Abstract:
Source: US2005277086A It is intended to provide an occludator whereby joint movements at occlusion being similar to the actual tempromandibular joint movements of an individual patient or ideal movements can be reproduced, and a face bow to be used for the occludator. To achieve this object, an occlusion plane against a standard plane is accurately drawn by using the above face bow F whereby the occlusion plane can be drawn at a high accuracy. A solid model of the tempromandibular joint similar to the tempromandibular joint form of an actual patient is used as the joint unit of the occludator K, while the positional relationship in the body at occlusion is three−dimensionally reproduced in the occludator I with the use of the above−described face bow F. It is also intended to provide an occlusion−confirming system and a tempromandibular joint−reproducing system with the use of an occludator whereby joint movements at occlusion being similar to the actual tempromandibular joint movements of an individual patient or ideal movements can be reproduced. To achieve this object, the tempromandibular joint of the body is photographed with a local X−ray CT device to give three−dimensional image data and then a solid model of the tempromandibular joint is constructed based on the three−dimensional image data. This solid model is employed as the joint unit of the occludator K and the positional relationship in the body at occlusion is three−dimensionally reproduced.

Abstract:
Source: US2013284651A The liquid recovery filter includes several embodiments, each of which provides for the recovery of liquid otherwise trapped within the filter housing and element. Each embodiment includes a series of vents, purge ports, and passages that communicate fluidly with the filter housing and filter core. Certain vents and purge ports are initially opened following filtration operations to allow pressurized gas to flow into the housing, thereby forcing residual unfiltered liquid through the filter. When this has been accomplished, another vent is opened to the filter core to allow filtered liquid to flow from the downstream or outlet passage from the filter core. Some embodiments have the filter outlet located above the filter, and include a downstream drain port extending from the filter core. The downstream drain port provides for the recovery of filtered liquid when the vent or purge port is opened in these embodiments.

Abstract:
Source: US5671818A A rotary drill bit for use in drilling holes in subsurface formations comprises a bit body having a leading face and a gauge region, a number of blades formed on the leading face of the bit and extending outwardly away from the axis of the bit so as to define between the blades a number of fluid channels leading towards the gauge region, a number of cutting elements mounted side−by−side along each blade, and a number of nozzles in the bit body for supplying drilling fluid to the fluid channels for cleaning and cooling the cutting elements. In at least one of the fluid channels, adjacent the gauge region, is an opening into an enclosed passage which passes internally through the bit body to an outlet which, in use, communicates with the annulus between the drill string and the wall of the borehole being drilled. The portion of the gauge region outwardly of the opening comprises a bearing surface which, in use bears against the wall of the bore hole and extends across the width of the channel.

Abstract:
Source: US2013312761A An endoluminal occluding device consisting of a conical–shaped structure which is attached to a threaded central tubular element is capable of occluding a body lumen immediately after placement. When deployed within a body lumen, such as a fallopian tube, the conical–shaped structure extends radially outward from the central tubular element, thereby acutely occluding the body lumen, and, in the case of the fallopian tubes, preventing conception. As the acute occlusion device is being implanted into a body lumen, it is rotated, as the screw threads, which embed into the body lumen wall, advance the device within the body lumen to the desired located. Once implanted and deployed into a body lumen, the acute occlusion device provides immediate occlusion of the body lumen. A proximal anchor prevents the endoluminal device from migrating into the body lumen once it has been deployed.

Abstract:
Source: US2002032432A An attachment tool to facilitate the attachment of a catheter or similar elongated instrument to a guide−wire or other elongated guide member, without requiring access to either end of said wire or member. Said tool providing repeatable and reliable alignment of components to be attached, while being operated with a single hand. The tool further facilitates the attachment of a plurality of catheters or instruments to a single wire or member.

Abstract:
Source: US2009209900A The present invention is directed to a device and method for opening obstructed body internal passages and for sensing and characterizing tissues and substances being in contact with the device of the invention. In general, the device of the present invention comprises a catheter tube capable of inducing vibrations in a guidewire contained therein, wherein said vibrations of the guidewire are utilized for opening a passage through an occlusion. The in–vivo vibrations may be induced by means of a magnetic field actuating means (5) and a guidewire (2) comprising magnetic coupling means (3), or by means of transducers, which may be also used for the sensing.

Abstract:
Source: US2016192962A Atherectomy catheters and methods of using them are described herein. In particular, described herein are optical coherence tomography (OCT) catheters that may include a distal tip that can be deflected away from the long axis of the device using a multi−channel bushing. The bushing may include at a hinge point that is offset (e.g., located on a side of the elongate body near the distal end of the elongate body) and a rotatable cutter near an imaging assembly that can be driven against the wall with a high mechanical advantage.

Abstract:
Source: US2003097172A A reducer implant for insertion in a blood vessel, for reducing an inner diameter of said vessel and flow therethrough, having at least one narrowed section having a first diameter; and at least one flared section having a diameter substantially greater than said first diameter. Optionally, the reducer is formed of a material and has a geometry that does not cause coagulation of blood in its vicinity.

Abstract:
Source: US2014277099A Vaso−occlusive apparatuses, including implants, and methods of using them to treat aneurysms. The vaso−occlusive implants described herein include one or more soft and expandable braided member coupled to a pushable member such as a coil that maybe inserted and retrieved from within an aneurism using a delivery catheter as well as a friction element between the soft braided member and the coil. The friction element allows the relatively soft and elongate implant to be pushed out of a cannula without binding up within the cannula.

Abstract:
Source: US2003164168A Lung volume reduction is performed by the placement of a device (2) into a branch of the airway (34) to prevent air from entering that portion of lung. This will result in adsorption atelectasis of the distal portion of lung. The physiological response in this portion of lung is hypoxic vaso−constriction. The net effect is for a portion of lung to be functionally removed, i.e. a selected portion of lung is removed from both the circulation and ventilation. The build up of secretions is accommodated by using a valve (5, 15, 29) in the obstructive device, the valve opening upon coughing etc.

Abstract:
Source: US2001039426A Methods and apparatus for passing attachment apparatus (e.g., connector devices, staples, etc.) or connector material (e.g., suture thread, wire, cord, filament, monofilament, etc.) into or through the wall of a luminal anatomical structure (e.g., a blood vessel or other anatomical conduit) for the purpose of; i) closing the lumen of the anatomical structure, ii) forming an anastomotic junction between separate anatomical structures (or between approximated segments of the same anatomical structure), and/or iii) attaching an article (e.g., an endoluminal, extraluminal or transluminal graft) or other apparatus to the wall of the anatomical structure.

Abstract:
Source: US2001037808A An implantable flow control element is provided which prevents air from entering an isolated portion of a patient's lung. The element may permit air to escape from the isolated portion so that the element acts like a valve. Systems for implanting pulmonary devices are also provided.

Abstract:
Source: US2006122638A The present invention, the ASD, is a mechanical device for anchoring hollow tube–like structures in the human body, such as blood vessels and ureters. It facilates positioning needles or catheters in blood vessels and it prevents those from dropping out of the vessel or from "wandering off" in the vessel. The ASD can be used in every interventional medical situation for diagnostic or therapeutic purposes. The ASD is very easy to fix onto the vessel wall. Screwing is a fast technique saving operating time and requiring only basic microsurgical skills. The manufacturing is easy. It should be understood that the foregoing is illustrative and nor limiting, and that modifications may be made by those skilled in the art, without departing from the scope of the invention.

Abstract:
Source: US2010044102A There is provided a system, apparatus and methods for removal of material for the path of a laser beam during laser drilling of a borehole and for removal of displaced borehole material from the borehole during laser drilling. In particular, there are provided paths, dynamics and parameters of fluid flows, and apparatus for obtaining such, for use in conjunction with a laser bottom hole assembly.

Abstract:
Source: US4813938A A catheter introduction syringe for the introduction of a catheter or catheter guide wire into a patient's body, the catheter introduction syringe comprises a hollow substantially cylindrical syringe barrel to support a needle thereon having a substantially cylindrical plunger slidably disposed therein, the substantially cylindrical plunger includes a centrally disposed channel formed longitudinally therethrough having a valve assembly disposed in operative relationship relative to the centrally disposed channel to prevent passage of air or liquid therethrough during flushing or aspirating of the catheter introduction syringe and permit the introduction of a catheter or catheter guide wire through the centrally disposed channel, hollow substantially cylindrical syringe barrel and needle for introduction into the patient's body without the flow of air or liquid through the centrally disposed channel.

Abstract:
Source: US2010030246A A device for occluding septal defects or other bodily passage−ways includes two anchors connected to an occluding body. The occluding body may be formed as a plug or tube of biocompatible material configured to occlude a bodily passageway. At least one of the anchors includes a grasping member in the form of a loop or suitably shaped structure, which is configured for releasable attachment to an anchor engaging member, such as a biopsy forceps. In a further aspect a closure device assembly includes a closure device linked to the biopsy forceps and collapsibly disposed in a catheter. By positioning the catheter near a bodily passageway, such as a PFO, and disengaging the forceps from the grasping member, the closure device may be released so as to facilitate stable closure of a septal opening, such as a PFO.

