PatBase Coverage at Update 2017 Week 26 (Year 2017 Week 26)

PatBase Coverage includes 100+ million documents from over 100 patent–issuing authorities and includes patent applications, granted patents, utility models and designs â€“ detailed in the below coverage listings.

Abstract:
Source: US2001034583A The invention detects the loft time and/or speed of a vehicle, such as a sporting vehicle, during activities of moving and jumping. A loft sensor detects when the vehicle leaves the ground and when the vehicle returns to the ground. A microprocessor subsystem converts the sensed information to determine a loft time. A display shows the recorded loft time to a user of the system. In addition, a speed sensor can detect the vehicle's speed for selective display to the user. The invention is particularly well−suited to sporting activities such as snowboarding where users loft into the air on ski jumps and catch "air" time but have no quantitative measure of the actual time lapse in the air. Therefore, users in skiing can use invention to record, store, and playback selected information relating to their sporting day, including the total amount of "air" time for the day and information such as dead time, i.e., time not spent on the slopes.

Abstract:
Source: US2003205027A An automated food processing system and method is provided that allows food to be dispensed, fried and packaged in a suitable container, which may be an individual portion−sized container. In one embodiment, the system includes separate automated modules for dispensing, frying and packaging the food. In one embodiment, an automated dispensing device dispenser a predetermined portion of food from a bulk storage container or food dispensing magazine. Food is dispensed from the automated dispensing device to an automated fry device that can include at least one circular fry wheel having a plurality of food containing compartments. After the food is fried it is dispensed from the fry device to an automated packaging device. The automated packaging device dispenses food to a container that may be an individual portion−sized container that is retrieved, erected and held into position for filling by an automated container handling system. After a food container is filled, a conveyor system transports the filled container to a suitable pick−up location.

Abstract:
Source: US2005034763A A fluid delivering hydrant providing a valve actuated assembly with enclosing shroud and water resistive doom handle assembly to protect the assembly from exposure to the weather while preventing entry of rainwater into a building structure upon the roof of which the device has been installed.

Abstract:
Source: US6827529B Vacuum pneumatic conveying apparatus and method are described to provide for a simple, economical, convenient (and preferably automatic) system for conveying ice on an as−required basis from a source such as an ice maker to one or more receptors at locations remote from that source. The system can be configured such that dispensing locations can be added or eliminated from the system or temporarily taken "off line" from the system without the need to change the basic system configuration or the central ice providing apparatus. The apparatus in various embodiments includes an ice source, a conveying conduit from the source to the receptor, a vacuum pump for moving the ice through the conduit by vacuum, and the receptor to collect the conveyed ice. The receptor may be an ice/beverage dispenser, an accumulator for retention and discharge to further devices, an intermediate storage dispenser, or an air lock device from where the ice can be projected over significant distances. Ice and vacuum may simultaneously be routed into different branched routes, utilizing a unique diverter/air shifter with the capability of providing routing to up to four different routes. Appropriate sensors and controllers, which may be microprocessor−based, may be used to automate the system. The entire system is easily cleanable. The system is advantageously used by restaurants, groceries, hotels and motels, hospitals, laboratories, and many other establishments where the providing of ice at various locations is desirable or required.

Abstract:
Source: US2012104153A A rotorcraft is disclosed. The rotorcraft may include a rotor having at least one tip nozzle, a compressor having an outlet for compressed air, and a network of conduits connecting the outlet of the compressor with the tip nozzle. In operation, the compressor may deliver a flow of compressed air to the tip nozzle. As the flow of compressed air exits the at least one tip nozzle, it may cause rotation of the rotor. This rotation may prerotate the rotor and shorten the take off distance required by the rotorcraft. Take off of the rotorcraft may be accomplished without ever adding fuel to the flow of compressed air to the tip nozzle.

Abstract:
An automated apparatus for grinding an ice blade on an ice skate is disclosed. The apparatus includes a processor, an input means, a skate holder, a measuring device, and a grinding device. The input means is in communication with the processor to permit a user to select an ice blade grinding option. The skate holder is configured to releasably hold an ice skate in a fixed grinding position. The measuring device is in communication with the processor, and is configured to measure a shape of the ice blade. The grinding device is in communication with the processor, and is configured to perform a grinding action on the ice blade based on the selected ice blade grinding option, to change the shape of the ice blade to a desired shape. Also disclosed are methods of measuring, sharpening, and grinding an ice blade, as well as ice blade measuring and grinding systems utilizing the aforesaid methods.

Abstract:
Source: US2005048168A Use of starch(es) and starch derivatives in frozen desserts for improved meltdown and shape retention, including reduced expansion and contraction of the frozen dessert when transported at high altitudes, e.g., over mountain ranges. These improved characteristics are retained in the frozen dessert even after multiple heat shock cycling. The starch(es) and starch derivatives inhibit ice crystal formation in frozen after heat shock cycling.

Abstract:
Source: US2007139168A The present invention is directed generally to a smart modem device for vehicular and roadside applications for remote data collection and transmission to a central data collection and processing facility. The modem includes a number of sets of connection managers and monitors for performing specified tasks with respect to connections with various networks. Each set of connection managers and monitors is different and corresponds to a selected card type and/or network service.

Abstract:
Source: US2014306799A Methods and systems for a detecting an intruder near or within a vehicle are disclosed. Specifically, a method to detect and identify a person near or within a vehicle as an authorized or an unauthorized user is provided. In the event an unauthorized user is detected within a vehicle, the system may take a number of actions. In one embodiment, the actions comprise providing notice to one or more authorized users of the vehicle, disabling the vehicle, notifying emergency personnel or police, and emitting a visual or audio alarm.

Abstract:
Source: US2004144001A A plow mounting assembly is provided for removably attaching a plow blade to the front end of a vehicle. The plow mounting assembly includes a frame assembly semi−permanently connected to a front end of an associated vehicle. A blade assembly includes a plow blade and a grasping assembly in a closed position removably connected to the frame assembly.

Abstract:
Source: US2005011075A A vegetation pruning device (2) includes a pair (4,6) of pivotally coupled arms. A motor bracket (36) with a rotary output drive (34) provides drive to a cutting element (8) which is coupled to the rotary output drive (34). The cuffing element (8) is arranged for cutting vegetation (44) presented thereto.

Abstract:
Source: US2001027584A A snow removing device for removing snow and ice from the roof of semi–trailers, vans and similar vehicles. The snow removing device includes; a scraping blade slidably mounted for vertical movement between spaced apart vertical frame posts. A mechanism is provided for automatically adjusting the position of the scraping blade relative to the vehicle's roof so as to maintain a predetermined blade spacing between the blade lower peripheral edge and the vehicle's roof in order to prevent the scraping blade from damaging structures protruding from the vehicle's roof. A resilient skirt extends from the scraping blade so as to fill the spacing there underneath and so as to contact the vehicle's roof. A mechanism is also provided for adjusting the amount of pressure exerted by the scraping blade and resilient skirt on the vehicle's roof depending on the consistency of the snow being scraped. A breaking assembly is further provided for breaking slabs of hardened snow and ice supported on the vehicle's roof. A mechanism is provided for adjusting the height of the breaking assembly. Another mechanism is provided for adjusting the pressure exerted by the breaking assembly on the vehicle's roof.

Abstract:
Source: US1733095A ly clescribecl, to 21 position for again rccsriving work to be moved lmeliY\`GI*H the Wheels in position for grinding. As the grinfling wheel and the zxrm 67 move away from the regulating Wheel, the ground Work rolls off the regulating wheel and is disclirwged. The speed of the ziutoimitic IYIOVGHIQIUQS above described may be incron sod or clccrozised so as to foul, grind and Llisclmrge work auto~ Inaticully at any desired rate by adjusting the bolt 104 in an :ipp1‘_lt;_gt;priatc position upon the cone pulleys 105 and 106. Thus the Work pieces lllihy be ground at– il most suitzable rate which depends upon the oliaracter of the work and other such variable factors; as will be readily uiiderstood by those skilled in the art, If it is desired to operate the uiucliine automatically for one complete cycle and then stop the z111ton1atic iiiovements with the \\'02'l(11\OVing menilvfer and the grinding wheel away from the 1‘GgL`ll21ti]1g Wheel, this may be nccomplished by moving the lever 127 and hence rod 122 (see Fig. Q) to bring the projection on the rod 122 to fl' p1'odétc1'111i11ecl location within the path circu111scribetl by the projection 135 upon the tripper cam l3ii. With the projection 134 in this position, it will be observed that, at the end of the cycle of the a11to1r1atic lnovements, the projection 135 comes in colitzml; izhercwith to move the double link 119 and the cl11tr:l1 yoke (to the 1~ig;l1t as viewed in Fig. 2) to clisangage the clutch 107 f1'0111 the pulley 99. The Work piece is then placed in the tray 70 and the lever 127 drzlwxi forward, or to the left as shown in Fig. 2, to cause rod 127 to rise and strike arm 128, thus to throw Llxo clutch 107 in, thus to start the apparfmzs, as previously described. The lever 1127, after sta1“ti11g, is than again moved to bring the projection 111 an :1]1l11'op1'iaio position to again stop the uuto111;1t1_lt;z 111oveme11ts: after one complete cycle. _ The aultoiimtic niovements may be stopped, when necessary, with the Wheels together in grinding rela:i_lt;_gt;11, or in 21. siiitable position for truing. by 111ovi11g the lever to a suitablna extent :1.nd_to bring the projection 134 into an appropriate p1'edete1~111i11ctl position Within the path of the projection 135 011 the tripper cam 136. It Will be observed that when the projection 135 of trippcr cam 136 strikes :against the projection 134 O11 the rod 122 to tluow the double link 119 and the clutcli yoke to the right, as seen i11 Fig. 2, the arm 111 is caused to turn about the shaft TT and when the 21 3 mei; of the ‘Lshapecl end projectio11 112 c_lt;_gt;i11citlcs with the apex of the V–slmped and projcutiolt 1l3,tl1e inclined surface of the and p1'ojoL;ti_lt;;;1 113 is forced by the spring 11,6 along tho inclined stirface of the end Pl`0jGCtl01l li2,tl1u1‘eby positively throwing the clutch out of 911– gIlgCITICTlf with the pulley 99. A, SilY1ll€\.1` nction takes place when the clutch is tl11'oW11 111 to start the autoluatio 1I1OVCHl€]1tS. The CUXHY plete (:l1atcl1–o11gn,gi1'1g and cl11tcl1–clisc11gagi11;_gt;; moveinents are thus assured. Y }To1'rnz11ly, the spring S3 (Fig. 2) is Linficv sullicicnt co111p1~cssio11 to nisrintain the link 79 in QL lixcd position relative to the rod Sl, However, if at Work piece be_lt;:o111es cloggud bgt\V€6`l1l}l\€ Work moving 111e111bc1' and the lllilgazine, or if other emergency arises, the swing ‘io os mo S 1,733,095 83 is' uoiuprossetl a stitlicient 211T1(JLl1ll» to prevent ,l5lll'l'll(!l` 11'l(`1\`L‘f1'll¥11l2 ol' the ztrin 67 of the Worl; 1Z1O`»’l1`lg l11GCl12U11,5X1'1, :mel thereby safeguairals the lT)0Cl`li11l1S111 z1g;1i11et1 lnreziknge :uid pe1‘111ii.s the _lt;1pm»z'z11._lt;_gt;1‘ tn 1'e111ove the rsuiise of the 1rru_g11la1'ity ol operation. 'Four–aided grinrling throat in \\'hieh work ot r'o|=nd section ie l`C'f`f?–l.\`G_lt;l for sinrriltaf neoiisrgrindirigramd rotation, said grinding throat including a grinding wheel rotatable at r'elatively high speed. a regulating wheel rotatable at relatively low speed. said wheels being adapted to present aciljacent operative surtaees traveling in opposite directions, 2. niemlier for holding; the ivorl: in operative relation to said two' wheels and adapted to take up the thrust of the fQfl'll1(l11`1§f wheel on the \\`0!`l{, and a inernlaer spaced from said liretarrentioned nrernlier tor taking up the oppositelv direotefl thrust of the reigixlatiiig Wheel on the work; means 'l`or relatively approaching and separating; said tivo Wheels; and power actuated inechanisin for relatively separating and approaching said two 1llE111l_!€1'S, said nieehanisrn acting to relatively approach #ai d two members prior tothe coinpletion of the El~]')1J!'(JI2,Cl1l11Q' niovelnent of said two Wheels and to relatively separate said two rnpnrlfers after the separation of said two w ree S. 16. In grinding apparatus, in coznloination, a four–siflrzd grinding throat in which work ol round section is received for simultaneous gfrin di ng and rotation, said grinding throat including a grinding wheel rotatable at relatively high speed, a IG[l|`L1ll1tl11g wheel rotatztlale at relatively low speed, said Wheels being adapted to present adjacent operative surfaces traveling in opposite–directions, a rneinber for holding the work in operative relation to said tivo Wheels and adapted to take up the thrust ofllie grinding Wheel on the ivorlr, and a lnernloer spaced from said lirst–inentirmecl ineinlier' for taking up the oppositelv directed tlrrast of the reggulatingf \vh1_gt;r_gt;l on the work' means for–relativvlv a ~~ . i _ _ ,–V YY proaclnng and separating said, tivo wheels; power actuated l11l3(Tl3$l,1'L1S]J1 'Fmt relatively Separating and approarrlrrng; said tivo 1116111– lnera. said nieelianisrn acting to relatively approach said two mernliers prior to the conipletron ot the appronelnngg niovenrent of said two wheels and to relatively Separate said two nrefnhers aiter the S(1l)iLl'{lf1Ol1_ of sa/id two Wheels; and means controlled by said rnechauisin for hali;ing the operation thereof. 17. In grrnclrng apparatus, in coinlnnation, a four–Sided grinding throat in which work ot roam! section is received for simulLaneoue grinding and rotation, said grinding throat ineluding ai grinding wheel rotatalrle at relatively high speed, a regulating wheel rotatable at relatively low speed, said Wheels being adapted lo present a.¢;l]aeent operative surfaces; '– f ~ r="1. ' ri , a lraiehng in oppieue dir itronfs, nieinber for holding the worlc in operative relation to said two wheels and adapted to take up the thrust of the g'l`ll1(l;llll$l_\'.fl1Q(5l on the work, and a nienxlier S1)2i.(;1(¥IVIIII.l`Ol`L'1 said first–rnernionerl ineniber for taking up the oppositely directed thrust of the regulating wheel on the Work; nieans for relatively approaffvliing and

separating Said tivo wneeis; power actuated mcehanisrn for relatively eep~ Q5 DU 'fi arating and approaching said two members, said iueclianisin acting to relatively approach said two members prior to thc completion of the approaching movement of said two Wheels and to relatively separate said two members after the separation ol' said two Wheels; a clutch for controlling the action of said mechanisin; and means controlled by said ineelinnisxn for actuating said clutch. 18. In grinding appa ratus, in combination. a tour–sided grinding thron t» in which Work of round section is received for simultaneous grinding and rotation, said grinding throat including a grinding ivheel rotatable at rela– 1;, tively high speed, a regulating wheel rotatable at relatively low speed, said wheels being adapted to present adjacent operative surfaces traveling in opposite directions, a meniher 'For holding the ivorlz in operative relation to said tivo Wheels and adapted to take up the thrust ot the grinding Wheel on the work, and a member spaced from said iirst–mentioned inember for taking up the oppositelv directed thrust of the regulating ivhccl on the Work; means tor relatively approaching and separating said tivo Wheels; power actuated mechanism for relatively separating and approaching said two members. said mechanism acting to relatively approach said two members prior to the completion of the approaching movement of said tivo wheels and to relatively separate said two nicmbcrs after the separation ot said two wheels; means controlled by said mechanism for halting the operation lhereol; and means for making said last–mentioned controlled means ineffective. 19. In grinding apparatus, in combination, a work regulating wheel rotatable at relatively low speed, a grinding Wheel rotatable at relatively high speed, said wheels presenting adjacent operative surfaces traveling in opposite directions. said regulating wheel actiiig to rotate ivorlt ot round section interposed between said two wheels, si. blade–like extending between said wheels for work of round section in operative thereof, a magazine for holding a member holding relation supply of Work pieces, a movable member adapted to etlect movement of a work piece into operative rel ati on to said blade–like member, tliereby to present the \\'orl_lt; piece to the adjacent operative surfaces of said wheels, and means for presenting a Work piece, one at a time, from said magazine to said movable member. 20. In grinding apparatus, in combination, a Work regulating wheel rotatable at relatively low speed, a grinding wheel rotatable at relatively high speed, said wheels presenting adjacent operative surfaces traveling in opposite directions, said regulatiiig Wheel acting to rotate Work of round section interposed between said tvvo Wheels, means for holding work of round section between said wheels, a magazine for holding a supply ot Worlt pieces, a power actuated reciprocating member adapted to etiect a movement oi a ivork piece into operative relation to said Work holding means, thereby to present the work piece to said Wheels, and mechanisin operating in timed relation to said reciprocating member for subjecting the work pieces in said magazine, one at a time, to the action of said reciprocating member, 21. In grinding apparatus, in combination, a grinding Wheel adapted to be rotated at a relatively high speed, a regulating wheel positioned at a lower elevation than said grinding wheel and rotatable at a relatively low speed, thereby to control the rotation of work of round section interposed therebetween, said Wheels being adapted to present; adjacent operative suritaccs traveling in opposite directions, means for holding work of round section between said wheels, and a member movable in a general horizontal direction adapted upon movement toward said ivorlr li ol ding means to ellect movement of a work piece into opcral ive relation to the latter and to said Wheels and adapted upon subscquent movement away from said Work holding means to permit the Work piece to substantially roll Oli of the surface of said regulating wheel. In grinding apparatus, in combination, a work regulating wheel rotatable at relatively low speed, a grinding Wheel rotatable at relatively high speed, said wheels presenting adjacent operative surfaces traveling in opposite directions, said regulating wheel acting to rotate Work ot round section interposed between said tivo wheels, means for holding Work of round section between said wheels, power actuated mechanism includin a clutch tor moving a work piece into oper_ ative relation to said Wheels, said meclianisin being constructed and arranged to operate said clutch in a direction to halt said mechanism, and means for re–setting said clutch to make said meclianisin operative. 23. In grinding apparatus, in combination, a grinding ivhcel rotatable at relatively high speed, a regulating ivliecl positioned beneath said gjriiiding wheel and rotatable at a relatively low speed, said wheels being adapted to present adjacent operative surfaces traveling in opposite directions, means for holding Work of round section in operative relation to said adjacent operative surfaces of said two wheels, and means movable in 11 gfenerally horizontal direction and adapted to ctFeet a movement of a work piece into operative relation to said work holding incans and to said wheels. 24. In grinding apparatus, in combination, a grinding wheel rotatable at relatively high speed, a regulating Wheel positioned beneath said grinding Wheel and rotatable at a relative low speed, said wheels being adapted to present adjacent operative surfaces travelYo T5 G5 1'j2 1,733,095 ing in opposite clirectionzs, means for holding worlf ol? |'ound section in operative relation to said adjacent operative surfaces of :mid two wheels, moans nio vahle in an genernl~ ly horizuontal direcl–ion toward and 2l\V21y lroin said Work liolding means and uflaptecl upon Inovcinenl, toward said worl; holding means to clifnct a nioveniont of a work piece into operative relation to the latter and to– said \\'heel_gt;; and to hold the worlr piece against inovcincnt in levorzse direction and ndapted upon niovonienl. :away from said worli holding rnc;i,ns lo permit discliargc of the ivorli piece from the apparatus. In grinding apparatus, in co1rihi:na(,ion, a grinding wheel rotn.tz1l_ile at relzitively high speed, n. i'e;§uln.ting Wheel positioned beneath said grinding Wheel ond rotatulile at n relatively low speed, said ,wheels being atlztptcd to present ncljinzenl operative surfzuics tra,v_lt;zling' in opposite directions, means for holding work of round section in operative reintion to :mid axdjuccntioperative surlfuccre eil said two ivlincls, means inovnlile in at generally i1_lt;7l'lZOi1h5tl direction, toward and niray 'froin said Worlr holding ;nc\:uis and xulapted upon inovenient toward said Work holding niezuis in client n inovenicnt of a work piece into operative relation to lhe latter and to said wlreels and u pon movexncnt arriiy from Said worl; holding means to permitclisr:l1ar;go of the work piece from, the uppawtiifa, zi inagazine for holdin a supply of work pieces, and niezms l`o1~ presenting work pieces one at n. 1 line from said iimgnziiie to said liorizontally inovahle inenns. 26. In grinding; apparatus, in eoinbiiiation n grinding wheel rotulnlile at relatively hi gli speed, a rcggulating wheel positioned hcncatli said grinding wheel and rotntaliln :it a relatively lon' speed? said wheels being' ndaptccl to present ucljnreiit operative surfaces traveling in opposite directions, nooaus for lioldf ing; work olf round section in operative relation to Said nrljacent operative surfaces of said tivo wlieels, a, nizignzine for holding Z1 supply o l' 'n'oi'l_lt; pieces, zz power driven reciprocating: moans cooperating with Said magazine :md mlzipte–cl to receive fi ii–oz–k piece from the latter :ind elleift its rnovement into operative rclntion io :mid Wheeler upon movement in in one _lt;l_ire_lt;:tion

and upon niovemenl, in re~ verse direction to perniil, zliscliargc ol’ the \\'1f\Y`Il from the apparatus. 2–T. Li grinding apparatus, in coxnhination, a grinding wheel rotatnhle. :it relatively high speed, fl 1'_glllllLt~lll§§ wheel positioned hcnentli said frrinclinfr wheel :ind iotatalnlo at ri relotivel; low sliaeal, said wheels being adoptecl, to present :tdjaeent operative surfaces traveling in opposite directions, inennt: for holding \vorl_lt;, oi’ round section in O]]€Fi1lliV(5.l`_lt;ll$lll()H to Said srfljucent operative snrl’ar:es of said two wheels, si, inagazine for liolding n. supply of work pieces,\1ne11ns ,movable in a ggfneirnlly liorizontnl. direction adopted to receive u Work piece from said magazine and niove it toward said Work holding means, and ineans: operating in tiined relation to said lrx,Sl,~iiientioned means for removing the work piece from the latter and for coinploting the inovcnicnt of the Worlz piece into operative relntion to said Wheels. 28. In grinding apparatus, in combination, a grinding throat adapted for simultaneous grinding and rotating action upon work of round section and co1npi.'.isi11;;' three inenns, one of which iiiozinf; is in the forni of a grinding wheel adapted to he rotated at no relatively high speed, another of snid ineans being in the form of a i'egulnt»ing_; Wheel adapted to he rotated at a relatively low speed and in 2. direction to present an operative surface traveling in n direction opposite from that ol? the irdjncent grinding nflieel surface and fidapted tlioi'clJy to control the rotation of the work, and tho tliird of Whicli inonnsz includes a ineinlier for holding work oi’ round section in operative relation to said two Wheels; po\‘.;ci~ driven moons adapted in recurring sequence to change the relation of the grinrlin throat to the Work, thereby to permit insertion or removal of a. Work piece with respect to the grinding throat, and power controlled means for mnliing inoperative said, power driven means. 29. In grinding app:iratus, in combination, n grinding; throat adapted for siinullnneous grinding and rotating' action upon work of round section and comprising three means one of which means is in tlie form of a grin_lt;]~ ing wheel zidapted to he rotated at a relatively high speed, another of said means being in the form ol' a regulating Wheel adopted to he rotated at o relatively low speed rind in zz direction to present an operative surtncc travelingz; in a di reel ion oppoesite from that ol? the zuljacent grinding Wheel suri’nce :ind adapted tliereby to control the rotation of the work, and the tliircl of wliieli means includes a ineinlior for holding Work of round section in operative relation to sold two Wheels; power driven means €lLl5LI7l'€_lt;,l in re~ cnrring sequence to clmngc the relation of the grinding throat to the work, thereby to permit insertion or removal of zi. Work piece \\‘il.l1 respect to the Qinrling throat, a ehitzzli for controlling the operation of said power driven ineans, and nieuns for ni|i.oni:1,tic=illy oper:it~ ing said clutch, 30. In grinding apparatus, in conilniiiation, a grinding throat– adapted for simultaneous grinding and rotating action upon Work of round section und comprising three nicann, one ol' wliicli menus is in the forni ol it grinding wheel adapted to hc rota'Led at a relatively liigli Speed, another oi’ said ineans being in the form of a regulating Wheel adapted to he rotated at at relatively low speed and in fi. directionto present an operative surfe ce travel,– so ss no ion ios no ns Ut) no lf] if] ing in a direction opposite from that of the ad]aeent grinding wheel surface and adapted to control the rotation of the work, and the third of which means includes a member for holding work of round section in operative relation to said two wheels; power driven means adapted in recurring sequence to change the relation of the grinding throat to the work, thereby to permit insertion or removal of a work piece with respect to the grinding throat, a clutch for controlling the operation ol' said power driven means, means for automatically operating said clutch, and Inanuelly controlled means for re–setting said clutch. 31. In grinding apparatus, in combination, a grinding throat adapted for simultaneous grinding and rotating action upon work of round section and comprising three means, one of which means is in the form of a grinding wheel adapted to be rotated at a relatively high speed, another of said means being in the form of a, regulating wheel adapted to be rotated at a relatively low speed and in a direction to present an operative surface traveling in a direction opposite from that of the adjacent rinding wheel surface and adapted to contro the rotation of the work, and the third of which inc–ans includes a ineniloer for holding work ol round seetiou in operative relation to said two wheels; power driven means adapted in recurring sequence to change the relation of the grinding throat to the work, thereby to permit insertion or removal of a work piece with respect to the grinding throat, and speed–change inechanisni interposed in said power driven means and providing a plurality of differentrelative speeds any one of which is selectable at will for controlling at will the periodicity of operation of sa id power driven means. In grinding apparatus, in combination, a grinding throat adapted for simultaneous grinding and rotating action upon work of rouncl section and comprising three means, one of which means is in the form of a grinding wheel adapted to he rotated at a relatively high speed, another of said means being in the form of a. regulating wheel adapted to be rotated at il relatively low speed and in a direction opposite from that of the adjacent grinding wheel surface and adapted thereby to control the rotation of the work, and the third ot’ which means includes a member for holding work of round section in operative relation to said two wheels; power actuated means for controlling the movement of a work piece with respect to said grinding throat and speed–change mechanism interposed in said power actuated means and providing a. plurality of dilferent relative speeds any one of which is selectable at will for controlling at will the periodicity of operation of said power actuated means. 83. In grinding apparatus, in combination, a grinding throat adapted for simultaneous grinding and rotating action upon work of round section and comprising three means, one of which means is in the form ol’ a grinding wheel adapted to he rotated at a relatively high speed, another of said means being in the form of a regulating wheel adapted to be rotated at a relatively low speed and in a direction to present an operative sur lace traveling in a direction opposite from that of the adjacent grinding wheel surface and adapted thereby to control the rotation of the work, and the third of which means includes a member lor holding work of round section in operative relation to said two wheels; a. magazine for holding a supply of work pieces, power driven means adapted in recurring sequence to effect movement of a work piece 'From said magazine into said grinding throat, and speed–change mechanism interposed in said power driven means and providing a plurality of dilfercut relative speeds any one of which is selectable at will for controlling the periodicity of operation of said power driven means. 34, In grinding apparatus, in combination, a grinding throat adapted tor simultaneous grinding and rotating action upon work of round section and comprising three means, one of which means is in the form of a grinding wheel adapted to be rotated at a relatively high speed, another of said means being in the form of a regulating wheel adapted to be rotated at a relatively low speed and in a direction to present an operative surface traveling in a direction opposite from that of the adjacent grinding wheel surface and adapted thereby to control the rotation of the work, and the third of which means includes a xnemloer for holding work of round section in operative relation to said two wheels; mechanism 'tor

cycli cally ch angiug the relation of the grinding throat to the ivorlc and for effecting a movement of a work piece relative to the grinding throat, and means for automatically halting the OPGIWtion of said mechanism at the completion of a cycle. In grinding apparatus. in combination, a grinding throat adapted for simultaneous grinding and rotating action upon work of round section and comprising three means, one of which means is in the form oi' a grinding wheel adapted to he rotated at a relatively high speed, another of said means being in the form of a regulating wheel adapted to be rotated at a relatively low speed and in a direction to present an operative surface traveling in a– direction opposite from that of the adjacent grinding wheel surface and adapted thereliy to control the rotation of the work, and the third of which means includes a member for holding work of round section in operati ve relation to said two wheels; mechanism for cyelically changing the relation of $1.4 fI,738§0§5 the griurling tlnnat to the n'oi‘l_lt; and for ef– –fecting ainiovonient of a Work piece relative to the grinding throat, and speed–elmilge niechaniani providing fi, plurality of different relativeepeeds ony one ot which is selectable at –will for controlling at will the periodicity of operation of said niecluuiisni. 36. –ln grimling uppuinttis, in coinhiniition, –ii grinding throat adapted for simultaneous grinding :ind rotating action Upon worl; ot ‘round Section ‘rand GO1`(i1J1'lSll}f§ three means, 1one‘ot"\vhieh means in the lol–in ot :1 grinding wheel nilaipieil to he roratecl at si relatively high speed, another ol’ Said niezinfs he– –inv in thevl’o1'_lt;1n oi’ 21 re.1_gt;'ul:1tiiw~ wheel ndnptA S oiltlto he rotated fit relatively low speed land in 1:1 direction to prcszent an operative Sl1]`Ll:§I.(!6t»l"1IVGI~lllQ;ll] :1 diL‘ci'tion opposite from ‘that of the El–LI_i2L(.'{5Yllf grinding wheel surfsiee t11'1`(lf`}t(ll1]7t(?[l thereby to control the rotation of the wcufk, and the third of which nieans ineludoe 3, member for holding; Work ot round 'Section in operative relation tu said two wheels; nieelianisnl for eyoliezxlly changing the relation otithe grinding thron,t to the –work and for edeoting az rriovement of ai Wort; 'piece relative to the grinding tlimilt, 1`H€t1TlS ~eonti'ol]ed by S2Llkl~lTlQCl1t\]litSll'l im' halting hhe‘operution of the latter, und znerms for B(]~ll`1E|.l{lH§_§ said inecluinism again _lt;1po;'ni.ive. 257. Abstract:
Source: US2017022971A A bi–directional contra–rotating circular rail bearing Y–shaped compound blade fluid energy collection multi–unit power generating windmill, the windmill comprising: a windmill remote automatic control system (1); a Y–shaped compound blade (2) from a combining of single blades; a circular rail windmill body (3) bearing the Y–shaped compound blade (2); a circular windmill rail (4) bearing the circular rail windmill body (3) for operation; a circular rail connection cable pulling vehicle (5) running on the circular cable pulling vehicle rail to pull the circular rail windmill using a stay cable (209); a hydraulic energy collection multi–unit power generating system (6) or pneumatic energy collection multi–unit power generating system (7); the Y–shaped compound blade (2) is born by three circles of the circular rail windmill body (3) arranged equidistant thereon; the circular rail windmill body (3) has six circles.

Abstract:
Source: US2005120715A What has been created is a plurality and a variety of processes and a variety of devices correspondingly supportive to each process, wherein, a new partnership between; (1) a heat absorbing radiator compressed air pipes/tubes and (2) a gas turbine engine or a reciprocating piston engine,–is used to recapture and reconvert the, otherwise wasted, heat energies expelled by engines, by factories, by smelting plants, by distillation plants, by chillers/coolers/freezers, by cooking ovens, by lamps/stoves, by trash burners, and the heat energies created by the solar heat on the desert/ocean water,–into electric power and finally into hydrogen–deuterium fuel,–by having the engine's tailpipes submerged in cold compressed air inside the heat absorbing radiator pipes in reverse air flow, to further drive and re–drive the same engine; wherein, in order to capture fusion heat energy the hydrogen bomb is detonated in the deep ocean to catch the flames by the water and the hot water is used to energize the compressed air inside the heat absorbing radiator pipes; wherein, in order to produce fusion energy, an abundant electric arc is passed across liquid deuterium or across gaseous deuterium by the electro–plasma torch and sparkplug in the internal combustion engine, and by detonating a dynamite inside a liquid deuterium; wherein diamond is produced by placing carbon inside the hydrogen bomb; and wherein, deuterium fusion flame is used first in smelting glass to large sizes before running an engine.

Abstract:
Source: US2009160193A New hydroelectric turbine devices, systems, and methods, based on recirculation of fluid through at least one turbine, offer the potential for less costly and greater energy output in many applications.

Abstract:
Source: US2010207391A Extracting energy from waves, even large ones, is a challenge. The current application describes adjustments to wave turbine systems that work with small waves especially well. Configuring the waves, blades, and generators as part of the system is the subject of the current application.

Abstract:
Source: US3807477A A lower bead breaker is interconnected with an upper bead breaker through a fluid motor that powers both bead breakers, the lower bead breaker being pivotally connected to the motor's piston rod, and the upper bead breaker being pivotally connected to the motor's housing. The lower bead breaker is mounted for limited vertically upward movement in an arcuate path by virtue of a control arm that is pivotally fixed to the machine's main frame at one end and that carries the lower bead breaker's pivotal motor connection at the other end, and the upper bead breaker is mounted for limited vertically downward movement in a straight line path by virtue of the upper bead breaker's pivotal motor connection being captured in a vertical slot defined in the machine's stationary main frame.

Abstract:
Source: US6908373B Blade sharpener apparatus and method for ice resurfacing and paper cutting machines includes a table for laying a longitudinal blade in a stationary position thereon. A moveable carrier assembly attached to the table has a drill press power head that is lowered from a raised position so that a rotatable sharpening wheel is positioned at a selected angle against the edge of the blade. A stabilizing guide can slide under the table while the sharpening wheel and an additional guide wheel rolls across the longitudinal blade. Liquid can continuously cool the blade sharpening, and can be recycled for reuse. Another embodiment eliminates the rotating guide wheel, and attaches the carrier to the table so that only the rotating wheel contacts the blade. A hinge can support the carrier, and be adjustable by a rotatable bolt type member to different sharpening angles. A threaded guide rod can be rotated in place along the table so that a mateable threaded portion on the carrier can move along the guide rod. Power to operate the sharpening wheel and the moveable carrier can be supplied by electrical motors, and the like.

Abstract:
Source: US2005061721A Circulation systems for ponds, lakes, or other bodies of water. In one set of embodiments, water is drawn up from the depths of the body for exposure to the atmosphere and to generate an overall, high flow circulation pattern throughout the entire body. In other embodiments, the circulation in the body of water is primarily limited to an upper aerobic zone with only small and controlled volumes from a lower anaerobic zone being brought up. Each system preferably includes a flotation platform, dish, impeller, and draft tube with specific modifications to the various systems to adapt them for use in a variety of environments.

Abstract:
Source: US2016114464A A skate blade sharpening system includes a blade retention mechanism that holds a skate blade to be sharpened, and a rotating shaft configured to have a grinding wheel mounted on it, where the grinding wheel contacts the skate blade during sharpening. An arbor on the rotating shaft is of a heat−conducting material and has a heat−conducting mating with the grinding wheel when the grinding wheel is mounted on the rotating shaft. The arbor includes a set of vanes contributing to fan−like air flow about the arbor and grinding wheel for convective heat dissipation during the sharpening operation.

Abstract:
Source: US2015140901A The method is for sharpening a blade. An automatic sharpening apparatus is provided that has a holder. A blade is placed into the holder. A grinding–wheel driving motor, in operative engagement with a wheel on a spindle, rotates a grinding wheel. A grinding assembly motor moves the grinding wheel in an x–direction towards the blade. A linear motor moves the grinding wheel from a first position to a second position in a z–direction without moving the grinding–wheel driving motor. The rotating grinding wheel engages the blade. The grinding wheel sharpens the blade.

Abstract:
A cigarette (23) comprises a tobacco rod having filled and unfilled portions arranged so that electrical heater elements (31) may overlap both portions. The rod includes a tubular tobacco web. The web is constructed by converting tobacco feedstock into a continuous sheet of tobacco web and converting the continuous sheet of tobacco web into one or ore bobbins of tobacco web suitable for automated manufacture of cigarettes. A heater (25) comprises a supporting hub and electrically resistive heater blades (37) defining a receptacle (27) for an inserted cigarette (23). Each blade comprises first and second heater blade legs each having a first end and a second end, and a connecting section connecting the second end of the first leg and the first end of the second leg. The blades (37) are heated by a resistive heating circuit and heat the inserted cigarette (23). The legs are separated by a gap to permit entrainment of flavour substances upon drawing.

