Compound Descriptions:	ECOSPHERE Compound Descriptions:
Ethylenediaminetetraacetate (EDTA) – offers very good control of hardness ions. However, it will enhance the remobilization of heavy metals in the environment. It may contain trace amount of carcinogen. Nonylphenol ethoxylates – a non-ionic surfactant that is used to provide wetting and detergency. However, it is derived from a petroleum-based product. It has a suspected harmful biodegradable intermediate. 2-Butoxyethanol – effective water-soluble solvent to attack both water-soluble soils and water-insoluble oils and greases. However, it is a potential nose and eye irritant and may cause blood cell damage if absorbed through skin. Sodium Phosphates – offer good control of hardness ions and maintain alkalinity levels. They also increase cleaning efficiency by suspending dirt. However, phosphate are plant nutrients Those promote algae blooms.	Sodium Iminodisuccinate –biodegradable environmentally responsible chelating agent that softens water and buffers pH for maximum cleaning efficiency. Awarded by the EPA with the Presidential Green Chemistry Challenge Award. Linear Alcohol Ethoxylate - listed as Positive Environmental Profile surfactant on EPA design for the Environment Formulator Initiative. A non-ionic surfactant made from linear primary alcohol that biodegrades readily to compounds with low toxicity. Monoethanolamine - commonly used as a low odor source of alkalinity that aids in breaking up and emulsifying fatty oils. Sodium Metasilicate – controls water hardness and maintains alkalinity to build cleaning efficiency, increases cleaning efficiency by suspending dirt. Non nutritive to plants, will not cause alga blooms.