Abstract:
Source: US2002128707A A prosthetic device for sustaining a vessel or hollow organ lumen (a stent) has a tubular wire frame (1) with rows of elongate cells (2) having a larger axis and a smaller axis. The cells are arranged with the larger axis in the circumferential direction of the frame (2) and the smaller axis parallel to the axial direction thereof. Each cell is formed by two U−shaped wire sections, and in a plane perpendicular to the longitudinal axis one of the branches of the U−shaped wire sections in one row form together a closed ring shape (4) which provides the frame (1) with large radial stiffness. In the axial direction the frame (1) has only low stiffness so that it easily conforms to the vascular wall even if this deforms due to external loads. The interconnection between the cells (2) may be flexible.

Abstract:
Source: US2009069712A A medical device is provided having reduced penetration force. The device includes a body having a central hollow channel and a piezoelectric transducer received within and secured to the body. The piezoelectric transducer has a hollow portion concentric with the central hollow channel. A tubular member is associated with and in communication with the piezoelectric transducer. The tubular member has at least one open end formed concentric with the central hollow channel and the hollow portion of the piezoelectric transducer, wherein the transducer is adapted for vibrating at a frequency to produce an oscillating displacement of the tubular member.

Abstract:
Source: US5556389A An apparatus and method for treating an occlusion or constriction, such as a stenosis in a blood vessel or other conduit in the body, as well as an apparatus and method for treating a tumor or cancerous area occurring around a conduit or duct in the body. The apparatus includes a catheter provided with a ribbed balloon encircling a portion near its distal end. When inserted into the body over a guide wire and transported to the site of the stenosis, the balloon is inflated one or more times and, due to the ribbed balloon, blood perfuses around the catheter during the treatment. A radioactive source of material is inserted through the catheter to the site of the stenosis or cancer where it is maintained in position for a period of time to reduce the occurrence of re−stenosis or cancer. A guide wire provided with a removable core can be utilized to properly maneuver the catheter to the site of the stenosis or cancer.

Abstract:
Source: US2014026890A Headgear, comprising at least one strap; and at least one rigidizer, the headgear being arranged to position one of the at least one strap and one of the at least one rigidizer, with regard to one another such that the rigidizer imparts a desired shape to at least a portion of the strap while allowing said portion of the strap to move relative to the rigidizer.

Abstract:
Source: US2001031973A A suturing device allows a physician to remotely seal an incision in a blood vessel or other biological tissue. The device comprises an elongated tubular body having a distal portion which is adapted to be inserted percutaneously through the incision and into the blood vessel. The distal portion has first and second retractable arms which extend from the distal portion of the body and releasably hold a suture within the blood vessel. First and second retractable needles, each of which is configured to catch the suture from a respective arm, are provided along the body proximal to the retractable arms. The arms and the needles are remotely movable by the physician using a handle or other control mechanism provided at a distal portion of the device. In operation, the arms are initially deployed within the blood vessel to hold the ends of the suture beyond the circumference of the tubular body. The needles are then deployed from and then retracted into the body, during which time the needles pierce the vessel wall on opposite sides of the incision, release the suture ends from the retractable arms, and pull the suture through the vessel wall. The device is particularly useful for closing an incision in an artery following a catheterization procedure. In one embodiment, the catheter sheath introducer (CSI) used to perform the catheterization procedure is left in place during the suturing procedure.

Abstract:
Source: US2005128742A A light generating device for illuminating tissue adjacent to a body lumen while a distal end of the device is centered in the lumen, to render photodynamic therapy. The device can either occlude or displace bodily fluid, both without the use of a balloon. In one embodiment, a flushing lumen has a port adjacent to an array of light sources, to displace bodily fluid that might otherwise absorb light. Another embodiment employs a centering member that moves between a first position and a second position. The centering member centers the device in the lumen and preferably is formed of a shape memory material. In yet another embodiment, the device includes an outer sheath and an inner member that are independently positionable, enabling the centering member to be selectively positionable. The centering member can be non porous, such that the centering member also occludes fluid flow.

Abstract:
Source: US5375819A A valve assembly for controlling the delivery and exhaustion of pressurized air to and from an air spring. The valve assembly comprises a body having a valve bore with a coaxially open end, and a port in communication with the valve bore. The port is adapted to receive an air connection with an air spring. An actuator shaft, having a first end and a second end, is disposed coaxially in the valve bore for reciprocal movement between an actuating position and a rest position, and is biased toward the rest position. A valve block fixes within the valve bore and has an internal end and an external end. A coaxial bore extends from the internal end to the external end and slidably receives the actuator shaft second end. A stop chamber is disposed between the external end and the internal end. The valve block has a seat on the external end at the coaxial bore. An air passage communicates with the port and the coaxial bore. A stop member mounts on the actuator shaft within the stop chamber so that the actuator shaft second end will be spaced within the coaxial bore inwardly from the seat when the actuator shaft is in the rest position. Movement of the actuator shaft relative to the valve body is limited to the distance the stop moves within the stop chamber.

Abstract:
Source: US2004249337A A catheter apparatus for delivery of fluids to and/or withdrawal of fluids from a blood vessel in a body includes a catheter having at least two lumens and a sheath attached to the proximal end of the catheter. The sheath is positionable over an entire length of the catheter while the catheter is within the blood vessel and is adapted for direct attachment to the body. The sheath may provide protective and/or sterilization functions for the multi−lumen catheter.

Abstract:
Source: US2009099647A A vascular occlusion, flow restriction, shunt or filter device is disclosed comprising the assembly of at least two, of a number of selectable discrete interconnectable, interchangeable components, at least one component being of the type fabricated from metal strands braided into a tubular metal fabric having an expanded preset configuration and an elongated, collapsed reduced diameter configuration for delivery through a catheter to a treatment site and the device shaped to create an occlusion, flow restriction or shunt when placed in an opening in a body organ or vessel, the woven metal fabric having a memory property whereby the medical device tends to return to said expanded preset configuration when unconstrained.

Abstract:
Source: US2011160652A Disclosed is a portable therapeutic fluid dispensing device. The fluid dispensing device includes a reusable part (100) comprising a reusable part housing including at least a controller and a first portion (186) of a driving mechanism, and a disposable part (200) comprising a disposable part housing including at least a reservoir (220) to retain therapeutic fluid, an outlet port to which the therapeutic fluid is dispensed, a fluid conduit providing fluid communication between the reservoir and the outlet port, and a second portion (112) of the driving mechanism. At least a portion of the disposable part housing defines at least a portion of the reservoir. Also, the second portion of the driving mechanism is mechanically couplable to the first portion of the driving mechanism upon connection of the disposable part to the reusable part.

Abstract:
The present invention relates to an occlusion device (10) for blocking a biological tube, the biological tube being prone to a peristaltic wave having a wave length, and where the occlusion device comprises at least two sections (11, 12, 13), where each section (11, 12, 13) is connected by at least one narrowing (18, 19) to at least one other section. Especially the invention relates to reversible contraception of female and/or male gendered species, which is often achieved by methods of surgery, intervening with the biological tube, which are responsible for transportation of fertility fluids, such as the transportation of spermatozoes or oocytes in for example the human reproductive system.

Abstract:
Source: US2003009177A The invention provides a method of using an apparatus for manipulating matter in a confined or inaccessible space, comprising providing an apparatus having manipulator means at least partly constructed of one or more bent or twisted elongate shape memory alloy members having pseudoelasticity at the intended manipulation temperature, and a hollow housing or cannula capable of holding at least the shape memory alloy member(s) in a relatively straightened state, and actuating means for extending the shape memory alloy member(s) from the housing to manipulate matter within the space and for withdrawing the shape memory alloy member(s) into the housing, the arrangement being such that the shape−memory alloy member(s) bend(s) or twist(s) pseudoelastically in a lateral or helical sense to manipulate the matter on extending from the housing at the manipulation temperature, and become(s) relatively straightened on withdrawal into the housing at the temperature.

Abstract:
Source: US5676346A A valve mechanism for a needleless connector employs a deformable piston having a piston head of elliptical cross−section with a marquise−shaped bore formed along its longitudinal axis wherein the major axes of the respective generally elliptical shapes are oriented perpendicular to one another. The piston head is captured within the connector housing and is reciprocal between a section of reduced diameter adjacent the connection port and a section of enlarged diameter. Constraining the piston head into the section of reduced diameter causes the elliptical bore to be squeezed shut while positioning the piston head in the section of enlarged diameter causes the piston head to relax and assume its natural elliptical shape, while the bore similarly regains its natural open shape to provide a fluid path therethrough. A compressible or extendible section affixed to the piston head serves to bias the piston into the section of reduced diameter. A tapered section of the piston contacts the housing to secure the top of the piston flush with the top of the housing for ease in cleaning.

Abstract:
Source: US2002007190A Intralumenal material removal systems are provided. The intralumenal material removal system includes a cutter assembly positionable in the lumen of a mammalian subject and operably connected to system controls. One composite cutter assembly comprises a distal, fixed diameter cutter and a proximal, adjustable diameter cutter, the cutter assembly being axially advanceable by translating the drive shaft and rotatable by rotating the drive shaft. The adjustable cutting assembly is adjustable between a smaller diameter condition and a larger diameter condition by rotation of the drive shaft in opposite directions. The cutter may thus be introduced to and withdrawn from the material removal site in a retracted, smaller diameter condition that facilitates translation and navigation of the device through various lumens. The adjustable cutting assembly may be selectively expanded at the material removal site to facilitate cutting, removal and aspiration of the occlusive material. Temperature sensing at the material removal site and automated control features are also disclosed.