Abstract:
Source: CO4480005A 1. PROCESO PARA LA ELABORACION DE CONFITURAS HE– LADAS CARACTERIZADO PORQUE CONSISTE BASICAMENTE DE LA ELABORACION EN FORMA INDEPENDIENTE DE UNA MER– MELADA DE FRUTAS Y DE UNA MEZCLA DE AGUA Y AZUCAR LAS CUALES POSTERIORMENTE SE UNEN PARA FORMAR UNA MEZCLA TOTAL QUE SE LLEVA A MADURACION DE DONDE SALE PARA SER MOLDEADA COMO PALETA. 2. PROCEDIMIENTO PARA LA ELABORACION DE CONFITU– RAS HELADAS DE ACUERDO CON LA REIVINDICACION No. 1 CARACTERIZADO PORQUE PARA HACER LA MERMELADA SE LLEVAN A CABO LAS SIGUIENTES ETAPAS: A. RECEPCION Y SELECCION DE LA FRUTA, ESTE PROCE– SO SE HACE MANUALMENTE TENIENDO EN CUENTA TAMANO, ESTADO DE MADURACION Y OPTIMAS CONDICIONES FITOSA– NITARIAS. B. LA FRUTA UNA VEZ SELECCIONADA Y YA COLOCADA SOBRE UNA ESPECIE DE ZARANDA SE SOMETE AL LAVADO CON CHORRO DE AGUA FRIA. C. LUEGO PASA A UN PROCESO DE ESCALDADO EN AGUA A 50 GRADOS CENTIGRADOS DURANTE UN TIEMPO DE 10 A 15 SEGUNDOS. D. EXTRACCION MANUAL DE LA PULPA, QUEDANDO LA PULPA SEPARADA DE LA CORTEZA. E. PROCESO DE LICUADO MEDIANTE EL CUAL LA PULPA SE FRAGMENTA COMPLETAMENTE QUEDANDO SEPARADA DE LA PEPA O SEMILLA. F. DESSEMILLADO POR MEDIO DE FILTRACION UTILIZAN– DO UN FILTRO DE LIENZO TIPO MANGA. G. AL CONCENTRADO DE PULPA DE FRUTA ASI OBTENIDO SE LE ADICIONA AZUCAR EN UNA EN UNA PROPORCION DE DOS PARTES DE FRUTA POR UNA DE AZUCAR, ESTA MEZCLA SE ELABORA EN UNA MARMITA PARA LUEGO SER LLEVADA LENTAMENTE HASTA UNA TEMPERATURA ENTRE 60 Y 85 GRADOS CENTIGRADOS, DONDE UNA VEZ ALCANZADA LA TEMPERATURA SE MANTIENE EN ESE PUNTO DURANTE UN TIEMPO DE 10 A 15 MINUTOS, PARA OBTENER UNA MERME– LADA DE FRUTA. H. LA MERMELADA ASI OBTENIDA SE ENVASA EN TAMBO– RES PLASTICOS O ENVASES DE VIDRIO HERMETICAMENTE CERRADOS Y SE DEJA EN REPOSO POR LO MENOS DURANTE 24 HORAS. 3. PROCEDIMIENTO PARA LA ELABORACION DE CONFITU– RAS HELADAS DE ACUERDO CON LA REIVINDICACION No. 1 CARACTERIZADO PORQUE SEPARADAMENTE SE PREPARA OTRA MEZCLA COMPUESTA DE AGUA Y AZUCAR, DONDE EL AGUA SE PASA PRIMERO POR UN FILTRO DE CARBON ACTIVADO Y LUEGO POR UN FILTRO DE ARENA, PURIFICADA EL AGUA SE LE ADICIONA EL AZUCAR EN PROPORCION DE CUATRO PARTES DE AGUA POR UNA DE AZUCAR. 1. Process for the production of confectionery HE– LADAS wherein it consists basically PROCESSING INDEPENDENTLY OF A MER– ROAN FRUIT AND A MIXTURE OF WATER AND THEREAFTER WHICH SUGAR TOGETHER TO FORM A TOTAL MIX THAT TAKES WHERE DOES matured to be molded as a palette. 2. PROCEDURE FOR THE PREPARATION OF RAS frost CONFITU– according to claim No. 1, characterized MARMALADE TO TAKE OUT THE FOLLOWING STEPS: A. RECEPTION AND SELECTION OF FRUIT, this process is done manually BEARING NOTE size, stage of maturity and optimal conditions PLANT PROTECTION nity. B. FRUIT AND ONCE SELECTED AND PLACED ON A KIND OF ZARANDA SUBMITTED TO WASH WITH COLD WATER JET. C. THEN GO TO A PROCESS WATER scalding 50 degrees Celsius for a period of 10 to 15 seconds. D. REMOVAL MANUAL PULP AND ARE SEPARATE PULP BARK. E. blending process whereby fragments PULP being completely separated from the PEPA or seed. F. DESSEMILLADO by filtration UTILIZAN– DO A FILTER BAG TYPE SLEEVE. G. TO CONCENTRATE FRUIT PULP OBTAINED ASI is added sugar in a ratio of TWO PARTS OF FRUIT BY A SUGAR, this blend is made in a pot TO BE BORN THEN SLOWLY TO A TEMPERATURE BETWEEN 60 AND 85 DEGREES CELSIUS WHERE After reaching the temperature is

maintained at that point for a period of 10 to 15 minutes to obtain a MERME– LADA FRUIT. H. MARMALADE thus obtained is packaged in TAMBO– RES PLASTIC OR GLASS CONTAINERS sealed and allowed to rest for at least 24 hours. 3. PROCEDURE FOR THE PREPARATION OF RAS frost CONFITU– according to claim No. 1, characterized OTHER MADE SEPARATELY WATER AND SUGAR BLEND, where water is first passed through a charcoal filter and then filter PREPARES ARENA, PURIFIED WATER is added sugar ratio of four parts water to A SUGAR.

Abstract:
Source: US4119132A A skid prevention device for tires, which tires are provided with longitudinally– and radially–extending rows of treads separated by discrete, laterally–extending rows of recesses, includes a plurality of elongated, generally U–shaped metal claws disposed within the rows of the recesses of the tire, the outer ends of which have spikes secured thereto, and the inner ends of which are pivotably supportable in the recesses of the tire. The device also includes means for pivotably mounting the inner ends of the claws in the recesses of the tire for movement between an extended position, in which the claws are pivoted upwardly with their spikes extending radially outwardly beyond the upper surface of the treads of the tire, and a retracted position, in which the claws are pivoted downwardly with their spikes lying below the upper surface of the treads of the tire. In addition, the device includes means for pivotably moving the claws between the extended and retracted positions thereof.

Abstract:
Source: US6922920B A snow removal apparatus in the form of a shovel in which a leveraged arrangement is used to lift snow gathered on the shovel blade by lateral movement of such blade while supported by a handle adjustably secured upon the blade and the shovel handle is rested upon an underlying surface while snow is being lifted and moved to a dumping area by leveraged foot movement upon a pivot arm pivoted upon the handle and attached to the blade thus avoiding strain on a shovelers arms and spine while shoveling.

Abstract:
Source: US2002077642A A debulking catheter comprising a debulking assembly for debulking a body lumen. The catheters of the present invention can include a flexible proximal portion coupled to a rigid distal portion. A tissue debulking assembly can be disposed within the rigid portion to debulk the body lumen. In exemplary embodiments, the rigid portion is rotatably coupled to the flexible portion such that rotation or deflection of the rigid portion, relative to the flexible portion, can expose the tissue debulking assembly through a window in the catheter to debulk the body lumen.

Abstract:
Source: US2004154715A The invention concerns a method whereby when the tyre reaches a wear threshold level, acoustic wear indicators emit a sound signal by coming into contact with the ground. Magnetic, optical and mechanical embodiments are also disclosed. A detector consisting of a microphone placed beneath the vehicle and a processing unit switches on an indicator placed in the instrument panel. In a more sophisticated version, the detector by matching the acoustic signal phase with the ABS data, identifies the tyre concerned. The invention is useful for detecting tyre deterioration, or that of any, other type of surface such as pads, and the like, and for detecting the presence of snow chains or nails.

Abstract:
Source: US2002085745A A document processing system comprises an input receptacle for receiving documents. A transport mechanism receives the documents from the input receptacle and transports the documents past a full image scanner and a discrimination unit. An output receptacle receives the documents from the transport mechanism after being transported past the full image scanner and the discrimination unit. The full image scanner includes means for obtaining a full video image of said documents, means for obtaining a image of a selected area of said documents, and means for obtaining information contained in said selected area of said document. The discrimination unit includes means for determining the authenticity of said document. A system controller directs the flows of documents over the transport mechanism.

Abstract:
Source: US5601473A gAn apparatus and method for sharpening skate blades operate by measuring the length of a skate blade, determining a predetermined profile corresponding to a desired radius of curvature for the blade, and coordinating the motion of a grinding wheel and the blade to grind the blade according to the predetermined profile. A grinding force is applied by the grinding wheel against the blade using a stepper motor coupled through a screw drive, thereby not allowing the grinding wheel to chatter or bounce against the blade. In addition, the blade is clamped end–to–end by a clamping assembly that also determines the length of the blade via the position of the clamp.

Abstract:
Source: US6341887B An ice cream mixing apparatus comprises a funnel for holding ice cream and flavor additives, an auger and a linear actuator for moving the auger into the funnel, in which position a rotation of the auger will mix the ice cream and the flavor additives. The funnel forms part of an enclosure with at least one spray nozzle for pointing a water spray at the auger for washing purposes. The auger has at least one vane in an area which is hit by the water spray during the relative movement of the funnel and auger, causing a deflection of the water spray.

Abstract:
Source: GB583933A [Class 106 (i)] In a card–controlled accounting machine wherein a debit or credit balance of a series of debit and credit items is obtained automatically as a true number by entering into an accumulator credit items as a nines' complement and debit items as true numbers, a unit is carried to each order of the accumulator when the next lower order passes from 0 to 1 and to the lowest order when the highest passes from 0 to 1. The balance is read out as the tens complement of each digit of a credit balance in the accumulator and as the tens complement of each digit of a debit balance after adding to the debit balance conversion digits obtained by subtracting twice the value of each digit of the debit balance from eleven and taking account only of the units digit of each subtraction. Driving mechanism. A constantly–rotating shaft 10 (Fig. 12) drives, through gear–wheels 11, 12 two gear–wheels 14, 16 fixed to a common shaft, the gear–wheel 16 driving the printer drive shaft 35 through a further gear–wheel 34. A second printer drive shaft 17 is rotated at a variable speed by a gear–wheel 33 which, by means of a cam device, is slowed down during a portion of its rotation and then accelerated so that its average speed is equal to the speed of the uniformly rotating shaft 35. A friction device eliminates any irregularity in the predetermined speed variations of the shaft 17 which are designed to give a constant speed during the analysis of the 9–1 index positions on the record card and a slower speed during the analysis of the "O," "X" and "R" positions. Printing mechanism. This is generally similar to that described in Specification 525,985, [Group XVI]. The alphabet type are selected according to perforations in the " O," " X " or " R " positions as shown in Fig. 4b. When a hole is sensed during the analysing of the 9–1 positions, a print relay 61 (Fig. 4) is energized and pulls a wire 63 to rock a bell–crank 64 which pulls down a T–shaped member 65, one arm 66R of which is engaged with, and so rocks, a bell–crank 67. This releases a pawl 76 so that a tooth 77 on the pawl engages a groove of a rotating sleeve 68 secured to the shaft 17. Thus, the gear–wheel 70, to which the pawl 76 is pivoted, starts to rotate with the shaft 17 and, through an intermediate gear–wheel 79, drives a type wheel 60 upon which alphabetical and numerical type is arranged in accordance with Fig. 4b. After the 9–1 positions have been analysed, the four characters in the row (Fig. 4b) corresponding with the number sensed by the card–reading mechanism pass the printing platen at a reduced speed (by virtue of the cam device described above) and the required letter is selected when a second hole is sensed in the "O," " X " or " R " positions respectively or, where no pilot hole is 'punched, the numeral is printed. The sensing of a hole in the "O," " X " or " R " positions again energizes the corresponding print relay 61, rocking the bell–crank 64 and pulling down the T–member 65 as before, but cam means has moved guide plates 88 so that the arm 66L of the T–member engages a bell–crank 87 which then releases a pawl 86 to engage a groove 84 of a sleeve secured to the constantlyrotating shaft 35. Thus a cam disc 85 is clittelieci,to the shaft 35 at a time corresponding with the position of the pilot hole (if any) in the card, and a raised portion 83 of the cam rocks an arm 82 of the member carrying the type wheel 60 which remains stationary during this printing movement as the rolling of the wheel 60 over. the gear 79 is counteracted by the rotation of the latter. The printing of numerals is initiated by a cam 130, formed as a flange on the gear–wheel 79, which rocks a lever 132 about its fulcrum 133 and so lifts a member 134 carrying a contact piece 138 until it is opposite contact plates 140, 141. After the " R " position has been passed, cam means rocks the arm carrying the numerical print bail 143, thus causing the contact piece 138 to bridge the contacts 140, 141 so energizing the print magnet 61 to cause the engagement of the pawl 86 with the " N groove 84 and the printing of the corresponding

numeral. Printing of zeros. The circuit for printing a zero passes through the contacts for printing a numeral in a higher denomination. Thus no zeros are printed to the left of the highest numeral, but zeros are printed to the right in the absence of numerals in particular denominations. In such cases no rotation of the type wheel 60 takes place and, since the gear 79 is also stationary, the lever 132 is not rocked and so the contact plate 138 is positioned opposite the contacts 141, 162, as shown. When cam. means causes the zero print bail 142 to push the plate 138 into engagement with the contacts 141, 162, an impulse energizes the print magnet 61 and thus operates the cam 83 and the printing mechanism in the manner described. Accumulator mechanism. The accumulator elements 172 (Fig. 4a) are driven by a constantly−rotating, fluted shaft 165 when an idler gear 175, pivoted on an arm 174, is moved into engagement therewith. A pawl 191, pivoted to the arm 174, locks the idler gear when in the inoperative position. This pawl 191 is pulled by a spring 192 against a stationary member 194, but when a bail 176 moves to the right during the card sensing period, the spring 192 pulls the arm 174 over to engage the idler wheel 175 with the fluted drive shaft 165 and at the same time the pawl 191 is rocked out of engagement with the idler wheel. Entry of credit amounts negatively. The entry of the nines complement of each digit of a credit item is accomplished by engaging the accumulator at the beginning of the cardsensing −period and disengaging it when the numeral is sensed in the card. The absence of a " debit " hole in the control column of a card gives rise to an impulse during the first reading by the upper brushes which energizes the appropriate relay 195 (Fig. 4a), thus pulling a link 196 to rock a lever 197 which releases a three−armed lever 198 to engage the hook of its arm 20 over the point 201 of a member'202. This serves to hold the member 202 against a spring 215 when a bail 203 is. subsequently lifted (see next paragraph). As the bail 176 (by cam means, not shown) ismoved to the right at the beginning of the second card sensing, the arm 174 follows and the accumulator is engaged and starts to rotate as described above. When the numeral perforation is sensed by the brushes and a relay 61 (Fig. 4) is energized to control the printing mechanism, the lever 132 is rocked by the cam 130 and a pin 209 on the lever lifts a link 207, the lower end 212 of which engages a pin 211 on the accumulator arm 174. Thus, the arm 174 is rocked to disengage the idler gear 175 after the nines complement of the digit has been entered into the accumulator. Entry of debit amounts additively. The sensing of a hole in the control column of a card by the upper brushes causes an impulse to be sent to the relays 195 slightly later than in the case of a credit amount. By this time the bail 203 has moved upwards and the member 202 rocked anticlockwise under the influence of the spring 215, so that the hooked arm 200 engages a second point 216 on the member 202. This movement of the member 202, together with the lowering of a bail 217, causes a projection 220 on the link 204 to engage a lug 221 on the upper end of the accumulator arm 174 and thus prevent the movement of the latter when the bail 176 moves to the right. The movement of the link 204 also pushes the link 207 aside so that the hook 212 on the lower end disengages the pin 211. Thus the accumulator is not engaged until the print relay 61 is energized and the lever 133 rocked to lift the link 207 which now lifts the link 204, disengaging the projection 220 from the lug 221 and allowing the arm 174 to swing to the right and couple the accumulator to the fluted drive shaft 165 as already ,described. The rotation of the accumulator elements is terminated when the bail 176 is moved back to−the left by its cam control. Similar cam−controlled bails restore the other members to their original positions. Units carry mechanism. Transfer takes place when an accumulator element passes from 0 to 1 and is initiated by a high part 261 (Fig. 4a) on the cam. 260 attached to each accumulator element which rocks a lever 262 whose lower end then allows the transfer of a contact blade 265 from a contact 266 to a contact 267, the lever 262 being latched in this position by a spring−urged member 263. At a predetermined time in the machine cycle an electrical impulse passes through all the circuits completed by the engagement of blades 265 with contacts 267 and energizes the control magnet 195 of the next higher denomination (except in the case of transfer from the highest denomination which energizes the control magnet of the lowest denomination). The bails 176, 203, c. are moved by their cam controls a second time in the machine cycle for effecting the transfers, each of the arms 174 bearing an accumulator element which is to receive a carry swinging to the right and the idler wheel 175 being engaged with the fluted drive shaft 165 a sufficient time to add " one " into the accumulator. Where no carry is to take place, the magnet 195 is not energized to latch the member 202 which therefore rocks anticlockwise when the bail 203 is lifted and so retains the arm 174 in the manner described above. Accumulator readout. A series of pinions 270 (Fig. 4a) are rotated by the accumulator 172 about a stationary shaft 271 having longitudinal contact strips 272, insulated from each other over which slides a brush 273 attached to a flange 274 integral with each pinion 270. A brush 275 maintains contact with the flange 274. The contact strips are arranged so that the brush

Abstract:
Source: US5680715A The machine incorporates a front and a rear motorized units operatively connected together, and in which power is transmitted from one unit to the other so that they are both serf–propelled. A snow levelling device is disposed between the two motorized units for breaking irregularities on the trail and delivering excess snow behind the rear unit. A compaction and levelling unit is placed at the rear of the rear unit. Both the snow levelling device and the compaction and levelling unit may be raised from the ground especially in case of difficulties. This arrangement does not usually become inoperative in heavy snow or on inclined surfaces.

Abstract:
Source: US2014174838A A riding lawn care vehicle may include a frame, an engine, a steering assembly, a support platform and a front mount assembly. The frame may be attachable to a pair of front wheels and a rear wheel assembly of the riding lawn care vehicle. At least a portion of the engine may be mounted to the frame substantially between the front wheels. The steering assembly may include steering levers operably coupled to respective ones of the front wheels of the riding lawn care vehicle via respective hydrostatic drive pumps driven by the engine. The steering assembly may enable steering of the riding lawn care vehicle based on drive speed control of the front wheels responsive to positioning of steering levers of the steering assembly.

Abstract:
Source: US2002110625A The invention relates to a package having a first web defining a cavity and a second web bonded to the first web, wherein the second web includes microperforations at a location that is specific to minimize the escape of liquids from the cavity to the exterior of the package. In one particular embodiment, the first web defines a four sided cavity with walls and corresponding flaps attached to the walls that can be folded and bonded to the cavity walls. The second web is an overwrapping lidding web, wherein microperforations are provided on the web material so that the microperforations are aligned with a flap recess, which in turn is in communication with the interior of the tray cavity. In this manner, suitable gas exchange can occur with minimal to no escape of liquids from the tray cavity.

Abstract:
Source: US5249445A A mobile metal building forming machine forms panels of predetermined length from a coil of flat metal and then the formed panels are continuously crimped on their side edges for strength and are selectively curved by crimping the bottom of the panel. The crimping and curvature are automatically controlled so that building panels with vertical walls and an arched roof may be formed. A moveable crimping roll is automatically portioned to control the curvature and the roll is chain driven so that it may be moved without affecting its rotational drive.

Abstract:
Source: US1993741A What I claim is: 1. A fluid apparatus for transmitting power, having a rotary blade wheel impeller energizing the nuid, a rotatable blade wheel turbine runner driven by said fluid, a guide wheel With curved vanes changing angular momentum of said fluid and a casing illled with a driving fluid and enclosing said impeller, said runner, and said guide Wheel, said wheels comprising the circuit in which said fluid circulates, said runner wheel equipped with movable and adjustable blades, said adjustable blades at light loads being convergent i. e. of reaction pressure decreasing type, said adjustable blades at heavy loads, being divergent i. e. of the anti–reaction pressure increasing type. 2. Power transmission mechanism comprising a path for iluid including rotary driving vanes, a nrst shaft connected to rotate said vanes, rotary driven vanes, a second shaft aligned with said first shaft and connected to rotate with said driven vanes, and gates, said driven vanes being movable and their angular position in the path of iluid being adjustable automatically under the control of said fluid, said driven vanes being reversible at Will, while in operation, said gates being interposed between the exit from said driven vanes and the entrance to said driving VBJISS. 3. A fluid torque converter for transmitting power, comprising an impeller having wingshaped blades with a front blade area smaller than one half the area of the surface of revolution generated by rotation of the impeller around the impeller axis, a turbine runner wheel having Q5 T0 blades with blade area larger than the blade area of said impeller, a guide wheel with guide vanes, a casing containing a driving iluid and enclosing said impeller, said runner, and said guide wheel, large clearance spaces being provided between said guide wheel and said impeller, between said impeller and said runner, and between said Yllllner and said guide wheel. 4. A fluid device for transmitting power, having a casing, a nuid in said casing, a guide wheel with gates, and impeller wheel with curved vanes, and a runner wheel with curved blades in said casing, said runner wheel comprising a hub and a sleeve movable relatively thereto, said blades being movable and pivoted on said hub, connecting means between said sleeve and said blades, means capable of displacing said sleeve axially for adjusting the angular position of said blades, means to make said runner blades immovable and rigid in reverse speed and neutral position also to make said blades yieldable in lower speed position of said blades, said guide wheel interposed between the exit from said runner and the inlet in said impeller. 5. A duid device for transmitting power, having a stationary casing, a circulating Huid, a stationary guide wheel with gates to change angular momentum 01 the Huid, an impeller energizing the fluid and a runner driven by said nuid in said casing, said runner comprising a movable sleeve, a hub, blades movably mounted on said hub, each blade provided with a gear, rods provided with gear teeth connecting said gear with said sleeve, and means for axially displacing said sleeve relative to said hub for adjusting the angular position of said blades, by means of said rods. 6. In combination an engine having a nywheel and a stationary iiywheel housing, a nuid power transmitter comprising a plurality of driving members connected to said :dywheel energizing the Huld and a plurality of driven members with movable blades receiving energy from the iluid a guiding member adapted to increase the angular momentum of the circulating and power transmitting iluid, a casing fastened to said housing and closing said members, a clutch having a driving part and a driven part, said driving part connected to said driving member or the transmitter and said driven part of said clutch secured to said driven member, and means to engage and

dlsengage said clutch while in operation, said means also to turn the angular position of said blades. 'L A reversible turbine power torque conveter comprising a passage for tluld including driving vanes, movable and reversible driven vanes, and guide vanes interposed between the exit from the driven vanes and the entrance to the driving vanes, discharge angle or said guide vanes being smaller than '15 deg., and means for turning said driven vanes to adjust their angular position so as to cause forward, or reverse rotation. 8. A reversible turbine torque converter C0111– prising a passage for fluid, including driving vanes, reversible dlrven vanes and guide vanes interposed between the exit from said driven vanes and the entrance to said driving vanes, angular position of said driven vanes being adjustable so as to change rotating direction of said driven V8¥IBS. , 9. A turbine power torque coverter comprising a pamage for nuid including a. plurality of driving wheels with blades working in series, a plu– ` – – wx 'U' M, assi' Aifsiissts 1 1 rality of driven wheels equipped with blades working in series, and single stage guide vanes, said guide vanes interposed between the exit from the last driven wheel and the entrance into the flrst driving wheel, length of said blades in direction of now being smaller than spacing oi' said blades, one part of said wheels having blade area smaller than the area of the surface of revolution generated by rotation oi' said wheels around their axis, another part of said wheels having a blade area larger than the area of revolution of 'said wheels. 10. A reversible turbine power torque converter comprising a passage for fluid including a plurality of pump impellers working in series, a plurality of turbine runners working in series, single stage stationary guide vanes interposed between the exit from the last runner and the inlet in the ilrst impeller, vanes of said turbine runners being pivotally adjustable, and means for turning said pivoted vanes to reverse the rotation of said runners. 11. A reversible turbine power torque converter comprising a passage for :lluid including driving vanes, driven vanes, and stationary gates interposed between the inlet to the driving vanes and the exit from the driven vanes, said driven vanes as well as said gates being pivoted and automatically adjustable under the control or the nuid, also being adjustable, at will, while in operation, to control the direction of said driven vanes rotation, and means to put said gates out of action, while in operation, and means to make said driven vanes lnen`ective while in operation. 12. In a fluid power transmission a casing, fluid and blade wheels in said casing, a fluid channel in said blade wheels, said nuld being capable of circulating in said channel and adapted to transmit power trom driving wheel to driven wheel, entrance angle ol' the driving blade wheel and exit angle of the driven blade wheel being smaller than corresponding angles calculated on basis ol' mean effective velocity diagrams, the dilference between the actual and the calculated angle being greater for a wheel with smaller blade area but being smaller for a wheel with greater blade area. 13. In a duid power transmission a casing, Enid and blade wheels in said casing, a fluid channel in said blade wheels, said nuid being capable of circulating the power transmitting from driving wheel to driven wheel in said channel, exit angle of the driving blade wheel and inlet angle of the driven blade wheel being greater than corresponding angles calculated on bas 's of mean effective velocity diagrams, the difference b‘ –tween the actual and the calculated angle “elng .renter for a wheel with smaller blade area nut being smaller for a wheel with greater blade are t, 14. In a fluid power transmission a ca ng, nuld, and blade wheels in s– id casing, a E .fd channel in said blade wheels, said fluid being zapable of circulating and po' 'er transmitting in said channel, some oi said wheels having a hub, movable bladm thereon, each blade provided with pinion gear, rods axially shiftable in said hub and provided with gear teeth meshing with said pinlons,»and means for axially displacing said rods for adjusting the angular position of said movable blades, at will, while in operation, means to make said blades yieldable, and means to lock said wheels by means of said rods for direct drive

Abstract:
Source: US2016249637A Present disclosure discloses a new ice cream machine with reducer transmission. The new ice cream machine comprises a housing on which a compressor, a condenser, an evaporator, a stirring tank, a stirring shaft, a motor, a feeding bowl, a discharge valve and a control panel are arranged. The housing is a rectangular box which is formed by a front plate, a rear plate, a top plate, a bottom plate, a left plate and a right plate which are connected one with the other. The compressor and the condenser are arranged on the bottom plate, and the compressor is successively connected with the condenser and the evaporator. The stirring tank is arranged on the front plate, and the evaporator is wound on outer wall of the stirring tank. The stirring shaft is arranged in the stirring tank, and is connected with the motor and located in a same horizontal plane therewith. The feeding bowl is arranged on the top plate and communicated with the stirring tank. The discharge valve is arranged on the front plate. The control panel is arranged on the front plate. The machine according to present disclosure has advantages of simple structure, small volume, light weight, easy to operate and energy saving, etc, and satisfies the requirements for energy saving and environmental protection.

Abstract:
Source: US4318323A In a band saw (10) particulaly adapted for cutting meat, blade scrapers (25, 26) remove debris from the band saw blade (18) and throw it laterally and forward of the blade (18) into an enclosure (40), which can be removed without the use of tools for cleaning and for disposing of the collected debris. The location of the blade scrapers (25, 26) is slaved to the location of the saw blade (18) to automatically maintain the proper relationship for most efficient debris removal without adjustment.

Abstract:
Source: US2005186893A A fully automated apparatus and system for processing shellfish such as shrimp and crawfish including the cooking, drying and peeling thereof. The present invention utilizes excessive heat

generated by boilers and the like to heat the dryers. The product is cooked in a brine mix that once used is transferred to a broth processing system to make a seafood flavored broth and is also injected as a fine mist into a furnace where is crystallizes into a solid product to be used as a seafood flavored salt.

Abstract:
Source: GB775859A 775,859. Grinding GARRINGTONS, Ltd. July 20, 1953 [April 18, 1952], No. 13203/54. Divided out of 775,856. Drawings to Specification. Class 60 A machine for surfacing a gas turbine blade or like workpiece comprises means for subjecting a matrix of form identical with or proportionate to the desired form of the finished blade and a blade blank to synchronized rotation or oscillation about spaced parallel axes, an abrasive band arranged to be advanced around a rotatably–mounted pulley which. is disposed in close proximity with the blank and is of convex configuration in a plane transverse to its axis, and means for oscillating the pulley and portion of the band thereon about an axis transverse to its axis of rotation and the longitudinal axis of the blade: The machine, which is constructed identically with that described in Specifications 775,856, 775,857 and 775,858, comprises a tool head (39) which carries a tracer (44) and an abrasive band (38) passing over a barrel–shaped pulley (43) and is supported by parallel links (45, 46), the pivot (52) of the upper links being formed by an eccentric arranged to be rotated by a ram (56) actuated by a cain (56b) rotating with the matrix; to take account of twist in the blade, a superimposed control is provided on the ram by means of a control member actuated as the blade moves under the band.

Abstract:
Source: US6652221B A flowing water actuatable turbine system, wherein the turbine system is mounted for operational co−operation with water current by means of an upstanding column/pile in such manner as to be

axially displaceable length ways of the column/pile. The turbine system is preferably arranged to be rotatably about the longitudinal axis of the column. Floatation means can be provided for operationally supporting the turbines which can include blade pitch control.

Abstract:
A modular gas–heat anti–icing method and device for high–power wind turbine blades. A modular heating system (5) is arranged on the root part of a blade (6), a ventilating duct (19) is paved in the blade (6), a wind deflector (21) is arranged at the end of the ventilating duct (19), and the wind deflector (21) divides the leading edge of the blade into two parts, so that the hot air in the ventilating duct (19) is led to the blade tip and then circulates into the root part of the blade via the rear edge of the blade, making the hot air circulate inside the blade (6) and forming a "blade root to blade tip to blade root" closed loop. The purpose of mainly heating the leading edge of the blade is achieved, so it is ensured that the whole blade will not ice by preventing the leading edge of the blade from icing. Said method and device enable the anti–icing and deicing function of high–power wind turbine blades, increase the generating efficiency of the wind turbine in winter, reduce the overall load and the overall running risk, and can be applied to a wind wheel of a running wind turbine.

Abstract:
Source: GB775856A 775,856. Grinding. GARRINGTONS, Ltd. July 20,1953 [April 18, 1952], No. 9817/52. Class 60 [Also in Group. XXII] Apparatus for surfacing an elongated work blank, such as a gas turbine blade, which is of irregular cross–section and provided with a groove, recess or shoulder disposed at an angle to its longitudinal axis comprises means for subjecting a matrix of form corresponding with the desired form of the finished work piece and a work blank to synchronized rotation or oscillation about spaced parallel axes, means for engaging a tracer with the matrix surface and for utilizing the relative movement between the tracer and the matrix ta control the relative position of a surfacing tool in operative engagement with the work blank so as to shape the surface of the same to a configuration identical with that of the matrix, means for advancing the work blank and tool relatively longitudinally of the blank so that the tool describes a helical path thereon, the means operative when the tool is at the inclined groove, recess or shoulder for changing the angle of the helix so that it corresponds with the inclination of such formations. As applied to the grinding of a blade 15, Fig. 1, which projects from the inclined face 21 of a shoulder platform 18, a tool in the form of an abrasive band 38, Figs. 4 and 5, and the tracer constituted by a roller 44 are supported in a hollow head 39 carried at the ends of parallel liriks 45, 46 so as to be disposed above the work blank 15 and matrix 30 which are mounted on a longitudinallymovable slide 25. Chucks 27, 28, Fig. 7, on the slide receive the root ends of the matrix and work blank, respectively, the opposite ends of which are supported in tailstocks 31. The drive of the chucks from an electric motor 37, Fig. 4, is through infinitely–variable gearing 36, chain drive 34, shaft 33 on the fixed frame and gearing 32 so arranged as to effect the drive while permitting movement of the slide 25. The gearing 36 is controlled by a pneumatic or hydraulic ram so as to maintain a constant linear relative velocity between the band 38 and surface of the blank which it engages, this effect being produced by a cam 77b, Fig. 7, which is shaped peripherally to correspond with the cross–section of the blade, rotates with the chuck 27, and actuates the control valve of the ram. The band 38, which is driven by a motor 42, passes over idler pulleys 40 and(at the point of engagement with the blank, a barrel–shaped roller 43. The tracer roller 44, which is also barrelshaped, is rotatable on an axis parallel with that of the roller 43 and carried by a vertically–adjustable slide 50. The inclination of the head 39 to the vertical is continuously varied during each revolution of the blank so that the band makes substantially point engagement with the blank and its operative surface is maintained tangential to the blade surface. For this purpose, the pivot 52, Fig. 4, of the upper pair of links 45 is formed as an eccentric rotatable by a pneumatic or hydraulic ram 56 as controlled by a valve 56a, Fig. 7, actuated by a cam 56b which rotates with the chuck 28 and is shaped peripherally to correspond with the variation around the cross–section of the blade of the inclination of the blade surface measured longitudinally of the blade and relatively to its axis. The control valve 56a is carried by an arm 56c pivotable about the axis of the chuck and engaging at its outer end a sine bar 56d which is mounted on the fixed frame for adjustment out of the horizontal whereby the action of the cam may be advanced or retarded 'in accordance with the degree of twist of the blank. The roller 43 is given one to–and–fro oscillation about a vertical axis during each rotation of the blank so as to provide a smooth surface finish and ensure that, when the band is dealing with that part of the blank adjacent the inclined face 21 of the platform 18, it lies parallel to such face when operating on both sides of the blank. For this purpose, the roller 43 is supported on a vertical spindle 58, Fig. 8, having a lateral arm 60 engaging an inclined cam slot in a plate 61 on a carrier 62 which is movable vertically by pneumatic or' hydraulic ram 64; the control valve of the ram is actuated by a cam rotating with the chucks 27, 28.

The slide 25 is advanced slowly to feed the blank and matrix past the band. and tracer during the finishing of the main portion of the blank (so that the tool and tracer describe helical paths on the blank and matrix) by an electric motor 68, Fig. 4, which drives a crank disc 67 carrying an adjustable crank−pin 69 connected to the slide by a rod 70 incorporating a doubleacting pneumatic or hydraulic ram 71; during this operation, the ram is ineffective and one of a pair of adjustable stops 73 on the rod 72 of the ram contacts an abutment 74 on the ram. When the band 38 reaches a position adjacent the inclinedplatform face, the slide is reciprocated to and fro for the distance a, Fig. 1, once for each revolution of the blank by the sole action of the ram (to provide the desired change in the angle of the aforesaid helical path); the control valve of the ram which acts through a servo−valve is controlled by a cam 71b, Fig. 7, rotating with the chuck 27. The ram is rendered operative for this purpose when a dog 88 moving with the slide acts through a stop 86 to slide coupled bars 82, 84 whereby an abutment 81 opens both a switch 79 to stop the motor 68 and a valve 78 to permit the supply of pressure fluid to the control valve of the ram. To achieve this effect, the slide bar 82, which is coupled by cranks or eccentrics 83 to the bar 84, had previously been set by a hand knob 90 to its extreme right−hand position so that the abutment 81 is correctly placed to operate as described above under the action of the dog 88. At the end of the operation, the hand knob 90 is turned to slide the bar 82 leftwards so as to actuate the valve 78 and switch 79 to stop the ram 71 and start the motor 68 in reverse for the return of the slide 25. When the slide reaches its extreme withdrawn position, the dog 88 acts through a stop 87 to slide the bars 82, 84 whereby an abutment 93 opens a switch 95 to stop all the motors; the actuating member of the switch also actuates the control valve 49a of a ram 49, Fig. 4, which by its connection to the lower pair of parallel links 46 lifts the head 39 clear of the blank and tracer. After the insertion of a new blank, the turning of the knob 90 slides the bar 82 to cause the abutment 93 to actuate the switch 95 to re−start the motors and lower the tool head The above arrangement may be modified by providing a separate abrasive band for operating upon each of a number of parallel blanks or one band passing around a series of pulleys for action upon all the blanks, and, if desired, the abrasive band may be replaced by a grinding wheel or milling cutter. Specifications 777,857, 777,858, and 777,859 are referred to. The Provisional Specification describes also the actuation of a trip arm on the slide 25 at the appropriate time in the machine cycle to bring a follower into engagement with the cam 71b which thereafter controls the ram 71 to reciprocate the slide in the neighbourhood of the shoulder platform.

Abstract:
Source: DE2040059A1 [Source: Claim 1] Patentansprüche I)BetriebBsystem zum Transport für Personen und Güter mittels Schienenfahrzeuge, die auf Gleisen mit mindestens zwei metal lischen Fahrschienen fahren, von denen eine in Abschnitten unterteilt und gleichzeitig von der anderen Fahrschiene elek trisch isoliert ist, und bei dem über Fahrzeugkontaktschuhe und kurze, ortsfeste Kontaktstücke während der Dauer ihrer Be rührung beim Überfahren direkte elektrische Verbindungen von den Fahrzeugen zur Gleisanlage oder umgekehrt für Bahrzeug–beeinflussungen, Weichenstellungen und Meldungen hergestellt werden, dadurch gekennzeichnet, dass innerhalb Jedes Gleisab schnittes (GA1,GA2, GA3, GA4, GA...) ein elektrischer Konden sator (CG, CG/2, CG/3,CG/4) die durchlaufende Masse–Fahrschiene (MF) mit der Jeweils zugehörigen Isolier–Fahrschiene (IF) überbrückt, und die in mehrere gedachte, parallel e Kontakt spuren (W,R,S,V,P,V',S',R',W') aufgeteilten Gleise mit für je de der beiden Fahrtrichtungen auf Je einer Kontaktspur liegen den Kontaktschienenstücken für die Sicherung des Nah–,Weit und Flanken–Bereiches (SKSN,SKSW,SKSF;S'KSN,S'KSW,S'KSF) co diert sind, sowie ebenfalls codiert sind mit auf den anderen Kontaktspuren liegenden Geschwindigkeits–Kontaktschienenstücken (V1KS, V2KS, V3KS;;V'1KS,V'2KS,V'3KS)für die entsprechende Ge schwindigkeits–Beeinflussung im Fahrzeug (LOK), mit Pilot Kontaktschienenstücken (PKS, PKSW, PKSÜ, PKSZ) für das Zusam einwirken mit den Sicherheits– und Geschwindigkeits–Kontakt– schi enen stücken, für Weichen–Fernstellungen beeStumpffa.hrten, für Schranken– und Warnlicht–Betätigung an Strassenübergängen und zur Ausführung von Zwangs–Zughalten an besonderen Gleis stellen, mit Rückmelde–Kontaktschienenstücken (X1–2LS,X3E; R'1–2KS,R'3KS) für Weichenstellungs–Rückmeldungen, Positionsmeldungen und für Wirkverbindungen beim automatischen Wieder anfahren der Triebfahrzeuge bei "Frei"–gewordenen Gleisab schnitten, und mit Weichenstell–Kontaktschienenstücken (WKS;; W'KS) zum Fernstellen sämtlicher spitzbefahrener Weichenarten sowie mit Ortsfest–Teilen (SM) magnetischer Annäherungsschal– ter (ANS) in Gleisdreiecken und Kehrschleifen für Positionsmeldungen, und dass im Triebfahrzeug (LOK) das Zusammenwirken mit den verschiedenen Kontaktschienenstücken der Gleis–Codier– und über die fahrtrichtungsabhängig einschaltbaren Auflaufkontaktschuhe (ASW,ASR,ASS,ASV,ASP,ASV',ASS',ASR',ASW') erfolgt, die in Bezug auf die Sicherheits–Kontaktschienenstücke (SKSN, SKSW,SKSF,S'KSN,S'KSW,S'KSF)im wesentlichen mit zwei Sicherheits–Relais (SR1,SR2) verbunden sind,von denen eines an die Bordbatterie (Bt1/Bt2) und das andere an einen Niederfrequenz– Generator (NF–G) angeschlossen ist und mit Brems–Relais (3R1, BR2) in Verbindung stehen, und die in Bezug auf die Geschwindigkeits–Kontaktschienenstücke (V1KS, V2KS, V3KS;;V1KS,V'2KS, V'3KS) mit mehreren Geschwindigkeits–Relais (VR1, VR2) verbunden sind, denen mehrere mit dem Fahrzeug–Tachometer (T) zusam– menwirkende Tacho–Relais (TR1, TR2, TR3,TR4, TR5) für die Geschwindigkeits–Programmierung nachgeschaltet sind und ebenfalls mit den Brems–Relais (BR1, BR2) sowie mit einem Elektro–Brems Ventil (EBV)zusammenwirken, und bei denen die Auflaufkontaktschuhe in Bezug auf die Pilot–Kontaktschienenstücke (PKS,PKSW, PKSÜ, PKSZ) mit zwei Pilot–Relais (PRl,PR2) verbunden sind, von denen das eine (PR1) mit den Brems–Relais (BRi,BR2) und dem Elektro–Brems–Ventil (EBV) in Wirkverbindung steht, und bei denen die Auflaufkontaktschuhe in Bezug auf die Rückmelde Kontaktschienenstücke (R1–2KS,R3KS;;R'1–2KS,R'3KS) mit zwei Rückmelde–Relais (RR1,RR2) verbunden sind, denen ein Hilfs Relais

(S) für daa Wiederanfahren des Zuges bei "Frei"−gewor− denen Gleisabschnitten und für die Abgabe von Positionsmeldun− gen nachgeschaltet ist und mit einem Pilot−Relais (PRl)sowi. mit den Brems−Relais (BR1,BR2) in Wirkvrbindung stehen und die bezüglich Weichenstellungs−Rückmeldungen mit den Weichen stell−Schützen (WS1,WS2) zusammenarbeiten, und bei denen die Auflaufkontaktschuhe in Bezug auf die Weichenstell−Kontakt schienenstücke (WKS;;W'KS) über ein Weichen−Relais (wR)mit den Weichenstell−Schützen (WS1,WS2) in Verbindung stehen, die mit Hilfe der Rückmelde−Relais (RR1,RR2) über Schaltmittel (AHR) entweder an zwei handbetätigte Weichenstell−Tasten (WT1,WT2) oder an entsprechend programmierte Speicher (Sp1,Sp2) über ein schrittweise arbeitendes Speicher−Abfragewerk (SpAW)angeschlos− sen sind, und wobei bezüglich der Ortsfest−Teile (5M) der mag netischen .Annäherungsschalter (ANS), dessen Kontakt−Teil (KT) am Triebfahrzeug (LOK) die richtige Folge der Positionsmeldun gen bei Durchfahr−t von Gleisdreiecken (GD) und Kehrschleifen (KSE) herstellt. 2)Betriebssystet nach Anspruch 1, dadurch gekennzeichnet, dass die Kontakt spuren (W,R,S,V) für die eine Fghrtrichtung im Be reich der Masse−Fahrschiene (MF) und die Kontaktspuren (W',R', S',V1) für die andere Fahrtrichtung im Bereich der Isolier Pahrschienen (IF) verschieden weit von der Gleismitte entfernt sind und symmetrisch zu ihr liegen, und eine für beide Fahrt richtungen gemeinsame, entweder mit der Gleismittellinie zusas− menfallende oder, bei anderweitig belegter Gleismittellinie, beiderseits von ihr räumlich aufgeteilte Kontaktspur (P) vor banden ist. 3)Betriebssystem nach Anspruch 1 und a, dadurch gekennzeichnet, dass die Isolier−Fahrschiene (1F) jedes Gleisabschnittes (GA1, GA2,GA3...) in der einen Fahrt @@h@@ng mi@ inn@@@ @b des ersten und des zweiten benachbar@en Gleis@@ @hni @es auf eine Kontakt− spur (S) im Bereich der Masse−Fahrschiene (MF) angeordneten, isoliert befestigten Sicherheits−Kontaktschienenstücken (SKSN, SKSW) elektrisch leitend verbunden ist, und in der anderen Fahrtrichtung mit innerhalb des arsten und des zweiten anderen benachbarten Gleisabschnittes auf der anderen, zur Gleismittel− linie symmetrischen Kontaktspur (S') im Bereich der Isolier Fahrschienen (IF) angeordneten, isoliert befestigten Sicher heits−Kontaktschienenstücken (S'KSN,S'KSW) ebenfalls elektrisch leitend verbunden ist, 4)Betriebssystem nach Anspruch 1 bis 3, dadurch gekennzeichnet, dass parallel zu den Sicherheits−Kontaktschienenstücken (SKSN, SKSW;;S'KSN,S1KSW) auf der für beide Fahrtrichtungen gemeinsa men Kontaktspur (P)Pilot−Kontaktschienenstücke (PKS,PKSW,PKSÜ, PKSZ) angebracht sind,welche bei weichenlosen Gleisabschnitten mit der Masse−Fahrschiene (1IF) metallisch direkt und vor stumpf befahrenen Weichen sowie vor Schranken (SCHR) und Warnkreuzlam pen (WKls) bei Strassenübergängen mit deren entsprechenden Antrie ben (ABR,AUFR; EINR,AUSR) und bei Zwangs−Haltstellen (ZHS,ZHS') mit deren entsprechenden Gleis−Relais (GR) elektrisch leitend verbunden sind. 5)Betriebssystem nach Anspruch 1 bis 4, dadurch gekennzeichnet, dass sowohl parallel zu den Sicherheits−Kontaktschienenstücken (SKSN,SKSW;S'KSN,S'KSW) als auch für sich allein auf einer wei teren Kontakt spur (V) im Bereich der Masse−Fahrschiene (MF) bezw. einer hierzu symmetrischen Kontaktspur (V') im Bereich der Isolier−Fahrschienen (IF) Geschwindigkeits−Kontaktschienen stücke (V1KS, V2KS,V2KS;;V'1KS,V'2KS,V'3KS) angeoracht sind,von denen das jeweils eine sich auf eine höhere Geschwindigkeit (z .3.i2O km/h) beziehende Geschwindigkeits−Kontaktschienenstück (V1KS,V'1KS) über eine Diode (VD1,V'D1) mit der Masse−Fahr schiene (MF) elektrisch v'erbunden ist, während das jeweils andere sich auf eine mittlere Geschwindigkeit (z.B.80 km/h) beziehende Geschwindigkeits−Kontaktschienenstück (V2KS,V'2KS) über eine gegenüber der vorstehend genannten in entgegen,gesetz− ter Richtung liegenden Diode (VD2,V'D2) mit der Masse−Fahrschiene (MF)elektrisch verbunden ist, und das jeweils andere sich auf eine niedrigere Geschwindigkeit (z.B.40 km/h) beziehende Ge schwindigkeits−Kontaktschienenstück (V3KS,V'3KS) metallisch direkt mit der b(asse−Fahrschiene (MF) verbunden ist. 6)Betriebssystem nach Anspruch 1 bis 5, dadurch gekennzeichnet, dass auf einer weiteren Kontaktspur (R) im Bereich der Masse Fahrschiene (bezw. auf einer hierzu symmetrischen Kontakt spur (R') im bereich der Isolier−Fahrschienen Rücknelde−Kon− taktschienenstücke (R1−2KS,R3KS;;R'1−2KS, R'3KS) angebracht sind, die für die Weichenzustands−Rückuteldungeqisoliert befes tigt und über von den Weichenstell−Antrieben (WA1,WA2@,WA2, WA3,WA4) betätigten Umschaltkontakten (WAU1) je nach Weichen zungenlage entweder über je eine in Sperr−Richtung oder über je eine in Durchlass−Richtung liegende Diode (RD1,RD2) mit der Masse−Fahrschiene (MF) verbunden sind, während sowohl die für die Positionsmeldungen verwendeten, für sich alleinstehenden Rückmelde−Kontaktschienenstücke (R3KS,R'3KS) am jeweiligen An fang eines Gleisabschnittes als auch die für das automatische Wiederanfahren eines vorher automatisch abgebremsten Zuges bei "Frei"−gewordenen Gleisabschnitten parallel zu den betreffenden Sicherheits−,Pilot− und Geschwindigkeits−Contaktschienenstücke angeordneten Rückmelde−Kontaktschienenstücke (R3KS,R'3KS) me tallisch direkt mit der Masse−Fahrschiene (kF) verbunden sind. 7)Betriebssystem nach Anspruch 1 bis 6, dadurch gekennzeichnet, dass auf einer weiteren Kontaktspur (W) im Bereich der Masse Fahrschiene (MF) für die eine Fahrtrichtung und auf der hierzu symmetrischen Kontaktspur (W') im Bereich der Isolier−Fahrschie− nen (IF) für die andere Fahrtrichtung Weichenstell−Kontakt schienenstücke (WKS,W'KS) isoliert befestigt sind, die mit den Weichenstell−Antrieben (WAI,Wl2u,WA2,WA3,WA4,WA5), der spitz befahrenen Weichen (WG1,WG2,WG3,WG4 ,KWG) über Weichenstell Leitungen(WL,W'L) verbunden sind, wobei jede dieser Weichen stell.−Leitungen am Eingang für die eine Abzweigrichtung, wie entsprechendes Relais ER1 oder entsprechende Wicklungshälfte (WH1) des Stellmotors(WSM), über eine Diode (WD1) und am Ein gang (ER2,WH2) für die andere Abzweigrichtung über eine in Gegenrichtung liegende Diode(WD2) geführt und die gemeinsame Rückleitung (WIR) aus den Eingängen des jeweiligen Weichenstell Antriebes mit der Masse−Fahrschiene (MF) elektrisch leitend verbunden ist. 8)Betriebssystem nach Anspruch 1 bis 7, dadurch gekennzeichnet, dass die Verbindungen Jeder Isolier−Fahrschiene (IF) in beiden Fahrtrichtungen mit den innerhalb des jeweils ersten benach barten Gleisabschnittes (GA..) angeordneten Sicherheits−Kon− taktschienenstücken für den Nah−Bereich (SKSN,S'KSN) als Nah Sicherheits−Leitung (SLN,S'LN) und mit den innerhalb des Je weils zweiten benachbarten Gleisabschnittes (GA1,GA2,GA ...) angeordneten Sicherheitskontaktschienenstücken für den Weit Bereich (SKSW,S'KSW) als Weit−Sicherheits−Leitung (SLW,S'LW) fungieren, die in der Art von an kurzen Pfählen (LP) zu beiden Seiten jedes Gleises geführten Zaunleitungen mit Soll−Riss Stellen (SORP,SORS), vorzugsweise in Form von Stecker und Buch se, ausgebildet sind, bei denen die jeweils zu einer Fahrt richtung gehörigen und an Weichen (WG1,WG2,WG3,WG4),Kreuzungs− weichen (KWG) und Kreuzungen (KG) einmündenden Nah−Sicherheits− Leitungen (SLN,S1LN) elektrisch miteinander verbunden sind, während die zu jeweils einer

Fahrtrichtung gehörigen und an Weichen und Kreuzungsweichen entstehenden Weit−Sicherheits Leitungen (SLW,S'LW) sowie die aus Weichen in die Abzweige heraustretenden Nah−Sicherheits−Leitungen (SLN,S'LN) über vom jeweiligen Weichenstell−Antrieb (WA1,WA2a,WA2,WA3,WA4,WA5)betätigte Umschaltkontakte (WAU3,WAU4,WAU3'WAU4') geschleift sind,wobei in der Weichenzungen−Endlage jeweils höchstens Je eine dieser Leitungen und bei nicht in der Endlage anliegenden Weichen− zungen alle diese Weit− und Nah−Sicherheits−Leitungen (SLW, S'LW; SLN,S'LN) unterbrochen sind. 9)Betriebssystem nach Anspruch 1 bis 8, dadurch gekennzeichnet, dass zur Sicherung gegen Flankenfahrten bei Weichen (WG2,WG3, WG4),Kreuzungsweichen (KWG) und Kreuzungen (KG) die zum −vor der jeweiligen Einmündungs− oder Kreuzungsstelle liegenden Vorfahrt−Gleisabschnitt (VGA) gehörige Isolier−Fahrschiene (IF) durch eine Flanken−Sicherheits−Leitung (SLF,S'LF;;SLF1,SLF2, SLF2') mit einem innerhalb des jeweiligen anderen, ebenfalls vor dieser Steile befindlichen War@e−Gleisabschnittes (WGA, 1WGA,2WGA) angeordneten Sicherheits−Kontaktschienenstück für den Flanken−bereich (SKSF,S'KSF) verbunden ist, welches auf der gleichen Kontaktspur (S,S'), in Fahrtricntung zu dieser Stelle, vor den anderen Sicherheits−Kontaktschienenstücken für den Nah− und Weit−Bereich angebracht ist, während bei Parallel Gleisverbindungen die vom jeweiligen Sicherheits−Kontaktschie− nenstück für den Flanken−Bereich des bei Verbindungsfahrt als \Narte−Gleisabscbnitt fungierenden entsprechenden Gleisabschnit tes ausgehende IRlanken− @icherheits−Leitung zu einem vom Wei chenstell−Antrieb betatigbaren Umschaltkontakt geführt ist, der diese Flanken−Sichelheits−Leitung bei Weichenstellung auf Verbindungsfahrt ins Parallelgleis mit der Isolier−Fahrschiene von dessen Vorfahrt−Gleisabscrnitt verbindet und bei Weichen stellung auf Parallelfahrt diese Flanken−Sicherheits−Leitung an die Nah−Sicherheits−Leitung des vorherigen Warte−Gleisab schnittes anschliesst. 10)Betriebssystem nach Anspruch 1 bis 9, dadurch gekennzeichnet, dass die al Triebfahrzeug (LOK) räumLich über den entsprechen de Kontaktspuren (W,R,S,V,P,V',S',R',W') angeordneten, die Stromübertragung zu den einzelnen entsprechenden Kontakt schienenstücken bewerkstelligenden Auflaufkontaktschuhe (ASW, ASR,ASS,ASV,ASP,ASV;ASS'::ASR' ,ASW') in zwei seitliche Gruppen (mit ASW,ASR,ASS,ASV und ASV',ASS',ASR',ASW') und eine mittlere Gruppe (ASP) aufgeteilt sind, von denen die eine seitliche Gruppe für die im Bereich der Masse−Fahrschiene (MF) liegenden Kontaktspuren (W,R,ss,V) der einen Fahrtrichtung, die andere seitliche Gruppe für die im Bereich der Isolier Fahrschienen (IF) liegenden Kontaktspuren (W',R',S',V') der anderen, entgegengesetzten Fahrtrichtung und die mittlere Gruppe für die den beiden Fahrtrichtungen gemeinsame,entweder auf der Gleismittellinie oder beiderseits davon räumlich auf geteilt liegende Kontakt;;pur (P) zugeordnet ist, wobei Je nach Fahrtrichtung des iriebfahrzeuges entweder die zur einen seit lichen Gruppe gehörigen Auflaufkontaktschuhe (ASW,ASR,ASS, ASV) oder die zur anderen seitlichen Gruppe gehörigen fiuflauf− kontaktschuhe (ASW;;ASR',ASS',ASV') über mit dem Fahrtrichtungs schalter (FR) gekuppelte Umschaltkontakte (U1,U2,U3,U4) mit den entsprechenden Schaltelementen im Triebfahrzeug verbunden sind, und bei denen die mittlere, einen Auflaufkontaktschuh (ASP) oder zwei elektrisch verbundene suflaufkontaktschuhe beinhaltende Gruppe in der Regel direkt, jedoch bei Wendezug− einrichtung ebenfalls über einen zusätzlichen Umschaltkontakt (U5) am Fahrtrichtungsschalter (FR), an die zugehörigen Schult− elemente des Triebfahrzeuges angeschlossen ist. ll)Betriebssystem nach Anspruch 1 bis 10, dadurch gekennzeichnet, dass der die Fahrtrichtungsgemässe AnSchaltung des jeweiligen Aufl aufkontaktschuhes (ASS,ASS') für die Sicherheits−Kontaktschienenstücke (SKSN,SKSW,SKSF;;S'KSN, S'KSW,S'KSF)bewir .ende Umschaltkontakt (U4) mit dem Spulenanfang eines ersten und eines zweiten Sicherheits−Relais (SR1,SR2) verbunden ist, von denen das erste in Reihe mit einer Drosselspule (Dr) liegende Sicherheits−Relais (SRi) mit seinem Spulenende an einen isolierten Aussenpol (+) der mit einer an Fahrzeug−Masse und damit an der Masse−Fahrschiene (MF) liegenden Mittelanzapfung (MAZ) versehenen Bordbatterie (Bt1/Bt2) und das zweite in Reihe mit einem Kopplungs−Kondensator (CK1) liegende Sicher heits−Relais (SR2) mit seinem Spulenende an einen Ausgang (AG1) eines Niederfrequenz−Generators (NF−G) angeschlossen ist, der mit seinem anderen Ausgang (AG2), vorzugsweise über einen Kopplungs−Kondensator (CK2), an der Mittelanzapfung (MAZ) bezw. an Fahrzeug−Masse und damit auch an der Masse−Fahrschiene (iF) anliegt, wobei der Auflaufkontaktsc'huh (ASP) für die Pilot Kontaktschienenstücke (PKS,PKSW,PKSÜ,PKSZ) mit dem Spulenan fang eines ersten niederohmigeren Pilot−Relais (PR1) und eines zweiten hochohmigeren Pilot−Relais (PR2) verbunden ist, von denen das Spulenende des zweiten Pilot−Relais (PR2) direkt und das des ersten Pilot−Relais (PR1) über einen Schutzwider stand (SW) an einen isolierten Aussenpol (−) der Bordbatterie (Bt1/Bt2) angeschlossen und dem Schutzwiderstand ein Ruhekon takt des zweiten Pilot−Relais (PR2) parallel geschaltet ist. 12)Betriebssystem nach Anspruch 1 bis 11, dadurch gekennzeichnet, dass der die fahrtrichtungsgemässe Anschaltung des Jeweiligen Auflaufkontaktschuhes (ASV,ASV') für die Geschwindigkeits Kontaktschienenstücke (V1KS,V2KS,V3KS;V'1KS,V'2KS,V'3KS) bewirkende Umschaltkontakt (Ul) am Fahrtrichtungsschalter (FR) mit dem jeweiligen Spulenanfang eines ersten Geschwindigkeits−Relais (VR1) und eines zweiten Geschwindigkeits−Relais (VR2) sowie über einen ersten Basis−Widerstand (BW1) mit der Basis eines ersten Komplementär−Transistors (VT1) vom npn−Typ und über einen zweiten Basis−Widerstand (BW2) mit der Basis eines zweiten Komplementär−Transistors(VT2) vom pnp−Typ verbunden ist, wobei das Spulenende des ersten Geschwindigkeits− Relais (VRi) über die Emitter−Collector−Strecke des ersten Komplementär−Transistors (VT1) am isolierten negativen Aussenpol (−) und das Spulenende des zweiten Geschwindigkeits−ltelais (VR2) über die Emitter−Collector−Strecte des zweiten Kamplemen tär−Transistors (VT2) am isolierten positiven Aussenpol (+) der Bordbatterie (Btl/Bt2) angeschlossen und dem ersten Ge schwindigkeits−Relais (VR1) eine Diode (D1) in Sperr−Richtung gegen seinen Spulenanfang und dem zweiten Geschwindigkeits Relais (VR2) eine Diode (D2) in Durchlass'−Richtung von seinem Spulenanfang parallel geschaltet ist. 13)Betriebssystem nach Anspruch 1 bis 12, dadurch gekennzeichnet, dass der die fahrtrichtungsgemässe Anschaltung des jeweiligen Auflauf−Kontaktschuhes (ASR,ASR') für die Rückmelde−Kontakt schienenstücke (R1−2KS,R3KS;R'1−2KS,R'3KS) bewerkstelligende Umschaltkontakt (U2) am Fahrtrichtungsschalter (FR) mit dem jeweiligen Spulenanfang eines ersten Rückmelde−Relais (RR1) und eines zweiten Rücknelde−Relais (RR2) sowie über einen ersten Basis−Widerstand (BW3) mit der Basis eines ersten Kom plementär−Transistors (RT1) vom npn−Typ und über einen zweiten Basis−Widerstand (BW4) mit der Basis eines zweiten Komplemen− tär−Transistors (RT2) vom pnp−gyp verbunden ist, wobei das Spulenende des ersten Rückmelde−Relais (RR1)

über die Emitter Oollector−Strecke des ersten Komplementär−Transistors (RT1) am isolierten negativen Aussenpol (−) und das Spulenende des zweiten Rückmelde−Relais (RR2) über die Emitter−Collector Strecke des zweiten Komplementär−Transistors (RT2) am isolier ten positiven Aussenpol (+) der Bordbatterie (Bt1/Bt2) ange schlossen und dem ersten Rückmelde−Relais (RR1) eine Diode (D3) in Sperr−Richtung gegen seinen Spulenanfang und dem zweiten Rückmelde−Relais (RR2) eine Diode (D4) in Durchlass−Richtung von seinem Spulenanfang parallel geschaltet ist. 14)Betriebssystem nach Anspruch 1 bis 13, dadurch gekennzeichnet, dass eine Gruppe von mit dem Fahrzeug−Tachometer (ist) zusammen wirkenden Tacho−Relais (TR1,TR2,TR3) mit ihten Spulenenden am isolierten Aussenpol (+) der Bordbatterie (Btl/Bt2) angeschlos− sen ist, bei denen der zeitweilige anschluss an den anderen Aussenpol (−) der bordbatterie für das höheren Geschwindigkei− ten zugeordnete Tacho−Relais (TR1) über die Ser@enschaltung eines Arbeitskontaktes vom ersten Geschwindigkeits−Relais (VR1) mit einem Ruhekontakt des zweiten Geschwindigkeits−Relais (VR2), für das mittleren Geschwindigkeiten zugeordnete Tacho−Relais (TR2) über die Serienschaltung eines Ruhekontaktes vom ersten GeschwindipDkei ts−elais (VR1) mit einem hroeits− kontakt des zweiten Geschwindigkeits−Relais (VR2) und für das niedrigeren Geschwindigkeiten zugeordnete Tacho−Sielais3 (TR3) über die Serienschaltung eines Arbeitssontaktes vom ersten Geschwindigkeits−Relais (VR1) mit ebenfalls einem Arbeitskontakt des zweiten Geschwindigkeits−Relais (VR2) erfolgt, wobei das Fahrzeug−Tachometer (T) auf einer ersten (KB1) seiner beiden Kontaktbahnen (KB1,KB2), die von einem mit zwei Kontaktschlei− fern versehenen, mit dem der Spulenverbindungen der Tacho−Relais (TR1,TR2,TR3) entsprechenden isolierten Aussenpol (+) der Bordbatterie (Bt1/Bt2) verbundenen Zeiger (TZ) bestrichen werden, u.a. ein Kontaktsegment für hothere Geschwindigkeiten (Kbil'; z.B. 125 bis 160 km/h),ein Kontaktsegment für mittlere Geschwindigkeiten (KSM; z.B. 85 bis 120 km/h) und ein Kontaktsegment für niedrigere Geschwindigkeiten (KSN; z.B. 45 bis 80 km/h) beinhaltet, bei denen das Kontaktsegment für höhere Geschwindigkeiten (KSH) mit dem Kontaktsesaent für mittlere Geschwindigkeiten (KSi) über je einen, unter sich parallel liegenden Arbeitskontakt des den mittleren Geschwindigkeiten sowie des den niedrigeren Geschwindigkeiten zugeordneten Tacho−Relais (TR2,TR3) verbunden ist, während das Kontaktsegment für niedrigere Geschwindigkeiten (KSN) mit dem Kontaktsegment für höhere Geschwindigkeiten (La;;H) über einen weiteren Arbeits kontakt des Tacho−Relais für niedrigere Geschwindigkeiten (TR3) verbunden ist und das Kontaktsegment für höhere Geschwin− digkeiten (KSH) über je einen, unter sich parallel liegenden Arbeitskontakt der Tscho−Relais für höhere, mittlere und nied− rigere Geschwindigkeiten (TR1,TR2,TR3) einmal mit einem an sich bekannten Elektro−Brems−Ventil (EBV) über einen Ruhekontakt des zweiten Sicherneits−Relais (SR2) verbunden ist, und zum anderen über eine Reihenschaltung des Arbeitskontaktes des ersten Pilot−Relais (PR1) und eines weiteren Ruhekontaktes des zweiten Sicherheits−Relais (SR2) sowie einem zu dieser Reihen schaltung parallel liegenden Arbeitskontakt des ersten Sicher heits−Relais (SRl) mit dem Spulenanfang eines ersten, mit Ab fallverzögerung versehenen Auslöse−Relais (AR1), dessen Spu lenende an einem isolierten Aussenpol (−) der Bordbatterie (Bt1/Bt2) liegt, verbunden ist. 15)Betriebssystem nach Anspruch 1 bis 14, dadurch gekennzeichnet, dass das Fabrzeug−Tachometer (T) auf seiner ersten Kontaktbahn (KBl) im Anschluss an das Kontaktsegment für niedrigere Geschwin digkeiten (ESN) mit einem weiteren Kontaktsegment für allein Geschwindigkeiten (KSK; 3.B. 15 bis 40 km/h) und einen daran anschliessenden Kont aktsegme nt für Kleinst−Ge schwindigke it en (KSO; z.B. 0 bis 10 ki/h) ausgestattet ist, bei denen das für Klein−Geschwindigkeiten bestimmte Kontaktsegment (KSK) mit dem Spulenanfang eines diesen Klein−Geschwindigkeiten zugeordneten Tacho−Relais (TR4) und das für Kleinst−Geschwindigkeiten be stimmte Kontaktsegment (KSO) mit dem Spulenanfang eines diesen Kleinst−Geschwindigkeiten zugeordneten Tacho−Relais (TR5) ver bunden ist, wobei die Spulenenden dieser Tacho−Relais (TR4, TR5) am entsprechenden isolierten Aussenpol (−) der Bordbatterie (Bt1/Bt2) liegen und das Kontaktsegment für niedrigere Geschwin digkeiten (KSN) Je nach Stellung des Tacho−Zeigers (TZ) mit dem Kontaktsegment für Klein−Geschwindigkeiten (KSK) und/oder mit dem Kontaktsegment für Kleinst−Geschwindigkeiten (KSO) über einen Arbeitskontakt des ersten Pilot−Relais (PR1) mit den in Reihe dazu angeordneten Arbeitskontakten dieser Tacho−Re lais (TR4,TR5) verbunden ist. 16)Betriebssystem nach anspruch 1 bis 15, dadurch gekennzeichnet, dass der Ruhekontakt des die Halt−Bremsung des Zuges einleiten den ersten Auslöse−Relais (AR1) mit der Erl egerspule eines sich selbsthaltenden, ersten Brems−Belais (BRi) in Reihe liegt, welches bei ungehinderter oder nur vorübergehend geschwindig− keitsbegrenzter Fahrt angezogen ist, wobei nach seinem Abfall über seinen Ruhekontakt das Elektro−Brems−Ventil (EBV) mit einem auf einer zweiten Kontaktbahn (KB2) des Fahrzeug−Tacho meters (T) angeordneten, den Geschwindigkeitsbereich vom An fang der Klein− bis zur höchsten Geschwindigkeit umfassenden langen Kontaktsegment (KF) verbunden ist, während ein weiteres, suf der zweiten Kontaktbahn (KB2) im Bereich der Kleinst−Ge− schwindigkeiten angeordnetes kurzes Kontaktsegment (KO) über eine Serienschaltung eines Arbeitskontaktes vom ersten Geschwin digkeits−Relais (VRI) und eines Arbeitskontaktes vom zweiten Geschwindigkeits−Relais (VR2) eine Verbindung mit der Erreger spule eines zweiten Auslöse−Relais (AR2) herstellt, dessen Ruhekontakt mit der Erregerspule eines die Halt−Bremsung des Zuges bis zu seinem Stillstand bewirkenden, selbsthaltenden zweiten brems−Relais (BR2) in Reihe liegt, wobei nach seinem Abfall über seinen Ruhekontakt das Elektro−Brems−Ventil (EBV) mit dem kurzen Kontaktsegment (KO) der zweiten Kontaktbahn (KB2) verbunden ist. 17) Betriebssystem nach Anspruch 1 bis 16, dadurch gekennzeichnet, dass die höheren, mittleren und niedrigeren Geschwindigkeiten zugeordneten Tacho−Relais (TR1,TR2,TR3) mit im Abgang unter einander verbundenen Selbsthaltekontakten ausgestattet sind, die über die Reihenschaltung eines Arbeitskontaktes des ersten Brems−Relais (BR1) eines Arbeitskontaktes des zweiten Brems Relais (BR2) und dem Ruhekontakt eines Hilfs−Relais (HR) mit dem entsprechenden Aussenpol (−) der Bordbatterie (Bt1/Bt2) verDunden sind, wobei das mit der Spannung der Bordbatterie betriebene Hilfs−Relais (HR) innerhalb einer Reihenschaltung aus einem Arbeitskontakt des ersten Rückmelde−Relais (RR1) einem Arbeitskontakt des zweiten Rückmelde−Relais (RR2) und einem Ruhekontakt eines Weichen−Relais (WR) liegt, und die automatische Wiedereinschaltung des ersten und zweiten Brems− Relais (BR1,BR2) über die Reihenschaltung aus dem bbeits− kontakt eines Umschaltkontaktes des Hilfs−Relais (HR), dem Arbeitskontakt eines Umschaltkontaktes des ersten Pilot−Relais (PRi), dem Ruhekontakt des ersten Sicherheits−Relais (SR1) und je einem sich zu den einzelnen Brems−Relais (BR2,BR1) verzwei− genden Arbeitskontakten des zweiten Sicherheits−Relais (SR2) vom entsprechenden Pol (MAz) der Bordbatterie (BT1/Bt2) aus erfolgt, wobei das

Elektro−Brems−Ventil (EBV) mit einem Um schaltkontakt gekuppelt ist, der in Bremsstellung von eines Pol (+) der Bordbatterie aus die Bremssteuerleitung (BSL) für die Motor− bezw. Getriebebremse unter Spannung setzt, und in der Brems−Lösestellung je nach Lage des Fahrtrichtungsschalters (FR) über dessen Umschaltkontakt (U6) die entsprechende Vor wärts− bezw.Rückwärts−Fahrsteuerleitung (FSL) fur den Fabr− antrieb einschaltet. 18)Betriebssystem nach Anspruch b bis 17, dadurch gekennzeichnet, dass für die richtige ermittlung der von den Rückmelde−Kontakt− schienen(R3KS) gesteuerten Positionsmeldungen, die den nach einander folgenden Gleisabschnitten (GA1,GA2, GA2,GA...)unter Einschluss von Gleisdreiecken und Kehrschleifen als steigende oder fallende Zahlen zugeordnet sind, der Arbeitskontakt des mit der Mittelanzapfung (MA@) der Bordbatterie (Bt1/Bt2) bezw. mit der Fahrzeugmasse verbundenen Umschaltkontaktes am Hilfs Relais über den Ruhekontakt des Umschaltkontaktes am ersten Pilot−Relais (PR1) und über je eine,sperr−richtungsbezogen entg;egengesetzt liegende Diode (D5,D6) mit dem addierenden Zahlmagneten (ZM1) und dem subtrahierenden Zählmagneten (Zç) eines an sich bekannten Vorwärts−Eückwärts−Zählers als Positi ons−Anzeiger (PA) verbunden ist, bei dem die gemeinsame dück leitung (ZRL) der Zählmagnete (ZM1,ZM2) zu einem mit dem Fahrt richtungsschalter (FR) gekuppelten Umschaltkontakt (U7) geführt ist, dessen beide Ausgänge über die nachgeschalteten Polwechsel− kontakte eines bistabilen Anpassungs−Relais (APR) mit dem po sitiven (+) und negativen (−) Aussenpol der Bord−Batterie (Bt1/ Bt2) verbunden sind, so dass diese gemeinsame Rückleitung (ZRL) je nach Stellung des Fahrtrichtungsschalters und des bistabilen Anpassungs−Relais entweder mit dem positiven (+) oder mit dem negativen Aussenpol (−) der Bord−Batterie (Bt1/Bt2) Verbindung hat, und wobei das bistabile Anpassungs−Relais (APR) über einen an sich bekannten,magnetischen Annäherungsschalter (ANS) mittels eines Stromimpulses in die entgegengesetzte Lage umschaltbar ist, wobei dessen Kontakt−Teil (KT) am Triebfahrzeug (LOK) und dessen Schalt−Magnet (SM) bezw. dessen betreffendes Kraft linienleitstück ortsfest innerhalb des Gleisverlaufes jeder Kehrschleife (KSE) und innerhalb von einen der drei Gleis Stränge jedes Gleisdreieckes (GD) an der Umkehrstelle der Steige bezw. Fall−Tendenz für die Gleisabschnitts−Zahlen (GA1,GA2,GA..), vorzugsweise in der Gleismitte befestigt ist. 19)Betriebsaysstem nach Anspruch 1 bis 18,dadurch gekennzeichnet, dass der die fahrtrichtungsgemässe Anschaltung des jeweiligen Auflaufkontaktschuhes (ASW,ASW') für die Weichenstell−Kontakt schienenstücke (WKS',W'KS) bewerkstelligende Umschaltkontakt (U3) am Fahrtrichtungsschalter (FR) mit dem Spulenanfang eines Weichen−Relais (WR) verbunden ist, dessen Spulenende aa je ei nen Arbeitskontakt eines der beiden für die Umstellung der Weichenzungen in ihre beiden Endlagen vorgesehenen Weichenstell− Schütze (WS1,WS2) angeschlossen ist und in Abhängigkeit von deren Jeweiligen Lage entweder mit dem positiven Aussenpol (+) oder mit dem negativen Aussenpol (−) der Bordbatterie (Bt1/Bt2) oder mit keinem der beiden in Verbindung steht, wobei für die jeweilig vorgesehene Weichenstellung Jeweils eines der beiden mit Selbsthaltekontakten (SHK)ausgestatteten Weichenstell−Schüt ze(WS1,WS2) in Abhängigkeit von der Lage eines Schaltgliedes für Hand− oder Automatik−betrieb, wie Automatik−Hand−Relais (AHR), entweder mittels zweier, einzeln von Hand betätigbarer Weichenstell−Tasten (WT1,WT2) oder mittels eines entsprechend programmi.erten Speichers (Sp1,Sp2) und dessen Speicher−hbfrage− werk (SpAW) einschaltbar ist, und wobei der Abfall des jeweils angezogenen Weichenstell−Schützes nach ausgeführter Weichen stellung durch die Unterbrechung seiner beiden parallel liegen den Einspeisungen (ES1,ES2) zu den Selbsthsthaltekontakten (SHK) erfolgt, indem durch den einzug des betreffenden Ruckmelde−Re− lais (RR1,RR2) beim Befahren des Rückmelde−Kontaktschienen stückes (R1−2KS;R'1−2KS) mit Öffnung seines Ruhekontaktes die Unterbrechung einer der beiden Einspeisungen (ES1) und infolge Anzu0,es des Weichen−Relais (WR) beim Befahren des Weichenstell− Kontaktschienenstückes (WKS,W'KS) mit Öffnung seiner beiden Ruhekontakte die Unterbrechung auch der anderen Einspeisungen (ES2) sichergestellt ist. 20) Betriebssystem nach Anspruch l,dadurch gekennzeichnet, dass der die Masse−Fahrschiene (MF) mit der Isolier−Fahrschiene (IF) überbrückende Kondensator (CG) bezw. dessen Kapazität innerhalb eines Gleisabschnittes (GA...) in zwei gleiche Kondensatoren (CG/2) mit je halber Kapazität aufgeteilt ist, von denen Je einer an jedem der beiden Gleis−Enden des Gleisabschnittes an geordnet ist, während bei an Weichen (WG2) gebildeten Gleis abschnitten mit drei Gleis−Enden die Kapazität in drei gleiche Kondensatoren (CG/3) mit je einem Drittel der Kapazität aufbe− teilt ist, von denen je einer an je einem dieser drei Gleises Enden angebracht ist und bei an Weichenverbindungen (WG2,WG3), Kreuzungs−Weichen (KWG) und Kreuzungen (KG) gebildeten Gleis abschnitten mit vier Gleis−Enden die Kapazität in vier gleiche Kondensatoren (CG/4) mit je einem Viertel der Kapazität auf geteilt ist, von denen je einer an jedem der vier tileis−nden angeordnet ist. 21)Betriebssystem nach Anspruch 1 bis 6 und 9,dadurch gekennzeichnet dass die Jeweiligen, Je nach Fahrgeschwindigkeits−Bereich, (z.ss.über 125 bis 160 km/h, über 85 bis 120 km/h,über 45 bis 80 km/h bezw. über 15 bis 40 km/h) entsprechend weit vor der zugehörigen Nur−bei−Gefahr"−Haltstelle (HS,HS') angeordneten "Nur−bei−Gefahr"−Bremsbeginnstellen (z.B.BS 125/160,BS 85/120, BS 45/80,BS 15/40) aus je einem Pilot−Kontaktschienenstück (PKS), einem dazu parallel angeordneten, dem jeweiligen Fahr geschwindigkeits−Bereich entsprechenden Geschwindigkeits−Kon taktschienenstück (V1KS,V'1KS; V2KS,V'2KS;V3KS,V'3KS), einem dazu ebenfalls parallel angeordneten Sicherheits−Eontaktschie− nenstück für den Weit−Bereich (SESW,S'KSW) mit einem im gerin gen Abstand hierzu auf der selben Kontakt spur liegenden Sicher heits−Kontaktschienenstück für den Nah−Bereich (SESN,S'KSN) und gegebenenfalls einem oder mehreren hierzu in geringem hb− stand auf dieser gleichen Kontaktspur liegenden ,Sicherheits Kontaktschienenstücken für den Flankenbereich (SKSF,S'KSF) sowie einem zu diesen wiederum parallel angeordneten Rücknelde− Kontaktschienenstück (R3KS,R'3ES) für die automatische Wieder einschaltung der Brems−Relais (BR1,BR2) bei "Frei"−gewordenem, voraus− bezw. in der Flanke liegenden Gleisabschnitt bestehen, bei denen das jeweilige Geschwindigkeits− und Rückmelde−Kon taktschienenstück kürzer ist als die übrigen Kontaktschienen stücke einschliesslich der aneinander gereihten Sicherheits Kontaktschienenstücke, und in Fahrtrichtung gesehen,gegenüber deren Anfängen zurückversetzt sind. 22)Betriebssystem nach Anspruch 1 bis 6, dadurch gekennzeichnet, dass die Jeweiligen, Je nach Fahrgeschwindigkeits−Bereich ent sprechend weit vor der zugehörigen Zwangs−Haltstelle (ZHS,ZHS') angeordneten Zwangs−3remsbeginnstellen (z.B,ZBS 125/160, ZBS 85/120, ZBS 45/80) aus je einem Pilot−Kontaktschienenstück (pKS), einem dazu parallel angeordneten, dem jeweiligen Fahr geschwindigkeits−Bereich entsprechenden Geschwindigkeits−Kon taktschienenstück (V1KS,V'1KS, V2KS, V'2KS, V3KS,V'3KS) und den dazu ebenfalls parallel und auf der gleichen