- **search:** SS2 FT=occlu* and hollow and (channel or passage or bore) and (ovar* or fallopian) (Results 56)
- List: SS2 1–50 (FT=occlu* and hollow and (channel or passage or bore) and (ovar* or fallopian)) (Results 56)

Abstract:
Source: US2012283758A Apparatus for occluding a blood vessel, the apparatus comprising: an occluder, the occluder being configured so that at least a portion of the occluder may assume (i) a diametrically–reduced configuration for disposition within the lumen of a tube, and (ii) a diametrically–expanded configuration for disposition adjacent to the blood vessel, such that when said at least a portion of the occluder is in its diametrically–expanded configuration adjacent to the blood vessel, the occluder will cause occlusion of the blood vessel.

Abstract:
Source: US2001041900A A device for occluding a body lumen, and particularly contraceptive or sterilization device for occluding a reproductive tract or lumen to prevent the passage of reproductive cells through the tract or lumen, generally comprising a tubular member, and a mesh member, transversely disposed on the tubular member lumen. The mesh member is permeable to allow for tissue ingrowth, which produces a tissue impregnated mesh occluding the body lumen. The occluding device of the invention can be used in the fallopian tubes of a female patient, the vas deferens of a male patient, or other body lumen.

Abstract:
Source: US2008047563A An occlusion device for actively occluding orifices of fallopian tubes includes a resilient body having an elongated member with a first end and a second end. The elongated member further includes a first leg ending with the first end of the elongated member, a second leg ending with the second end of the elongated member and a connection member positioned therebetween. A first orifice plug is secured at the first end of the elongated member and a second orifice plug is secured at the second end of the elongated member. The first and second orifice plugs are shaped and dimensioned to seat at the orifices of the fallopian tubes or within the fallopian tubes as the elongated member spreads outwardly with the first end and second end moving apart. A delivery device for delivery of medication or therapeutic agents to a uterine cavity is also disclosed.

Abstract:
Source: US2002120276A An embolization device includes one or more expansible, hydrophilic embolizing elements non−releasably carried along the length of a filamentous carrier that is preferably made of a very thin, highly flexible filament or microcoil of nickel/titanium alloy. At least one expansile embolizing element is non−releasably attached to the carrier. A first embodiment includes a plurality of embolizing elements fixed to the carrier at spaced−apart intervals along its length. In a second embodiment, an elongate, continuous, coaxial embolizing element is non−releasably i− fixed to the exterior surface of the carrier, extending along a substantial portion of the length of the carrier proximally from a distal tip. In either of the embodiments, the embolizing elements may be made of a hydrophilic, macroporous, polymeric, hydrogel foam material. In the second embodiment, the elongate embolizing element is preferably made of a porous, environmentally−sensitive, expansile hydrogel that expands, after a predetermined time delay, in response to a change in an environmental parameter, such as pH or temperature.

Abstract:
Source: US2003208223A There is provided apparatus (14) incorporating an elongate hollow element (22) for being positioned along a body cavity of a patient. The hollow element has a leading region and a trailing region and is arranged for being progressively everted along the hollow element from the leading region to thereby be increasingly extended for progressively lining the body cavity as the trailing region follows along. The apparatus generally further comprises an enclosure comprising an insertion head (16) for being inserted into an entrance of the body cavity and a flexible bag (18) in which the hollow element is housed. The hollow element is extended from the insertion head by increasing pressure within the enclosure. Methods for positioning the hollow element along the body are disclosed. The apparatus is particularly suitable for use as a tamponade device for use in the lower gastrointestinal tract for stemming internal bleeding.

Abstract:
Source: US2009054875A Flexible sleeve having a leading (distal) edge that can be advanced over a conventional angioplasty guide−wire to facilitate balloon angioplasty catheter and stent catheter crossing complex coronary lesions such as chronic total occlusions or heavily calcified, non−compliant lesions.

Abstract:
Source: US2008135053A Methods, systems and devices for performing gynecological procedures. According to one embodiment, there is provided a device for occluding a fallopian tube, the device including an outer member and an inner member. The outer member may be a hollow, frusto−conical structure shaped to include an open proximal end, an open distal end, and a side wall. The outer member may be self−expandable such that the distal end is biased radially outwardly. In addition, the side wall may have a porous structure to permit the ingrowth of tissue therethrough. Tines may be provided on the outer surface of the side wall to promote the anchoring of the outer member in a fallopian tube. The inner member, which may be structured to induce scarring, may comprise an elongated fibrous body fixed at its proximal end to the proximal end of the outer member. A bore may extend distally from the proximal end of the inner member to receive a delivery rod. The inner member, which may have pores or interstices to permit the ingrowth of tissue thereinto, is coated or impregnated with a sclerosing agent.

Abstract:
Source: US2002099332A A novel process for paving or sealing the interior surface of a tissue lumen by entering the interior of the tissue lumen and applying a polymer to the interior surface of the tissue lumen. This is accomplished using a catheter which delivers the polymer to the tissue lumen and causes it to conform to the interior surface of the lumen. The polymer can be delivered to the lumen as a monomer or prepolymer solution, or as an at least partially preformed layer on an expansile member.

Abstract:
Source: US2001029389A The invention provides a variety of bone marrow–shielding tourniquets and methods for using them to perform bone marrow–shielded chemotherapy with or without general and without the need to remove a patient's bone marrow for protection during the procedure. In the invention method, pressure is applied to at least one body part of the patient that contains myelopoietic bone marrow to temporarily occlude arterial flow to the bone marrow while blood circulation through the remainder of the body is maintained. Then an effective amount of at least one myelosuppresive chemotherapeutic agent is administered to the blood circulation in the remainder of the patient while the arterial flow through the at least one body part is occluded and so that the myelosuppresive effect of the agent is substantially dissipated within the maximum safe period for the occlusion of

the arterial flow, or about three hours. The pressure is removed to restore blood circulation to the bone marrow when the effect has substantially dissipated and within the maximum safe period. By the invention method, a tumor located in the remainder of the body is treated by the at least one chemotherapeutic agent without destruction of a substantial portion of the bone marrow in the occluded body part. The bone marrow shielding tourniquets for use in the invention chemotherapeutic method are designed to substantially cover at least the shoulder or hip area of a human so as to occlude arterial flow therein and include inflatable bladders that apply the requisite pressure when the tourniquet is applied to the wearer. The shoulder tourniquet optionally is designed to occlude arterial flow into the proximal scapula as well as into the shoulder area. Bilateral tourniquets are also provided for simultaneous occlusion of bilateral shoulders and, optionally, bilateral scapulae.

Abstract:
Source: US2013312761A An endoluminal occluding device consisting of a conical–shaped structure which is attached to a threaded central tubular element is capable of occluding a body lumen immediately after placement. When deployed within a body lumen, such as a fallopian tube, the conical–shaped structure extends radially outward from the central tubular element, thereby acutely occluding the body lumen, and, in the case of the fallopian tubes, preventing conception. As the acute occlusion device is being implanted into a body lumen, it is rotated, as the screw threads, which embed into the body lumen wall, advance the device within the body lumen to the desired located. Once implanted and deployed into a body lumen, the acute occlusion device provides immediate occlusion of the body lumen. A proximal anchor prevents the endoluminal device from migrating into the body lumen once it has been deployed.

Abstract:
Source: US3822702A A fluid dispensing instrument and method for introducing a fluid, as drug materials, into the canals of the Fallopian tubes of a primate female. The dispensing instrument has a tubular probe carrying an

expandable balloon assembly. A stop collar on the probe positions the balloon assembly in the uterine cavity. The balloon assembly has a sleeve member which is initially expanded to close the lower portion of the uterine cavity. The drug material is introduced through the probe into the upper portion of the uterine cavity above the expanded balloon assembly. The balloon assembly is then further expanded to force the drug material from the upper portion of the uterine cavity into the canals of the Fallopian tubes. The expanding balloon assembly divides the material and forces the drug material into both of the canals.

Abstract:
The present invention relates to an occlusion device (10) for blocking a biological tube, the biological tube being prone to a peristaltic wave having a wave length, and where the occlusion device comprises at least two sections (11, 12, 13), where each section (11, 12, 13) is connected by at least one narrowing (18, 19) to at least one other section. Especially the invention relates to reversible contraception of female and/or male gendered species, which is often achieved by methods of surgery, intervening with the biological tube, which are responsible for transportation of fertility fluids, such as the transportation of spermatozoes or oocytes in for example the human reproductive system.

Abstract:
Source: US2001046518A Pharmaceutically acceptable hydrogel polymers of natural, recombinant or synthetic origin, or hybrids thereof, are introduced in a dry, less hydrated, or substantially deswollen state and rehydrate in a physiological environment to undergo a volumetric expansion and to affect sealing, plugging, or augmentation of tissue, defects in tissue, or of organs. The hydrogel polymers may deliver therapeutic entities by controlled release at the site. Methods to form useful devices from such polymers, and to implant the devices are provided.

Abstract:
Source: US2010106149A Devices suitable for insertion into a hollow anatomical structure within a patient for the purpose of ablating tissue within or surrounding the hollow structure so as to induce occlusion of the hollow structure are provided. The devices are in the form of guidewires with functional tips, that comprise at least one heating module, at their distal ends. The devices of the invention are suitable for occluding hollow anatomical structures selected from vasculature or from non−vascular ducts and tubes, via percutaneous, laparoscopic or endoscopic routes of access. Methods of using the devices in the treatment of patients are also described.