Kontaktspur angeordneten Sicherheits−Kontaktschienenstücken für den Weit und Nah−Bereich (SKSW,S'KSW;SKSN,S'KSN) bestehen, bei denen das jeweilige Geschwindigkeits−Kontaktschienenstück kürzer ist als das Pilot−Kontaktschienenstück bezw. die beiden Sicherheits kontaktschienenstücke, und in Fahrtrichtung gesehen, gegenüber deren Anfängen zurückversetzt ist. 25)Betriebssystem nach Anspruch 1 bis 6 und 9,dadurch gekennzeich net, dass die "Nur−bei−Gefahr"−Haltstelle (HS,HS') aus je ei nea Pilot−Kontaktschienenstück (PKS),einem dazu parallel ange ordneten Geschwindigkeits−Kontaktschienenstück (V3KS,V'3KS), den beiden dazu ebenfalls parallel auf der gleichen Kontakt spur angeordneten Sicherheits−Kontaktschienenstücken für den Weit− und den Nah−Bereich (SKSW,SKSN;;S'KSW,S'KSN) und gegebe nenfalls einem, oder mehreren hierzu in geringen Abstand auf der gleichen Kontaktspur liegenden Sicherheits−Kontaktschienen stücken für den Flankenbereich (SKSF,D'KSF) sowie einem zu dis sen wiederum parallel angeordneten Rückmelde−Kontaktschienen stück (R3KS,R'3KS) für die automatische Wiedereinschaltung der Brems−Relais (BR1,BR2) bei "Frei"−gewordenen voraus− bezw. in der Flanke liegenden Gleisabschnitt bestehen, bei denen das jeweilige Geschwindigkeits− und Rückme@de@Kontaktschienenstück kürzer ist als die übrigen Kontaktschienenstücke einschliesslich der aneinander gereihten Sicherheits−Kontaktschienenstücke, und in Fahrtrichtung gesehen, gegenüber deren Anfängen zurück versetzt sind. 24)Betrieossystem nach Anspruch 1 bis 6, dadurch gekennzeichnet, dass die Zwangs−Haltstellen (ZHS,ZHS') aus je einem Pilot−Kon taktschienenstück (PKSZ),welches mit dem Spulenanfang eines mit seinem Spulenende an der Masse−Fahrschiene angeschlossenen, eine der hier unterbrochenen Sicherheitsleitungen (z.B.SLW) mittels seines Aroeitskontaktes überbrückenden Gleis−Relais (GR) verbunden ist, sowie einem parallel zum Piiot−Kontakt− schienenstück angeordneten Geschwindigkeits−Kontaktschienen stück (V3KS,V'3KS) und den dazu ebenfalls parallel und auf der gleichen Kontaktspur angeordneten Sicherheits−Kontakt schituenstücken für den lleit− und den Nahbereich (SKSW,S'KSW;; SKSN,S'KSN) bestehen, bei denen das jeweilige Geschwindigkeits Kontaktschienenstück kürzer ist als das Pilot−Kontaktschienen stück bezw. die Weiden aneinander gereihten Sicherheits−Kon− taktschienenstücke, und in Fahrtrichtung gesehen, gegenüber deren Anfangen zurückversetzt ist. 25)Betriebssystem nach Anspruch 1,2,5 und 6, dadurch gekennzeich net, dass für Geschwindigkei ts−Begrenzungen Je ein einzeln angeordnetes Geschwindigkeits−Kontaktschienenstück (ViKS bezw. V'1KS für 120 km/h, V2KS bezw. V'2KS für 80 km/h, V3KS bezw. V'3KS für 40 km/h)und für die Jeweilige Aufhebung einer Ge schwindigeits−Begrenzung ein einzeln oder im Verband einer "Nur−bei−Gefahr"− oder Zwangs−Brem@beginn− bezw. Haltstelle (z.B. BS 85/120;HS,ZHS) angeordnetes, direkt mit der Masse−Fahrschiene (MF) verbundenes Rückmelde−Kontaktschienen stück (R3KS,R'3KS) vorgesehen ist. 26)Betriebssystem nach Anspruch 1 bis 10, dadurch gekennzeichnet, dass die einzeln oder im Verband angeordneten, zwischen den Fahrschienen (FS) auf den Jeweils entsprechenden Kontaktspuren (W,R,S,V,P,V',S',R' ,W1)angebrachten Pilot−,Geschwindigkeits−,Sicherheits−,Rückmelde− und Weichenstell−Kontaktschienenstücke (z. b.PKS,VlKS,V2KS,V3KS,' SKSN,SKSW,SKSF,R1−2KS,R3KS, WKS) aus hochkant gestellten, an ihren Enden mit Auflauf− schrägkanten (AK) versehenen Flacheisenbändern bestehen, die an aus den Betonschwellen (SCH) herausragenden und in ihnen verankerten, aus Rund− oder Vierkanteisen geformten Kontakt− schienenstück−Haltern (KSSH) mit ihrer Oberkante in entsprechen der Höhe über Fahrschienen−Oberkante, jedoch höher als Spur zwangsschienen oder Radlenker, angeschweisst sind, und gegebe nenfalls über die rückwärtig in den Betonschwellen verlaufen den ICont akt schienenstück−Halter und deren angeschweissten,kabel− artigen Masseverbindungen (MVB),fallweis unter Zwischenfügung je einer entsprechend eingelöteten Diode (VD1,VD2), kontakt sicher mit der Masse−Fahrschiene (MF) neben den Betonschwellen verschweisst sind. 27)Betriebssystem nach Anspruch 1 bis 10 und 26, dadurch gekenn zeichnet, dass durch Gleisverformungen besonders gefährdete Gleisabschnitte mit zusätzlichen, an den Isolierstoss−Schwellen oder in deren Nähe beidseitig angebrachten, mit Steckern und Buchsen versehenen Soll−Rissstellen (SORS) für die fallweise Unterbrechung der Nah− und Weit−Sicherheitsleitungen (SLN,SLW; ; S'IN,S'LW) ausgeüstet sind, bei denen die trennfähigen Stecker jeder Soll−Rissstelle über ein Isolier−Zwischenstück (IZS) mit einem längs der jeweiligen Masse− und Isolier−Fahrschiene (MF, IF) an deren Aussenseite, in kurzem Querabstand, von ihr,straff gespannten, aus Invarstahldraht bestehenden Auslösedraht (ADR) verbunden ist,der innerhalb von in entsprechenden Längsabstän− den an der Aussenseite der betreffenden Fahrschiene (FS) ange schweissten Auslösedraht−Haltern (ADH) geführt und am Ende des betreffenden Gleisabschnittes an einem ebenfalls an der Aussen seite der jeweiligen Fahrschiene angeschweissten Endblock (AL)B) befestigt ist, wobei zwischen Auslösedraht und Isolier−Zwischen stück ein zu den Steckern der Soll−Rissstelle wegübersetzendes Hebelgetriebe (HGT) eingefügt ist. 28)Betriebssystem nach Anspruch 1 bis 13,18 und 19, dadurch gekenn zeichnet, dass die die Kontaktschi.enenstücke (z.B.PKS,V1KS,SKSW, R3KS,WKS)bestreichenden, über den entsprechenden Kontaktspuren (W,R,S,V,P,V',S',R',W') des Gleises am Trieb−Fahrzeug (LOK,STW) an einer Drehachse (ASD) auf− und ab schwenkbar gelagerten und je unter der Federwirkung eines gleichzeitig als Schwingungs dämpfer fungierenden Federbeines (FB) stehenden Auflaufkontakt− schuhe (ASW,ASR,ASS,ASV,ASP,ASV',ASS',ASR',ASW') als einarmige, vorzugsweise aus Leichtmetallguss bestehende, von einander elek trisch isolierte Hebel ausgebildet sind, von denen jeder an seinem freien Hebelende mit einer nach unten gerichteten, in Längsrichtung verrundeten, einen Hohlraum mit einem Frostschutz mittel enthaltenden Ölgemisch (ÖG) einschliessenden Ausbuchtung (ASB) ausgestattet ist, in deren Mitte innerhalb einer mit Querbohrungen (QB)versehenen, den Hohlraum von oben nach unten durchsetzenden Verbindung (veb) ein nach unten aus der Aus buchtung ein wenig heraustretendes, bürstenartiges Drahtbündel (BDB) als eigentlicher Schleifkontakt angeordnet ist,dessen Drähte vorzugsweise aus einer praktisch verschleissfesten Berylli− um−Bronze−Legierung bestehen, während der Hohlraum Jedes auf laufkontaktscbuhes üoer eine in die Nähe der Drehachse (ASD) führende Bohrung (BO) und einen hir angeschlossenen Ölschlauch (ÖS) mit einem gemeinsamen Öltank (ÖT) in Verbindung steht und das jeweilige,zu den Umschaltkontakten (U1,U2,U3,U4) des Fahrt richtungsschalters (FR) bezw. zu den Pilot−Relais (PR1,PR2) führende Leitungskabel (ASK) ebenfalls in der Nahe der Dreh achse angeschlossen ist. 29)Betriebssystem nach Anspruch 1 und 14 bis 17, dadurch gekenn− zeichnet,dass die von einem Aussenpol (+) der Bord−Batterie Bt1/Bt2 aus über den mit Kontaktschleifern ausgestatteten Zeiger (TZ) des Fahrzeug−Tachometers (T) und deren Kontakt− segmente (KSH, KSM, KSN, KSK,KSO,KF,KO) angesteuerten

Relais (TR4,TR5,AR1,AR2) und Kontroll−Lampen (Li,L2,L3) sowie das Elektro−Brems−Ventil (EBV) in den Emitter−Collector−Strecken zugeordneter npn−Schalt−Transistoren (TR4T,TR5T,AR1T,AR2T,L1T, L2T,L3T,EBVT) liegen, deren Basisanschlüsse über die Basis Widerstände (BW5,BW6,BW8,BW7,BW10,BW11,BW9,BW12) mit den Kon taktsegmenten des Fahrzeug−Tachometers (T) direkt bezw.unter Zwischenschaltung der zugeordneten Kontakte der Geschwindig keits−Relais (VR1,VR2), der Sicherheits−Relais (SR1,SR2), der Brems−Relais (BRi,BR2), des Pilot−Relais (PRI) sowie der Tacho Relais (TR1,TR2,TR3) verbunden sind, während den Spulen der Relais und der Spule des Elektro−Brems−Ventils je eine in Sperr−Richtung zum anderen Aussenpol (−) liegende Diode (D30, D31,D33,D32,D7) parallel geschaltet ist. 30)Betriebssystem nach Anspruch 1 und 19, dadurch gekennzeichnet, dass die beiden parallel liegenden Einspeisungen (ES1, ES2) zu den Selbsthaltekontakten (SHK) der fest an Fahrzeugmasse bezw. an der Mittelanzapfung (MAZ) der Bord−Batterie (Bt1/Bt2) ange schlossenen Weichenstell−Schütze (WS1,WS2) von einer gemein samen Einspeiseleitung (ESL) ausgehen, die über einen Ruhe kontakt der Hand−Drucktaste (HD) und einen in Reihe hierzu liegenden Ruhekontakt der Automatik−Drucktaste (AD) mit einer −in Abhängigkeit von der Stellung eines zwei in entgegengesetz− ter Fahrtrichtung liegender Ziel−Orte (A−B) einstellbaren Ziel−Schalters (ZS)− wechselbare Polarität der Aussenpole (−,+) der Bord−Batterie führende Wechsel−Pol−Leitung (WPL) verbun den ist, indem diese an den gemeinsamen Kontakt eines zum Ziel−Schalter (ZS) gehörigen Umschaltkontaktes mit drei Schalt stellungen geführt ist und uie weiden äusseren kontakte der Schaltstellungen an je einen Aussenpol der bord−batterie ange schlossen sind, wobei der gemeinsame Kontakt eines weiteren, zum Ziel−Schalter gehörigen Umschaltkontaktes mit drei Schalt stellungen über je einen in Reihe zueinander liegenden Ruhe kontakt des ersten und zweiten Weichenstell−Schützes (WSI,W52) mit einem Aussenpol (−) der Bord−Batterie verbunden ist und die beiden untereinander verbundenen äusseren Kontakte dieser Schalt stellungen über einen Arbeitskontakt des Automatik−Hand−Relais (MiR) an den Klinken−Magneten (KM) eines als Speicher−Abfrage− werkes (opAW) ausgebildeten, an sich erkannten Schrittschalt− werkes angeschlossen sind, während der mittlere Kontakt die ser drei Schaltstellungen über eine vom Schaltrad−Nocken (SNO) in der Anfangsstellung des Speicher−Abfragewerkes durch einen Ruhekontakt (RUK) unterbrechbare Rücklaufleitung (PLL) mit dem Selbstunterbrecherkontakt (SUK) des Klinken−Magneten verbunden ist. ,31)Betriebssystem nach Anspruch 1, 19 und 30, dadurch gekenn zeichnet, dass eine erste Abzweigung der Wechsel−Pol−Leitung (WPL) über einen Ruhekontakt des/Rückmelde−Relais (RR1), den Ruhekontakt der/Weichenstell−Taste(WT2),den Arbeitskontakt der /Weichenstell−Taste (WT1) sowie über die in Reihe miteinander liegenden Ruhekontakte des Automatik−Hand−Relais (AHR), der Automatik−Drucktaste (AD) und des/Weichenstell−Schützes (WS2) als Erregerleitung (EL1) am/Weichenstell−Schütz (WS1) ange achlossen it, während ein zwei Abzweig der Wechsel−Pol Leitung über einen Ruhekontakt des anderen,/Rückmelde−Relais (RR2), den Ruhekontakt der/Weichenstell−Taste (WT1), den Arbeits kontakt der/Weichen@tell−Taste (WT2) sowie über die in Reihe miteinander liegenden anderen Ruhekontakte des Automatik−Hand Relais (AHR), der Automatik−Drucktaste (AD) und des/Weichenstell Schützes (WS1) als Erregerleitung (EL2) mit dem/Weichenstell Schütz (WS2) verbunden ist, wooei des Automatik−Hand−Relais (AHR) vom unerregten Hand−Betrieb mittels des Arbeitskontaktes der Automatik−Drucktaste (AD) von einem Aussenpol (−) der Bord−Batterie (Bt1/Bt2) aus über Buchsenkontakte (bu) und Steck kontakte (st) mit einer Kurzschlussverbindung (kv) des jeweili gen angeschlossenen Speichers (Sp1,Sp2) sowie über einen Ruhe kontakt der Hand−Drucktaste (HD) zum Automatik−Betrieb auf Selbst haltung einschaltbar ist. 32)BetrieDssystem nach Anspruch 1,19,30 und 31, dadurch gekenn zeichnet, dass ein dritter abzweig der Wechsel−Pol−Leitung (WPL) über eine Reihenschaltung je eines Ruhekontaktes der Rückmelde− Relais (RRI,RR2) mit einem weiteren Buchsenkontakt (bU) für einen Steckkontakt (st) bezw. den Stromlauf durch den jeweils angeschlossenen Speicher (Sp1,Sp2) verbunden ist, dessen aus weiteren Steckkontakten (st) für die Stellungsarten der Weichen je paarweise herauskommenden Abgänge über weitere Buchsenkon takte (bu,) an die Kontakte (1,2,3...) der beiden Kontakt−Ebenen (E1,E2) des Speicher−Abfragewerkes (SpAW) angeschlossen sind, bei denen die Abgang (lb) für "Linksabzweig" an Weichen bezw. "Bogenfahrt" an Kreuzungsweichen vom jeweiligen Kontakt der ersten Kontskt−Ebene (E1) mittels ihres Kontaktarmes über einen Arbeitskontakt des Automatik−Hand−Relais (AHR) sowie über die erste Erregerleitung (EL1) jeweils mit dem ersten Weichenstell− Schütz (WS1) verbindbar und die Abgänge (rk) für "Rechtsabzweig" an Weichen bezw. t reuzungsfahrt" an Kreuzungsweichen vom je− weiligen Kontakt der zweiten Kontakt−Ebenen (E2) mittels ihres −synchron zum ersten laufenden− Kontaktarmes über einen weiteren Arbeitskontakt des Automatik−Hand−Relais sowie über die zweite Erregerleitung (EL2) jeweils mit dem zweiten Weichenstell Schütz (WS2) verbindbar sind. 33)Betriebssystem nach Anspruch 1,19,30 bis 32, dadurch gekenn zeichnet, dass der jederzeit von Hand umprogrammierbare,vorzugs weise mittels Steckkontakten (st) eines iehrpoligen Steckers in die mit Buchsenkontakten (bu) versehene mehrpolige Buchsen leiste des Speicher−Abfragewerkes (SpAW) steckbare Speicher (Sp1) ausser seiner Kurzschlussverbindung (kv) aus einer Reihe eng aneinander liegender, einpoliger Umschalter besteht,bei denen jeder der gemeinsamen Eingänge mit einander verbunden und zu einem der Steckkontakte (st) geführt ist, der über den betref fenden Buchsenkontakt mit der von den Ruhekontakten der Rück melde−Relais (RR1,RR2)kommenden Wechsel−Pol−Leitung (WPL) ver bindbar ist, und bei denen jeweils einer der beiden Abgänge jedes zu beiden Stellungsarten einer Weiche gehörigen Uoschal− ters für "Rechtsabzweig" bezw. "Kreuzungsfahrt"(rk) und jeweils der andere der beiden Abgänge für "Linksabzweig" bezw. "Bogen− fahrt" (lb) an je einen der vorzugsweise paarweise angeordneten Steckkontakte (st) des Speichers (Sp1) angeschlossen ist. 34)Betriebssystem nach Anspruch 1,19,30 bis 33, dadurch gekenn zeichnet, dass der fest programmierte, iür zwei verschiedene Fahrstrecken bezw. für eine Fahrstrecke in beiden Richtungen zwischen zwei Ziel−Orten bestimmte, vorzugsweise mittels Steck kontakten (st) eines mehrpoligen Steckers in die mit Buchssen− kontakten (bu) versehene mehrpolige Buchsenleiste des Speicher Abfragewerkes (SpA steckbare Speicher *(Bp2) ausser seiner Kurzschlussverbindung (kv) mit einer Verzweigungsleitung (vzl) versehen ist, die zu den über den betreffenden Buchsenkontakt mit der von den Ruhekontakten der Rückielde−Relais (RRi ,RR2) kommenden Wechsel−Pol−Leitung (WPL) verbindbarem Steckkontakt (st) geführt ist, wobei von dieser Verzweigungsleitung (vzl) aus für auf gleichen Kontakten (1,2,3...) der beiden Kontakt− Ebenen (E1,E2) des Abfrage−Speicherwerkes (SpAW) herbeizuführ enden gleichartigen Weichenstellungen Jeweils bei "Linksab− zweig" bezw. "Bogenfahrt" (lb) eine durchgehende Verbindung zu dem an einen Kontakt (7) der ersten

Kontakt−Ebene (E1) führenden abgang (lb) des Steckkontaktes (st) gelegt ist und der zu dem an einen.gleichen Kontakt (7) der zweiten Kontakt Ebene (E2) führende Abgang (rk) des Ste'c,kkontaktes ohne Verbindung verbleibt, und jeweils bei "Rechtsabzweig" bezw. "Kreu zungsfahrt" (rk) eine durchgehende Verbindung zu dem an einen Kontakt (5) der zweiten Kontakt−Ebene (E2) führenden Abgang (rk) des Steckkontaktes gelegt ist und der zu dem an einen gleichen Kontakt (5) der ersten Kontakt−Ebene (E1) führende Abgang (lb) des Steckkontaktes ohne Verbindung verbleibt, während für auf gleichen Kontakten (1,2,3...) der beiden Kontakt− Ebenen (El,E2) hervorzurufenden verschiedenartigen Weichenstellungen in der einen Fahrt− bezw.Ziel−Orts−Richtung (A) jeweils bei "Linksabzweig" bezw. "Bogenfahrt" (lb) die Verzweigungsleitung (vzl) über eine in Durchlass−Richtung zu ihr liegende Diode (D23) mit dem zu einem Kontakt (6) der ersten Kontakt−Ebene (E1) führenden Abgang (lb) des Steckkontaktes (st) verbunden und der zu dem an einen gleichen Kontakt (6) der zweiten Kontakt−Ebene (E2) führende abgang (rk) des Steckkontaktes für "Rechtsabzweig" bezw. "Kreuzungsfahrt" (rk) gemäss der anderen Fahrt− bezw. Ziel−Orts−Richtung (B) über eine in Sperr−Richtung angeordnete Diode (D22) mit der Verzweigungs− leit−ung verbunden ist, und bei denen in der einen Fahrt− bezw. Ziel−Orts−Richtung (A) jeweils bei "Rechtsabzweig" bezw.Kreuzungsfahrt (rk) die Verzweigungsleitung über eine in Durchlass Richtung zu ihr liegende Diode (D20) mit dem zu einen Kontakt (4) der zweiten Kontakt−Ebene (E2) führenden Abgang (rk) des Steckkontaktes verbunden und der zu dem an einen gleichen Kontakt (4) der ersten Kontakt−Ebene (E1) führende Abgang (lb) des Steckkontaktes für "Linksabzeigung" bezw. "Bogenfahrt" (lb) gemäss der anderen Fahrt− bezw, Ziel−Orts−Richtung (B) über eine in Sperr−Richtung angeordnete Diode (D21) mit der Verzweigungs− leitung (vzl) verbunden ist. [Source: Claim 1] Claims I) BetriebBsystem for transporting goods and people by means of rail vehicles traveling on tracks having at least two metallic rails, one of which is divided into sections and simultaneously elec electrically insulated from the other running rail, and the emotion on vehicle contact shoes and short, fixed contacts throughout the period of loading the driving over direct electrical connections of the vehicles to the track system or vice versa influences for Bahrzeug−, decisions and reports are produced, characterized in that within each Gleisab−section (GA1, GA2, GA3, GA4, GA...) capacitor, an electrical condensate (CG, CG / 2, CG / 3, CG / 4) the continuous mass−running rail (MF) associated with each insulating running rail (IF) bypassed, and the imaginary in multiple, parallel e contact tracks (W, R, S, V, P, V ', S', R ', W') split tracks with each for de of both directions are on the a contact trace the contact rail sections for securing the local, wide and flank area (SKSN, SKSW, SKSF; S'KSN, S'KSW, S'KSF) co diert are, and are also encoded with the other Contact tracks lying speed contact rail sections (V1KS, V2KS, V3KS;; V'1KS, V'2KS, V'3KS) for the corresponding Ge−velocity impact on the vehicle (LOK), with pilot Contact rail pieces (PKS PKSW, PKSUE, PKSZ) for the co act with safety and speed contact − ski enes pieces, for switches remote positions beeStumpffa.hrten, ask for for barriers and warning lights operating at road junctions and the implementation of forced train stops at special track, with feedback contact rail sections (X1−2LS, X3E; R'1 −2KS, R'3KS) for switch position feedback, position reports and for the active compounds in the automatic re−approach the traction units in "free" −gewordenen Gleisab cut, and with point−setting contact rail sections (WKS;; W'KS) to remote locations all pointed trafficked turnout species and with Stationary parts (SM) magnetic Annaeherungsschal− ter (ANS) in track triangles and reverse loops for position reports, and that the motor vehicle (LOK) the interaction with the different contact rail sections of track encoding and on the direction of travel switchable running on contact shoes (ASW, ASR, ASS, ASV, ASP, ASV 'ASS' ASR 'ASW') is carried out, in relation to the safety contact rail sections (SKSN, SKSW, SKSF, S'KSN, S'KSW, S'KSF) substantially with two safety relays (SR1, SR2) are connected, one of which is the on−board battery (Bt1 / Bt2) and the other to a low−frequency generator (NF−G) is connected with the brake relay (3R1, BR2) in conjunction standing, and with respect to the speed contact rail sections (V1KS, V2KS, V3KS;; V1KS, V'2KS, V'3KS) multi−speed relay (VR1, VR2) are connected, which several with the vehicle speedometer (T) together menwirkende speedometer relay (TR1, TR2, TR3, TR4, TR5) connected downstream of the speed programming and also with the brake relay (BR1, BR2), and with an electric brake valve (EBV) cooperate and in which the winding contact shoes are connected with respect to the pilot contact rail elements (PKS, PKSW, PKSUE, PKSZ) with two pilot relay (PRl, PR2), of which one (PR1) with the brake relay (BRI, BR2) and the electric brake valve (EBV) is operatively connected to, and in which the winding contact shoes with respect to the feedback contact rail sections (R1−2KS, R3KS;; R'1−2KS, R'3KS) with two feedback relay (RR1, RR2) are connected, where an auxiliary relay (S) for daa restarting the train at "free" −gewor− which track sections is and downstream of the discharge of Positionsmeldun− gen and with a pilot relay (PRI) sowi. with the brake relay (BR1, BR2) are in Wirkvrbindung and cooperate regarding turnout position feedback with the turnout vice−Protect (WS1, WS2), and in which the running on contact shoes with respect to the point operating contact seemed pieces (WKS;; W'KS) via a switch relay (wR) with the A switch−Protect (WS1, WS2) are in communication with using the feedback relay (RR1, RR2) via switching means (AHR) either two hand−operated railway switch keys (WT1, WT2) or appropriately programmed memory (Sp1, Sp2) a gradual working memory query work (SPAW) con− nected, and wherein with respect to the territorial parts (5M) likes genetic.Annaeherungsschalter (ANS), the contact part (KT) on the traction unit (LOK) the correct sequence of Positionsmeldun gen at drive−through t of track triangles (DG manufactures) and reverse loops (KSE). 2) Betriebssystet according to claim 1, characterized in that the contact tracks (W, R, S, V) for a Fghrtrichtung in Be rich the ground running rail (MF) and the contact tracks (W ', R', S ', V1) for the other direction in the field of insulating Pahrschienen are (IF) at different distances from the track center and symmetrical to it, and zusas− a directions for both driving common, either with the track centreline menfallende or where otherwise occupied is center of the track, on both sides of their spatially divided contact track (P) before bound. 3) operating system according to claim 1 and a, characterized in that the insulating running rail (1F) of each track section (GA1, GA2, GA3...) in a ride @@ @@ h ng mi @ @@@ inn @b of the first and second benachbar @ s @@ track @hni @es on a contact track (S) arranged in the area of the mass−running rail (MF), isolated fortified safety contact rail sections (SKSN, SKSW) is electrically connected to, and in the other direction with within the arsten and second other adjacent track section on the other, line for Gleismittel− symmetrical contact trace (S ') in the field of insulation arranged rails (IF), isolated fortified material safety contact rail sections (S'KSN, S'KSW) is also electrically connected, 4) operating system according to claim 1 to 3, characterized in that parallel to the safety contact rail sections (SKSN, SKSW;; S'KSN, S1KSW) on both forward and reverse gemeinsa men contact track

(P) pilot contact rail sections (PKS PKSW, PKSUE, mounted PKSZ), which in soft loose track sections to the ground−running rail (1iF) metallic directly and on dull traffic switches and front gates (SCHR) and Warnkreuzlam pen (WKls) at road junctions with their corresponding Antrie ben (ABR, AUFR; SETUP, AUSR) and forced maintenance points (ZHS, ZHS ') with their corresponding track relay (GR) are electrically connected . 5) operating system according to claim 1 to 4, characterized in that both parallel to the safety contact rail sections (SKSN, SKSW; S'KSN, S'KSW) as well as on its own on a white direct contact track (V) in the field of mass−running rail (MF) respectively. a purpose symmetric contact track (V ') in the insulating rails (IF) speed contact rails pieces (V1KS, V2KS, V2KS;; V'1KS, V'2KS, V'3KS) are angeoracht, of which each have a to a higher speed (for.3.i2O km / h) relating speed contact rail piece (V1KS, V'1KS) via a diode (VD1, V'D1) with the mass−driving rail (MF) is electrically v'erbunden, while the (zB80 km / h) relating speed contact rail piece (V2KS, V'2KS) with each other to an average speed over a listed opposite the above counter, legal ter direction lying diode (VD2 V'D2) in of (MF) is electrically connected ground running rail, and the other to a lower speed (zB40 km / h) relating Ge−velocity contact rail piece (V3KS, V'3KS) metallic directly with the b (asse−running rail (MF is) connected. 6) operating system according to claim 1 to 5, characterized in that on a further contact track (R) in the field of mass running rail (respectively. On a purpose symmetric contact track (R ') in the area of the insulating rails Ruecknelde−contact seemed pieces (R1−2KS, R3KS;; R'1−2KS, R'3KS) are attached, the for the switch state Rueckuteldungeqisoliert fasten taken and of the railway switch drives (WA1, WA2 @, WA 2, WA3, WA4) operated changeover (WAU1) tongue position, depending on the course either one in the reverse direction or via one lying in the forward−biased diode (RD1, RD2) with the ground running rail (MF) are connected, while both used for position reports, itself standing feedback contact rail sections (R3KS, R'3KS) on each to start a track section as well as the for the automatic restarting a previously automatically braked train at "free" −gewordenen track sections parallel to the question safety, pilot and speed Contaktschienenstuecke arranged feedback contact rail sections (R3KS, R'3KS) me tallisch directly to the ground−running rail (kF) are connected. 7) operating system according to claim 1 to 6, characterized in that on a further contact track (W) in the field of mass running rail (MF) for one direction of travel and on this symmetrical contact track (W ') in the field of insulating Fahrschie− NEN (IF) for the other direction of travel A switch contact seemed pieces (WKS, W'KS) are mounted isolated that the railway switch drives (WAI, Wl2u, WA2, WA3, WA4, WA5), the sharp traffic turnouts (WG1, WG2, WG3, WG4, KWG) via point−setting lines (WL, W'L) are connected, each of said switches stell. lines at the input for a branch−off direction, as corresponding relay ER1 or corresponding winding half (WH1) of the servomotor (WSM), via a diode (WD1) and on a gear (ER2, WH 2) of the other branch direction in a lying opposite direction diode (WD2) and is the common return line (WE) of the inputs of the respective point setting drive to the mass−running rail (MF) is electrically connected. 8) operating system according to claim 1 to 7, characterized in that the compounds Each insulating runner rail (IF) in both Driving directions to the inside of each first neighboring area track section (GA..) arranged Safety contact rail pieces for the near−field (SKSN, S'KSN) as Nah Safety line (SLN, S'LN) and with the inside of the Weil second adjacent track section (GA1, GA2, GA...) arranged safety contact rail sections for far function area (SKSW, S'KSW) as Wide Security Administration (SLW, S'LW), which in the nature of on short piles (LP) to both sides of each track out fence lines with desired crack are Set (SORP, SORS), preferably in the form of plug se and book formed, in which the corresponding respectively to the direction of travel and at switches (WG1, WG2, WG3, WG4), crossing soft (KWG) and crossings (KG) which opens near−Security − lines (SLN, S1LN) are electrically connected to each other, while the exposure to each direction of travel associated and Switches and crossings resulting Wide Security lines (SLW, S'LW) and of course emergent in the feeders Nah Safety lines (SLN, S'LN) via the respective switch actuating drive (WA1, WA2a, WA2, WA3, WA4, WA5) operated changeover contacts (WAU3, WAU4, WAU3'WAU4 ') are looped, wherein the switch blades end position in each case more than one of these, depending lines and not applied in the end position switch− all tongues this far and near−safety cables (SLW, S'LW; SLN, S'LN) are interrupted. 9) operating system according to claim 1 to 8, characterized in that for security against flank rides in switches (WG2, WG3, WG4), slip switches (KWG) and intersections (KG) which lie to −before the respective junction or intersection of way−track section (VGA) associated Insulating running rail (IF) by a flank security line (SLF, S 'LF;; SLF1, SLF2, SLF2 ') arranged with a section of each other, which is also located in front of Steep War @ e−track section (WGA, 1WGA, 2WGA) safety contact rail section for the flank area (SKSF, S'KSF) is connected, which on the same track contact (S, S '), in Fahrtricntung to this body, mounted in front of the other safety contact rail sections for local and wide−area, while at the same track connections the nenstueck the respective Security Kontaktschie− for the edge region of at link travel functioning as \ Narte−Gleisabscbnitt corresponding Gleisabschnit tes outgoing IRlanken− @ is afety line led to an actuable from Wei chenstell drive changeover which this edge sickle Deities line with framework at Connection ride connects the parallel track with the Insulating running rail of the right of way−Gleisabscrnitt and turnout position on parallel drive these flanks Security line connects−section of the near−security management of the previous waiting−Gleisab. 10) operating system according to claim 1 to 9, characterized in that the al locomotive (LOK) spatially over the corresponding de contact tracks (W, R, S, V, P, V ', S', R ', W') arranged that power transmission to the individual corresponding contact pieces seemed bewerkstelligenden running on contact shoes (ASW, ASR, ASS, ASV, ASP, ASV; ASS ':: ASR' , ASW ') in two lateral Group (ASW, ASR, ASS, ASV and ASV 'ASS' ASR 'ASW') and a middle group (ASP) are divided, of which one side group for the field of mass−running rail (MF) lying contact tracks (W, R, ss, V) of a direction, the opposite lateral group for the field of insulation running rails (IF) situated contact tracks (W ', R', S ', V') of the other, opposite direction of travel and the average is associated with group for the two directions of joint, either on the track center line or on either side thereof to spatially divided situated contact;; pure (P), depending on direction of iriebfahrzeuges either to a union group since associated running on contact shoes (ASW, ASR, ASS, ASV) or the side to the other group associated fiuflauf− contact shoes (ASW;; ASR 'ASS' ASV ') via switches with the running direction (FR) coupled changeover (U1, U2, U3, U4) with the corresponding switching elements are connected in the train, and in which the average, a casserole contact shoe (ASP) or two suflaufkontaktschuhe containing group electrically connected generally directly but in Wendezug− also means an additional changeover (U5) on the travel direction switch (FR), to the is associated Schultheiss elements of the traction unit connected. Il) operating system according to claim 1 to 10, characterized in that the direction Correct connection of the respective edition

aufkontaktschuhes (ASA, ASA ') for the safety contact rail sections (SKSN, SKSW, SKSF;; S'KSN, S'KSW, S'KSF) be Farming.END changeover (U4) with the coil start of a first and a second safety relay (SR1, SR2) is connected, the first of which in series with a choke (Dr) lying safety relay (SRi) with its coil end to an insulated outer pole () of a lying on vehicle mass and thus on the mass−running rail (MF) with center (MAZ) provided on−board battery (Bt1 / Bt2) and the second in series with a coupling capacitor (CK1) lying material safety relay (SR2) with its coil end to an output (AG1) of a low−frequency generator is connected (NF−G), which with its other output (AG2) preferably via a coupling capacitor (CK2), at the center tap (MAZ) respectively. abuts vehicle mass and thus also on the ground running rail (iF), the Auflaufkontaktsc'huh (ASP) for the pilot is Contact rail pieces (PKS PKSW, PKSUE, PKSZ) with the Spulenan catch a first niederohmigeren Pilot relay (PR1) and a second higher impedance Pilot relay (PR2) connected, of which the coil end of the second pilot relay (PR2 switched) on−board battery (Bt1 / Bt2) connected and the protection resistor, a Ruhekon clock of the second pilot relay (PR2) parallel −) directly and the first pilot relay (PR1) a protection cons stand (SW) to an insulated outer pole (is. 12) operating system according to claim 1 to 11, characterized in that the direction of travel according to the Relevant interface running on contact shoe (ASV, ASV ') for the speed contact rail sections (V1KS, V2KS, V3KS; V'1KS, V'2KS, V'3KS) effecting changeover (Ul) on the travel direction switch (FR) with the respective coil start of a first−speed relay (VR1) and a second speed relay (VR2) and via a first base resistor (BW1) to the base of a first complementary −Transistors (VT1) of the nPN type and a second base resistor (BW2) with the base of a second complementary transistor (VT2) is connected pnp type, the coil end of the first speed relay (VR i) on the emitter−collector path of the first complementary transistor (VT1) to the insulated negative outer pole (−) and the coil end of the second speed ltelais (VR2) via the emitter−collector Strecte the second Kamplemen Secretary transistor (VT2) in the isolated positive outer pole () connected to the on−board battery (Btl / Bt2) and the first Ge−velocity relay (VR1), a diode (D1) in the reverse direction to its initial coil and the second speed relay (VR2), a diode (D2) is connected in parallel in Durchlass'−direction from its initial coil. 13) operating system according to claim 1 to 12, characterized in that the direction of travel according to the respective connection casserole contact shoe (ASR, ASR ') for feedback−contact seemed pieces (R1−2KS, R3KS; R'1−2KS, R'3KS) bewerkstelligende changeover (U2) on the travel direction switch (FR) with the respective coil start of a first feedback relay (RR1) and a second Ruecknelde relay (RR2) and via a first base resistor (BW3) to the base of the first com mentary −Transistors (RT1) of the nPN type and a second base resistor (BW4) is connected to the base of a second complementarity Secretary transistor (RT2) of the PNP gyp, the coil end of the first feedback relay (RR1) on the emitter Oollector path of the first complementary transistor (RT1) to the insulated negative outer pole (−) and the coil end of the second feedback relay (RR2) via the emitter−collector path of the second complementary transistor (RT2) at isolier th positive outer pole () is the on−board battery (Bt1 / Bt2) closed and the first feedback relay (RR1), a diode (D3) in the reverse direction to its initial coil and the second feedback relay (RR2) a diode (D4) is connected in parallel in the forward direction from its initial coil. 14) operating system according to claim 1 to 13, characterized in that a group of the vehicle speedometer (is) cooperating tacho relay (TR1, TR2, TR3) with ihten coil ends on the isolated outer pole () of the vehicle battery (Btl / Bt2) is connected, in which the temporary connection to the other outer pole (−) of the on−board battery for higher velocities associated tacho relay (TR1) on Ser @ enschaltung a work contact from the first speed relay (VR1) with a normally closed contact of the second−speed relay (VR2), for the average velocities associated tacho relay (TR2) via the series connection of a break contact of the first GeschwindipDkei ts−held relay (VR1) with a hroeits− contact of the second−speed relay (VR2) and assigned for the lower speeds Tacho Sielais3 (TR3) takes place via the series connection of a Arbeitssontaktes from the first speed relay (VR1), also with a normally open contact of the second−speed relay (VR2), wherein the vehicle tachometer (T) on a first (KB1) of its two contact paths (KB1, KB2), which provided a two Kontaktschlei− away, with the insulated outer pole corresponding to the coil connections of tacho relay (TR1, TR2, TR3) () of the on−board battery (Bt1 / Bt2) associated pointer (TZ) are coated, among other things, a contact segment for hothere speeds (KBIL '; for example, 125 to 160 km / h), a contact segment for medium speeds (KSM; eg 85 and 120 km / h) and a contact segment for lower speeds (KSN; eg 45 until 80 km / h) includes, where the contact segment for higher speeds (KSH) with the Kontaktsesaent for medium speeds (Ksi) via one, in parallel among themselves normally open contact of the intermediate speeds and the lower speeds associated tacho relay (TR2, TR3) connected is, while the contact segment for lower speeds (KSN) to the contact segment for higher speeds (La;; H) is connected via a further relay contact Tacho relay for lower speeds (TR3) and the contact segment for higher speeds (KSH) via one, under parallel lying Contact closed the Tscho relay for higher, medium and nied− challenging speeds (TR1, TR2, TR3) once connected to a known electrical brake valve (EBV) via a normally closed contact of the second Sicherneits relay (SR2), and on the other hand via a series circuit of the make contact of the first pilot relay (PR1), and a further break contact of the second safety relay (SR2) and one to this series circuit lying parallel normally open contact of the first material safety relay (SRL) with the coil start of a first, with from falling delay provided tripping relay (AR1), whose Spu shaft end of an insulated outer pole (−) of the on−board battery (Bt1 / Bt2) lies, is connected . 15) operating system according to claim 1 to 14, characterized in that the Fabrzeug speedometer (T) on its first contact track (KBL) speeds following the contact segment for lower Geschwin (ESN) with another contact segment alone speeds (KSK; 3.B 15 to 40 km / h) and an adjoining Kont aktsegme nt for micro−Ge schwindigke it en (KSO; eg 0 to 10 ki / h) is equipped, in which the for small speeds specific contact segment (KSK) with the coil beginning of this small velocities associated tacho relay (TR4) and be micro−speeds voted contact segment (KSO) with the coil beginning of this micro−velocities associated tacho relay (TR5) ver is connected, the coil ends of the tacho relay (TR4, TR5) on respective insulated outer pole (−) of the on−board battery (Bt1 / Bt2) are and the contact segment for lower Geschwin speeds (KSN) Depending on the position of the speedometer pointer (TZ) with the contact segment for small velocities (KSK) and / or with the contact segment for micro−speeds (KSO) via a contact of the first pilot relay (PR1) with the series−arranged thereto working contacts this Tacho Re lay (TR4, TR5) is connected. 16) operating system by demanding 1 to 15, characterized in that the normally closed contact of the initiate the stop−braking of the train the first tripping relay (AR1) with the explanation egerspule a self−holding, first brake Belais (BRi) in series is, which is dressed with unhindered or temporary speed−keitsbegrenzter drive, wherein (EBV) with one on a second contact path (KB2) arranged after its drop over his break contact the electric brake valve of the vehicle

speedometer meters (T), the speed range from to catch the small to the highest speed comprehensive long contact segment (KF) is connected, while another, the second contact path (KB2) suf in the field of micro−speeds arranged short social segment (KO) via a series circuit a work contact from first Geschwin digkeits relay (VRI) and a working contact of the second speed relay (VR2) a compound having the exciting coil of a second tripping relay (AR2) is prepared, whose closed contact with the excitation coil of the stop−braking of the effecting train to its standstill, self−retaining relay second brake (BR2) is connected in series, wherein after its drop across its rest contact the electric brake valve (EBV) with the short contact segment (KO) of the second contact path (KB2) is connected. 17) operating system according to claim 1 to 16, characterized in that the higher, middle and lower speeds associated tachometer relay (TR1, TR2, TR3) are provided with the finish of interconnected self−holding contacts, via the series connection of a normally open contact the first Brake relay (BR1) a working contact of the second braking relay (BR2) and the normally closed contact of an auxiliary relay (HR) with the corresponding outer pole (−) of the on−board battery (Bt1 / Bt2) are verDunden, said operated with the voltage of the board battery auxiliary relay (HR) within a series connection of a normally open contact of the first feedback relay (RR1) a contact of the second feedback relay (RR2) and a normally closed contact of a switch relay (WR), and the automatic reclosing of the first and second braking − relay (BR1, BR2) via the series circuit of the contact of a changeover switch bbeits− of the auxiliary relay (HR), the Contact closed a change−over of the first pilot relay (PR i), the normally closed contact of the first safety relay (SR1), and one to each brake relay (BR2, BR1) branching lowing working contacts of the second safety relay (SR2) from the corresponding pole (MAZ) of the on−board battery (BT1 / Bt2) from done, the electric brake valve (EBV) is coupled to switch contact with a man who in the braking position by a () pole of the vehicle battery from the brake control line (BSL) for the motor respectively. Transmission brake tension set, and in the brake−release position depending on the position of the direction switch (FR) on the changeover (U6) the corresponding ago waerts− bezw.Rueckwaerts−driving control line (FSL) for the Fabr− drive turns on. 18) operating system according to claim b to 17, characterized in that controlled for the proper determination of the rails of the feedback−contact (R3KS) position reports that the after successive track sections (GA1, GA2, GA2, GA...) under Inclusion of rail triangles and reversing loops are assigned as rising or falling numbers, the contact of the center tap (MA @) the on−board battery (Bt1 / Bt2) respectively. with the vehicle mass associated changeover switch on auxiliary relay via the NC contact of the changeover on the first Pilot relay (PR1) and via one, blocking−direction based Missed; egengesetzt lying diode (D5, D6) with the adding number magnets (ZM1) and subtracted Zaehlmagneten (ZC) of a known forward Eueckwaerts counter as positi ons indicator (PA) is connected, wherein the common Dueck line (ZRL) of magnetic counters (ZM1, ZM2) to the driving direction switch (FR) coupled changeover (U7) is performed, the two outputs on the downstream Polwechsel− contacts a bistable relay adjustment (APR) with the po tive () and negative (−) outer pole of the board battery (Bt1 / Bt2) are connected so that these common return (ZRL) depending on the position of the direction switch and the bistable matching relay with either the positive () or to the negative outer pole (−) of the on−board battery (Bt1 / Bt2) has connection, and wherein the bistable matching relay (APR) on a known, magnetic proximity switch (ANS) is by means of a current pulse can be switched in the opposite position, whereby its contact−part (KT) on the traction unit (LOC) and whose switching magnet (SM) respectively. whose Affected force linienleitstueck fixed within the track curve at any Reverse Loop (KSE) and within one of the three track strands each track triangle (DG) at the reversal point of the tray respectively. is case−trend for the track section numbers (GA1, GA2, GA..), preferably mounted in the middle of the track. 19) Betriebsaysstem according to claim 1 to 18, characterized in that the direction of travel according to the respective connection running on contact shoe (ASW ASW ') for railway switch contact seemed pieces (WCS' W'KS) bewerkstelligende changeover (U3) on the travel direction switch (FR) with the coil start of a connected switch relay (WR), the coil end aa each egg nen make contact one of the two for the changeover of switch tongues provided in its two end point setting − Sagittarius (WS1, WS2) is connected and in function of their Respective able either to the positive outer pole () or to the negative outer pole (−) of the on−board battery (Bt1 / Bt2) or with either of them is connected, wherein for the respective intended switch position each one of the two self−retaining contacts (SHK) equipped point setting Shakers ze (WS1, WS2) depending on the position of a switch element for manual or automatic operation, like automatic hand relay (AHR) either by means of two, individually hand−actuated A switch keys (WT1, WT2) or by means of a corresponding programmi.erten memory (Sp1, Sp2) and its memory hbfrage− factory (SPAW) is switched on, and the waste of each attracted railway switch contactor after executed turnout position parallel by the interruption of its two the feeds (ES1, ES2) to the Selbsthsthaltekontakten (SHK) is done by piece through the detail of that jerk alarm relay (RR1, RR2) when running the feedback−contact rails (R1−2KS; R'1−2KS) with opening his retirement contact the interruption of the two supplies (ES1) and due Anzu0, it of course relay (WR) when running the railway switch − Contact rail section (WKS, W'KS) with opening of its two closed contacts the interruption and the other feeds (ES2) is ensured. 20) operating system according to claim l, characterized in that the mass of the driving rail (MF) with the insulating running rail (IF) bridging capacitor respectively (CG). whose capacity within a track section (GA...) into two equal capacitors (CG / 2) is divided with each half capacity, respective one of which is arranged at each of the two rail ends of the track section, whereas at at switches (WG2) formed track sections with three track−ends the capacity in three equal capacitors (CG / 3) divides aufbe− with one third of the capacity is two, one on each of which one of these three track ends is attached and at crossovers (WG2, WG3), crossing points (KWG) and intersections (KG) formed track sections with four track ends the capacity in four equal capacitors (CG / 4) each with a quarter of the capacity is divided on, each of which is arranged at each of the four tileis−ends. 21) operating system according to claim 1 to 6 and 9, characterized in that the respective, depending on the driving speed range (z.ss.ueber 125 to 160 km / h and more than 85 up to 120 km / h for 45 hours to 80 km / h respectively. "Arranged −Haltstelle (HS, HS ')" according to well before the associated only at−risk about 15 to 40 km / h) only at−risk "−Bremsbeginnstellen (zBBS 125/160, BS 85/120, BS 45/80, BS 15/40) of one pilot contact rail piece (PKS), a thereto arranged in parallel, each driving−speed range corresponding speed Kon clock accessory rail (V1KS, V'1KS; V2KS, V ' 2KS; V3KS, V'3KS), one to also arranged parallel security Eontaktschie− nenstueck for the Wide−area (SESW, S'KSW) with a gen in clotting distance therefrom on the same contact track lying material safety contact rail section for the close−range (SESN, S'KSN) and possibly one or more this slightly HB stood on this same track contact lying, safety Contact rail pieces for the

flank area (SKSF, S'KSF) and one of these in turn arranged parallel Ruecknelde – contact rail piece (R3KS, R'3ES) for the automatic reclosing of the brake relay (BR1, BR2) in "free" –gewordenem, provided respectively. lying in the cross section of track exist, in which the respective speed and feedback–Kon is clock seemed piece shorter than the other contact rails pieces including juxtaposed Security Contact rail pieces, and in driving direction, are compared to their beginnings back to. 22) operating system according to claim 1 to 6, characterized in that the respective ones, depending on the driving speed range accordingly well before the associated forced stopping place (ZHS, ZHS ') arranged duress 3remsbeginnstellen (eg, CSE 125/160, ZBS 85/120, 45/80 ZBS) of one pilot contact rail piece (pKS), a thereto arranged in parallel, each driving–speed range corresponding speed Kon clock accessory rail (V1KS, V'1KS, V2KS, V'2KS, V3KS, V'3KS) and to likewise arranged parallel and on the same contact track safety contact rail pieces for the Far and Near–field (SKSW, S'KSW; SKSN, S'KSN) exist, in which the respective speed contact rail piece shorter respectively than the pilot contact rail piece. the two safety contact rail pieces, and in driving direction, is set back from the beginning. 25) operating system according to claim 1 to 6 and 9, characterized in that the "Just–in–danger" –Haltstelle (HS, HS ') from each egg nea pilot contact rail piece (PKS), a parallel thereto arranged speed contact rail piece (V3KS, V'3KS), the two to also parallel on the same track contact arranged safety contact rail pieces for the far and the near–field (SKSW, SKSN;; S'KSW, S'KSN) and where appropriate one or more lying in this short distance on the same track contact Safety contact rails pieces for the flank area (SKSF, D'KSF) and one to dis sen in turn arranged parallel feedback–contact rails piece (R3KS, R'3KS) for the automatic reclosing of the Brake relay (BR1, BR2) in "free" forward––gewordenen respectively. lying in the cross section of track exist, in which the respective speed and Rueckme @ de @ contact rail piece is shorter than the other contact rail sections including juxtaposed safety contact rail sections, and seen in the direction of travel are compared to their beginnings added back. 24) Betrieossystem according to claim 1 to 6, characterized in that the forced–stop locations (ZHS, ZHS ') of one pilot Kon clock accessory rail (PKSZ) connected to the coil beginning of his coil end to the mass–running rail is connected, one of the broken here safety lines (zBSLW) via its Aroeitskontaktes bridging track relay (GR) connected, as well as a parallel to Piiot–contact accessory rail arranged speed contact rails piece (V3KS, V'3KS) and to also parallel and arranged on the same track contact safety contact schituenstuecken for lleit– and short range (SKSW, S'KSW;; SKSN, S'KSN) are made, in which the respective speed contact rail piece is shorter than the pilot contact rails piece respectively. the willow lined up Safety contact rail pieces, and in driving direction, is opposite its beginnings back to. 25) operating system according to claim 1,2,5 and 6, characterized in that for speeds control ts–limits respectively The single arranged speed contact rail piece (Viks. V'1KS for 120 km / h V2KS respectively. V'2KS for 80 km / h V3KS respectively. V'3KS 40 km / h) and for the annulment of a Respective Ge schwindigeits limiting a singly or in association of a "Just–in–danger" – or duress Brem @ respectively start date. Stopping place (e.g. BS 85/120; HS, ZHS) arranged directly with the ground running rail (MF) connected feedback–contact rails piece (R3KS, R'3KS) is provided. 26) operating system according to claim 1 to 10, characterized in that individually or arranged in the association between the travel rails (FS) to the respectively corresponding contact tracks (W, R, S, V, P, V ', S', R ' , W1) attached pilot, speed, safety, feedback and railway switch contact rail sections (eg. B.PKS, VLKs, V2KS, V3KS, ' SKSN, SKSW, SKSF, R1–2KS, R3KS, WKS) of detected edgewise, at their ends with casserole slanted edges (AK) provided flat iron bands exist, the on of the concrete sleepers (SCH) outstanding and enshrined in them, formed of round or square steel contact accessory rail holders (KSSH) with its upper edge in accordance with the height above rails–top, but higher than trace forced switchers or guard rails are welded, and where appropriate on the rear in the concrete sleepers extend the ICont nude accessory rail–holder and their welded, cable– like mass compounds (MVB), fall setting with the interposition of a respective corresponding soldered diode (VD1, VD2), reliable contact with the ground running rail (MF) are welded in addition to concrete sleepers. 27) operating system according to claim 1 to 10 and 26, characterized in that particularly vulnerable by track deformation track sections with additional, to the insulated joint–sleepers or near mounted on both sides, with plugs and sockets provided target crack sites (SORS) for the occasional interruption of the short and long security lines (SLN, SLW;; s'in, S'LW) are ausgeuestet in which the releasable connector at any desired point plan on a intermediate insulating piece (IZS) with a along the respective mass and insulating running rail (MF, IF) to the outside of which, in a short lateral distance, from her taut, consisting of Invarstahldraht trigger wire (ADR) is connected, to which within in corresponding Laengsabstaen– the on the outside of the respective running rail (FS) welded Ausloesedraht– holders (ADH) is secured out and at the end of that track section at a welded also on the outer side of the respective running rail end block (AL) B), wherein between trigger wire and insulating intermediate piece a weguebersetzendes to the plugs of the target plan office lever mechanism (HGT) is inserted. 28) operating system according to claim 1 to 13.18, and 19, characterized in that the Kontaktschi.enenstuecke (zBPKS, V1KS, SKSW, R3KS, WCS) bestreichenden, over the corresponding contact tracks (W, R, S, V, P, V ', S', R ', W') of the track on the traction vehicle (LOK, STW) on a rotational axis (ASD) up and pivoted from stored and each of the spring action of a same time as a vibration damper acting shock absorber (FB) standing Auflaufkontakt– shoes (ASW, ASR, ASS, ASV, ASP, ASV 'ASS' ASR 'ASW') as a single–arm, preferably made of cast light alloy, are formed from each elec tric insulated lever of each at its free lever end with a downwardly directed, in rounded longitudinal direction, a cavity with an antifreeze oil mixture containing medium (OEG) enclosing bulge (ASB) has, at its center within a with cross bores (QB) is provided, the cavity from the top down by releasing compound (veb) a downwardly from the From indentation a little out Trespassing, brush–like bundle of wires (BDB) is arranged as an actual sliding contact, which wires preferably consist of a virtually wear–beryllium to bronze alloy, while the cavity Every leading to laufkontaktscbuhes ueoer one in the vicinity of the axis of rotation (ASD) bore (BO) and a hir connected oil hose (ATS) with a common oil tank (OEt) is in communication, and the respective change–over to the (U1, U2, U3, U4) of the direction switch (FR) respectively. is the pilot relay (PR1, PR2) leading cable (ASK) also connected in the vicinity of the axis of rotation. 29) operating system according to claim 1 and 14 to 17, characterized in that the outer pole of a () of the on–board battery Bt1 / Bt2 via the equipped with cutters Contact Pointer (TZ) of the vehicle speedometer (T) and their contact segments (KSH, KSM, KSN, KSK, KSO, KF, KO) guided relay (TR4, TR5, AR1, AR2) and control lamps (Li, L2, L3) and the Electric brake valve (EBV) associated with the emitter–collector paths NPN switching transistors (TR4T, TR5T, AR1T, AR2T, L1T, L2T, L3T, EBVT) lie, whose

base terminals via the base resistors (BW5, BW6, BW8, BW7, BW10, BW11, BW9, BW12) with easy contact segments of the vehicle speedometer (T) directly bezw.unter intermediate circuit of the associated contacts of the relay keits VELOCITY (VR1, VR2), the safety relay (SR1, SR2), the Brake relay (BRi, BR2), the pilot relay (PRI) and the speedometer relay (TR1, TR2, TR3) are connected, while the coils of the relay and the coil of the electric−brake−valve each in reverse direction to the other outer pole (−) lying diode (D30, is connected in parallel D31, D33, D32, D7). 30) operating system according to claim 1 and 19, characterized in that the two are parallel feeders (ES1, ES2) of respectively the self−holding contacts (SHK) firmly to the vehicle mass. at the center tap (MAZ) of the board battery (Bt1 / Bt2) is closed railway switch contactors (WS1, WS2) of of a common feed line (ESL) out, the contact about a relaxation of the hand−push button (HD) and this in series normally closed contact of the automatic push button (AD) −in a function of the position of a two lying in the opposite direction ter destinations (AB) adjustable To switch (ZS) − changeable polarity of the outer poles (−,) of the on−board battery leading change−pole line (WPL) verbun to be by them to the common contact of the target switch (ZS) associated changeover switch with three switching is tings out and uie grazing external contacts of the switch positions to a respective outer pole of on−board−battery is connected, said the common contact of another, to the destination switch corresponding changeover switch with three switch settings on each in series with one another lying rest contact of the first and second railway switch contactor (WSI, W52) with an outer pole − at the board battery is connected and the two outer contacts interconnected these switching settings via a normally open contact of automatic hand relay (MiR) () the pawls magnet (KM) of a work as a memory query (opAW) are formed, connected to be detected Sequencer work, while the central contact which these three switching positions via a from the ratchet wheel cam (SNO) in the initial position of the memory −Abfragewerkes by a Normally Closed (RUK) interruptible return line (PLL) with the Even breaker contact (SUC) is connected the jack magnets. , 31) operating system according to claim 1, 19 and 30, characterized in that a first branch of the alternating−pole line (WPL) via a normally closed contact of / feedback relay (RR1), the Contact open the / A switch button (WT2), the normally open contact of the / A switch button (WT1) as well as the lie together in series normally closed contacts of the automatic hand−relay (AHR), the automatic pushbutton (AD) and the / A switch−contactor (WS2) as excitation line (EL1) on / switch stand−contactor (WS1) is achlossen it, while a two branch exchange pole line through a normally closed contact of the other, / feedback relay (RR2), the normally closed contact of the / A switch button (WT1), the work contact the / switch @ tell button (WT2) and on the lying together in series other normally closed contacts of the automatic−manual relay (AHR), the automatic push button (AD) and the / A switch connected contactor (WS1) as excitation line (EL2) with the / A switch contactor (WS2), wooei of automatic hand relay (AHR) from unexcited hand−holding means of the make contact of the automatic push button (AD) from an outer pole (−) of the On−board battery (Bt1 / Bt2) via socket contacts (bu) and plug contacts (st) with a short−circuit connection (kv) of jeweili gen attached storage (Sp1, Sp2) and a rest contact of the hand−push button (HD) for automatic operation on Even entertainment is switched on. 32) BetrieDssystem claim 1,19,30 and 31, characterized in that a third branch of the alternating−pole line (WPL) via a series circuit of a respective break contact of the feedback − relay (RRI, RR2) with another female contact (bU) for a plug contact (st) respectively. the circuit is connected by the respective attached storage (Sp1, Sp2), which made further plug contacts (st) for the position types of switches, each in pairs outcoming Departures on further Buchsenkon contacts (bu) to the contacts (1,2,3...) of the two contact planes (E1, E2) are connected the memory−query mechanism (SPAW), in which the outlet (lb) respectively for "left turn" of course. "bow ride" at crossing points on the respective contact of the first Kontskt level (E1) by means of its contact arm via a contact of automatic hand relay (AHR) and on the first excitation line (EL1) respectively to the first point setting − Contactor (WS1) connectable and Departures (rk) at points respectively for "right turn". t reuzungsfahrt "at crossing points from the respective contact of the second contact layers (E2) by means of its first −synchron laufenden− contact arm via a further contact of automatic hand relay and on the second excitation line (EL2) respectively to the second point setting Contactor (WS2) can be connected. 33) operating system according to claim 1,19,30 to 32, characterized in that the bar at any time manually reprogrammable, preferably by means of plug contacts (st) a iehrpoligen plug into the female contacts (bu) provided multi−pole connectors of the memory −Abfragewerkes (SPAW) portable memory (Sp1) except its short−circuit connection (kv) of a series narrowly spaced, SPDT exists in which each of the common inputs connected together and to one of the plug contacts (st) is performed, the over the Subject Author fenden socket contact with the normally closed contacts of the return register relay (RR1, RR2) next alternating−pole line (WPL) is ver bindable, and in which one of the two outlets each associated with two types of provisions of a switch Uoschal− ters for "right turn" respectively. "Intersection journey" (rk) and each of the other of the two branches for "left turn" respectively. "Bow ride" (lb) to each one of the preferably paired is plug contacts (st) of memory (Sp1) connected. 34) operating system according to claim 1,19,30 to 33, characterized in that the permanently programmed, lor two different routes respectively. specific for a distance in both directions between two target locations, preferably by means of plug contacts (st) of a multi−pole plug into the contacts with Buchssen− (bu) provided multi−pole female connector of the memory query work (SpA pluggable memory * (Bp2) except his short−circuit connection (kv) with a branch line (VZL) is provided, which for upcoming on the respective socket contact with the normally closed contacts of Rueckielde relay (RR i, RR2) alternating−pole line (WPL) bondable plug contact (st) is guided, by this branch line (VZL) made for on same contacts (1,2,3...) of the two contact − planes (E1, E2) of the polling storage plant (SPAW) herbeizufuehr forming similar decisions each with "a left−hand branch" respectively. "Bow ride" (lb) a continuous connection to the to a contact (7) of the first contact plane (E1) leading disposal (lb) of the plug contact (st) is placed and to the at einen.gleichen contact (7) of second contact plane (E2) leading outlet (rk) of Ste'c, kkontaktes without compound remains, and whenever a "right turn" respectively. "Kreu tion ride" (rk) a continuous connection to the to a contact (5) of the second contact plane (E2) leading outlet (rk) of the plug contact is placed and to which a same contact (5) of the first contact level (E1) leading outlet (lb) of the plug−in contact without compound remains, while at the same contacts (1,2,3...) of the two contact planes (EI, E2) be evoked various decisions in respectively a ride. target local direction (A) in each case "left turn" respectively. "Bow ride" (lb) the branch line (VZL) a in the forward direction to their lying diode (D23) with a contact (6) of the first contact plane (E1) leading outlet (lb) of the plug contact (st) connected and at the same to a contact (6) of the second contact plane (E2) leading disposal (rk) of the plug−in contact for "right

turn" respectively. "Intersection journey" (rk) respectively in accordance with the other ride. Target local direction (B) via a arranged in reverse−biased diode (D22) is leit−ung connected to the branch, and in which in respectively a ride. target spatial direction (A) in each case "right turn" bezw.Kreuzungsfahrt (rk) the branch line a in the forward direction to their lying diode (D20) with about a contact (4) of the second contact layer (E2) leading outlet (rk) of the plug−in contact connected and at the same to a contact (4) of the first contact plane (E1) leading outlet (lb) of the plug−in contact for "Linksabzeigung" respectively. "Bow ride" (lb) according to the other travel expenses respectively, target spatial direction (B) via a arranged in reverse−biased diode (D21) with the branch line (VZL) is connected.

Abstract:
Source: US2001034583A The invention detects the loft time and/or speed of a vehicle, such as a sporting vehicle, during activities of moving and jumping. A loft sensor detects when the vehicle leaves the ground and when the vehicle returns to the ground. A microprocessor subsystem converts the sensed information to determine a loft time. A display shows the recorded loft time to a user of the system. In addition, a speed sensor can detect the vehicle's speed for selective display to the user. The invention is particularly well−suited to sporting activities such as snowboarding where users loft into the air on ski jumps and catch "air" time but have no quantitative measure of the actual time lapse in the air. Therefore, users in skiing can use invention to record, store, and playback selected information relating to their sporting day, including the total amount of "air" time for the day and information such as dead time, i.e., time not spent on the slopes.

Abstract:
Source: US2005034763A A fluid delivering hydrant providing a valve actuated assembly with enclosing shroud and water resistive doom handle assembly to protect the assembly from exposure to the weather while preventing entry of rainwater into a building structure upon the roof of which the device has been installed.

Abstract:
Source: US2014306799A Methods and systems for a detecting an intruder near or within a vehicle are disclosed. Specifically, a method to detect and identify a person near or within a vehicle as an authorized or an unauthorized user is provided. In the event an unauthorized user is detected within a vehicle, the system may take a number of actions. In one embodiment, the actions comprise providing notice to one or more authorized users of the vehicle, disabling the vehicle, notifying emergency personnel or police, and emitting a visual or audio alarm.

Abstract:
Source: US2004144001A A plow mounting assembly is provided for removably attaching a plow blade to the front end of a vehicle. The plow mounting assembly includes a frame assembly semi−permanently connected to a front end of an associated vehicle. A blade assembly includes a plow blade and a grasping assembly in a closed position removably connected to the frame assembly.

Machine translation: Human–centric to interpret the earth natural eggs human world and its surrounding celestial bodies (space) mountains (nature), plants (a plant), animal (an animal) ttawi all the world as a collection of all that the nature of physical exercise lives in the law, and also receive rule are living. And all the time natural ecosystems is not spatially stationary wind (wind), cloud (cloud), non (rain), snow (snow), heat (hot waether), cold (cold weather) and so changes in the physical state another is constantly acting. Each component state nature of each pressure (atmospheric pressure), temperature (temperature), moisture (humidity), wind (the direction of the wind), wind speed (the velocity of wind), etc. can be measured. In addition, the percentage change in time according to the schedule it does not know the amount and quality of human beings by themselves because you can not go against the earth (earth) the limited environmental capacity (dynamic capacity) in a rapid increase in car usage and industrial facilities such accelerated expansion, caused by environmental pollutants, natural physical systems circular order of nature itself appropriately in clean air of loss (carring capacity of the earth) and the playback controls to push the boundaries of extreme weather, and weather conditions create a serious future of mankind leads to the question of the survival of the crisis was Such abnormal climate, and weather conditions into the cause of a car accident (a motoring accident) in a wide variety of symptoms continued to increase human dignity (human) life (life) and limited the earth's resources (global perspective) continued to resulting in loss of all our fellow human beings are placed the unfortunate reality is true, be regarded. This problem is real and a personal or social organization to be a specific problems in the country sueopgo, our fellow human beings (man kind) that need to be addressed in common to all (commonness) challenge (a task) is More car traffic accident caused by human–created life from the human resources and human effort to take measures to protect the (effort) in nature, a limited variety of other countless acts of life through a relationship with a durable life (permanence of life) as human beings not only to maintain an absolute four people to pursue (on appointed task), and because it also can have a human is not only an existential destiny (destiny) is a. Therefore, efforts to seek a means for solving problems of the automotive technology sector are not specific to the unique creative skills, and not all of mankind has achieved the culmination of the various philosophical disciplines have been observed in the confines of human ideological in nature, the results derived in the changes in physical conditions in the earth and all living things and the human condition and human–created all the fruits of human civilization can not banguhal jikyeonagaryeo means nobody will be able to do so is self–evident haengwiil. Our man–made car (automobile) on the road (a road) Award motor vehicle crashes that occur (a collision) due to traffic accidents (a motoring accident), the purpose of safe and smooth movement, and established traffic regulations (traffic regulations) in the human free will (free will) according to the judgment (judgment) while being used by the traffic regulations (traffic regulations) breach of (a traffic offense) and driving operations immaturity (unripe) And do not care to stand a little careless enemy actions and, natural and artificial changes in climatic conditions combined with a car driving environmental change are occurring in the relationship. it beyond the reach of human will and capacity of the area irresistible natural weather conditions that may occur sporadically in the car in the form of a crash in a car accident caused a car crash that caused a traffic accident earlier in the components from the human physical safety and the ability to defend proprietary safety devise means trying to give the car a very desirable feature for your patience will be. Cars on the road, the car pursuant to its original manufactured state, depending on how the use of common natural environment in using the week (day time) and night (the night time) (changing light environment), spring, summer, autumn and winter (four seasons) (temperature change) and non (rain), wind (wind), fog (fog), snow (snow), etc. have been used in severe weather conditions. These changes in the natural environment (natural environment) in the automobile road of artificial road traffic and car driving by car to the driver a number of humans, has caused unexpected problems. Because of these problems in human and vehicle safety by presenting a way to ensure the millions of people working for human development as well as the man who owns the car in the history of all mankind, all the technology (new technology) on the purpose (an object)

based on (the basic) will be. In addition, a number of safety features such chain technology decisions are now producing a car packed with a technique called weak, and although the house constantly that require research and development is a fact. How to use such vehicles now comes to technology–intensive chain of human passively by relying on (handworked) operated by the operation as directed passively by sensors without being directed automatically (automatic action) as a function has to be working. Operating instructions of human passively relying on the features that a car engine (an engine) maneuver, since according to the road car suspension (suspension) and dongryeokgi relationship (a dynamometer) to break down the relationship between driving on the deulyigo each angle, in humans directed by passive manipulation capabilities in the automotive lighting system (a lamp device) a signaling device (optical signal devices) and the braking device (a damping device) etc. In general, cars driving cars on the road to observe the state of natural snow and rain in the weather, such as abnormal weather conditions until the end time in hours, and hours more than non–weather (rain), snow (snow) and naturally made huroseo Natural materials are scattered on the road you are driving a car on the road wheels of the car by the Thai portion of the rotational motion generated by the rotation in the locomotion and the friction between natural substances deposited on the road (frictional) under the direction of a car (fixed direction) against the direction (in the apposite direction) of a car on the road back up the finely dispersed natural substance is sprayed on the front and rear car of a car crash caused by physical exercise is an artificial nature. These artificial physical exercise is a very common phenomenon observable phenomena as rain, snow vehicles on the road to driving a car that appears to be a common phenomenon in Figure 1 are organized into. This is the same direction (fixed direction) the same lane (a traffic land) continuously traveling in a car driving by is identified as a unique phenomenon. Figure based on the car when b, b–round car in the driving wheels to spin–off from a car the size of the fine natural materials by the state to drastically speed omni–directional clock b motorists a bad state (go out of sight) will lead to. Such a bad state of the clock driver in the car b visceral (instinctive) in order to ensure forward visibility, window dakyigi device (wiper mechanism) for work on the instructions of the window switch ON dakyigi device will conduct manipulative behavior. And it's about the physical location of a and b are placed in motion relations are applied to all vehicles will be able to do. Such spontaneous changes in the natural environment, and then, depending on road conditions and vehicle driving characteristics automobile physical exercise reasons, caused by the positional relationship between the driver's driving environment in all directions when gyebulryang (man–made environment) routine observed through the car for display lighting system (tail lamp) on the operating state (situation) using the two kinds of forms (two type) are present as are characteristic. An indication of the backward equalization device (tail lamp mechanism) is used taillamps ON state OFF taillamps use a car and another car in the state is using the form on this general interpretation as feasible using the taillamps ON Cars are driving a car that car drivers driving a car motor skills due to road conditions, taking into account the display backward by lights, etc, taillamps and progress in the same direction by using the hubangwi hayeogeum car a more aggressive drivers to drive safely Glucose hubangwi car to a car crash with a possible location for a positional relationship gwangyesang hubangwi recognize that motorists in their cars in a full range of motion status of the poet to give and ensure maintaining relations with each other based on the distance to ensure the safety safe distance to avoid a car crash on the human body to obtain any hubangwi motorists (body) far away from the signal coming from the body (a signal) that accepts a sense receptors (receptor) of the special senses (special sensation) of vision (vision) in the light (light) stimulation caused by road vehicles to suit your environment by sending the signals to detect (perceive) and the reaction by the judge to ensure a safe distance by actively trying to keep above may occur in the posterior For a car crash in an active preventive safety measures used in the lighting system for displaying backward depending on how aggressively the driver is applied, if the other one did not apply, or scrutiny... or is it reverse.Those motorists driving cars due to changes in the natural environment due to road conditions, slip (slide over the rain, slide over the snow) by increasing the braking distance and vehicle movements on the physical change of state for defense when driving a car that must be reflected in the concept of physical exercise, red state (a defensive measure) is vital to (recognize) and consequent need for seasonal (an opportunity), situational (the state of things) lack of proper equipment operation skills for new drivers and old physical and mental decreased ability to exercise the body will be the driving state. Climate change than in the natural environment since the car you are driving a car on the road due to the characteristics of physical exercise on the risk of problems and driving in a state of such an experience in driving motorists to recognize anyone, and also to the rear of a car full spectrum lights taillamps light up and off of state used in the form of two moseupjung anyone easily in such situations to their own sense of omnidirectional vehicles receptors (receptor) of eyes (eyes) are secured through the street poet, visual check of the tubes counted in, taillamps light up the car can be more easily could see the gamgakhal. And it's high–speed driving (at high speed) Highway takes place (an express high way) to keep a very long distance between cars is especially true in the state. Used in these backward taillamps deunghwain indication in the night of the Road Traffic Act Article 31 is referred to in paragraph (1) sunrise until after sunset, lights that turn on is the ability to use force. However, in circumstances described jigeumgeot human, subjective judgments by the operator acts done by manually manipulating the instructions, so to lose is not as efficient in its use will be able to. Dakyigi car window while driving device (wiper mechanism) to a working state in a car requires the driver to forward the clock to ensure that the situation can be interpreted as the logical, the status of these drivers to drive a car (driving) on the concentration (concentrate) with a low forward visibility due to bad road conditions, and omni–directional vehicles for state changes in the physical exercise and cognitive decline as a braking geupchaseonbyeongyeong (a sharp curve) etc. can lead, it's a series of cars driving normal highway bridge You are in the form of flat gwangyesang (dimensional analysis) before, after, left, right, is common to let a car can be Rough around the edges, in such a situation, lighted taillamps sokeseoneun smooth road traffic and safety for the driver and the car will be very necessary. Describing the operational definition of jigeumgeot (operational definition) in the context of work on the device as long as the window dakyigi proportionally lit taillamps driver needs to mothayeotgeon not injihayeotgeon automated manner of backward light is intended to be lit taillamps. Indication on the backward equalization taillamps hit by cars most climate since at least with respect to the use omni–directional vehicles from the road wheels that rotate (rotating system) of a tire (tire) on the road and snow (snow) or stagnant rainwater (rain) and other natural substances friction (frictional force) is dispensed by the (direction of tangent line with constant velocity along the blown) as a result of collisions

hubangwi apyurichanggwaui hubangwi car driver's forward visibility is poor, the anterior clock in order to secure an instinctive (instinct), the window dakyigi device (wiper mechanism) as the time needed to work on the backward equalization Chapter indication polled taillights (tail lamp) Automatic light (auto lighting) sikimeuroseo hubangwi distance drivers (distance) and position changes, and information about a safe distance and braking distance determined in accordance with the information that corresponds to the pre-warning measures for the transmission of light (light) through the visual stimulus (make a signal) may occur in the rear of the car by implementing from a collision with a car driving safety features to aid in advance of rain or snow on a car road traffic aggressive prevention and smooth traffic alone how to use various kinds of flat (degrees of freedom) of a car accident (a motoring accident) on can be said too inefficient. More advanced for the prevention of car accidents (progress) Technology Development (technical developments), depending on your needs through the development of new operational definition of efficient technology (undefined notions) for a specific car driving situations (natural environment) and intrinsic a car driving conditions (man-made environment) to provide priority to the human in the protective function (a defensive measure) Many different forms are as follows: Humans, omni-directional clock to secure the window in the driver dakyigi device (wiper mechanism) tells the action (command) from the state by the stable clock backwards until the time of driving on the same road (trial run) inside your car to the driver to provide information on car driving backward directed indication taillights passive switch operation by judging their own actions even if they do not have a car tail light automatically illuminates backward indication (auto lighting) is to: And this is the name of the safety circuit is called the Intelligent Vehicles. It exists in various forms of information that is built around the car to handle the logical development of the concept design. This is a car engine stops or biunjeon state agencies focused on the human temporal changes in work (time sequence) according to the analysis on the order of the logical design work is about relationships. Effect relationship between the different dimensions of each phase angle, human psychology (a mental state), mental (mind), act (action) and the related physical changes in the state (state variables) according to the human psyche, spirit, one trillion kinds of behaviors by an ordinal information on the operation unit circle (cycle) among the acts that formed on the logical interpretation is designed. It is in the driver forward visibility visual stimuli such as poor health and the natural world (natural environment), and of physical phenomena, such as rain and snow janjaehan substances according to the state after the exercise the different dimensions (degrees of freedom) of binding to explore the cause (intermediate steps), taking into account the time change occurs in the process of the phenomena and a car accident (a motoring accident) combined with the cause makes the relationships established. Depending on the cause (a major cause) blended effects (interact) in accordance with functional changes due to vehicle value of time, obtain information on the state, acting on a car accident according to the new defense relationship in the logical system is designed for the purpose of theory building. Organized a variety of information resources based on the object in view of the car on a real car production machinery (mechanism), electricity (electricity), electrical (an electron system) dongjakgap strains (data) to induce, any such information to the consistent Electrical and electronic order forms, depending on the physical interpretation in the yard as possible by switching to the combination of components provided in the form means that the functional design. Natural weather conditions (natural environment), road conditions (man-made environment), human (a human), automotive (automobile), a traffic accident (an automobile accident), these multi-dimensional information in the form of a set of mathematical tools for cleanup (set) can be summarized to borrow. It's different dimensions (degrees of freedom) of the object (an individual) to the set (set) is. X is an element within a set of set of people, cars, nature, weather climate, elements such as roads that contains a set (set) is It means a different level of elements (an element) deulyijiman fundamental elements that make up an automobile accident must be. This could be the following proposition. The set of X, causing a car accident is a collection of the underlying cause. And this proposition is easy to see chamimeul. Because motor vehicle accidents make up the elements that emerged as common to all phenomena deulyimyeo, but also among them, assuming that there is only one element in a car accident can happen because: You look at it again, logically, human beings do not exist or is not related to motor vehicle accidents. Car does not exist or is not related to motor vehicle accidents. Intangible nature of natural space weather climate that does not exist or are not related car accidents. And the road does not exist or are not related accidents. These are not ordinary common sense can understand, and also from that meeting a set of X in a car accident that will be able to identify the underlying cause. In this set of elements and dimensions to the conceptual meaning of the common physical concepts (physical) that corresponds to a dimension to the definition (a definition) is. The physical quantities defined for the dimension physical (physical quantity) is the number two kinds of change that can be. Between different objects to solve complex problems, regardless of the number units or when high-level understanding that would be useful in the analysis because the set is very important. And this extension of the principle of comprehensive (generic extension principle) Let us apply to. the concept of a comprehensive set of x (geneticist) and the dimension is set. Human (a human) What? Physiological (human physiology) organisms capable of structural analysis, but according to the physical action sokseongjeok component instincts (Instinct) will be. For a definition of instinct acting signals in the concept of ecological stimuli (Sign stimulus), haebalin innate mechanisms (Innate Releasing Mechanism), fixed patterns of behavior (Fixed Action Patten) and formed the center, and behavior (one trillion kinds of driver behavior), the external signals coming from the environment caused by some very unusual.Instinctual behavior and environmental factors that cause stimulus is called the signal, the signal stimulus itself, which corresponds to a small part of the situation, and the innate human nervous system, usually mechanism called haebalin any nerve center (central nervous system) have, and this stimulated by the impact caused by the signal when stimulated by nerves and muscles chain reaction (consecutive reaction) causing, this series will appear in the reaction of instinctive behavior. Fixed behavior (Fixed Action Patten) of the act, there are already born, or scheduled fixed action as having to adjust it according to the stereotactic spatial variation (Orienting) is called. In other words, every human being is a driver for a county to mean the same person all the same these days because the driver briefly define what you are all operating according to the analysis sample is assumed to be human. Meteorological nature (natural environment) and to the Earth (earth) on the space and the atmosphere (the atmosphere) on the physical phenomena change initiative deulroseo rain (rain), snow (snow), heat (hot weather), cold (cold weather) and it belongs to. The energy to start up the car starts acting mechanical structure from the starter motor vehicles generally (starting motor) in