Abstract:
Source: US2004097927A A saddle−shaped compression device and methods of fastening a dysfunctional intervertebral disc are used to (1) compress a protrusion to alleviate nerve impingement, (2) fortify the annulus to stabilize a motion segment, (3) minimize the inward/outward bulging and delamination of the annulus, (4) atrophy the nerve to treat discogenic pain, (5) correct the curvature of spinal deformities, (6) elevate the disc space to treat spinal stenosis, and (7) seal the seepage of nucleus pulposus from a herniated disc.

Abstract:
Source: US2015025310A An applicator for use in the fitting of an occlusive plug of the screw in kind to a fallopian tube, said applicator comprising: a body member; an eyepiece fitted to one end of the body member; an elongate probe carried by, and projecting from the other end of the body member; a fibre optic cable extending from the eye−piece along the interior of the probe to a terminal end of the probe distal from the body member; a nose piece movably mounted at said distal end of the probe and adapted to releasably receive a rear, drive end of an occlusive plug; a mechanical connection extending between the body member and the nose−piece whereby the practitioner may, within limits, vary the angle of the nose−piece with respect to its carrier tube; and a rotational drive means extending between the body member and the nose−piece to apply torque and hence rotational movement to an occlusive plug temporarily held by the nose−piece.

Abstract:
Source: US2002095150A An electrosurgical system comprises a radio frequency generator (1), an electrosurgical instrument (E1), and a fluid enclosure (42). The generator (1) has a radio frequency output for delivery of power to the electrosurgical instrument (E1) when immersed in an electrically−conductive fluid. The electrosurgical instrument (E1) has an electrode assembly (32) at the distal end thereof, the electrode assembly comprising a tissue treatment electrode (34), and a return electrode (38) axially spaced therefrom in such a manner as to define, in use, a conductive fluid path that completes an electrical circuit between the tissue treatment electrode and the return electrode. The fluid enclosure (42) is adapted to surround an operation site on the skin of a patient or an incision leading to a cavity surgically created within the patient's body. The fluid enclosure (42) includes sealing means (44) for sealing against the patient's tissue, and the fluid enclosure includes at least one port (50a, 52a) through which the electrosurgical (E1) is insertable, and through which the electrically−conductive fluid can enter and/or leave the enclosure. The fluid enclosure device of the present invention can also be used to treat tumours within the colon. The enclosure, which includes a proximal and a distal bung, is inserted into the colon in a deflated condition and then inflated with a conductive fluid or gas. The colon can be supported against the pressure of the fluid or gas with a pressure sleeve that has been inserted to surround the region of the colon being treated. An electrosurgical instrument is then inserted into the colon and manipulated to vaporize the tumor.

Abstract:
Source: US5595909A A filter device containing cell masses and single cells is described. The device contains porous hollow fibers and hepatocytes entrapped within a contracted gel matrix.

Abstract:
Source: US2004206448A This invention provides novel nanofibers and nanofiber structures which posses adherent properties, as well as the use of such nanofibers and nanofiber comprising structures in the coupling and/or joining together of articles or materials.

Abstract:
Source: US2005096498A A kit and method are described for treating congestive heart failure. The kit may comprise multiple components including a shaping device, deployment tool, patch, and suture. The method may utilize one or more of these components.

Abstract:
Source: US2003018299A An injection apparatus includes components that facilitate injection of relatively viscous materials into a patient. An injection apparatus may include a transition−bore needle apparatus, which has a proximal end, a distal end, and a lumen extending from the proximal end to the distal end, in which the diameter of the proximal end is greater than the diameter of the distal end. An injection apparatus may include a hand−held injection facilitation apparatus, which may be coupled to a syringe. The hand−held injection facilitation apparatus can include a pivot arm and a body with a rod disposed within the body and coupled to the pivot arm. Movement of the pivot arm results in a proximal or distal movement of the rod within the body to effectively cause material to be expelled from the syringe. An injection apparatus may include a transition−bore needle apparatus and a hand−held injection facilitation apparatus in combination.

Abstract:
Source: US3856016A An occlusion clip which includes two laterally spaced clip portions interconnected at both ends by connecting portions and provided with indexing means in one connecting portion, and an instrument for applying the occlusion clip which includes two jaws movable relative to one another adjacent one end of a tubular structure in such a manner as to close the occlusion clip in a predetermined manner, one of the jaws, particularly the movable jaw being provided with a complementary indexing means and the tubular structure accommodating,

if necessary, an optical viewing device as well as a means for emitting a beam of light within the area of the jaws.

Abstract:
Source: US2012296353A A graft device is provided comprising a flow conduit and a surrounding covering. The graft device is for connecting between a first body space and a second body space. In one embodiment, the flow conduit is a vein, such as a harvested saphenous vein, useful as an arterial graft, for example and without limitation, in a coronary artery bypass procedure. Also provided are methods of preparing a graft device and connecting the graft between a first body space and a second body space, such as the aorta and a location on an occluded coronary artery, distal to the occlusion.

Abstract:
Source: US4101984A A novel cardiovascular prosthetic device or implant having many useful cardiovascular applications comprises a porous surface and a network of interconnected interstitial pores below the surface in fluid flow communication with the surface pores. Tissue forms a smooth thin adherent coating of self–determining thickness on the porous surface making it resistant to the formation of the blood clots normally associated with the presence of foreign bodies in the blood stream.

Abstract:
Source: US2001056232A The invention describes a system, method, and means for an MRI transseptal needle that can be visible on an MRI, can act as an antenna and receive MRI signals from surrounding subject matter to generate high−resolution images and can enable real−time active needle tracking during MRI guided transseptal puncture procedures.

Abstract:
Source: US2002150603A An immunoisolatory vehicle for the implantation into an individual of cells which produce a needed product or provide a needed metabolic function. The vehicle is comprised of a core region containing isolated cells and materials sufficient to maintain the cells, and a permselective, biocompatible, peripheral region free of the isolated cells, which immunoisolates the core yet provides for the delivery of the secreted product or metabolic function to the individual. The vehicle is particularly well−suited to delivery of insulin from immunoisolated islets of Langerhans, and can also be used advantageously for delivery of high molecular weight products, such as products larger than IgG. A method of making a biocompatible, immunoisolatory implantable vehicle, consisting in a first embodiment of a coextrusion process, and in a second embodiment of a stepwise process. A method for isolating cells within a biocompatible, immunoisolatory implantable vehicle, which protects the isolated cells from attack by the immune system of an individual in whom the vehicle is implanted. A method of providing a needed biological product or metabolic function to an individual, comprising implanting into the individual an immunoisolatory vehicle containing isolated cells which produce the product or provide the metabolic function.

Abstract:
Source: US6332466B An ovarian capsule includes a capsule body enclosing an interior for receiving an ovary and defining a selectively openable, selectively closeable access. The access, when open, forms a gap, space or opening in the ovarian capsule through which an ovary is introduced in the interior. When the access is closed, withdrawal of the ovary from the interior is prevented whereby the ovary is encapsulated by the ovarian capsule to prevent fertilization of ova released by the encapsulated ovary. A method of encapsulating an ovary in the body of a patient includes the steps of introducing an ovarian capsule in the abdominal cavity of the patient, opening the ovarian capsule to provide access to the interior thereof, positioning an ovary of the patient within the interior of the capsule and closing the ovarian capsule to encapsulate the ovary and prevent withdrawal of the ovary from the ovarian capsule.

Abstract:
Source: US3870048A A method for sterilizing the human female by tubal ligation comprising the use of a ring applicator device having forceps means slidably mounted inside a cylindrical tube for grasping the Fallopian tube and pulling it within the device and means for pushing or otherwise displacing an elastic or stretchable ring over the portion of the tube held within the device, thereby effecting a ligature thereof. The procedure is preferably used in conjunction with a viewing device such as a laparoscope or a culdoscope. The placement of the elastic ring on the tubes eliminates the need for time–consuming procedures which are discomforting to the patient and the use of bulky and expensive equipment. Moreover, depending upon the size and elastic power of the rings, the sterilization can be made permanently or reversibly, as desired. The device and method are also applicable to the sterilization of the human male by the ligature of the vas.

Abstract:
Source: US2001049355A The present invention provides a method of inhibiting angiogenesis within a tissue by providing exogenous SLED to cells associated with the tissue. The presence of exogenous SLED inhibits angiogenesis within the tissue, in part by interfering with the ability of vascular endothelia to expand within the tissue. The invention also provides a method for determining the severity of a tumor be assaying for the presence of SLED within the tumor. To facilitate the inventive methods, the present invention provides pharmaceutical compositions including sources of SLED.

Abstract:
Source: US2003074052A The present invention is directed to bistable cells and their use in devices, particularly medical devices such as stents, clamps and valves. An expandable stent formed of a plurality of bistable cells is described. The stent has two or more stable configurations, including a first stable configuration with a first diameter and a second stable configuration with a second, larger diameter. A valve comprising a bistable cell for use in eliminating incontinence is also disclosed.

Abstract:
Source: US5454809A A method, and device utilized to practice it, for the resolution of tissue by radio frequency sparking. The device of the present invention having a distal end which is insertable within and along the lumen of a tubular body member and manipulated there through to desired position where the device will be operated. The device comprises an elongated flexible hollow tube having a distal end, a proximal end, and a diameter smaller than the diameter of the tubular, body member into which the device is being inserted; passage means within the tube; a plurality of electrodes adjacent the distal end of the device; and means for selectively supplying radio frequency electrical current to at least one of said electrodes.