the rotation due to the action agency with power suction (intake stroke), compression (compression stroke), explosion (expansion stroke), and exhaust (exhaust stroke) four kinds of the repeated cycle (cycle) within the Power Authority is repeated by the combustion of fossil fuels at the same time continuing the piston (piston), coupled with the crankshaft (a crankshaft) rotational movement of the (rotational motion) as powertrain (transmission), respectively, prior to undergoing addition, electro–mechanical devices are connected to the Power Authority Power Authority re–machine the physical kinetic energy into electrical energy by converting institution relating to the power intake system, exhaust system for the sensor (sensor) and facilitate the operation of various devices and device drivers and control device (controls) and a pointing device for each kind of electrical energy to the smooth (electric power) is to supply, all installed in the car constitutes a unique cycle of organic gineunggye Sikkim complete and up to that point is assumed to contain the expansion. Since humans rely on for the purpose of moving the spatial position and movement of energy inside the car hit the accelerator gyee Chapter one trillion kinds (accelerator) neurological change through the driver's body movement is passed through a road point from one point to another location outside the energy that can move independently, without regard to means. Road vehicles on the road with another car that changes in real–time obstacle (an obstacle), signs (traffic sign), signal (a traffic control signal), such uncertainties constantly changing mix of physical exercise that is defined sokeseoui. These different dimensions mean conceptually meaningful words in a traffic accident phenomena that make up the relevant elements (element), and this common people of biological sensory receptors (somatic receptor) through the collection of information (information gathering) in accordance with rational logic system (intellectual construction) will be available through the emotional cognition. Y is the set of elements in the set X (element), who used them as human–centric, cars made in the structure function relationships established many relationships (relational) and substituting (correspond) to the set of things is derived. It is also produced in a real car based on the behavior of the structure and the general public can find out anyone. X to Y and work out a set of sets of the elements whose car use and interpret the human good to be induced to begin. That make it a car accident due to the interaction of four elements combine to cause the relationship to start by relying on a human is due to take place, normally dependent on humans to terminate the relationship is contacting. Human element in the set X itself about the relationship, yet at the same time a car is required to establish a combined volume–based (bond energy) has. It–dimensional (degrees of freedom) in the property or the human element (component) can be called. Such dimensional elements (dimension analysis) need to work with a willingness to move in accordance with the purpose of positional and dimensional coupled with car sikige relationship is established. Independent of human free will, according to the action integral, coupling relation in humans and vehicles in the car for the ride will be. However, the internal motion characteristics (property) and the component (component) jeokeuroneun car with a unique combination of athletic ability is an unfulfilled state. Independent of human will become bound to the car and under any subsequent changes achieved in the automotive mechanical compositionally athleticism and ability to manipulate human biological coupling in the singyeonggyejeok is, this car boot (starting) or cranking (a crank) powered by the behavior of institutions and systems that work for the adjuncts from the starting point that can be. In addition, since this point in human biological functions (health state) to a car involved in physical exercise capacity and through that they need to think together in the same state, and also to afford a true sports car physically. Therefore, X is a set Y to a set of human wonsojung start (starting) can be flagged as a. Set of Y elements (an element) of start–up (starting) your vehicle according to a human running a passive activity is completed, the temporal point on its production vehicles pursuant to the exercise capacity associated with a unique kinetic energy of internal organs, the circulatory system (cycle) will be. It is due to start work on the power at the start of electrical energy from mechanical structural starter motor vehicles generally (starting motor) in the rotation due to the Power Authority operates with a suction (intake stroke), compression (compression stroke), explosion (expansion stroke) and exhaust (exhaust stroke) repeated the four kinds of fossil fuels in internal combustion engines by the agency at the same time repeated continuous piston (piston) coupled to the crankshaft (a crankshaft) rotational movement of the (rotational motion) to the driveline (transmission) Prior to each underway for each. In addition, agencies attached to the power electrical machinery and related sensors (sensor) on the Power Authority re–machine the physical kinetic energy into electrical energy by converting institution relating to the power intake system, exhaust system for the sensor (sensor) and the behavior of various devices, And the convenience of the driver unit and control device (controls) and a pointing device for each kind of electrical energy to the smooth (electric power) to supply and installed in the car all the unique gineunggye organic cycle is complete and that point constitute a sikimeul assume that expanded to include. Since humans rely on for the purpose of moving the spatial position and kinetic energy systems inside the car to hit one trillion kinds Chapter accelerator (accelerator) neurological change through the exercise by passing through a body to exercise and road cars from one point to another location point Regardless of the external energy and will enter at the beginning of an independent movement. The beginning of the road movement of vehicles along a fixed direction of the car because it is bound to exercise undongsang that one should have jayudoman, this road to explain the vehicles in a single variable (variable) explained by assuming only according to various criteria to interpret inaccessibility (difficult), avoiding the more accurate because a consistent interpretation is available. Bekteoryang car to start it (vector quantity) can be determined by two saenggyeo remain on the inside of the driver his visual sense (the sense of sight) through the speed indicator (tachometer) through the recognition (recognize) may be. Instructions such representations speed analog (analog), digital (digital) can be sent to, but it can be said to be equal to the sensory organ. Vehicle speed indicator (tachometer) on the changes mean that the real driving cars on the road, and this man in the car and started to enter into the state road traffic rush by that time will be able to interpret. Such visual instructions to the driver inside the car in relation to the state elements as a set of X–car speed (tachometer) ?? observation (observe) can be found at: In general, electrical, mechanical and electronic consists of describing the process based on electronic and understand. Electronic speedometer (electronic tachometer) the wheel (a wheel), etc. Field installed sensors or inductive sensors (induction sensor), etc., obtained by an electrical pulse (pulse) is generated in the form. This vehicle running speed is proportional to the noise in the low–pass filter for removing an element and then through a Schmitt trigger pulse is rectangular. Selling only two rectangular pulses of equal length in stable multivibrator is converted to a square wave. Movable type coil instrument connected analog (analog) speed is proportional to the integral rectangular pulses

gyeyongeuro instructions (integral function) accounted for as a process operator and visual instructions to check that the driver will change. Element for these cars in the set point X on Y can be seen as an independent movement in the aggregate elements (element) is the speed (velocity) that leads to the relationship between the elements (the system of proportional representations), and am in the set Y physical movement of elements of the speed of the vehicle components are included.X to a set of elemental nature, the weather (change of natural environment), the situation (man−made environment) which of the driving situation and road interpretation to take precedence beneficial coincidence of two things (at the same time), depending on families of the foregoing nature of Meteorology climate of snow and rain in the context of a natural phenomenon that occurs after the car driving safety's sake to build defenses are described in the first bar is the procedure the natural world. X to the set of natural elements as intangible as a spatial concept that the state was determined in the context of understanding the meaning. In general, a visual check can be intangible, and that's where this place is the atmosphere (the atmosphere) is called. The atmosphere (the atmosphere), a place conceptually atomic configuration (microscopic point of view) in the Earth's gravity (gravity) is a set formed by the atmospheric water vapor (steam), including the composition of nitrogen (nitrogen) 78 percent, and oxygen (oxygen) 21 percent, Ar (argon) 0.9 percent, carbon dioxide (carbon dioxide) 0.03 percent, and consists of unseen things that can be seen by anyone. The space (space) generated from the sun through the solar (the sun's ray), by temperature (temperature), etc. Circulating ten mechanical energy (cycle) is being made. These changes in temperature inside a car in the direction from the outer surface to the temperature change is required, this is inside the car on the driver aboard the physiological (body) sensory receptors (somatic receptor) stimulate (a stimulus) cause (a cause) invisible to the action of (element) as it will require a significant reaction. Over such a natural atmospheric effects due to the heat in the car with the driver about the relationship status of the natural temperature of the cold when a driver heading towards the direction of the heat (hot weather) to the car being made inside the space temperature control device operations, and vice versa nature: when the temperature in the direction of heat, cold, driver direction (cold weather) to the car interior space temperature control devices that can be seen followed by attempts to manipulate. According to external temperature effects on the reaction conditions applied to the law are being carried out in the actual car used in the check, and it gyejeolsang (the time of the year) when assigning the summer heat (summer) is, the car naebugye eeokeondisyeongye of (cooling) cycle is maintained by the low temperatures, cold winter (winter) to the opposite inside the car as a hiteogye (heating) cycle that is maintained by the high temperatures inside a car gyee state of human results of the operation will be regarded by the body is given. So what about the natural world on climate meteorological element for a set of X, Y set of climatic conditions on natural weather heating (air conditioning) and induction should be listed. This is so that two of the heater (air conditioning) due to the action in the manner of its composition is as follows. (However, only the heater will be described in the text, but about the behavior of the two electronic components (electricity) that together are the same.) Heating method, the power authority (an engine) according to the type water−cooled (liquid cooling engine) and air−cooled (air cooling engine) is slightly different depending on, and water−cooled (liquid cooling engine) power, most agencies (an engine) that passes through the coolant heat exchanger (heater radiator) heating the air to the heating and air−cooled (air cooling engine) in some cases the air heat exchanger installed in the exhaust pipe (heater radiator) heating is a way to pass heated. How to adjust the quantity to it by the wind blowing the electric motor (air conditioning of vehicle), depending on the operation of the control (control) the common form in which (commonness) is applied to. Now, home heating systems in aggregate X Y wonsojung natural collection, weather, climate, and meaning in nature, including climate change. Now the rest of the set of X elements wonsojung car was with the road conditions, On the information routinely observed (observation) according to the result (result) only assume (assumption) deployed to the theoretical situation, because of natural climate phenomena rain weather (rain) snow (snow) on the progress or completion of phenomena defined huran time there was an understanding expressed in content according to the description of the road and vehicle movement on sanjeokdoen materials that will be limited to the Recall action. Substances on the state of the road sanjeokdoen rain, nundeungeun car (automobile) in the physical movement (motion) with the action (interact) are interrelated. Power transmission system according to the chain of the final act of a car wheel (a wheel) to the rotational motion (rotational motion) and the relation jineunde, this car in the center of the wheel (center point) outside (outside) portion of the tire on the configuration and materials and contact with the physical exercise, according to the microscopic size of the transfer of energy in the direction opposite to the direction of automotive injection phenomenon (direction of tangent line with constant velocity along the blown) occurs through the same road you are driving straight on board vehicles Watch where space is typically secured to the front of the glass part of the driver (windshield) and collision (collision between element particles) is. As a result of collisions of glass (windshield) unique to the visible transmittance seongjilin (clairvoyance) by causing a rapid deterioration in the rain, nundeunge phenomenon by the end doeeoteumedo changdakyigi device driver (wiper mechanism) know that the action is. Changdakyigi device (wiper mechanism) behavior on the switch inside the car to the driver on board (switch) is based on the value can be manipulated, and also because the actual car is the same set X of elements of Y to a set of road conditions and driving a car window dakyigi device (wiper mechanism) is induced by the assignment. Changdakyigi jangchigye (windshield wiper system) in the configuration, operating principles generally electric, compressed air and are classified, general electric motors in the expression (wiper motor), links, and cancer (wiper arm), blade (wiper blade) is to switch to the ON position if changdakyigi device, the motor rotational movement (rotational motion) is associated with partial rotary motion by the power to install the front glass area of the ashes in a car that corresponds to a portion of material forces in the area is to remove the form. And primary energy (power) in the form of electricity (electricity) is So now the set X to a set of Y−dimensional relationship between elements and the assignment and the actual daily guided automatically by the judge in the visible−board meeting in a verifiable form was lodged in the. In addition to human hearing (a mental state), mental (mind), physical (body), psychological features related to physical quantities (psychophysical quantity) can be called things, it causes the X in the collection of elements derived by means of As a result of the unique properties that can be found that the state can be included. Use their cars on the set of Y elements that operates according to the assignment in time to analyze situations in order of when, due to time changes may know others. That type of information processing does not apply on the concurrent processing in a sequential form of state enable it to

trying to achieve, because as easy. The temporal order of such circuit design (circuit design) in a logical map (logic map) and that as such due to the set of elements Y, respectively, into two distinct understanding as a signal that can be obtained. This component is defined as the set of elements accordingly to becoming a yirueojigo the system design, logic design (system design), so Z is naturally a set of configuration elements in the temporal behavior of the element X set of conditions defined by the value of the final action (a definition), and elemental way to mark a common Arabic numerals (arabic numerals) should be listed as. Y to a set of elements (element) as a four start-up (starting), speed (velocity), heater (heating), the window dakyigi device (wiper mechanism) is the basis of the foregoing information, you will wooseonil startup. It means a combination of humans and vehicles, and driving a car on the preparation phase corresponds to the physical exercise, and all cars should mean circulation in the internal energy system. Set of Y and Z set the startup element is assigned to an element. Then start up (starting) in the rate since the actual car (velocity), heater (heating), the window dakyigi device (wiper mechanism) work on the driver (a driver) in a random order determined in accordance with free will, but you are driving a car If the speed (velocity) can see that the second order. Rate set Y Z elements are assigned to a set of two elements. Weather conditions in the natural world as the weather and then a set of Y elements (an element) heater (heating) is assigned to the Z-set of three elements. Finally, a set of windows in a car driving road dakyigi devices yellow Y Z elements are assigned to a set of four elements. Z is the purpose of this organized according to a set of logical order (sequence), and X, Y, Z set the X set to clean up a traffic accident (a motoring accident) on the component causes (element) is set to, Y set of causes components for the automotive action (element) is set to, Y set of components for causing a car to work on a set order, and also use the car for a set of Z order of the temporal behavior (time sequence) is Each element on each element of the set Y by analyzing the electrical properties have the same nature as that produced in the form of a real car on the check so that configuration can be seen gyereul.Start (starting) Iran gidongjangchigye in a real car (starting system) and dongryeokgi relationship (an engine system) can cost in relation to interpretation. Typically by rotation in the key way in everyday life and electricity (electricity), by the way that wireless electronic switch inside the car on the way, can be divided according to the actions. These three ways Hillsbrad car battery power source (battery) power to start the motor (electric motor) in the rotation (rotational motion), the initial power to exercise authority and aims to induce a prototype of the entire operation because all of the same things can be seen. In addition, during operation of the primary energy jeongieneojiim work (electricity power) can see. Speed (velocity) What physical exercise (physical quantity) to be related to the status of physical exercise on a car driver in the car to be able to recognize each sensor (induction sensor) in the final driver sigyesang Km / h in the instructions state that the purpose of the unit, and this also in the structure electricity (electricity), based on the electronic behavior guseonggye, and energy were significant differences in the principles of operation of electrical energy (electricity power) can be seen that as the default. Cooling, heating (ventilation system) What? External heat ever about the status of a car inside the driver's action are based, as air-conditioning (cooling water) and heating (heating) a different direction ten enemy origin (the origin) have, but inside a car in the temperature change, the purpose and configuration that meets the criteria for gyeyigie Heating, Power Authority (an engine) coolant (cooling water) to pass through a heat exchanger (heater radiator) using a heated air blower motor (fan motor) controlled by the vehicle interior heating This form consists of controlling the behavior of the electrical switches also operate according to the blower motor, which is based on work found in the form of electrical energy as the primary energy (electricity power) is Window dakyigi device (wiper mechanism) according to the driving situation in a car on the driver a visual watch mokjeokdoen important to ensure that functions as a switch located inside the car electric motor rotates by the action (generate electricity) and it is connected to the glass unit (windshield) while in contact with substances (snow or rain) in a manner that eliminates this action by also achieving electrical energy guseonggye (system) can see that. Organize a set of four kinds of elements when qualitative aspects, Y has a set of electrical properties of elements, and their own work in gyega circulation and can be seen that the electrical energy involved. It stopped as they work with each element with regard to the state, electricity (electric current) is flowing or not flowing, the, the switch is turned ON to OFF state are you'll notice. Each angle is the set of Z elements, ie ON, OFF, or stop (stop), and logically operate in an unknown state (logic) ON the "0" OFF "1", and it may be written in reverse (converse) also possible can see that. Organize them on the basis of intelligent vehicle driving safety circuitry produces behavior made. Drawing an intelligent car driving safety circuit that operates from inside a car can be understood by the whole concept As a general electrical circuit diagram in relay or relay configured as a playground. Relay (relay) is a 4pin type relay, in multistage guseonggye enjingye (engine), Speedometer (tachometer system), I'm collateral (air conditioning system), Windows dakyigi jangchigye (windshield wiper system) are connected to the voltage (voltage) and current (electric current) is the same for both the home and will be described. Each one of the internal relay Re1, Re2, Re3, Re4, Re5 and Re4 in the center consists of Re1 each at the bottom of each S1 input terminal (input) A, B, C, D through the enjingye, speedometer, heating systems and window systems are connected with dakyigi device. Intelligent vehicle driving safety circuit behavior (action) and action are as follows: Relay (relay) is like all four of the terminals, respectively, B, S1, S2, L is the terminal. Re1 b terminal on the power (battery) is connected to. It starts with the actual car and the driver intended to be used inside a car while on board, start-up (engine starting) hang power agencies (an engine system) is a circular ?? make quite a unique energy system, the electrical input terminals a and electronic signal is input through the input terminal S1 to Re1 (input) and, S2 output from the terminal (output) is S2 terminals grounded (earth) is connected to. Therefore, in this state, the relay Re1 B terminal and L terminal unique dongjakin inside S1, S2, because current flows between the electromagnetic (an electromagnet) stimulation pulled jeopgeukjareul contact (a point of contact) climbs up pushed point B. L circuit closed (close) in accordance with the principles of operation S1, S2 signal is input to the B terminal in its current form is associated with the current through the power of L is the terminal goes into. In the multistage to Re1 Re2 B to the L terminal is connected to the terminal. However, the power obtained from the current Re2, B is the standby terminal contacts. This is the start of the intelligent vehicle driving safety circuit (engine starting) information about (starting information) is only (recognize) that the state can be treated. Since start-up operator for the purpose of moving the car, due to the kinetic energy remaining in the tachometer (tachometer system) so you can see it in action on the motion on the speedometer in the car a certain amount of movement when the inputs change state ryange true (input) b signaling through

(signal) input (input) is Intelligent vehicles driving through the input terminal b, the input signal to the safety circuit is connected to terminals S1 to S2 Re2 output terminal and ground (earth) flows. Re2 B terminals by the action of the distinguished L current output terminal of the L Re2 and Re3 terminal is connected to the B terminal. These conditions in the car boot (engine starting), speed (velocity) such a state of two pieces of information processing can be made, and added that together with the information processing Re3 is waiting to be processed in the B terminal. Re3 information on it yet because it was not according to the input signal. Followed by a car driving under natural climatic conditions Weather drivers in the temperature inside the car (a change of temperature) as a vehicle for the displacement operator Heating gyega by switch operation by relying on its own energy cycle begins, the input terminals (input) C signals are being input to enter S1 to S2 is listed as Re3 ground (earth) flows. Re2 behavior and also inside the same signals S1 and S2 during the Re3 flowing currents in the B terminal is output to the L terminal to B terminal is facing in Re4. In this state, start the car (engine starting), speed (velocity), due to natural weather conditions weather information (data) processing the input corresponds to the state, and that information is processed in Re4 B terminal is in the standby state. Then, the processing status information from the driver's car driving according to road conditions in order to ensure directional clock and window dakyigi gyee switch operation by the device a unique window dakyigi device gyee circulation is established, through the signal input terminal d being input, the input terminal d to enter information into the terminal Re4 S1 to S2 is output to ground sikimyeo flows. Re4 B, the information you were waiting in the terminal is output to the L terminal. Relay Re4 Re5 the L terminal is connected to the terminals S1 and S2 output is grounded. This is all the information (data) is done in the treatment process. And in the B terminal and L terminal Re5 respectively tadane a 'b' is connected to the. a 'and b' in between the taillights light switch SW1 (tail lamp switch) and, Re5 Re5 in the S1.S2 the signal flowing in during the L terminal and B terminal, because the conduction tail lights (tail lamp) lights up (on lighting) is This function is performed as a mokjeokhan. Drawing on a description of the content and information processing in the form of AND logic based on intelligent vehicles driving in a manner designed to operate in safety circuits is the effect on the way. Weightlifting is the same as him. Drawing two boxes for the automotive driving safety circuit behavior and acts in accordance with the actual level of automobile manufacturing technology and the power consumption of the product in production efficiency (efficiency) to reflect, a semiconductor device (transistor) and resistor (resistance) and relay (relay) circuit is designed to bind to. It constructs the input information to the difference between the drawing and not a function of information processing and action for the same meaning to it according to the output (output) to provide. 2 drawings in content and logical flow of information processing by the AND operation is that the form–oriented, and it is weightlifting. Circuit in FIG Information.This Minister s1 input (input), s2 processing unit (process), s3 output (output) can be divided into input wealth composition, the corresponding device input terminals S1, A, B, C, D, and each of each resistor connected to the top elements R1, R2, R3, R4 are connected to the input terminal to the bottom of the sidonggye (starting system), Speedometer (tachometer system), nanbanggye (air conditioning system), Windows dakyigi jangchigye (windshield wiper system) and each of each is connected.A seolmyeongsang the sidonggye (starting system), B the speedometer (tachometer system), C the collateral I (air conditioning system) and D dakyigi jangchigye the window (windshield wiper) connects to an addition built connection between description it does not matter if the mubangha. S2 is denied treatment T1, T2, T3 and T4 are a four spikes of small semiconductor transistor (transistor) is composed. Mokjeokdoen in the selection of a semiconductor device features a rectangular ones for the various forms may be expressed replaces. In this circuit, bipolar (Bipolar) NPN–type transistor in series (Transistor) is Transistor (transistor) of basically three terminals, and each angle of the emitter terminal (Emitter), database (Base), collector (Collector) is called the emitter, base, collector, respectively, E, B, C symbol is represented by And B, T1, R1 and is connected to the bottom, E a ground terminal (earth) is connected to. R2 and T2 are connected to the B and E at the bottom of the ground terminal (earth) is connected to. T3 is connected to B, and E at the bottom of the R3 and the ground terminal (earth) in the R4 and T4 are connected to the B and E at the bottom of the ground (earth) is connected to the altar. Output (output), and device configuration corresponding to the S3 R5, R6, R7, R8 and output terminals connected to the F relay (relay) B consists of a relay terminal and L terminal switch for each light, each taillight (tail lamp switch) is connected to the multi–stage. It includes deulkkaji. Device, the resistor R5, R6, R7, R8, so that each of the connection at the bottom of each R5 is connected to terminal T1, the collector. R6 at the bottom of the collector terminal is connected to T2. R7 at the bottom of the collector terminal is connected to T3. And at the bottom of the T4 R8 to the collector terminal is connected to. R5, R6, R7, R8 to the top of the output (output) F are connected by R9 it up voltage (voltage) is at stake. This circuit operates on the circuit analysis is the reverse inference. First output (output) when based on the R4, T1 at the top of the resistor R4 is connected to the collector and the sunbanghan voltage is affirmed. T1 internal structural relationship in the forward voltage for D1 or, D2 on the dotted line because the reverse voltage and no current in the same direction. This NPN type transistor (transistor) on the internal structure of two diodes (diode) because the fitted understood that help to explain, which takes the voltage to the terminals T1, even though the collector emitter current is not flowing into the state by default is. T1 and T2, T3, T4 are all the same state. These conditions intended to be used on the driver's car, and start–up (engine start) on the T1 base (base) terminal through the information (data) input (input) and will be. T1, then the base (base), emitter (emitter) is made between the voltage drop, the base (base), emitter (emitter) between the current (electric current) is the flow. It is the base emitter diode between the internal (diode) because the forward. At this time, the collector (collector), emitter (emitter) Novelties current flowing between the base, due to the flow of current between the emitter current in diode D2 (electric current) flows are over. This is a real collector, the emitter between the current flow by measuring to check and as a result, T1 and the base, emitter between the current flow to the collector, the emitter between the current flow transistor (transistor) of the special behavior takes advantage of the startup (engine start) the information (data) will be written to the treatment. However, information on the entire circuit elements on the rest of the three did not enter the relay mokjeokdoen behavior is not done. Since the speed (velocity), I'm collateral (air conditioning system) and dakyigi jangchigye window (windshield wiper system) information on input terminals, respectively, B, C, D are input through the voltage drop, respectively, T2, T3, T4 treatment that has been entered into in accordance with its output relay (relay) operation on the tail lights lit (on lighting) switch in the ON operation has a value. Therefore, passive rear lights lit on the

driver circuit before the automatic light switch operation (auto lighting) and performs functions mokjeokhan. Intelligent Vehicles in safety circuits in everyday life with the invention snow, rain on a car driving over the duration of the driver on the road motorcade driving snow to the driver in an environment (eyes) in order to ensure forward visibility through the window visual dakyigi device (wiper mechanism) dongjakhu to switch ON, the rear of a car accident that may occur in order to secure themselves from the act of active conflict prevention activity for the purpose of backward light is lit and the switch instructs the operation amount of time it takes to operate 1sec Assuming that jam. 100 Km / h based on a car driving by. A second driver tells the operating time for the actual road distance from the car during the move that you know 27.7m 27.7m What car because the mileage interval corresponding to the driver and vehicle safety features for the car itself, first by providing a quick road For rain to snow–facing car slip (slide over the snow), etc. for the preventive effect of collisions (prevention effective) there. In addition, in such a situation analysis on the use of light according to the layman on how to use for beginners (a beginner) and elderly (senior citizen) in their defensive driving skills by driving aggressively because it complements the standing crisis that may occur in posterior vehicle prior to or at risk of aggressive defense by running the best cars in the smooth road accidents due to communication and actively contribute to the effective preservation of life (effective) to provide. contained in this application form for the word meaning and reference books, electronic information and communication engineering dictionary: book publishing wait and physicochemical Iwanami Dictionary: daegwangseorim, 2004 daebeopjeon: Code Publisher, micro–electronic circuits Design: Mechanism Researcher, Life Science Dictionary: Academy Books, Electronics Dictionary: occupy almost same proportion, Human Physiology: Publishing the effective date, and biology: Eul Press, younghan Medical Dictionary: sumunsa

Abstract:
Source: CO4480005A 1. PROCESO PARA LA ELABORACION DE CONFITURAS HE– LADAS CARACTERIZADO PORQUE CONSISTE BASICAMENTE DE LA ELABORACION EN FORMA INDEPENDIENTE DE UNA MER– MELADA DE FRUTAS Y DE UNA MEZCLA DE AGUA Y AZUCAR LAS CUALES POSTERIORMENTE SE UNEN PARA FORMAR UNA MEZCLA TOTAL QUE SE LLEVA A MADURACION DE DONDE SALE PARA SER MOLDEADA COMO PALETA. 2. PROCEDIMIENTO PARA LA ELABORACION DE CONFITU– RAS HELADAS DE ACUERDO CON LA REIVINDICACION No. 1 CARACTERIZADO PORQUE PARA HACER LA MERMELADA SE LLEVAN A CABO LAS SIGUIENTES ETAPAS: A. RECEPCION Y SELECCION DE LA FRUTA, ESTE PROCE– SO SE HACE MANUALMENTE TENIENDO EN CUENTA TAMANO, ESTADO DE MADURACION Y OPTIMAS CONDICIONES FITOSA– NITARIAS. B. LA FRUTA UNA VEZ SELECCIONADA Y YA COLOCADA SOBRE UNA ESPECIE DE ZARANDA SE SOMETE AL LAVADO CON CHORRO DE AGUA FRIA. C. LUEGO PASA A UN PROCESO DE ESCALDADO EN AGUA A 50 GRADOS CENTIGRADOS DURANTE UN TIEMPO DE 10 A 15 SEGUNDOS. D. EXTRACCION MANUAL DE LA PULPA, QUEDANDO LA PULPA SEPARADA DE LA CORTEZA. E. PROCESO DE LICUADO MEDIANTE EL CUAL LA PULPA SE FRAGMENTA COMPLETAMENTE QUEDANDO SEPARADA DE LA PEPA O SEMILLA. F. DESSEMILLADO POR MEDIO DE FILTRACION UTILIZAN– DO UN FILTRO DE LIENZO TIPO MANGA. G. AL CONCENTRADO DE PULPA DE FRUTA ASI OBTENIDO SE LE ADICIONA AZUCAR EN UNA EN UNA PROPORCION DE DOS PARTES DE FRUTA POR UNA DE AZUCAR, ESTA MEZCLA SE ELABORA EN UNA MARMITA PARA LUEGO SER LLEVADA LENTAMENTE HASTA UNA TEMPERATURA ENTRE 60 Y 85 GRADOS CENTIGRADOS, DONDE UNA VEZ ALCANZADA LA TEMPERATURA SE MANTIENE EN ESE PUNTO DURANTE UN TIEMPO DE 10 A 15 MINUTOS, PARA OBTENER UNA MERME– LADA DE FRUTA. H. LA MERMELADA ASI OBTENIDA SE ENVASA EN TAMBO– RES PLASTICOS O ENVASES DE VIDRIO HERMETICAMENTE CERRADOS Y SE DEJA EN REPOSO POR LO MENOS DURANTE 24 HORAS. 3. PROCEDIMIENTO PARA LA ELABORACION DE CONFITU– RAS HELADAS DE ACUERDO CON LA REIVINDICACION No. 1 CARACTERIZADO PORQUE SEPARADAMENTE SE PREPARA OTRA MEZCLA COMPUESTA DE AGUA Y AZUCAR, DONDE EL AGUA SE PASA PRIMERO POR UN FILTRO DE CARBON ACTIVADO Y LUEGO POR UN FILTRO DE ARENA, PURIFICADA EL AGUA SE LE ADICIONA EL AZUCAR EN PROPORCION DE CUATRO PARTES DE AGUA POR UNA DE AZUCAR. 1. Process for the production of confectionery HE– LADAS wherein it consists basically PROCESSING INDEPENDENTLY OF A MER– ROAN FRUIT AND A MIXTURE OF WATER AND THEREAFTER WHICH SUGAR TOGETHER TO FORM A TOTAL MIX THAT TAKES WHERE DOES matured to be molded as a palette. 2. PROCEDURE FOR THE PREPARATION OF RAS frost CONFITU– according to claim No. 1, characterized MARMALADE TO TAKE OUT THE FOLLOWING STEPS: A. RECEPTION AND SELECTION OF FRUIT, this process is done manually BEARING NOTE size, stage of maturity and optimal conditions PLANT PROTECTION nity. B. FRUIT AND ONCE SELECTED AND PLACED ON A KIND OF ZARANDA SUBMITTED TO WASH WITH COLD WATER JET. C. THEN GO TO A PROCESS WATER scalding 50 degrees Celsius for a period of 10 to 15 seconds. D. REMOVAL MANUAL PULP AND ARE SEPARATE PULP BARK. E. blending process whereby fragments PULP being completely separated from the PEPA or seed. F. DESSEMILLADO by filtration UTILIZAN– DO A FILTER BAG TYPE SLEEVE. G. TO CONCENTRATE FRUIT PULP OBTAINED ASI is added sugar in a ratio of TWO PARTS OF FRUIT BY A SUGAR, this blend is made in a pot TO BE BORN THEN SLOWLY TO A TEMPERATURE BETWEEN 60 AND 85 DEGREES CELSIUS WHERE After reaching the temperature is

maintained at that point for a period of 10 to 15 minutes to obtain a MERME– LADA FRUIT. H. MARMALADE thus obtained is packaged in TAMBO– RES PLASTIC OR GLASS CONTAINERS sealed and allowed to rest for at least 24 hours. 3. PROCEDURE FOR THE PREPARATION OF RAS frost CONFITU– according to claim No. 1, characterized OTHER MADE SEPARATELY WATER AND SUGAR BLEND, where water is first passed through a charcoal filter and then filter PREPARES ARENA, PURIFIED WATER is added sugar ratio of four parts water to A SUGAR.

Abstract:
Source: US2002085745A A document processing system comprises an input receptacle for receiving documents. A transport mechanism receives the documents from the input receptacle and transports the documents past a full image scanner and a discrimination unit. An output receptacle receives the documents from the transport mechanism after being transported past the full image scanner and the discrimination unit. The full image scanner includes means for obtaining a full video image of said documents, means for obtaining a image of a selected area of said documents, and means for obtaining information contained in said selected area of said document. The discrimination unit includes means for determining the authenticity of said document. A system controller directs the flows of documents over the transport mechanism.

Abstract:
Source: US2004154715A The invention concerns a method whereby when the tyre reaches a wear threshold level, acoustic wear indicators emit a sound signal by coming into contact with the ground. Magnetic, optical and mechanical embodiments are also disclosed. A detector consisting of a microphone placed beneath the vehicle and a processing unit switches on an indicator placed in the instrument panel. In a more sophisticated version, the detector by matching the acoustic signal phase with the ABS data, identifies the tyre concerned. The invention is useful for detecting tyre deterioration, or that of any, other type of surface such as pads, and the like, and for detecting the presence of snow chains or nails.

Abstract:
Source: US2005186893A A fully automated apparatus and system for processing shellfish such as shrimp and crawfish including the cooking, drying and peeling thereof. The present invention utilizes excessive heat

generated by boilers and the like to heat the dryers. The product is cooked in a brine mix that once used is transferred to a broth processing system to make a seafood flavored broth and is also injected as a fine mist into a furnace where is crystallizes into a solid product to be used as a seafood flavored salt.

Abstract:
Source: CA1061062A An automatic swimming pool cleaner comprised of a car adapted to travel underwater along a random path on the pool vessel surface for dislodging debris therefrom. The car wheels are driven by a water powered turbine to propel the car in a forward direction, along the vessel surface. In order to prevent the car from being driven into a position, as for example against a vertical wall, from which it cannot emerge, a wheel geometry is employed which, upon contact, develops a horizontal force component parallel to the vertical wall, to thus enable the car to spin off. Alternatively, or in combination, a water flow produced reaction force can produce a torque to turn the car with respect to the engaged wheel to enable the car to spin off. The car is designed with a low center of gravity and a relatively buoyant top portion so as to produce a torque which maintains the car correct side up when on the pool bottom. Means are provided on the car for producing a water flow having a force component perpendicular to the vessel surface to provide good traction between the car wheels and the vessel surface. Further, a water flow produced suction is created adjacent to the vessel surface for collecting debris into a basket carried by the car. In addition, one or more hoses is pulled by the car and whipped by water flow to sweep dirt from the vessel surface.

Abstract:
Source: GB775856A 775,856. Grinding. GARRINGTONS, Ltd. July 20,1953 [April 18, 1952], No. 9817/52. Class 60 [Also in Group. XXII] Apparatus for surfacing an elongated work blank, such as a gas turbine blade, which is of irregular cross–section and provided with a groove, recess or shoulder disposed at an angle to its longitudinal axis comprises means for subjecting a matrix of form corresponding with the desired form of the finished work piece and a work blank to synchronized rotation or oscillation about spaced parallel axes, means for engaging a tracer with the matrix surface and for utilizing the relative movement between the tracer and the matrix ta control the relative position of a surfacing tool in operative engagement with the work blank so as to shape the surface of the same to a configuration identical with that of the matrix, means for advancing the work blank and tool relatively longitudinally of the blank so that the tool describes a helical path thereon, the means operative when the tool is at the inclined groove, recess or shoulder for changing the angle of the helix so that it corresponds with the inclination of such formations. As applied to the grinding of a blade 15, Fig. 1, which projects from the inclined face 21 of a shoulder platform 18, a tool in the form of an abrasive band 38, Figs. 4 and 5, and the tracer constituted by a roller 44 are supported in a hollow head 39 carried at the ends of parallel liriks 45, 46 so as to be disposed above the work blank 15 and matrix 30 which are mounted on a longitudinallymovable slide 25. Chucks 27, 28, Fig. 7, on the slide receive the root ends of the matrix and work blank, respectively, the opposite ends of which are supported in tailstocks 31. The drive of the chucks from an electric motor 37, Fig. 4, is through infinitely–variable gearing 36, chain drive 34, shaft 33 on the fixed frame and gearing 32 so arranged as to effect the drive while permitting movement of the slide 25. The gearing 36 is controlled by a pneumatic or hydraulic ram so as to maintain a constant linear relative velocity between the band 38 and surface of the blank which it engages, this effect being produced by a cam 77b, Fig. 7, which is shaped peripherally to correspond with the cross–section of the blade, rotates with the chuck 27, and actuates the control valve of the ram. The band 38, which is driven by a motor 42, passes over idler pulleys 40 and(at the point of engagement with the blank, a barrel–shaped roller 43. The tracer roller 44, which is also barrelshaped, is rotatable on an axis parallel with that of the roller 43 and carried by a vertically–adjustable slide 50. The inclination of the head 39 to the vertical is continuously varied during each revolution of the blank so that the band makes substantially point engagement with the blank and its operative surface is maintained tangential to the blade surface. For this purpose, the pivot 52, Fig. 4, of the upper pair of links 45 is formed as an eccentric rotatable by a pneumatic or hydraulic ram 56 as controlled by a valve 56a, Fig. 7, actuated by a cam 56b which rotates with the chuck 28 and is shaped peripherally to correspond with the variation around the cross–section of the blade of the inclination of the blade surface measured longitudinally of the blade and relatively to its axis. The control valve 56a is carried by an arm 56c pivotable about the axis of the chuck and engaging at its outer end a sine bar 56d which is mounted on the fixed frame for adjustment out of the horizontal whereby the action of the cam may be advanced or retarded 'in accordance with the degree of twist of the blank. The roller 43 is given one to–and–fro oscillation about a vertical axis during each rotation of the blank so as to provide a smooth surface finish and ensure that, when the band is dealing with that part of the blank adjacent the inclined face 21 of the platform 18, it lies parallel to such face when operating on both sides of the blank. For this purpose, the roller 43 is supported on a vertical spindle 58, Fig. 8, having a lateral arm 60 engaging an inclined cam slot in a plate 61 on a carrier 62 which is movable vertically by pneumatic or' hydraulic ram 64; the control valve of the ram is actuated by a cam rotating with the chucks 27, 28.