Abstract:
An endarterectomy catheter and method for removing obstructions from an artery comprises a cylindrical, oval, kidney shaped or other shape housing (110), the housing having an opening (120) inside which a primary shear (130) is movable. The primary shear is razor sharp and cylindrical or other shaped with a smooth or serrated or threaded finish on the inner diameter and movable by means of a firing wire (104) connected by an adapter to a trigger mechanism, which moves the primary shear backward and forward within the housing to excise, encapsulate and store obstructions that protrude into the opening. The primary shear can also be moved by an electric wire and solenoid, hydraulic system or other means. A guide wire (102) positions the catheter in an artery, fallopian tube or other lumen and an inflatable saline anchor or anchors stabilize the catheter against the obstruction to execute a precise cut.

Abstract:
Source: US6066139A An apparatus for transcervical sterilization or transcatheter embolization with a controlled bipolar RF catheter for creating thermal lesions in the fallopian tubes or thrombosing vessels has a catheter elongate along an axis thereof with a patient end. The catheter is circular and sized for transcervical insertion into the fallopian tube or transcatheter vessel insertion, respectively. A connector on an end of the catheter opposite the patient end has the terminations for RF and monitoring and is shaped for the surgeon to manipulate during placement and withdrawal. Two or more bipolar electrodes on the patient end are placed so each electrode is spaced from another with each circumscribing the catheter. A mucosa or thrombus sensor responsive to applied RF energy passing between the two or more bipolar electrodes determines the condition of the transmural formation of a lesion or the thrombus between each of the electrodes. The sensor is a temperature sensor positioned in the space between the electrodes measures the change in mucosal layer temperature or the thrombus during the application of RF energy. An RF generator electrically coupled to the electrodes and the sensor is alternately a phase detector in circuit with the coupling determines reactance of tissue as an indicator of lag or lead of the voltage wave form or current wave form delivered or is an impedance responsive circuit positioned in the RF generator to determine voltage and current delivered so a calculator finds impedance delivered for finding initial electrode contact with the tissue and for measuring the change in mucosal layer. The temperature sensor connects to an RF generator with control circuitry regulating delivery to a temperature range. A method for sterilization has the steps of inserting a catheter, delivering RF and monitoring the effect on the mucosa or thrombus, circumscribing the catheter with two or more bipolar electrodes, each of the electrodes spaced from one another and passing RF energy therebetween.

Abstract:
Source: US2002010457A An apparatus and method of use or treatment are disclosed for creating intrauterine adhesions resulting in amenorrhea. In particular, the apparatus relates to an easily deployed intrauterine implant that readily and consistently reduces or eliminates abnormal intrauterine bleeding. In addition, the apparatus is also used as a uterine marker device for visualizing endometrial tissue thickness and potential changes. The method of the present invention serves as a supplement to or a replacement for conventional hysterectomy or ablation/resection procedures used to treat menorrhagia.

Abstract:
Source: US2005268918A A sterilization device which causes occlusion to the fallopian tubes of a patient is designed to be trancervically positioned in the intramural portion of the tube without perforating the tube. The device includes a flexible hollow catheter having an interior passageway, a distal end for insertion trancervically into a patient, and a proximal end opposite the distal end for grasping and manipulation by a physician. The device further includes a pair of diametrically opposed electrodes, each being movably mounted on the distal end of the catheter and radially movable with respect to the distal end. The electrodes are elongated axially and arcuate transversely and are expandable from a closed state, which defines the distal end of the catheter with a reduced diameter for proper transcervical delivery and placement in the fallopian tube of a patient, and an open state, where the electrodes are separated from one another a greater distance than when they are in the closed state, to define the distal end of the catheter with an enlarged diameter. In the expanded state, the diametrically opposed electrodes stretch the tissue of the fallopian tube to reduce blood flow and to help localize heating of the surrounding tissue. The electrodes are provided with RF (radio frequency) energy in their expanded state to heat the tissue of the fallopian tube which they contact. A temperature sensor situated at the distal end of the catheter measures the temperature of the heated tissue. The RF energy provided to the electrodes is controlled to ensure that the tissue is not overheated.

Abstract:
Source: US2002192198A Organogenesis methods, including angiogenesis, are disclosed wherein genetic material, such as a growth factor and a physiological nutrient culture are employed in such process. Also included is another aspect of the invention wherein a physiological medium is used in combination with such genetic material to direct and/or control organogenesis.

Abstract:
Source: US2003015203A A method of introducing continuous lengths of filament into the body in surgical procedures in which it is desirable to place a significant amount of material into the body through a small portal. The material so introduced may serve to bulk a tissue or cavity of the body or to occlude a vas, as well as to introduce diagnostic or therapeutic agents into a site in the body. A device for implementing the method has a mechanism for feeding the filament through a conduit in such a manner that sufficient force is applied to the filament that it is forced into the desired site. In one embodiment, a system of reciprocating cannulae and synchronized grippers is used to supply the requisite force to the filament.

Abstract:
Source: US2005273094A A tubal sterilization device having sesquipolar electrodes includes a hollow catheter defining an interior passageway, the catheter including a first end for insertion transcervically into a patient, and a second end opposite the first end for grasping and manipulation by a physician. The device further includes an electrode tip situated at the first end of the catheter. The electrode tip includes a first portion having a first electrode, the first portion being preferably formed generally conically in shape so that it may be snugly fit into the tubal osteum of the fallopian tube. The electrode tip further includes a second portion having a second electrode which is a coil formed from a wire which is helically wrapped about an insulating spacer or support. The second portion of the electrode tip with the second electrode may be retracted within a bore formed axially within the first portion of the electrode tip and may selectively extended therefrom for placement within the intramural segment of the fallopian tube. A slider linkage within the hollow catheter moves the second portion and second electrode between its retracted position and extended position. Bipolar RF (radio frequency) energy is provided to the first and second electrodes to cause the selective heating of tissue within the intramural segment of the fallopian tube.

Abstract:
An apparatus is disclosed comprising a first device (1) for generating aerosol, smoke or vapour (5) from one or more regions of a target, an inlet conduit to an ion analyser or mass spectrometer,the inlet conduit having an inlet through which the aerosol, smoke or vapour (5) passes, and a Venturi pump arrangement arranged and adapted to direct the aerosol, smoke or vapour5towards the inlet.

Abstract:
Source: US2014323859A A device is provided to confirm intratubal occlusion in a subject of a fallopian tube having an inner diameter that includes a tubular shaft having a distal end and an interior lumen. An examination head is joined to the distal end of the shaft. A visualization modality in the examination head provides visual or acoustic imaging of the fallopian tube. A power source for the visualization modality is provided. A handle is provided for control of the device. An ex vivo imager of an ocular, video headgear, or a video display is provided in communication with the visualization modality. A process for evaluating an intratubal implant in a fallopian tube through optical or sonic wave visualization is also provided.

Abstract:
Source: US4085743A A multiple occlusion ring applicator device and method for applying elastic occluding rings to an anatomical tubular structure which comprises an inner cylinder, an intermediate cylinder and an outer cylinder, said cylinders being slidably disposed with respect to each other, and forceps means slidably disposed within said inner cylinder, said inner cylinder, said intermediate cylinder, said outer cylinder and said forceps

means cooperating to effect the application of multiple elastic occluding rings to the tubular structures without the necessity of removing the instrument from the patient's body for reloading purposes.

Abstract:
Source: US5368603A An endarterectomy catheter for removing obstructions from an artery comprises a cylindrical housing, the housing having an opening across which a primary shear is movable. The primary shear is razor sharp and cylindrical and movable by means of a cable and trigger backward and forward within the housing to excise obstructions that protrude into the opening. A guide wire positions the catheter in an artery. The edge of the housing at the opening may be sharp to grip the obstruction and to assist in the cutting action of the primary shear. The shear is hollow and collects debris from the excised obstruction. Openings in the housing allow blood to pass through the body. A method of removing obstructions from an artery includes locating a housing in an artery with an obstruction protruding into an opening in the housing, moving a razor sharp cylindrical shear across the opening to excise the obstruction, encapsulating the excised obstruction in the housing, and removing the housing from the artery.

Abstract:
Source: US3687129A A male contraceptive device which comprises a plug having a coating of fabric on its outer walls. The plug is inserted in the vas deferens. The fabric coating allows for the ingrowth of cells from the wall of the vas deferens into the fabric. This provides for complete occlusion of the vas deferens to prevent passage of the sperm therethrough.

Abstract:
Source: DE3343248A1 The implant is a hollow body 1 subdivided into a capsule 3 and a tubular outlet 2 which serves as substitute for a fallopian tube whose function is disturbed. The capsule 3 has a passage opening 6 through which the ovary 4 belonging to the disturbed fallopian tube is inserted in the interior of the capsule. Inside the capsule it is retained by a suitable mounting. The passage opening 6 is sealed except for a passage for the supply thread 5 connected to this ovary after insertion of the ovary 4. In the region of the inlet opening 15 of the fallopian tube whose function is disturbed the tubular outlet 2 is connected to the interior of the uterus 20. In the inserted state, the capsule 3 catches the mature egg cells supplied by the ovary 4 and guides them towards the outlet where they are fertilised and may remain before they finally reach the uterus. In principle, the capsule 3 thus takes over the function of the funnel–shaped entrance to the fallopian tube and the tubular outlet 2 correspondingly assumes the function of the actual fallopian tube, so that the implant simulates the entire correct function of the natural fallopian tube.

Abstract:
Source: US2005033448A The present invention relates to a body implantation tube to be used for normalizing the flow of fluid in tubular organs of human body, injured by disease or accident, and comprising, a tubular body member with a longitudinal passage; one or more expanding–fixing members surrounding the body member, the expanding–fixing member being expanded, by absorbing the fluid flowing along the passage of the body member, to be fixed, in a tubular organ as a result of expansion; and a plurality of holes connecting the longitudinal passage of the body member to the expanding–fixing member, the holes being formed on the portion of the body member contacting to the expanding–fixing member.

Abstract:
Source: US4765332A An atherectomy apparatus and method is disclosed for the purpose of surgical excision of atheromas which typically consist of plaque deposits that cause narrowing (stenosis) of an artery. The apparatus, called a pullback atherectomy catheter, cuts and collects obstructive material into a collection chamber as the catheter is pulled back through obstructive material within a human vessel such as an artery.

Abstract:
Source: US2004104027A A method and associated apparatus continuously optimizes reservoir, well and surface network systems by using monitoring data and downhole control devices to continuously change the position of a downhole intelligent control valve (ICV) (12) until a set of characteristics associated with the "actual" monitored data is approximately equal to, or is not significantly different than, a set of characteristics associated with "target" data that is provided by a reservoir simulator (32). A control pulse (18) having a predetermined signature is transmitted downhole thereby changing a position of the ICV. In response, a sensor (14) generates signals representing, "actual" monitoring data. A simulator (32) which models a reservoir layer provides "target" data. A computer apparatus (30) receives the "actual" data and the "target" data and, when the "actual" data is not approximately equal to the "target" data the computer apparatus (30) executes a "monitoring and control process" program code which changes the predetermined signature of the control pulse to a second and different predetermined signature. A new pulse having the second predetermined signature is transmitted downhole and

the above process repeat until the "actual" data received by the computer apparatus (30) is approximately equal to the "target" data.

Abstract:
Source: US2011208181A A method for maintaining patency in a duct or hollow vessel located within the body of a patient is described wherein the duct includes one or more obstructions. The method comprises the steps of introducing a device into the duct, the device comprising a catheter having a distal and a proximal end, wherein the distal end includes a distal tip portion and wherein the distal tip portion comprises at least one energy delivery member; locating the device within the duct at a position proximal to the obstruction; delivering energy to the duct and any surrounding tissue via the at least one energy delivery member for a specified time period, so that the obstruction is removed from the duct; and withdrawing the device from the duct. It is optional to subsequently place a device such as a stent at the therapy site in order to further maintain long term patency of the duct. It is also optional to apply a dilation force to the duct or hollow vessel after the energy delivery phase. Systems are also described for performing the methods of the disclosure.

Abstract:
Source: US4509504A A method for obstructing channels, ducts and other hollow spaces in human and animal

bodies is disclosed comprising inserting a device having a portion thereof adapted to swell at least 20 percent in size when in contact with the fluid of the human or animal body, the device being in a shape matching and cooperating with the channel to be obstructed.

Abstract:
Source: US4768507A This invention is in the field of percutaneous insertion catheters that are used for placing a coil spring stent into a vessel of a living body for the purposes of enhancing luminal dilation, preventing arterial restenosis and preventing vessel blockage resulting from intimal dissection following balloon and other methods of angioplasty. The stent can also be used for the maintaining patency of many different ducts or vessels within a living body.

Abstract:
Source: US2010057067A A cryogenic medical device for delivery of subcooled liquid cryogen to various configurations of cryoprobes is designed for the treatment of damaged, diseased, cancerous or other unwanted tissues. The device is a closed or semi−closed system in which the liquid cryogen is contained in both the supply and return stages. The device is capable of generating cryogen to a supercritical state and may be utilized in any rapid cooling systems. As designed, the device comprises a number of parts including a vacuum insulated outer dewar, submersible cryogen pump, baffled linear heat exchanger, multiple pressurization cartridges, a return chamber, and a series of valves to control the flow of the liquid cryogen. The cryogenic medical device promotes the subcooling to any external cryogenic instrument.

Abstract:
Source: US2007244492A The tubal splint is designed to fit the inner side of a tube, such as fallopian tubes, and can be slided in through the fimbriated end (outer side of entrance toward the uterus) prior to the reanastomosis. This invention is to provide a simple method for tubal reanastomosis suturing operation. By utilizing the splint, both ends of the tube can yield the best prognostic position for the suturing. This invention is to provide a tubal splint so that the stitches can be placed easily and appropriately on the right spots when both ends are arranged in proximity.

Abstract:
Source: US2002111647A Disclosed is an adjustable occlusion device for use in a body lumen such as the left atrial appendage. The occlusion device is removably carried by a deployment catheter. The device may be enlarged or reduced to facilitate optimal placement or removal. Methods are also disclosed.

Abstract:
Source: US2009105722A Devices, methods, and systems facilitate and enable treatment of ischemic stroke. More specifically, a tethered basket−like system operates in conjunction with a microcatheter system, to provide arterial support and capture emboli.

Abstract:
Source: US2012089047A Catheter apparatuses, systems, and methods for cryogenically modulating neural structures of the renal plexus by intravascular access are disclosed herein. One aspect of the present application, for example, is directed to apparatuses, systems, and methods that incorporate a catheter treatment device

comprising an elongated shaft. The elongated shaft is sized and configured to deliver a cryo−applicator to a renal artery via an intravascular path. Cryogenic renal neuromodulation may be achieved via application of cryogenic temperatures to modulate neural fibers that contribute to renal function, or of vascular structures that feed or perfuse the neural fibers.

Abstract:
Source: US2014260928A Methods of forming a structure for treating a vessel include providing a mandrel and braiding a plurality of filaments around the mandrel. The mandrel may include a strand having a longitudinal axis and a plurality of balls coupled to the strand along the longitudinal axis. Pairs of the plurality of balls may be spaced along the longitudinal axis. Braiding the plurality of filaments around the mandrel may include, during braiding, forming a plurality of bulbs around the plurality of balls and forming necks between pairs of the plurality of balls. The methods may include, after braiding the plurality of filaments, heat treating (e.g., shape setting) the plurality of filaments on the mandrel. Portions of the braided plurality of filaments may be secured to the mandrel, for example using bangles, wire, and/or adhesive.

Abstract:
Source: US2009182287A Devices, systems, and methods for the localization of body lumen junctions and other intraluminal structure are disclosed. Various embodiments permit clinicians to identify the locations of intraluminal structures and medical devices during non−surgical medical techniques, such as cardiac ablation, by determining the intralumen conductance and/or cross−sectional area at a plurality of locations within the body lumen.

Abstract:
Source: US2005113853A Systems and methods for crossing stenosis, partial occlusions, or complete occlusions within a body lumen. The systems generally include an elongate member such as a hollow guidewire that houses a rotatable and translatable drive shaft. The drive shaft typically has a distal portion that is advanced to create a path in the occlusive material that is large enough to allow the hollow guidewire to cross the occlusive material.

Abstract:
Source: US2008047563A An occlusion device for actively occluding orifices of fallopian tubes includes a resilient body having an elongated member with a first end and a second end. The elongated member further includes a first leg ending with the first end of the elongated member, a second leg ending with the second end of the elongated member and a connection member positioned therebetween. A first orifice plug is secured at the first end of the elongated member and a second orifice plug is secured at the second end of the elongated member. The first and second orifice plugs are shaped and dimensioned to seat at the orifices of the fallopian tubes or within the fallopian tubes as the elongated member spreads outwardly with the first end and second end moving apart. A delivery device for delivery of medication or therapeutic agents to a uterine cavity is also disclosed.

Abstract:
Source: US2002045855A A system of rotate−to−advance medical devices including catheters, dilators, occluders, stents, suprapubic catheters and camera introducers configured with external screw threads and depending substantially on rotation for means of advancement and emplacement in mammalian genitourinary and gastrointestinal passages and organs.

Abstract:
Source: US2014012307A A medical device comprising a compressed, inflatable, detachable single−lobed metal balloon attached to a catheter and methods of use for occluding blood vessels or treating vascular aneurysms are disclosed. The balloon can be made with ductile metals such as gold, platinum, or silver so that the balloon will conform to the shape of the void space during inflation and so that the balloon can be subsequently shaped by the application of an external force. The balloon can be configured such that it can be detached from the catheter by physical means or by electrolysis. The surface of the balloon can be configured to promote the growth of tissue into the wall of the balloon and to release drugs or pharmacologically active molecules, so that vessel occlusion or the sealing of an aneurysm will be maintained over time.

Abstract:
Source: US2002120276A An embolization device includes one or more expansible, hydrophilic embolizing elements non−releasably carried along the length of a filamentous carrier that is preferably made of a very thin, highly flexible filament or microcoil of nickel/titanium alloy. At least one expansile embolizing element is non−releasably attached to the carrier. A first embodiment includes a plurality of embolizing elements fixed to the carrier at spaced−apart intervals along its length. In a second embodiment, an elongate, continuous, coaxial embolizing element is non−releasably i− fixed to the exterior surface of the carrier, extending along a substantial portion of the length of the carrier proximally from a distal tip. In either of the embodiments, the embolizing elements may be made of a hydrophilic, macroporous, polymeric, hydrogel foam material. In the second embodiment, the elongate embolizing element is preferably made of a porous, environmentally−sensitive, expansile hydrogel that expands, after a predetermined time delay, in response to a change in an environmental parameter, such as pH or temperature.