The slide 25 is advanced slowly to feed the blank and matrix past the band. and tracer during the finishing of the main portion of the blank (so that the tool and tracer describe helical paths on the blank and matrix) by an electric motor 68, Fig. 4, which drives a crank disc 67 carrying an adjustable crank−pin 69 connected to the slide by a rod 70 incorporating a doubleacting pneumatic or hydraulic ram 71; during this operation, the ram is ineffective and one of a pair of adjustable stops 73 on the rod 72 of the ram contacts an abutment 74 on the ram. When the band 38 reaches a position adjacent the inclinedplatform face, the slide is reciprocated to and fro for the distance a, Fig. 1, once for each revolution of the blank by the sole action of the ram (to provide the desired change in the angle of the aforesaid helical path); the control valve of the ram which acts through a servo−valve is controlled by a cam 71b, Fig. 7, rotating with the chuck 27. The ram is rendered operative for this purpose when a dog 88 moving with the slide acts through a stop 86 to slide coupled bars 82, 84 whereby an abutment 81 opens both a switch 79 to stop the motor 68 and a valve 78 to permit the supply of pressure fluid to the control valve of the ram. To achieve this effect, the slide bar 82, which is coupled by cranks or eccentrics 83 to the bar 84, had previously been set by a hand knob 90 to its extreme right−hand position so that the abutment 81 is correctly placed to operate as described above under the action of the dog 88. At the end of the operation, the hand knob 90 is turned to slide the bar 82 leftwards so as to actuate the valve 78 and switch 79 to stop the ram 71 and start the motor 68 in reverse for the return of the slide 25. When the slide reaches its extreme withdrawn position, the dog 88 acts through a stop 87 to slide the bars 82, 84 whereby an abutment 93 opens a switch 95 to stop all the motors; the actuating member of the switch also actuates the control valve 49a of a ram 49, Fig. 4, which by its connection to the lower pair of parallel links 46 lifts the head 39 clear of the blank and tracer. After the insertion of a new blank, the turning of the knob 90 slides the bar 82 to cause the abutment 93 to actuate the switch 95 to re−start the motors and lower the tool head The above arrangement may be modified by providing a separate abrasive band for operating upon each of a number of parallel blanks or one band passing around a series of pulleys for action upon all the blanks, and, if desired, the abrasive band may be replaced by a grinding wheel or milling cutter. Specifications 777,857, 777,858, and 777,859 are referred to. The Provisional Specification describes also the actuation of a trip arm on the slide 25 at the appropriate time in the machine cycle to bring a follower into engagement with the cam 71b which thereafter controls the ram 71 to reciprocate the slide in the neighbourhood of the shoulder platform.

Abstract:
Source: US2009320713A The Application discloses People and Cargo Transit Systems and Vehicles (PCTSV), using Narrow Vehicles (NV), which can have the form of a Bus, Train, Tram, Maglev, Mono−Rail or even Car or Truck. A preferred version of which is Single Seat Wide or below 70 cm wide, preferably a Bus type to need no Rail, using Dedicated Narrow Lanes adjacent to Curbside of existing intra−city streets or limits of inter−city roads. Said NV and Lane have Anti−Roll Over Means to stabilize such a narrow vehicle, which also eliminate NV Swaying even when NV is a Bus or Car with has no inherent Sway Limiting. Being Ultra Narrow with No Sway and Running at Curbside results in Negligible or No Blocking of other vehicles by NV.Said Lane/Tack, Anti−Sway and Anti−Roll Structures all Allow being Run Over by other Traffic and have structures not to be damaged, thus can be crossed over at Crossroads and other entrances and exits along said Lane. NV has enough Doors and is Narrow, hence each Passenger can reach a seat or exit, with No Isle inside it to walk along. So it can have Low Profile, like a Sports Car, some 120 cm tall. Hence it is easy to have Covered Trenches at cross roads for non−stop crossing. Trenches can run along most or all the Track, in which case adherence to streets and roads is relieved. Such Narrow and Shallow Trenches take a tiny fraction of time and costs of Skyways or Subways. Each Passenger thus can have her own door, own seat, in a small Cabin, which can be opened and closed to next Cabin, have reclining seats to join to that of next Cabin to sleep on, have laptop tray, etc. All those make PCTSV much more appealing to user's, even better than private transport. There are many Variations other than above. There is an NV Car for the last mile and or long distance use, which can integrate with NV Public Transit. Also modifications to NVs for use in Cargo and Parcel Transit.

Abstract:
Source: AU2002302091A What has been invented is a series of scientific applications of the wideface energy converter device, be it in the form of a wideface solar heat receiver or a wideface fluid impeder device. The wider is the solar heat receiver, the more solar power is available for conversion. The wider is the sail of the boat, the more wind is available to push the boat. Wherefore, the wideface solar trap made up of multi–layer transparent roofs covering a heat insulated box is used to heat up a radiator tubings that contain water. The multilayer transparent roof, having spaces in between sheets, prevents solar heat from backing out hence the trap becomes hotter and hotter because the inner sheet is not in contact with the cold wind. This solar trap is now used to heat up radiator pipes of compressed air coming from a gas turbine engine and then returned back to the exhaust turbine of same engine. Applying the principle of the wind sail, the turbine blades of the compressor and the turbine blades of the exhaust turbine are made wideface as much as possible to produce maximum impedance against the expanding exhaust hot air and to produce maximum push upon the fresh air being compressed. This wideface fluid impeder is now expanded into an underwater platform from One Acre or much more and attached to floating hotels, large/small boats, and floating sea walls, to prevent oscillation by the surfs. 36 9 Fig.1 104 Fig.l

Abstract:
Source: EP1149038A1 A media storage system for an automated banking machine (10) inlcudes a flipper member (90, 178) which is rotationally movable to engage sheets. A gripper member (138, 182) is movably mounted relative to the flipper member. The flipper member further includes an arcuately extending slot (92, 180). The sheet extending in the slot is held in fixed engagement with the flipper member by the gripper member. Rotation of the flipper member to a releasing position causes the sheet to be engaged with a stop surface (160, 188) as the gripper member moves to release the sheet. Sheets released by the flipper member are positioned in a stack (94, 184). The flexible flap (160) engages each sheet after it has been released by the flipper member to conform the sheet to the stack. In alternative embodiments a flipper member (178) includes a picker portion (202). Picker portion is selectively operated to remove sheets from the stack.

Abstract:
The invention concerns a set of devices of a dwelling module for meeting emergency and extreme emergency requirements for coping with submarine quakes, standard earthquakes, floods and a plurality of natural disasters. Said set consists of several subassemblies, namely a dwelling module and other elements such as a foot, a heel, a leg, an emergency anti–seismic air lock, an extensible telescopic air lock, a protective shield, a horizontal wind turbine and the like.

Abstract:
Source: US2008274928A The present invention relates to compositions and methods employing a water soluble magnesium compound. In certain embodiments, the composition includes water and water soluble magnesium compound, but lacks other materials commonly used in cleaning compositions. The methods and compositions can provide magnesium ion at predefined ratios to calcium ion in water, such as magnesium ion in a molar amount equal to or in excess over a molar amount of calcium ion. A water soluble magnesium salt including an anion of a water soluble calcium salt is more effective than a magnesium salt with an anion of a water insoluble calcium salt. These compositions can be used for reducing lime scale or precipitate formation from hard water, removing soap scum, or the like.

Abstract:
Source: US2002082072A A ball selector and display device comprising a plurality of prize balls, a ball holder adapted to hold the balls in an individually controlled manner, a controller adapted to select a prize ball, a display mechanism adapted to display the selected prize ball to the player; and a positioning mechanism in communication with the controller adapted to position the selected prize ball relative to the display mechanism. The ball selector and display device may be combined with a jumbled ball display wherein the balls displayed by the ball selector and display device appear to originate from the jumbled ball display. The ball selector and display device may also be combined with a game apparatus that is adapted to allow players to play a game. In this embodiment, the ball selector and display device may provide a bonus award for the player. Several games are also provided that may be used with the ball selector and display device.

Abstract:
Source: GB688383A 688,383. Typewriters and c. BRITISH TABULATING MACHINE CO., Ltd. Jan. 30, 1950 [Jan. 31, 1949; Jan. 31, 1949; Jan. 31, 1949; Jan. 31, 1949], No. 2371/50. Class 100(iv) [Also in Group XIX] A record–card–controlled machine for census and like statistical purposes (see Group XIX) includes mechanism for printing on a record sheet, Fig. 42, amounts read out from unit counters and a foursection accumulator and a " group number " held in an electronic storage unit. The functions of the machine are controlled by a plugboard, Figs. 49A –R (not shown). Type–bar machines; hammer impression arrangements.–A record sheet is divided into half–sheets Fig. 42, which are printed simultaneously, two columns at a time by four printing banks each comprising four type bars 161, Figs. 13 and 20, carried by a fixed plate 160. The half–sheets are carried on typewriter–like carriages comprising platens 155 and the banks are so spaced that, e.g. columns 1, 16, Fig. 42, and like columns 31 and 46, are printed together. Each set of bars 161 is slidably mounted in a vertically slidable frame 169 and supported by spring–urged arms 172. The frames 169 are raised during each printing cycle by

cams 182 on shafts 183, Figs. 3 and 20, and carry the bars 161 with them until the latter are stopped by spring−urged pawls 175 released from the armature of magnets PM, Fig. 13, energized at times depending on the digits to be printed. The subsequent relative movement of a bar 161 and frame rocks an interposer 300 which closes checking contacts CKC through a T−member 301 for entry of the value printed into the accumulator. The bars 161 have−pawls 167 which cause automatic printing of zeros to the right of a significant figure. Printing hammers 189 are guided in comb slots in an operating frame 192 secured to a shaft 190, Figs. 3 and 13, which is rocked under control of a cam (not shown) fixed to a gear 196a. An inking ribbon 197 is provided for each carriage and feeding and reversing mechanism therefor.including spools 198. After printing, the pawls 175 are returned to latching position by a bail 178 secured to a shaft 179 which is rocked by a pin on a gear 186, Fig. 3. The gears 196a, 186 are driven by gears 188 on shafts 183 which are driven from a main print shaft 220, Fig. 20, when clutched to a co−axial shaft 216 connected to the motor shaft 120 and rotating at a slower speed than the card feed shaft 117. The shaft 216 carries a notched collar 222, Fig. 23, which co−acts with a dog 223 pivoted on an arm 219 fixed to the shaft 220. When the clutch magnet PCM is energized its armature releases the dog and the clutch is engaged for one or more revolutions. Letter−spacing, carriage−return, and line−spacing mechanism.−Each carriage is fed step by step by spring motor 350 and tape 351, Fig. 20, under control of spring−urged escapement pawls 353, Fig. 17, and a rack 352. The pawls have slots engaging a pivot 354, and the one engaging the rack is pulled leftward, Fig. 17, by the motor 350 so that its tail is in the path of an operating member 356. When the escapement solenoid (not shown) is energized it pulls down this member through linkwork 361, 358 and the rack is stepped one half tooth space into engagement with the other pawl, the functions of the pawls then being reversed. The carriages are coupled by a tie rod 362, Fig. 20, to ensure movement in unison. Each carriage is returned by a tape 409 wound on a pulley 408 normally loosely mounted on a shaft 406, Fig. 18, driven by worm gearing from the high speed shaft 117, Fig. 3. When the solenoid CRS, Fig. 13, is energized a lever 424 is rocked and a cam 422 is rotated by a spring−operated arm. 423 so that its serrated tread engages the resilient surface of a roller 407 on the shaft 406. The cam is then rocked with its supporting lever 420, thus pulling down a lever 416, Fig. 18, connected by a toggle link 415 to a twopart lever 412. The lever 412 actuates a disc friction clutch 411 to couple the pulley 408 to shaft 406, and the clutch engagement is maintained by the toggle action. The clutch is released when the carriage has been returned by a lug on the appropriate marginal stop (not shown) which rocks a trip lever 454, Fig. 20, connected by a link 455, lever 456 and link 458, Fig. 13, to a toggle−restoring lever 459. The marginal stops are adjustably mounted on a rack 450 and those for the carriage shown in Fig. 20 carry cam plates 461 which operate switches MS1, MS2 having roller−carrying operating levers 462. The switch MS1 is used for indicating that the carriage is in the returned position. The operation of switch MS2 initiates carriage return and other operations (see Group XIX). A third switch MS3 is operated when the carriage is in the first three positions for printing the amounts on the accumulator and the group number in the " Amount " and " Sort " columns respectively of the record sheet, Fig. 42. When a carriage is returned, the tape 409 operates the line−spacing. mechanism, Fig. 19, by rocking a bell−crank 479 which pulls down a spring−returned slide 477 so that a pawl 476 steps on the line−spacing ratchet 475. The pawl is normally held away from the ratchet by an arm 481 which can be set in three different positions for different line−spacing movements by a control lever 484 engaging one of three notches therein. The carriage shown in Fig. 20 carries contact brushes 506− which pass over contact strips to control the sequence of printing operations.

Abstract:
Source: US6240660B An attachment for use with snow handling equipment such as a snowplow blade or a wheel loader bucket or similar implement, the attachment comprising a plate pivotally mounted at each end of the implement and movable between a forwardly projecting horizontal deployed position and a retracted position wherein the plate extends upwardly and does not interfere with normal operation of the implement. In the deployed position the plate is freely pivotal upwards and has a rounded front lower corner so that it can readily ride over curb stones and similar obstacles without damaging the mechanism. The attachments have the effect of greatly increasing the snow handling capacity of the implement without significantly detracting from its normal utilization.

Abstract:
Source: US2003231485A A tubular Electro−Luminescent panel(s) light device offer a desired bending directions with super brightness basing on certain width of panel incorporated proper invertor system. The said panel(s) with much narrow width than tube means to allow the panel(s) can be bend at any direction and angle within the tube means to offer a desired light effects. The said panel(s) can be flat or twisted within the tube means which may have the desired colored, transparency, wall thickness, diameter, shape, length for requirement. The said device may incorporated with non−elastic means, magnetic means, tube holder, sensor means, Integrated circuit to add a lot of desired variety features.

Abstract:
Source: US2668595A (Claim 1) 1. An aircraft of the rotary blade type includ– ing in combination, a fuselage, a power driven substantially vertical shaft connected with the fuselage, a plurality of similar radially extending aerofoil blades equally spaced eircumferentially and having their root portions connected with the shaft for rotation therewith and so held as to prevent rotative movements of the said root portions about axes extending longitudinally of the blades, each blade being capable of substantial twisting about its longitudinal mean axis and with respect to,its nonrotatable root portion and having torsional resiliency causing it to be restored to its normal nosition after such tw;.sting, a plurality of similar pairs of aerofoil flaps carried respectiyely by the outer portions of the blades with one lap of each pair adjacent the leading edge of its blade and with the other flap of each pair adjacent the trailing edge ol the so,me blade, all of the said pairs of fiaps being subg'cantially equally spaced from the shaf4u and being angularly movable relatively to their respective blades about axes substantially parallel with the mean axes of the blades and the flaps of each pair being connected with each other for –movement in opposite directions about their re– ,as only the relatively small flap,$ are mqvpd, the spective axes so that the flaps of the said pairs norn–rally,serv,e 'by –_reason _of _aeradynamic fo'rees udting thereon during _rot2_tion to'twist 'the respective',blades –progr–essiv6ly –from _the _said _ro6t portions _toward the –said flaps and to :thereby change the effective blad6 pitches to varying stibst,antial ;exte–rits dependent on varying relative –angular _po_itions bf 'the flaps, _reldtiv6ly –mov–dbie _flap –r_ieVin–,; conne6tions extendinq from:the llaps:of the saidpalrs–to the:fuselage,–and–a,,pilot controlled flap–Olctua;ting_r_,iechailism ontm_fuselage fo–r–.no–ving–the said connections _ during.'rotationiof _the:blades arid.– taps so_as to:angulary ma,ve–the flaps,.of the several,pairs relatively,to fthe ibl–ades, the said flap _actuating –,–mech__nism ,enabling the–., pilot.to_.control the movement of the dircre_ft by,.reason of _varying fie_p induced twisting ljaf –the iblades and the resultant varying _ef feGti,ve:pitches_thereof.

Abstract:
Source: US2001024671A The invention is an apparatus for producing pizza by a mechanical, automated system without using baking tins for the dough bases and without using pre−prepared or pre−shaped bases. Dough bases are individually prepared from fresh pre−proportioned dough ingredients by a kneading and extrusion device. The dough base is then passed through a series of processing stations, such as a shaping press, a metering and distribution device for tomato purees or sauces, at least one metering and distribution station for garnishing (topping) ingredients and a baking station. The dough bases pass through the series of stations on a preheated or continuously heated transportation sheet. No pre−produced or pre−cooked, semi−finished products are used in the method. Each dough base is prepared and provided with toppings according to individual orders selected from a list.

Abstract:
Source: US4905808A A torque transmission device is provided wherein a rotary housing is connected to one of front and rear drive shafts which respectively drive front and rear axles of a four−wheel drive vehicle, while a rotary shaft coaxially carried by the rotary housing is connected to the other of the front and rear drive shafts. The housing receives therein a multiple disc clutch device for transmitting rotational power between the housing and the shaft through friction engagement between alternately arranged outer and inner clutch discs which are respectively rotatable bodily with the housing and the shaft. The housing also receives an axially movable piston to press the clutch discs for friction engagement. An end wall of the housing or an end cap secured thereto and a facing end surface of the piston define an axially narrow circuit chamber, within which a rotary with several radially extending blade portions is received to be rotated by the shaft. Several space sections into which the chamber is divided by the rotor blade portions are filled with silicon oil of a high viscosity. When the rotational speed difference occurs between the rotor and the housing, a pressure is generated within each of the space sections thanks to the high viscosity of the silicon oil and is directly applied to the piston, whereby rotational power is transmitted from the housing to the rotary shaft and vice versa.

Abstract:
Source: GB906113A 906,113. Photographic type–composing apparatus. AMERICAN TYPE FOUNDERS CO. Inc. Sept. 12, 1958, No. 8007/58. Class 98(1). Photographic type–composing apparatus comprises in combination a supporting frame; a rotatable character disc upon which is carried at least one set of master characters arranged arcuately on said disc and concentrically thereof from which selections are made for effecting composition; means for reproducing successive individual characters from said disc at a given point in the apparatus; and means for presenting selected characters on said disc at said point, the last–mentioned means comprising driving means for continually urging the disc to rotate about its axis in one direction only, means acting on said disc to arrest it at the next ensuing positioning of a given character at said point of reproduction, said means comprising at least one stop abutment on the disc displaced radially from its axis and one of a plurality of stop elements selectively inserted into the path of said abutment; and a carriage for intermittent movement of a sensitized sheet past the point of reproduction to space the recorded characters. The Specification defines photography as meaning any process in which an electromagnetic wave produces in a suitably prepared medium a visible image or a latent image which may be made manifest by suitably treating the medium, while the term sensitized sheet is stated to mean any sheet or tape as of film or paper adapted to receive such an image and record it. The invention is applied to a photographic type–setter unit B which is a modification for photographic recording of the proportional spacing automatic typewriter justified copy reproducer of Specification 763,463, wherein a punched tape prepared in an electric typewriter which also produces a trial copy is used to operate the reproducer by automatic operation of the keyboard mechanism, the tape bearing justification information as well as character and interword identifications. Essentially the modification consists in replacing the paper support roller on the reproducer by a photographic film carriage F and replacing the type basket and bars and ribbon by a rotatable master character disc D arrested with the required character in position at a fixed location relative to the keyboard 10B for optical projection on to the film under control of the appropriate keyboard lever mechanism and providing a lamp and a shutter S to effect a controlled exposure once a circuit is completed through the disc and the arresting

mechanism, whereafter the reproducer typewriter carriage escapement is operated under the control of magnets such as LE1 (Fig. 4) to effect along–the–line spacing, cams I, II, III on the shutter shaft being provided to time correctly the cycle of exposure and escapement operation. As described in Specification 763,463, but not shown in the present Specification, the justifying interword spaces are introduced when the space bar is operated, closing a contact WSC and setting the appropriate escapement magnets by circuits through relays JR1 to JR5 which store the justification information for the line. The punched tape is fed into a print reader 16 comprising a justification reader portion 16J and a print reader portion 16P arranged so that the justification instructions for the line are read and stored in the relays JR1 to JR5 before the character and width information is read to operate a code selector 13 for printing. Preferably, the trial copy recorder includes both a tape punching and a tape reading head, which latter effects keyboard operation and simultaneously punching of a second tape whereby a corrected tape may be produced from an original tape by stopping this tape when an error is reached, manually keyboarding the correct matter, and advancing the original tape by hand until the erroneous matter has been passed and then recommencing automatic tape operation. Matter may be produced in different point sizes by the use of alphabets in different sizes on the same or different master character discs or by variable optical magnification by adjustment of the projection lens 220, the appropriate character spacing being derived by exchangeable gearing between the escapement driven typewriter stub carriage 425 and the film carriage F. Alternatively, the appropriate film feed for different point sizes may be obtained by arranging that during the character code print reading cycle the escapement mechanism is actuated more than once. In this way the film carriage could be arranged to have a 4–point unit movement and 8–, 12–, or 16–point movements could be provided by double, triple or quadruple escapement operation. Style as well as case changes may be obtained without change of character disc by including a secondary font on the disc, images of which are projected on to the film when a font or " mixer " shift code punched on the tape in the trial copy recorder on operation of the ribbon or " colour " shift key is read, the selection of the font as well as selection of upper or lower case characters on the disc being effected by adjustable prisms housed at E in the light path. Provision is made for lighting a signal lamp 770 when the secondary font is in use. If the secondary font is of a point size which is a multiple or submultiple of that of the primary font, the required escapement movement may be provided by multiple escapement operation brought into operation by the mixer shift code. If the character disc bears fonts with point sizes in non–integral multiple relation, e.g. 8– and 12– point, multiple escapement operation may be used for both fonts with an escapement unit which is the H.C.F. of the sizes, e.g. by using a 4–point escapement unit with double and triple escapement respectively. Master character disc.–Each disc D comprises a transparent plastic plate covering with an opaque masking material to provide transparent characters on a dark ground arranged in three identical sectors each bearing the same four alphabets disposed in concentric arcs which consist of radial rows of upper and lower case symbols operated by the same key arranged in a primary font, e.g. Roman, and also in a secondary font, e.g. of a different style such as bold type. More than two fonts of symbols may be provided if appropriate shift codes and mechanisms are provided. Each disc is centrally apertured so as to be exchangeably mounted on a hub 140 on a hollow driven shaft 128 between the hub and a clamping member 145 engaged by the key end 150 of a rod 130 within the shaft and urged inwardly by a spring 137 engaging a collar 132 slidable on the shaft and pinned to the rod 130, the pin 131 being located in a key–way 133 in the shaft. Driving buttons 115 on the disc are thus urged by the clamping member 145 into driven engagement with a peripheral depression 142 on the hub, thus continually urging the disc to rotate clockwise, the member 145 acting as a slipping friction clutch plate. A conducting ring 320 on the disc engaged by a brush 330 is extended at 321 to carry pins 325 which engage the disc arresting means–the key–operated H –shaped blades 390– to complete a circuit controlling the exposure movement of the shutter S. Optical system.–Light from a universallymounted lamp 225 (Fig. 21) passing through a condenser 230 adjustable to form an image of the lamp filament on the projection lens 220 illuminates that portion of the disc D lying in the projection gate formed by the vertical slot in the mask M and the character images projected via prisms 270, 271 in the housing E by the lens 220 are masked by the exposure gate 212 so that only one character is formed on the film in the magazine extending across the exposure gate from supply cassette 516 to takeup cassette 525. Character selection.–Instead of type bars being connected to the keyboard mechanism, each link 34 is connected by a rod 35a to a T– shaped lever 350 pivoted on a bowed wire 352 secured in the body frame 50a and slidable in a slot 376 in the upper part of a comb–like member 372. For each T–lever there is a corresponding H–shaped blade 390 located in a slot 382 in an inverted comb–like plate 370, a curved strip 380 fastened over the tips of the comb retaining the H–blades against the action of compression springs 400. As a key lever is depressed the corresponding T–lever is pivoted anticlockwise about the wire 352 and raises the H–blade so that the nose 397 slides past the catch ledge 417 on the resiliently mounted latch plate 415 and engages the inclined surface 418 of the plate which is thereby displaced rearwardly sufficiently for the ledge 417 to be withdrawn from a blade previously in the latched position so that this falls to the position shown, and as the T–lever arm 355 falls back the nose 397 slides down the surface 418 and latches on the ledge 417. In this position an extension 393 on the front limb of the H–blade is positioned in the path of a pin 325 on the master character disc to arrest this, as it rotates clockwise, with thee appropriate radial character row in the projection gate defined by the vertical slot 240 in the mask M. The chosen face of the character row is projected on to the film through the exposure gate 212 of a height of one line only by the positioning of the two right–angled prisms 270, 271 rotatable about axes parallel to their vertices by levers 282, 305 having limbs movable between stops and controlled by rotary solenoids 290, 308 energized by change font or " mixer " shift and case shift tape signals respectively, the prism system performing the functions provided in a typewriter by raising the type basket. Film magazine and film feeding.–The supply cassette 516 comprises end caps screwed on to the threaded ends of a rod 540 on which the film is wound and making light–tight joints with the ends of the cylindrical cover of the cassette formed with velvet–lined lips from which the film pa

Abstract:
Device incorporated permanently into a motor vehicle for automatic mounting of non–slip accessories, which comprises a module arranged under the bodywork of the motor vehicle, which contains the elements for equipping the drive wheels of said motor vehicle when the latter is to travel on snow–covered or icy roads. The device is formed by a module (1) driven by electromechanical means, in the form of a workable box that contains a band (2) rolled up on a rotary shaft or drum, the end of which incorporates a "U"–shaped pull (3) with hooks at the ends. In addition, there are two horizontal–shaft rollers (4) with freedom to rotate, and a transversely moving blade (5) driven by an electric motor that drives a shaft (6). Supplementarily, on the drive–wheel rims (8) there are studs (9).

Abstract:
Source: GB776361A 776,361. Cutting machines. BRITISH UNITED SHOE MACHINERY CO., Ltd. (United Shoe Machinery Corporation). June 23, 1955 [June 25, 1954], No. 18625/54. Class 31 (1). [Also in Groups XVI and XXIV] A machine for marking shoe soles has a pressure head carried by a parallel linkage and arranged to carry a marking tool and movable downwards to press the sole towards a second tool for marking the lower side of the sole, the machine including a toggle for actuating the pressure head, and means for adjusting the lowest position to which the head is moved when actuated by the toggle means. As shown, a worktable 30, Figs. 5 and 7, has gauge rolls 36 and 38 for positioning an insole S, Fig. 10, laterally of the worktable for a marking and/or impressing operation. A movable head 50, Figs. 1, 5 and 12, carries presser members 52, 54 and 56 which press the insole S into engagement with dies 42, 44 and 46 respectively. A toothed indenting tool 58 carried by the head 50 co–operates with a die 48 to form indentations in the insole S to mark the breast–line, while presser members 60 and 62 co–operate with the dies 44 and 46 when positioned rearwardly of the table 30. Knives 64 and 66 are also carried by the head 50 for making incising cuts in the surface of the insole S. The head 50 has arms 68 and 70, Figs. 1 and 5, pivotally connected by a pin 72 to an arm 74 supported by a pin 76. The lower end of the arm 68 is pivotally connected by a pin 82 to an arm 84 pivotally supported by a pin 86, while the arm 70 is connected by a pin 88, coaxial with the pin 82, to an arm 90. Thus, the head 50 is held vertical during movement, since the axes of the pins 72, 76, 86 and 82 define a parallelogram. An eccentric 92 on a driving shaft 94 is coupled, by a connecting rod 96, to a toggle pin 98 which connects a link 102 and an arm 106 and a link 104 and an arm 108 respectively, the arms 106 and 108 being formed on a yoke 100 mounted on a pin 110 secured in arms 84, 90. The links 102 and 104 are pivotally mounted on a pin 112 having a notched central portion 114 to clear the arm 74. The ends of the pin 112 are secured in arms 118, 120 mounted on trunnions 122, 124, coaxial with the pin 98 when the rod 96 is in its most rearward position, i.e. with the head 50 raised. The stroke of the head 50 is adjustable by angular adjustment of arms 118, 120 about the trunnions 122, 124 by a bracket 126 pivotally connected to a sleeve 134 engaged by an adjustable screw 136 rotatable by a hand wheel 142 to move axially through a nut 138 to vary the height of the pin 112 in accordance with the thickness of the workpiece to be impressed and/or marked, the setting being indicated by a pointer 152 co–operating with scale markings on a plate 150. The presser member 52, Fig. 12, is secured by a screw 154 to a bracket 156 secured to the head 50, the member 52 being adjustable vertically by means of a slot 160 and adjusting screw 162. The presser members 54, 56, 60 and 62 are threaded into the head 50, and retained by locking plates, not shown. The indenting tool 58 is clamped to a rod 176 adjustable vertically in the head 50. The knives 64 and 66 are similarly mounted on the head 50. The knife 66 is clamped to a block 188 by a screw 190 extending through a horizontal slot 192 to permit transverse adjustment. A leaf–spring 196 is disposed behind the knife 66 and acts as a stripper to force a workpiece off the knife after a cutting operation. The block 188 is adjustably clamped by a screw 198 to a block 202 to permit forward and rearward adjustment by screws 206, 208, the block 202 being secured to the head 50 by a tongue and groove engagement which permits vertical adjustment of the block 202. The knife 66, Fig. 30, is secured on the block 188, slidably adjustable on the block 202, while the knife 64, Fig. 31 (not shown), is mounted on a block 1188 slidable on a block 1202 vertically adjustable on the head 50. The knives 66 and 64 are moved forwardly and rearwardly by a pivoted lever 772, Fig. 30, connected to a link 776 pivotally connected to the block 188. A similar link 784, Fig. 31 (not shown), pivotally connects the lever 772 and block 1188. When the lever 772, Fig. 30, is rocked, by manually sliding a rod 792, the knife 66 is moved in the opposite direction to the knife 64. The pivot of lever 772 is secured in a lateral extension 804 of an L–shaped slide 806. A U–shaped slide,

comprising parts 818 and 820, and a part 816, Fig. 31 (not shown), is secured on the head 50, Fig. 30. Screws 834 and 832, Fig. 31 (not shown), threaded through the part 820, engage the rearward ends of links 784 and 786, Fig. 30, to determine the rearward positions of the knives. The die 42, Fig. 5, is mounted upon an electrically−heated block 216 supported on springs 222 to permit yielding and tilting under the pressure of the presser member 52. Each die 44 has a stem which fits into one of a plurality of holes formed in a slide 224 movable transversely of the machine to bring a selected die into an operating position beneath the appropriate presser member 54 or 60. The slide 224 can replace a blank slide 246 when it is required to position the dies 44 beneath the member 60. Size marking dies are carried by a wheel 228 secured to a shaft 234 rotatable to bring a required die into operative position by a hand wheel 236. The hand wheel is integral with a dial 238 carrying numbers corresponding to the size marking dies which register with a stationary pin 245, the hand wheel normally being held locked by a coil spring 242. The die 48 is fixedly mounted in a recess in the table 30. Positioning workpieces.−A heel end gauge 40, Figs. 7 and 10, is secured to a member 250 forming part of an H−shaped slide 252 also having members 254 and 256. The slide 252 is slidable along a lower slide 260. A block 274 has a pin 276, Fig. 5, carrying a rotatable block 278 engaging a worm 280 on the shaft 234, rotation of the shaft 234 by the hand wheel 236 causing sliding of the block 274. To permit adjustment of the heel end gauge 40 independently of the hand wheel 236, a key 288, Fig. 7, engages a slot 290 in the member 254 and is clamped at required positions along the slot by a screw 302, a pointer 298 on the slide 252 co−operating with a scale 300 to indicate such positions. Alternatively, a rack 600 and pinion 602, Fig. 17 (not shown), is provided for adjusting the slide 252, Fig. 7. Edgegauges 36 and 38 are mounted on arms 306 and 308 pivoted on pins 310 and 312 secured to the table 30, Fig. 10. The arms 306 and 308, urged together by a spring 324, have extensions 314 and 316, the extension 314 having a slot 322. A block 318 mounted on a pin 320 secured upon the extension 316 engages the slot 322 to co−ordinate movements of the arms 306 and 308. When use of the gauge roll 38 is not required its supporting bracket 340 is turned through 90 degrees about a screw 344; similarly the roll 36 may be turned to inoperative position. A latch 364 normally retains the roll 38 in operative position. Driving arrangements.−A driven pulley 372, Fig. 1, drives the shaft 94 through a clutch, not shown, controlled by mechanism 374, Fig. 21, tripped by a treadle on a rod 376 or, automatically by insertion of an insole in a gauging mechanism, not shown. A pin 472, parallel to the axis of the shaft 94, is rotatably mounted in a disc 474 keyed to the shaft 94. The pin 472 has a half−round extension which can enter any one of a plurality of half−round recesses in an inner cylindrical wall of a ring, not shown, carried by the pulley 372, Fig. 1, to couple the shaft 94 to the pulley. A spring− pressed plunger 478, Fig. 21, in the disc 474 engages a head 480 on the pin to rotate the pin 472 into engaging position, while a lever 482 normally holds the pin in disengaged position. A pawl 484 holds the disc against retrograde rotation. The lever 482 is pivoted on a pin 486 and urged into stopping position by spring 488. The clutch is engaged by withdrawing the lever 482 from the pin 472 by rocking a lever 498 carrying a latch 492 engaging the lever 482 and connected to a rod 502 pivotally connected to an armature 504 of a solenoid 506. The solenoid 506 is energized by an electric circuit closed by engagement of the heel end of an insole S, Fig. 20, with a finger 448 positioned in a notch 444 of a heel gauge 440. An arm 450 pivoted on a stud 452 on a bracket 454 is held in engagement with the finger 448 by a spring 462. A lug 460 on the arm 450 engages a button 466 of an electric switch in a casing 468. After engagement of the clutch, an arcuate cam 510, Fig. 21, on the disc 474 depresses the latch 492 to release the lever 482, thus disengaging the clutch by rotating the pin 472. A guard 380, Fig. 3, not shown, protects the operator's fingers and facilitates the introduction of workpieces, while a sector 390, Fig. 21, engages a latch 392 forming part of the clutch mechanism 374 to prevent operation while the guard is raised. Adjustment for varying thickness of work. pieces.−A crank−arm 700, Figs. 22 and 24, is secured on a trunnion 122^{1} also carrying a yoke 116. A tension spring 702 is secured to the arm 700 and to an extension 704 of a pin 821. As the head 50 descends the spring 702 turns the arm 700 to swing the yoke 116 forward and downward about the trunnions 122^{1} and 124. A spacing link 706 is pivoted to the arm 700 and has a slot 710 engaging the pin 821 which controls the position of the yoke 116 in relation to the head 50 during its downward movement. Thus, the head descends idly until the presser members engage the workpiece which upon continued downward movement of the head causes the pin 112 to rise. This raising movement is opposed by a locking mechanism which permits only forward and downward swinging movement of the togglesupporting yoke 116 which holds the pin 112 against upward movement when the presser members engage the workpiece. As the connecting rod 96 comple

Abstract:
Source: GB352085A [Class 100 (iv).] Web feeding and guiding arrangements; papersupports; line–spacing mechanism.–In a webmanifolding arrangement of the kind comprising, as described in Specification 276,995, [Class 100 (iv), Typewriters and c.], a platen and a frame over which the webs are fed for line–spacing by means separate from the platen, the frame and platen are relatively movable to ease the webs and thereby facilitate line–spacing. In an alternative arrangement, the frame is omitted, the platen being movable to ease the webs, and line–spacing being effected by rollers arranged above the platen. In the apparatus shown in Figs. 1, 2 and 9 the webs H pass over an apron G, a roller L, a bar platen J, and a guide 100 on the carriage B, and the leading ends are clamped to a truck 45 which is movable on channelled standards 6 secured to the carriage. Carbon strips M pass between the webs at the printing line and are, in the manner described in the abovementioned Specification, fed when line–spacing is effected. The platen is carried by arms 12 suspended from links 14, 16, the links 16 being secured to a shaft 17 provided with cams 41 which engage pins 44 on the arms and normally hold the platen in forward position, in which position the parts of the webs between the guide 100 and the front of the apron G are bowed. To facilitate line–spacing and carbon–strip feed, the platen is moved rearwardly to ease the webs. For this purpose, the shaft 17 is rocked by means of a hand–lever 27, the cams 41 being thereby depressed and permitting springs 19 to retract the arms 12. The hand–lever is mounted on the carriage and is connected to a cam 28 engaging a lever 32 which is connected by a link 35 to an arm 38 on the shaft 17. The guide 100 forms part of a bail 101 carried by a rock shaft 19a. connected to springs which are arranged to hold the bail in either normal or raised position. The truck 45 has endplates 50, 51 carrying a sliding clamp–bar 52 which is pressed rearwards by means of spring–urged levers 57 and. holds the webs in contact with a flange 49 on the truck. The clampbar is released by means of a finger–lever 65 secured to a rock shaft 60 which is mounted in the endplates and has flats co–operating with straps 63 on the clamp–bar. The endplates carry rollers 70, 71 running on the front of the standards, and pinions 87 engaging racks 88 in the standards. Pawls 77, 78, Fig. 9, mounted on a lug 69 on the endplate 51 co–operate with racks 73, 75, the rack 73 being formed on the left–hand standard and the rack 75 being mounted therein for vertical movement. The rack 75 is connected to a bell crank 94 which is connected to a lever 91 arranged in the path of a roller 90 on the cam 28. On rocking the hand–lever 27, the platen is retracted. in the above–described manner to ease the webs, and the rack 75 then co–operates with the pawl 78 to raise the truck and thereby line–space the webs. To permit of depression of the truck, the pawls are

releasable by means of a thumb−lever 83 having a finger 84 for engaging the pawls. The standards have stoppins 109 in the path of adjustable plates 105 on the truck. The clamp−bar and truck have recesses 110, 47 for permitting the operator to grip and retain the webs when the truck is depressed. The recess 110 may be of the same width as the recess 47. When the pawls are released, the truck can be gradually raised or depressed by turning a shaft 85 mounted on the truck and having pinions 86 engaging the pinions 87. In the apparatus shown in Fig. 15, the truck is replaced by a feed−roller 118 mounted in the carriage B, and a pressure−roller 120 carried by a bail 119 on the carriage, a ratchetwheel on the feed−roller co−operating with a pawl on a rocking arm operated by the hand−lever 27. Springs hold the bail in either normal or raised position. On operation of the hand−lever, the platen J is retracted, and line−spacing is effected. The platen forms the subject−matter of Specification 352,087 and comprises a reversible casing 21, Fig. 1, and a soft filling 22 having curved impression −surfaces.
Web−cutting arrangements.−When the truck 45, Figs. 1, 2, and 9 is in depressed position, the typed parts of the webs H are severed by means of knifeedges 59 on the clamp−bar 52, and a knife−edge 112 on a slide 111 which is mounted on the clamp−bar and is pushed inwards to align the knife−edges. The slide is returned by a spring 117. The slide can be omitted. In the apparatus shown in Fig. 15, a knife 124 is carried by arms 123 which are pivoted on the bail 119 and have lugs 127 resting on the bail, and a finger−piece 128 for lifting the bail.