Abstract:
Source: US2012046679A Described herein are atherectomy catheters, systems and methods that include longitudinally displaceable drive shafts that drive actuation of one or more cutters at the distal end of the catheter. The catheters described herein may include one or more imaging sensors for imaging before, during or after cutting tissue. In some variations the imaging sensor may be rotated around the perimeter of the catheter independently of the rotation of the cutter. Also describe herein are imaging catheters that may be used without cutters.

Abstract:
Source: US2007016272A A catheter includes multiple primary leads to deliver energy for ligating a hollow anatomical structure. Each of the primary leads includes a resistive element located at the working end of the catheter. Separation is maintained between the leads such that each lead can individually receive power. The catheter can include a lumen to accommodate a guide wire or to allow fluid delivery. Energy is applied until the diameter of the hollow anatomical structure is reduced to the point where occlusion is achieved. In one embodiment, a balloon is inflated to place the resistive elements into apposition with a hollow anatomical structure and to occlude the structure before the application of energy. The inflated balloon impairs blood flow and facilitates the infusion of saline, or medication, to the hollow anatomical structure in order to reduce the occurrence of coagulation and to improve the heating of the structure by the catheter.

Abstract:
Source: US2002010480A A device is disclosed for introducing a flexible elongated element through at least two portions of a subject. In an embodiment, the device includes a proximal end and a distal end, as well as an advancement unit for longitudinally advancing the flexible elongated element toward the distal end such that a proximal end of the elongated element may pass from the distal end of said device with sufficient force to pass through the portions of the subject. The device also includes a securing unit for variably adjusting a securing force applied by the flexible elongated element to secure together the portions of the subject.

Abstract:
Source: US2005251187A An apparatus and method for connecting a first conduit to the heart without the need for cardiopulmonary bypass. The first conduit may then be attached to a second conduit that has a prosthetic device interposed. The second conduit may be connected to the aorta prior to the first conduit being attached to the heart. The prosthetic device may be a prosthetic valve or a pump, for example. The apparatus of the present invention includes an implantable connector with first conduit component, a retractor expansion component, a coring component, and a pushing component. The retractor expansion component is slide−ably coupled to the coring component. The retractor expansion component serves to seat against and separate the inside apical wall of the left ventricle so that the coring component may cut cleanly through the myocardium to form a tissue plug without leaving any hanging attachments to the inside walls. By remaining seated against the inside wall, the retractor expansion component follows the tissue plug into the coring component. The surgeon applies force and rotary motion to the pushing component sufficient to cut the tissue plug and implant the prosthetic component.

Abstract:
Source: US2006241675A In one aspect, embodiments of the present invention provide a filter having a first structural member extending along and clockwise about an axis, a second structural member extending along and counter clockwise about the axis and a material capture structure extending between the first and the second structural members and across the axis. In one aspect, the structural members may be joined to form two ends. In yet another aspect, there is provided a filter having a first spiral shaped support member having an end; a second support member positioned to cross the first spiral support member and form a loop between the end and the place where the second support member crosses the first spiral support member; and a material capture structure extending across and secured to the loop.

Abstract:
Source: US2005240146A A device suitable for removing material from a living being is provided, featuring an infusate pump, and an aspiration pump, both powered by a motor. The aspiration pump and infusate pump preferably feature a helical pumping mechanism, and operate at a high rate of rotation, thereby ensuring adequate pumping performance and flexibility. Additionally, a narrow crossing profile is maintained, ensuring that the device may reach more tortuous regions of the vasculature.

Abstract:
Source: US2003060755A Methods for treating bodily tissues and fluid vessels are disclosed. According to a method of repairing a perforation in a bodily fluid vessel, a viscous, moldable substance is inserted into the vessel at the location of the perforation. A path is opened through the moldable substance to permit fluid flow through the vessel. According to a method of introducing a tissue−killing substance into a bodily fluid vessel, a catheter is provided that has a blocking mechanism configured to selectively block and unblock the vessel. The catheter also has a delivery system that is configured to introduce the tissue−killing substance into the vessel. The vessel is substantially blocked upstream of a selected tissue using the blocking mechanism. The tissue−killing substance is introduced into the vessel through the delivery system, and the vessel is unblocked when the tissue−killing substance has substantially traveled toward the selected tissue. According to a method of occluding a bodily fluid vessel, a catheter is provided that has a first passage. The first passage has an occlusion element housed therein. The catheter is positioned in the vessel, and the occlusion element is moved out of the passage and into the vessel to thereby occlude the vessel. A catheter is also disclosed that may be used with the above methods.

Abstract:
Source: US2001031980A A clot and foreign body removal device is described which comprises a catheter with at least one lumen. Located within the catheter is a clot capture coil that is connected to an insertion mandrel. In one embodiment, the clot capture coil is made out of a solid elastic or superelastic material which has shape memory, preferably nitinol. The elasticity or superelasticity of the coil allows it to be deformed within the catheter and to then reform its original coil configuration when the coil is moved outside of the catheter lumen. In another embodiment the coil is a biphasic coil which changes shape upon heating or passing an electric current. Once the coil configuration has been established, the coil can be used to ensnare and corkscrew a clot in a vessel. A clot is extracted from the vessel by moving the clot capture coil and catheter proximally until the clot can be removed or released into a different vessel that does not perfuse a critical organ. Foreign bodies are similarly captured by deploying the coil distal to the foreign body and moving the clot capture coil proximally until the foreign body is trapped within the coil. By removing the device from the body, the foreign material is also removed.

Abstract:
Source: US2003167038A An occlusion catheter for the ascending aorta capable of obstructing the blood flow within the ascending aorta without inserting through the femoral artery. The occlusion catheter is provided with a drug release aperture formed in the region, which is closer to the proximal end of the catheter tube than a balloon on the outer circumference of the distal end and which is to be located in the vicinity of the coronary ostium when the balloon is placed within the ascending aorta. The present occlusion catheter, when inserted directly into the ascending aorta in the vicinity of the heart to obstruct the blood flow therewithin, enables delivery of a cardiac muscle protective drug to the vicinity of the coronary ostium without inserting the occlusion catheter through the femoral artery in the conventional manner.

Abstract:
Source: US2002032391A The present invention comprises a guidewire having a compressible guide section capable of deflecting a catheter to abut a lumen wall. The compressible guide section exerts an outward radial force while it is at least partially compressed within a lumen. The guide section permits a physician to precisely locate a catheter within a body lumen and adjust a catheter tip orientation to be directed to a particular side of a body lumen. A method is disclosed for properly matching a guidewire and a catheter to operate together in the present invention, along with a force measuring instrument to assist in measuring a catheter's resistance force value. This method and systems of the present invention involve determining the exact force relationship between the compressible guide section and the resistance of the catheter in vitro.

Abstract:
Source: US2006122638A The present invention, the ASD, is a mechanical device for anchoring hollow tube–like structures in the human body, such as blood vessels and ureters. It facilates positioning needles or catheters in blood vessels and it prevents those from dropping out of the vessel or from "wandering off" in the vessel. The ASD can be used in every interventional medical situation for diagnostic or therapeutic purposes. The ASD is very easy to fix onto the vessel wall. Screwing is a fast technique saving operating time and requiring only basic microsurgical skills. The manufacturing is easy. It should be understood that the foregoing is illustrative and nor limiting, and that modifications may be made by those skilled in the art, without departing from the scope of the invention.

Abstract:
Source: US2005049667A A delivery system and kit for endovascularly delivering a prosthesis along a guidewire to an curved implantation site includes a control handle having a handle body with a prosthesis movement control assembly movably disposed thereto. A proximal end of a catheter is connected to the control handle. A prosthesis delivery assembly is movably disposed in the catheter. The delivery assembly has a guidewire lumen slidably receiving therein the guidewire and having a curved distal end orienting the delivery assembly when passing through a curved vessel portion. A method for automatic endovascular alignment of the prosthesis includes loading it in the distal delivery assembly, positioning the guidewire into the curved implantation site, and threading the guidewire lumen over the guidewire with the delivery assembly and into the implantation site to at least approximately align the curved distal portion to a curve of the curved implantation site and, thereby, orient the prosthesis.

Abstract:
Source: US2002032432A An attachment tool to facilitate the attachment of a catheter or similar elongated instrument to a guide−wire or other elongated guide member, without requiring access to either end of said wire or member. Said tool providing repeatable and reliable alignment of components to be attached, while being operated with a single hand. The tool further facilitates the attachment of a plurality of catheters or instruments to a single wire or member.

Abstract:
Source: US2013312761A An endoluminal occluding device consisting of a conical–shaped structure which is attached to a threaded central tubular element is capable of occluding a body lumen immediately after placement. When deployed within a body lumen, such as a fallopian tube, the conical–shaped structure extends radially outward from the central tubular element, thereby acutely occluding the body lumen, and, in the case of the fallopian tubes, preventing conception. As the acute occlusion device is being implanted into a body lumen, it is rotated, as the screw threads, which embed into the body lumen wall, advance the device within the body lumen to the desired located. Once implanted and deployed into a body lumen, the acute occlusion device provides immediate occlusion of the body lumen. A proximal anchor prevents the endoluminal device from migrating into the body lumen once it has been deployed.

Abstract:
Source: US2003097172A A reducer implant for insertion in a blood vessel, for reducing an inner diameter of said vessel and flow therethrough, having at least one narrowed section having a first diameter; and at least one flared section having a diameter substantially greater than said first diameter. Optionally, the reducer is formed of a material and has a geometry that does not cause coagulation of blood in its vicinity.

Abstract:
Source: US2010044102A There is provided a system, apparatus and methods for removal of material for the path of a laser beam during laser drilling of a borehole and for removal of displaced borehole material from the borehole during laser drilling. In particular, there are provided paths, dynamics and parameters of fluid flows, and apparatus for obtaining such, for use in conjunction with a laser bottom hole assembly.

Abstract:
Source: US5676346A A valve mechanism for a needleless connector employs a deformable piston having a piston head of elliptical cross−section with a marquise−shaped bore formed along its longitudinal axis wherein the major axes of the respective generally elliptical shapes are oriented perpendicular to one another. The piston head is captured within the connector housing and is reciprocal between a section of reduced diameter adjacent the connection port and a section of enlarged diameter. Constraining the piston head into the section of reduced diameter causes the elliptical bore to be squeezed shut while positioning the piston head in the section of enlarged diameter causes the piston head to relax and assume its natural elliptical shape, while the bore similarly regains its natural open shape to provide a fluid path therethrough. A compressible or extendible section affixed to the piston head serves to bias the piston into the section of reduced diameter. A tapered section of the piston contacts the housing to secure the top of the piston flush with the top of the housing for ease in cleaning.

Abstract:
Source: US2008179764A The present invention provides a packing element comprising at least one sheet having a plurality of deformations, the sheet being operable to form a folded or helical configuration wherein adjacent portions of the at least one sheet are spaced to allow for flow of at least one of fluid, air and gas therebetween.

Abstract:
Source: US2003009177A The invention provides a method of using an apparatus for manipulating matter in a confined or inaccessible space, comprising providing an apparatus having manipulator means at least partly constructed of one or more bent or twisted elongate shape memory alloy members having pseudoelasticity at the intended manipulation temperature, and a hollow housing or cannula capable of holding at least the shape memory alloy member(s) in a relatively straightened state, and actuating means for extending the shape memory alloy member(s) from the housing to manipulate matter within the space and for withdrawing the shape memory alloy member(s) into the housing, the arrangement being such that the shape−memory alloy member(s) bend(s) or twist(s) pseudoelastically in a lateral or helical sense to manipulate the matter on extending from the housing at the manipulation temperature, and become(s) relatively straightened on withdrawal into the housing at the temperature.

Abstract:
Source: US2001007077A Apparatus and methods are provided for use in sealing a vascular puncture site. The invention comprises an introducer sheath with an integrated closure component. The closure component includes an advanceable resilient spring clip with an expanded delivery configuration in which opposing sides do not contact one another, and an unstressed deployed configuration, in which opposing sides close towards one another. The clip is advanced along the sheath until it pierces opposing sides of a vessel wall at a puncture site. The sheath then is withdrawn, thereby causing the clip to resiliently return to its unstressed deployed configuration and draw opposing sides of the puncture together to seal the wound.

Abstract:
Source: US2005226579A In general, in one aspect, the invention features a waveguide that includes a core extending along a waveguide axis and a confinement region surrounding the core. The confinement region includes a spiral portion and a non−spiral portion, wherein the spiral portion and the non−spiral portion extend along the waveguide axis.

Abstract:
Source: US2010094270A The present invention is directed toward a device that performs ablation of tissue. The device has a catheter with a shaft through which an ablative agent can travel, a first positioning element attached to the catheter shaft at a first position and a second positioning element attached to the catheter shaft at a second position. The shaft also has ports through which the ablative agent can be released.

Abstract:
Source: US2002065489A The syringe includes a barrel, a plunger, and an adapter for mounting the needle in the distal end of the barrel. The adapter includes a protrusion projecting away from the needle end and into the barrel defining an annular space between the barrel and the protrusion. The plunger and protrusion have complementary surfaces whereby the plunger may grip the adapter for removal of the adapter into the interior of the barrel after use. These complementary surfaces afford initial resistance to further axial movement of the plunger toward the adapter, signalling the user that further axial pressure will permanently lock the plunger and adapter to one another whereby, upon application of full axial pressure on the plunger, the complementary surfaces of the plunger and adapter permanently lock to one another to enable joint unitary movement of the plunger and adapter together with the needle carried by the adapter into the barrel. The adapter includes vent passages communicating between the central passage through the adapter and the annular space whereby air can be vented from the barrel after receiving fluid within the barrel and prior to injection. Thus, the syringe may be oriented in a vertical position needle end uppermost with the vent passages forming the most superior portion of the barrel interior whereby air may be vented.

Abstract:
Source: US2002091439A A delivery catheter having an inner catheter assembly, an inferior capsule catheter, and a capsule jacket assembly for use in deploying a graft having a compressible and expandable attachment systems in the thoracic region of an aorta. The graft is comprised of a tubular member having superior and inferior ends, each having an attachment system with wall engaging members secured thereto and is crimped along its

midsection to resist kinking and elongation. The delivery catheter includes an inferior capsule assembly for releasably retaining the inferior attachment system of the graft and a superior capsule assembly for releasably retaining the superior attachment system of the graft as well as a releasing system for maintaining the attachment systems in a compressed configuration and for facilitating expansion of the attachment systems. The delivery catheter also includes an anti–elongation wire attached to the inner catheter assembly to prevent stretching of the delivery catheter during deployment of the graft within the aorta. Upon removing the attachment systems from the capsule, the releasing system functions to allow the attachment systems to assume their expanded configuration and engage the walls of the aorta. The graft and attachment systems remain in the vessel after the delivery catheter is withdrawn.

Abstract:
Source: US2002151924A A hydraulically expandable medical device for insertion into an obstruction in a blood vessel, comprising a hydraulically expandable tube having a clover leaf shape in its relaxed, deflated, position; and longitudinal ridges attached to the expandable tube and harbored in the clover leaf shape, the expandable

tube adapted to be inflated and expanded with fluid, thereby pushing the elongated ridges outwardly into the obstruction material.

Abstract:
Source: US6015416A In accordance with the present invention, there is provided a surgical device for attaching a first hollow organ to a second hollow organ and creating a passageway therebetween. The device includes a first member comprising a first prong for entering a wall of the first hollow organ and a second prong for entering a wall of the second hollow organ. The prongs each have a proximal end which attaches to the first member and a distal end extending therefrom. The device further includes a second member having a plow for incising at least one of the hollow organs so as to create a passageway between the hollow organs. The second member further includes a plurality of needle paths on either side of the plow for guiding a needle through the walls of the hollow organ on either side of the passageway. The device further includes a means for driving a needle, having a suture attached thereto, so as to attach the hollow organs together. Lastly, the device includes a frame for coupling the first member and the second member together in operational engagement.

Abstract:
Source: US2011112564A A catheter (1) adapted to cross occlusions in vessels of a patient. The catheter is

having a proximal end reversibly insertable adjacent to the occlusion and a distal opposite end located outside the patient. When the pusher (10) in the OPEN configuration, it provides a preset void volume barriered by means of the pusher, the proximal end of the catheter and the inner surface of the vessel. The vacuum generating mechanism applies suction on the occlusion and on the inner surface of the vessel through the void volume, to collapse and fix the tissues around the pusher and to stabilize the pusher of the catheter so that the occlusion can be penetrated with a guide–wire (13).

Abstract:
Source: US5217474A A device for removing obstructions from vessels or small openings in the body, comprising a rotatable ablator tip which is guided to the obstruction in a reduced diameter configuration, expanded and rotated to remove the obstruction, and contracted to remove the device from the body. The variably expandable abrasive tip coil in one embodiment of the invention is actuated by a piston means disposed within the coil. A pair of collars is attached to the ends of the coil, and the piston effects relative longitudinal axial movement of the collars and, hence, the respective ends of the coil tip. When the ends of the coil tip are so moved with respect to one another, expansion and contraction of the diameter of the coil tip results. In another embodiment of the invention, the expansion tip coil is actuated by an expandable and contractible bellows means disposed within the coil, instead of the piston means. In another embodiment of the invention, the expansion and contraction of the coil tip are effected by longitudinal axial movement of an internal coil attached to one end of the coil tip, within an outer coil attached to the other end of the coil tip. In another embodiment of the invention, expansion and contraction of the coil tip are effected by an inflatable balloon disposed within the coil tip. The balloon expansion means enlarges preferably at the central portion of the coil to make a bulge.

Abstract:
Source: US2010106149A Devices suitable for insertion into a hollow anatomical structure within a patient for the purpose of ablating tissue within or surrounding the hollow structure so as to induce occlusion of the hollow structure are provided. The devices are in the form of guidewires with functional tips, that comprise at least one heating module, at their distal ends. The devices of the invention are suitable for occluding hollow anatomical structures selected from vasculature or from non−vascular ducts and tubes, via percutaneous, laparoscopic or endoscopic routes of access. Methods of using the devices in the treatment of patients are also described.

Abstract:
Source: US5019047A An apparatus for accurately infusing medicinal agents into an ambulatory patient at specific rates over extended periods of time. The apparatus is of a compact, low profile, laminate construction and includes an elastic distendable membrane, which, in cooperation with a thin planar base, defines a fluid chamber having a fluid outlet. Disposed within the fluid chamber is a thin fluid permeable member which precisely controls the rate of fluid flow through the fluid outlet.