Abstract:
Source: US5033213A An item of wearing apparel, such as a ski shoe or boot, provided with an energy source and an energy consuming device, such as a heater, and a mechanism for automatically terminating the energy supply as soon as the wearer removes the item of apparel. More specifically, the ski shoe or boot includes a shell base on which is journalled at least one movable upper element, such as a rear spoiler or a front cuff, to permit insertion and removal of the boot, wherein the boot includes a device controlling the energy supply of the consuming device. The boot further includes a linkage device between the movable upper element and the device controlling the energy supply so as to allow the energy supply of the consuming device only when the movable element of the boot is closed and to automatically cause the fuel supply to be shut off as soon as the movable element of the boot is moved toward the open position.

Abstract:
Source: DE3103961A1 The invention has the purpose of constructing a vehicle which, in addition to its economical production and without additional equipment, is capable of travelling on almost impassable and also wet terrain and on areas of sand. The invention can be used for research purposes and also for emergency and police operations etc. With some simplifications it is possible to use it as a passenger car for normal road traffic. The two–wheeled car comprises two large wheels which are attached laterally to a cabin. The insertion and the displaceability of the driving weight underneath the wheel axle make it possible for the car, in this case, to operate or move forward; the car maintains its horizontal position constantly during driving, when braking or even when stationary. The blades installed within the wheel spokes, in conjunction with special tyre parts, likewise make it possible for the car to move over snow–covered terrain, water and areas of sand.

Abstract:
A safety motor vehicle with a front vehicle part (260) mounted so as to pivot off about a horizontal transverse axis (263) on a rear part of the vehicle (261) and which in the event of a sharp braking process converts the kinetic energy of the vehicle into a raising of the centre of gravity of the vehicle and thus causes the front axial load on the carriageway to be increased.

Abstract:
Source: FR1379425A [Source: Claim 1] **ATTENTION** debut du champ CLMS peut contenir fin de DESC **. 172 soi1t solidaires aux moyens de supports 229 aux deux poutres 201 du pont roulant 200. Le second transporteur 172 comporte le tambour moteur 222, entraine par un dispositif moteur tel que moteur electrique, le tambour de renvoi 224 comportant le dispositif de tension 225 compose des vis, des coussinets et des glissieres et d'une pluralite de rouleaux 226, ces rouleaux soutenant aussi bien le brin porteur 227 que le brin retour 228. Le second transporteur 172 deverse les produits repris dans une goulotte 287 qui en etant solidaire aux poutres a treillis 21 par des supports 230 se deplace en meme temps que le pont roulant. La partie inferieure 231 de cette goulotte d'alimentation 229 se trouve au–dessus de la courroie 232 d'un troisieme transporteur 233 identique a tout point de vue au premier transporteur 1 et les produits deverses sur cette courroie 232 sont amenes par le troisieme transporteur 233 a l'atelier d'utilisation des produits. Ces differents appareils presentent de nombreux avantages et notamment L'ensemble des elements, servant a apporter les differents produits, est allege au maximum ce qui permet d'eviter les depenses supplementaires et onereuses pour la realisation de fondations importantes sur lesquelles sont scelles les rails servant de chemin de roulement. En outre l'ensemble des elements de reprise 101 et 117 est plus facilement malleable, d'ou une eco– nomie certaine de la force motrice et cette economie permet une reduction des prix de revient des produits finis. Le palpeur 92 dispose a la tete 58 de la fleche 54 du tripper 45 permet de doser tres exactement l'epaisseur de chaque couche des differents produits stockes meme si l'epaisseur de cette couche est tres minime. Le transporteur a raclettes 101 par le deplacement des couteaux racleurs 102 assure d'une part le glissement vers le has des produits stockes et d'autre part le melange des differents produits. L'utilisation de la couronne a billes 179 placee entre la partie superieure 145 et la partie inferieure 180 du chariot, mobile transversalement, permet de pivoter l'ensemble des elements de reprise compose par le transporteur a raclettes 101 et la roue–pelle 117. Ainsi on peut proceder au deplacement dans les deux sens de l'ensemble et il n'est plus necessaire de ramener celui–ci a son point de depart. On peut faire fonctionner continuellement les elements de reprise, malgre l'inversement du sens de la marche du pont roulant 200. Par le fonctionnement continu des elements de reprise 101 et 117 on augmente considerablement le rendement de l'installation. On evite egalement les frais supplementaires necessaires soit a l'installation d'un second ensemble des elements de reprise, soit d'un transbordeur. La cabine 167, abritant la personne chargee de surveiller le fonctionnement des appareils de reprise 101 et 117 est placee sur le chariot mobile 180 et se deplace en meme temps que l'ensemble forme par le transporteur a raclettes 101 et la roue–pelle 117 et la personne chargee de la surveillance voit tres facilement si les deux elements travaillent a plein rendement. L'articulation centrale 219 du pont roulant 200 absorbe les denivellations du terrain et meme si les trois rails 2071, 2072 et 2073 ne sont pas de niveau, le poids de l'ensemble des elements de reprise 101, 117 est reparti uniformement sur les trois rails 207l, 2072 et 2073 et les galets 210 des boggies 206 sont en contact permanent avec le dessus des rails 2071, 2072 et 2073. Bien entendu l'invention n'est pas limitee aux exemples de reaLisation ci–dessus decrits et representes et a partir desquels on pourra prevoir d'autres modes et d'autres formes de realisation sans pour cela sortir du cadre de l'invention. RESUME L'invention s'etend aux caracteristiques ci–apres et a leurs diverses combinaisons possibles 1D Installation de manutention notamment pour le stockage et la reprise de materiaux, installation caracterisee parce qu'elle comporte, en combinaison des moyens de mise en stock automatique des materiaux en provenance du lieu de dechargement et des moyens de reprise de ces memes

produits, pour acheminer ceux−ci vers un atelier d'utilisation, permettant de placer les aires de stockage dans le prolongement l'une de l'autre, ce qui permet d'une part, de reduire considerablement la surface de stockage, et d'autre part, d'eviter une perte de temps due au daplacement des differents elements composant l'installation de manutention; 20 Les moyens de reprises sont constitues par un ensemble d'elements formant un bloc dont la partie superieure pivote horizontalement par rapport a la partie inferieure, ce qui permet de continuer, en sens oppose du precedent et sans perte de temps, la reprise des produits stockes et de prendre alternativement des produits des differents amoncellements sur les aires de stockage disposees de part et d'autre de cet ensemble; 30 Le transporteur a raclettes comportant des couteaux raleurs fixes par un moyen quelconque sur une chaine attaque de front les differentes couches superposees triangulairement des produits stockes. Les couteaux raleurs provoquent le glissement vers le has des produits et par ce glissement on realise le melange des differents produits; 4 La roue−pelle, ayant sur son pourtour une pluralite de godets, ramasse les produits glisses a la base de l'amoncellement et elle les deverse sur un transporteur a courroie continue; 5 Le transporteur a courroie continue fonctionne a l'interieur de l'ossature metallique servant de support a la roue−pelle, et son brin porteur achemine les produits deverses par la roue−pelle vers une tremie; 60 Des rouleaux amortisseurs, situes sous le brin porteur de la courroie continue du transporteur a l'emplacement ou tombent les produits deverses par la roue−pelle absorbent au maximum l'effet de choc provoque par la chute des produits et reduisent considerablement l'usure de la courroie contínte; 7" Le bras de levier, permettant de lever ou de rabaisser le transporteur a raclettes solidaire de la roue−pelle, assure le contact permanent des couteaux racleurs avec le plan du coin des produits stockes et, en soulevant au maximum les deux appareils, il permet de pivoter l'ensemble et d'attaquer une aire de stockage situee de l'autre cote de l'axe longitudinal du transporteur transversal; s" Le treuil scelle sur le caisson contenant les contrepoids, permet, a l'aide d'un cable, de relever ou de rabaisser le bras de levier; 90 Le transporteur a courroie continue a axe transversal, sur lequel ont ete deverses les produits par la tremie, modifie perpendiculairement le par. cours du transport des produits et les achemine vers le transporteur longeant les aires de stockage; 10 Des boggies solidaires du bati de l'element mobile, assurent le deplacement transversal de l'ensemble des elements de reprise c'est−a−dire le transporteur a raclettes et la roue−pelle; 11" Des rails, reposant sur des poutres a treillis du pont roulant servent de chemin de roulement transversal a l'element mobile transversalement; 12" Le pont roulant se deplace longitudinalement sur trois rails paralleles aux aires de stockage et la combinaison du deplacement transversal avec le deplacement longitudinal permet de balayer toute la surface des aires de stockage; 130 L'articulation centrale du pont roulant absorbe les denivellations existantes entre les trois rails et assure la repartition du poids de l'ensemble sur ces trois rails en permettant aux deux tron cons du pont roulant de former une ligne brisee; i 40 Le transporteur a courroie continue longeant les aires de stockage, amene les produits deverses par le transporteur transversal a l'atelier duti− lisation; 15 Le transporteur a courroie continue para. lele aux aires de stockage apporte depuis le lieu de dechargement les produits destines a etre emmagasines a l'emplacement de stockage prevu; 160 Le chariot elevateur souleve le brin porteur du transporteur a courroie continue et permet d'elever les produits a la hauteur necessaire a leur deversement sur un autre transporteur; 17 Le transporteur a courroie continue perpendiculaire au transporteur precedent et place a l'interieur de l'ossature metallique de la fleche du tripper deverse les produits apportes sur le terrain destine au stockage; 18" Le piston a double effet, alimente par une pompe a huile, releve ou rabaisse la fleche du tripper et permet de doser tres exactement l'epaisseur de la couche des differents produits; 19 Le dispositif palpeur en liaison avec un indicateur de position, est situe a la tete de la fleche du tripper et actionne le relevement automatique de ladite fleche; 200 Le dispositif de controle, des formation de l'epaisseur voulue de la couche d'un certain produit, provoque l'arret de l'alimentation et un signal avertisseur quelconque transmet a un poste de commande central l'arret d'arrivee de ce produit et declenche le branchement de manutention deun autre produit; 21 Le tripper repose sur trois pieds realises en charpente metallique, et se deplace longitudinalement sur un chemin de roulement par l'interme− diaire d'une pluralite de boggies moteurs; 220 Les galets des boggies sont mis en mouvement par une transmission solidaire au reducteur accouple au moteur electrique et ils se deplacent sur les rails formant le chemin de roulement; 230 Les articulations solidarisent le tripper et le chariot elevateur et tout deplacement longitudinal du tripper entraine automatiquement le deplacement du chariot elevateur. [Source: Claim 1] ** WARNING ** start of CLMS field may contain late 172 soi1t solidarity to support means 229 to the two beams 201 crane. 200. the second carrier 172 includes the drum motor 222, driven by a motor device such as electric motor, the return drum 224 with the tensioning device 225 consists of screws, bearings and glissieres and a plurality of rollers 226, these rollers supporting both the carrier strand that strand 227 228. the second carrier 172 products listed pours into a chute 287 which being integral to beams a mesh 21 by supports 230 moves concurrently with the crane. the lower part 231 of the feed chute 229 is located above the belt 232 of a third carrier 233 identical in every respect to the first conveyor 1 and the dumped products on the belt 232 are brought by the third carrier 233 has the product use workshop. These different devices many PRESENT benefits including all of the elements serving to make the different products is maximum allege thereby avoid the additional expenses and onerous for the realization of important foundations on which are sealed track for road rolling. Also all resumption of Elements 101 and 117 is more easily malleable, hence a certain eco− nomy of the driving force and the economy allows a reduction in costs finished products. the probe 92 has a head 58 of the arrow 54 of 45 for the determination tripper very precisely the thickness of each layer of different products stored even if the thickness of this layer is very minimal. the carrier squeegees 101 by the displacement of the scraper blades 102 ensures both the slide into the hAS of stored products and also the mixture of different products. the use of the krona ball 179 placed between the upper part 145 and the lower portion 180 of the carriage transversely movable, allows you to rotate all recovery Elements made by the carrier 101 and squeegees bucket wheel 117. So you can proceed to the displacement in both directions of the whole and it is not necessary to bring it to its starting point. it can be continuously operate the resumption of elements, despite the reversal of the direction of travel of the crane 200. for the continuous operation of recovery elements 101 and 117 is increased considerably the efficiency of the plant. It also avoids the additional costs necessary either to install a second set of recovery Elements or a ferry. The cab 167, housing the person charged to monitor the operation of the devices resume 101 and 117 is placed on the carriage 180 and moves at the same time that the entire form by the carrier 101 scrapers and bucket wheel 117 and the person

charged surveillance seen very easily if both work Elements has full capacity. the central joint 219 crane 200 absorbs ground drop−offs, and even if the three rails 2071, 2072 and 2073 are not level, the weight of all recovery Elements 101, 117 and left evenly over the three rails 207L, 2072 and 2073 and the rollers 210 bogies 206 are in permanent contact with the top of the rails 2071, 2072 and 2073. course the invention is not limited to the embodiments described above and represented and from which we can predict other modes and other forms of realization without departing from the scope of the invention. SUMMARY The invention extends to the characteristics listed after and their various combinations 1D Installation handling including storage and recovery materials, the installation being characterized because it comprises, in combination means for automatically placing in storage of materials from the place of unloading and means of recovery of these same products, to transport them to a user workshop for placing the storage areas in the extension of one another, which allows on one hand to significantly reduce the storage surface, and secondly, to avoid a waste of time due to daplacement of different elements component handling facility; 20 means of times are constituted by a set of elements forming a block whose upper part rotates horizontally relative to the lower part, allowing to continue in opposite direction of precedent and without loss of time, recovery of stored products and alternately take products of various piles on ARRANGED storage areas on either side of this whole; 30 the carrier with squeegees moaners knives fixed by any means on a chain frontal attack the different layers superimposed triangularly of stored products. The knives moaners cause the slide to the HAS products and this shift is realized the mixture of different products; 4 wheel excavator, having on its periphery a plurality of buckets, picks snowsports products based the accumulation and pours them on a continuous carrier belt; 5 the carrier continuous belt works in the interior of the metal frame for supporting a bucket wheel, and carrying strand carries products spilled from the bucket wheel to a hopper; 60 rolls dampers, situated under the carrier strand continuous conveyor belt at the location or the fall spills by bucket wheel absorb maximum effect shock caused by falling goods and considerably reduce the wear of the belt contínte; 7 "The lever arm to lift or lower the carrier squeegees secured to the bucket wheel, ensures permanent contact with the scraper blades with the plane of the corner of stored products, raising the maximum both devices, it can rotate together and attack a storage area situated on the other side of the longitudinal axis of the cross conveyor; S "the winch seals on the box containing the counterweights, allows, with the aid of a cable, to raise or lower the lever arm; 90 the carrier has a continuous belt transverse axis, on which the products were dumped by the hopper, change the angles by. during the transport of goods and routes them to the carrier along the storage areas; 10 Supportive bati bogies of the mobile element, ensure the transverse displacement of all recovery Elements that is, −dire the carrier scrapers and bucket wheel; 11 "rails, beams resting on a lattice crane serve transverse runway to the mobile element transversely; 12" the crane moves longitudinally parallel rails on three storage areas and the combination of the transverse displacement with the longitudinal displacement allows to scan the entire surface of storage areas; the central joint 130 crane absorbs existing drop−offs between the three rails and ensures the weight distribution of all these three rails allowing two sections cons crane form a brisee line; 40 i the carrier continuous belt along the storage areas, brings products dumped by the transverse carrier is duti− workshop lisation; 15 the carrier continuous belt para.Lele storage areas brings from the place of unloading the goods intended to be stored in the planned storage location; 160 The carriage elevator raises the carrier side of the conveyor belt and allows a continuous of raising Products to the necessary height to their spill on another carrier; 17 the carrier continuous belt perpendicular to the previous spot and carrier inside the metal frame of the arrow of the tripper pours bringest products intended field storage; 18 "the double acting piston, powered by an oil pump, notes or demeans the arrow of the tripper and allows to dose very precisely the thickness of the layer of different products; 19 the probe device in connection with a position indicator is located at the head of the arrow of the tripper and operates the automatic increase of that arrow; 200 the control device, training the desired thickness of the layer a certain product causes the food and stop any alarm signal transmitted to a central control station for the arrival of this and stop triggers the connection ofone another product handling; 21 the tripper rests on three legs realized in metal structural, and moves longitudinally on a track through the intermediary of a plurality of bogies engines; 220 bogies rollers are set in motion by a transmission solidarity in reducer coupled to electric motor and they move on the rails forming the runway; 230 joints clamp the tripper and the lift truck and any longitudinal displacement of tripper automatically causes the displacement of the lift truck.

Abstract:
Source: GB412599A 27289/32, 35636/32, and 18703/33. [Classes 17 (i) and 17 (ii).] Heels.–Relates to shoes having heels built up of superposed lifts which heels are shaped to final form around their side and rear surfaces before they are attached to the shoes, and consists in methods of making wherein the heels are first trimmed to a predetermined shape under templet control, then, if desired, scoured under templet control to ensure retention of the shape to which they have been trimmed, and, finally attached. The soles do not extend to the rear end of the heels, and the rear end of the sole and the attaching face of the heel are shaped to complementary form only lengthwise of the shoe, the wings of the rear end of the sole being trimmed flush with the sides of the heel after attachment. To shape the attaching face of the heel, a cutting tool is used which operates simultaneously across the whole width of the heel and forms a ledge adapted to support the heel end of the sole extending across the full width of the heel and located below the general plane of the periphery of the attaching face of the heel. The heel is first built up and compressed, the dies being shaped to form a flattened peripheral rim at the attaching face and a recess at a predetermined position in this face to facilitate positioning in the trimming and scouring machines. The heel is then trimmed in a machine such as that described in Specification 411,448 and scoured in a machine such as that described in Specification 411,143, [Group XXIII]. The attaching face may then be shaped to conform with the bevelled end of a sole in a machine comprising a driven cutter 1035 shaped as a frustum of a cone and positioned adjacent to a work–supporting plate 1037, inclined at some 16 to the perpendicular to the axis of the cutter. The plate is adjustable towards or away from the cutter by an adjusting screw 1045, substantially in the line of the axis of the cutter by a screw 1053, and is clamped in adjusted angular position by a bolt 1057. A pair of fingers 1061, 1063 have hooked ends for engaging the breast edges of a heel and are mounted on stems 1065, 1067, respectively, formed with rack teeth engaging a pinion 1069, so that the fingers move simultaneously inwards towards each other or outwards. To adjust the distance apart of the fingers, the ends of the stem 1065 are screw–threaded and provided with nuts 1071, 1073, the latter backed by a spring. A fibre block 1079 engages the work adjacent the cutter. The fingers are bevelled to grip the heel and ensure it being withdrawn laterally from the cutter when the cut has been made. Alternatively, the heel and the rear end of the sole may have their engaging parts shaped to complementary form. The heel end of the sole is shaped to correspond with the cut made by the knife 1035, but left wider than the heel. The projecting wings are reduced flush with the side surfaces of the heel after attachment, the machine described in Specification 181,099 being suitable. If the uppermost lift of the heel should be of board instead of leather, it is preferable to harden the edge surface, after attachment, by the pressure of a smooth–surfaced roller. In another modification, the uppermost lift of the heel may be skived before the heel is built to agree with a skive of some #–inch width at the rear end of the sole. Specifications 181,099, [Class 17 (i)], 278,976, 305,276, [both in Class 17 (ii)], 306,192, 310,822, 331,934, 339,935, [all in Class 17 (i)], 398,845, and 408,210 also are referred to.

Abstract:
Source: US5017198A The invention relates to processes for the treatment of in particular medium and highly consistent material–gas mixtures to be pumped, preferably gas–containing, in particular air–containing fibrous material suspensions, a separation of the gas being effected prior to the pumping operation. The invention is mainly characterized in that the material–gas mixture, preferably the gas–containing fibrous material suspension, is subjected in a separate container separate from the pump housing for the separate gas separation, in particular air separation, preceding the pumping operation, to a conveniently high–speed rotation of in particular between 1,200 and 3,400 rpm, preferably of about 3,000 rpm, while at least in operation, gas, in particular air, is sucked off or a vacuum is generated approximately in the center of the rotating motion of the material–gas mixture. The invention further relates to plants and devices e.g. suitable for carrying out these processes. Conveniently, separate housings are provided for the degassing device and the pump.

Abstract:
Source: US5085136A A toaster having a bread holder (17) mounted to slide vertically in the toaster, has a mechanical device (25) for locking and unlocking the bread holder (17). This device (25) enables the holder (17) to be locked in a low position, and a return spring is provided for raising the holder (17). The mechanical device (25) comprises an upper connecting rod (56) articulated with a lower connecting rod (57) by a common articulation (59), an end of the upper connecting rod (56) opposite the common articulation (59) being articulated at a fixed point (58) and an end of the lower connecting rod (57) opposite the common articulation (59) being articulated with the holder (17). An intermediate lever (42) is articulated with the upper connecting rod (56), and a spring (63) acts on the intermediate lever (42) for retaining the holder (17) in the low position. An end of the intermediate lever (42) comprises a tip (24) which is engageable with a retaining catch (45) when the holder (17) is moved into the low position. The tip (24) and catch (45) are applied against each other under a substantially horizontal force (F7) resulting from the upwardly exerted force (F5) of the return spring of the holder (17).

Sätt att fiska med en båt enligt anspråk 1–13, kännetecknadt däraf att det består uti att kraftigt belysa ett förutbestämdt ytinnehåll af vattnet från en ljuskälla belägen öfver vattenjtan, hvarmed fisk tiiidrages in 1 den sälunda "belysta zonen, att åstadkomma deA belysta zonen att röra sig iraaåt och samtidigt i rörelsesätta fislcfängstmedel genom vattnet balc– ut från det belyata

området. Iyfceck Ocean Harvester Co, inc. r, – *4 . IOfIBUteslkaierafru and veneiaaä. Tämän keksinnön esineenä on kalastusvene Ja tarkoittaa se parannuksia kalastuksen toimintaan Ja välineisiin nähden. Keksinnön päätarkoitus, vaik– ka ei yksinomaan, voidaan lyhykkäisyydessä esittää seuraavasti: 1. Laatia parannettuja välineitä laivan eteenpälnkayttöä varten sekä eteenpäin– että sivusuunnassa, sekä parannettuja välineitä laivan ohjaamls– ta varten semmoisten toimintojen aikana. 2. Välineet kalan keräämistä varten ISA laivan tielle ja sen siirto kan– nelle, Joihin välineisiin on.edelleen yhdistetty välineitä siirtovälineiden tukkeutumisen estämistä varten. 3. Verkkolaitteen tai välpän parannettu rakenne, josta kaloja keräävät välineet pääasiallisesti laaditaan, mikä verkkolaite tai vaippa on siten rakennettu että se synnyttää pienimmän vastuksen vedenvirtaukseen nähden silmien tai reikien kautta sanotussa verkkolaitteessa tai Z and 5 välpässä; ja k. Välineet kalojakeräävien välineiden upotussyvyyden järjestelyä varten sekä välineet yhdistettyinä kalojakerääviin välineisiin jotta niiden kärki tulisi estetyksi kaivautumasta merenpohjaan kun ne toimivat matalassa vedes«?" Edelleen perustuu eräs piirre keksinnössä parannettuun menettelyyn ka– lastaa yöllä, Joka perustuu kalojen ISMäävetämlseen käyttämällä vahvaa etsijävaloa veneen etupuoliseen vyöhykkeesen Ja sen tielle, keräten tun– nottomia kaloja aina sen mukaan kuin vene kulkee eteenpäin, sekä siten ke– rättyjen kalojen nostamiseen veneen sisään. Keksinnössä edelleen esiintyvät piirteet, muut kuin tässä luetellut, kuin inyöskin sen edut selviävät tässä alempana olevasta selityksestä, tehty oheenliitettyjen piirustuksien yhteydessä. Oheenliitetyissä piirustuksissa kuvataan erilaisia käytännöllisiä tote– uttamismuotoja keksinnöstä, mutta niissä osoitetut rakenteet ovat pidettä– vät ainoastaan keksintöä kuvaavina eikä sen rajaplirfcjä määräävinä. Kuva 1 on sivuõievatsioni kalastajaveneestä Joka toteuttaa keksinnön. Kuva 2 on huipputaso siitä. Kuva 3 on pohjataso veneestä, esitettynä kuvassa 1. Kuva 4 takapäästä otettu elevatsioni veneestä. Kuva 5 on edestä otettu elevatsioni, mikä osoittaa kalojakeräävät vä– lineet, rungon ja osan ylemmästä laitoksesta. Kuva 6 on poikkileikkaus laivan läpi, otettuna pystysuoralstasossa viivaa 6–6 pitkin kuvassa 1. Kuvat 7 ja 7a ovat keskisiä leikkauksia kalojakeräävien välineiden pa– ft r/ ß rempana pidettävästä muodosta,kuvan 7a esittäessä sanottujen välineiden etu osan, samalla Kun kuv. 7 esittää taaemman osan siltä,Jolloin sanottu kuv. JfiS 7 on suurennetussa mittakaavassa suuremman selvyyden aikaansaamiseksi. On ymmärrettävä että kuv. 7a on Jatko kuvassa 7 osoitettuun rakenteesen. Kuva 8 on suurennettu erikoisosa leikkauksessa viivaa lo–lo pitkin kuvas– sa 7a. Kuva 9 on samantapainen erikoisleikkaus viivaa 9–9 pitkin kuvassa a. Kuva lo on erikoisosa tasossa eräästä verkon tai kalanluu–välpän elemen– tin muodosta, Jota pidän edullisempana käyttää, Ja tekee pienimmän vastuk– sen sen kulkuun nähden veden läpi. Kuva 11 on kuvan lo näköinen kuvaus, osoittaen jonkun verran muunnetun muodon kalanluurakenteesta. Kuva 12 on elevatsioni kuvassa 11 osoitetusta rakenteesta. Kuva 13 on katkonainen leikkaus laivasta osoitettu kuvissa 1–6, jolloin sanottu leikkaus on otettu viivaa 13–13 pitkin kuvassa 1. Kuva 14 on pltuusleikkaua eräästä rungoista, otettuna viivaa 1H–14 pit– kin kuvassa 13. Kuva 15 on leikkaus viivaa 16–16 pitkin kuvassa 3, osoittaen muutamia silpipyöriä edestä otetussa elevatslonissa. Kuva 16 on leikkaus viivaa 16–16 JIXI pitkin kuvassa 15. Kuva 17 on tasokuvaus yhden palkeista ulkoisesta päästä, Jolta käytetään kannattamaan kalojakeräavät välineet. Kuva IS on erikoisosainen leikkaus ynden siipipyärän kautta, kuteo viivaa 19–19 pitkin kuvassa 15. Kuva 19 on tasokuvaus alhaaltapäin yhdestä ainoasta venerungosta, esit– täen uusia piirteitä esilläolevasta keksinnöstä» Kuva 2o on pääasiallisesti keskinen, pystysuora leikkaus kuvassa 19 osoitetun veneen kautta. Kuva 21 on edestä otettu elevatsioni kuvissa 19 ja ‘2o osoitetusta ve– neestä. Kuva 22 on leikkaus viivaa 2g–23 pitkin kuvassa 2o. Kuva 23 on poikkileikkaus viivaa 23–23 pitkin kuvassa 2o, ja Kuva 24 on kuvassa 23 osoitetun leikkauksen näköinen, mutta osoittaen muunnetun muodon rakenteesta, yhdistäen laivansiivet. Viittaamalla piirustuksiin osoittaa A useampia laivanrunkoja, asetettui– na yhdensuuntaissuhteesen toisiinsa nähden,sivu sivussahtelsen kannen B alla, mikä kansi johtuu kaikkien runkojen yli ja ulkonee paraiten Jonkun vèrran sivuillepäin, I8A niiden keula Ja peräpuolelta, kuten selvästi osoitetaan kuvissa 3 Ja 6. Kaikki rungot ovat rakennetut yhtäläisiksi ja ovat yleistä rakennetta, kuten osoitetaan kuvissa 19–23. Kukin runko on pääasiallisesti varustettu suorilla, pystysuorilla sivuilla, mutta on sillä yleensä pienen veneen muoto Keskisessä, pituusläpileikkauksössa. Rungon si– vut joutuvat skkljyrkä3tl ales ja päättyvät pääasiallisesti vaakasuoriin emäpuihin a, joutuen käytännön kannalta otettuna kautta rungon koko pituu– den. Sisäinen leikkaus semmoisista, muodosteluista muodostaa rungon, jonka alempi 3ivu on pituussuunnassa kourulla varustettu, siinä kun on verrattain syvä uurre keulassa ja perässä, kuten paralten osoitetaan kuvissa 2o, 21 Ja 22, ja verrattain matala uurre keskilaivalla, kuten osoitetaan kuvassa 23. jQhtuon taaksepäin veneen kustakin nnja–ta neljästä ke3klemäpuusta kaytstääw pavächbttts, jotai kannattaa sen alemmasta päästä tavallinen euutøiiaula cx, peräsinpylvään Johtuessa ylöspäin ja on laakeroittu eteenpäin ja takaisin kääntöä varten kannessa..On välttämätöntä että nämät kaksi peräsintä kal– listuvat joko toiseen tai toiseen suuntaan K and X and iS and ä samassa kulmassa, ss on toimivat yhdensuuntaisessa suhteessa kaikkina hetkinä,, Ja jotta tämä kä– visi varmaksi ovat ne paralten yhdistetyt toisiinsa niiden päiden välistä jäykän nivelSïT avulla. Jos useampia runkoja A on asetettu toistensa vie– reen kuten osoitetaan kuvassa 3 on niveTV* tehty johtumaan poikki kaikkien peräsinten, niin että, kun yksi peräsin on toiminnassa, joutuvat kaikki muut jäieilä olevat samaan aikaan liikkeesen niin että ne pysyvät yhden– suuntaisessa suhteessa toisiinsa nähden kaikkina hetkinä. Löytyy eri tapoja joilla peräsimet voidaan saattaa toimintaan, mutta mi– nä pidän edullisempana käyttää sitä yleistä sovittelua, mikä osoitetaan kuvassa 3, jossa peräsimiä liikkeesen saattavia köysiä tai ketjuja g2 käy– tetään kiinnitettyinä ni/eleesen c1 Ja johtuvat veneen aisaan saatettavik– si toimintaan sopivien ohjaavien välineiden avulla. Parannettua kourulla varustettua runkoa tässä keksinnössä voidaan käyt– tää yksrunkoisessa tai useampirunkoisessa veneessä ja kaikissa tapauksissa voidaan sanotut rungot kukin erikseen saattaa liikkeesen yhden tai useampi– en potkurislipien c5 avulla, käytettyinä sopivien yhdisteiden avulla, kuten osoitetaan kuvassa 2o. Kun kourulla varustetun rungon rakennetta käytetään ykäirunkoisessa veneessä aijottu käytettäväksi hyvin aaltoilevas– sa meressä, voidaan runkoa varustaa laivasiivillä a1, kuten osoitetaan kuvassa 24, vaikka nämät voidaan jättää pois, jos niin halutaan. Kun useita runkoja selitettyä mallia on sovitettu yhteiden kannen alle, kuten osoitetaan kuvassa 3 ja 6, voidaan sanotut rungot saattaa liikkeesen kukin erikseen tai riippumattomasti potkurien avulla kuten on selitetty, tai voidaan lisäkäyttövälineitä käyttää. Minusta on tämän keksinnön mukai– nen vene käytettävä hyvällä nopeudella ja sentakia käytetään lisäkäyttävä– lineitä, niin että haluttu nopeus voidaan aikaansaada. Tämä väline osoite– taan useampien siipipyörien E muodossa, Joista y*3l sarja on sovitettu ri– viin rajamain olevien runkojen väliin, tuten osoitetaan Kuvassa 3. Kutakin lukumäärää näitä siipipyöriä voidaan täyttää, mutta, esitykseen nähden,ogoi tetaan kaksi panosta johtuen pääasiallisesti keulasta

perään, kahden runko– parin välissä, samalla kun muut osoitetaan sovitettuina parittain jälelläo– levien nautoparien väliin. Kun käytetään useita siipipyöriä, toinen toisen– sa takana, niin että koko sarja Joutuu keulasta perään, ÿl and SIXX olisi toi– sensa Jälkeen seuraavat siipipyörät katsottuina keulasta perään pidettävä liikkeessä yhä lisääntyvillä nopeuksilla. Se on, Jos ensimäiaen slipipyörän tulee tehdä loo tulee toisen pyörän tehdä suuremman lukumäärän kier– toja, esim. Ilo tal 12o Ja kolmannen slipipyörän pitäisi tehdä 13o;stä l4o:een J.n.e. tfämät kuviot ovat luonnollisesti ainoastaan selittävät, mutta käytetään niitä tekemään toiminta selväisi, koskapa, Jos kaikki siipipyörät vaikuttaisivat samalla nopeudella, syntyisi niin no– pea veden syöksy runkojen välissä, varustettuina ensimälsellä viidellä pyö– rällä, että Jälellä olevilla pyörillä ei tulisi olemaan mitään Erikoisosat parempana pidettävästä siipipyörien muodosta osoitetaan kuvissa 15,16 Ja IS. Kukin siipipyörä D on varustettu ontolla navalla d, laadittu onton, ilmatiiviin sylinterin muodossa Jonka kautta Johtuu käy– tettävä akseli dA, Jäykästi kiinnikiilattuna navan päihin. Navan vastakkai– set päät ovat varustetut laipoilla d2, Ja Johtuen säteensuuntaisesti navan ulkoisesta kehäpiiristä käytetään siipilehtiä d5, kuten paralten osoitetaan kuvassa IS, jolloin lehtien vastakkaiset päät ovat paralten jäykästi yhdis– tetyt laippoihin d2. Käytettävä X akseli d1 on sovitettu käantöliikettä varten kahteen varteen e, joiden toisten päiden kautta Johtuu käyttäakseli E (kat3Q kuv. 15 ja 16). Kayttöakaeli E Käytetään sopivasta koneistosta sovitettuna toiseen tai molempiin rajakkain oleviin runkoihin, ja pyörivä liike siirretään käyttöakseiista E käytettävään akseliin d1 hammaspyörän 1 2 e ätyailä ja yhdessä toimivan hammasketjun e avulla. Tätä rakennetta käy– tettäessä huomataan että koska slipipyörän napa d on ilmatiivis, se tulee kellumaan ja estämään siipipyörää painumasta kokonansa veden alle. Käytän– nössä johtuu pääasiallisesti ainoastaan puolet pyörästä vedenpinnan alle, ja sovittamalla pyörä kääntyviin varsiin e, saattaa sanottu pyörä kaikkina hetkinä mukautua itse puolestaan vedenpintaan nähden, mikä selvästikin vaihtuu veneen sormituksen mukaan. Saattaa olla toitottavaa voida toisi– naan kohottaa siipipyörä D erille vedenpinnasta, ja tätä tarkoitusta var– ii ten kiinnitetään kohottava nivel d alemmalla päällään käytettävään akse– liin d* mikä Johtuu ylöspäin veneen kannen B kautta. Käyttämällä pulttia d y/v/ it .. Ó mitä toimii nivelen d yhteydessä Ja on yhdistetty johteesen d, voidaan siipipyörä, slttenkun sitä on Kohotettu tarpeen mukaan,estää joutumasta ennen määrätyn S Kohdan alapuolelle. Jotta siipipyörä ei vahingoittuisi hylkytavarolsta, jään j.n.e taKia kul– j ohon kee Käyttävä aKseli E paralten putkenmuotoisen muhvin ï kautta, puts on jäykästi sovitettu useita suojaavia rimoja f, mitkä johtuvat lyhyen matkan yhdensuuntalssuhteessa Kääntyviin varsiin e nähden ja, jäleiläoievaan osaan nähden niiden ulottuvaisuutta, mukautuvat slipipyörän fUXfiiäSSft ulkoisen kehäpiirin mukaan, Kuten osoitetaan Kuvassa 16. TanKo r1 johtuu kaikKien näiden suojaavien rimojen Kautta Ja ankkuroidaan päistään Kääntyviin var– siin niin että se pysyttää rimat asianmukaisessa suojaavassa asennossa slipipyörän etupuolella. îïiinmuodoin olkoompa siipipyörä milloin tahansa toimivassa asennossa käytetään'sanottuja rimoja aina varjeluspölkkyinä suo– jaamaan siipilehdet C? vahingoittumasta. On useasti tarpeellista voida käyttää siipipyöriä Jo selitettyä lajia parittaln, Ja menettely hyvin säästel and västi aikaansaada tämä osoitetaan Ku– vassa 15, Jossa kaksi sllpipyörää D on sovitettu toistensa viereen yhtei– seen käytettävään akseliin d1 mikä saatetaan liiKkeesen yhteiäen käyttöak– selin S avulla, jolloin yksinkertaista ripustusjäsentä käytetään pysyt– tämään molemmat pyörät ylösnostettuina, kaniin halutaan. Molemmat siipi– pyörät sovitettuina kuten osoitetaan kuvassa 15 tulevat vaikuttamaan yksi– lön tapaan ja pääasiallisesti samalla tavalla kuin yksinäinen pyörä, paitsi että enemmän eteenpäin käyttävää voimaa tulee syntymään, siipipyörien käyt– tö voidaan toimittaa millä halutulla tavalla tahansa sopivan akselijohdon tai välittömien yhdisteiden avulla useampiin moottoreihin tai koneisiin, mutta ei ole tarpeellista osoittaa näitä yksityisiä osia, koskapa Koneisto siipipyörien Käyttöä varten on hyvin tunnettu eikä muodosta mitään osaa esilläolevasta keksinnöstä. Venettä telakkaan pantaessa varustettuna useammilla jo selitetyn laj1311– la rungoilla voivat kaikki ne osat mitkä tässä alempana luetellaan Kalastus toiminnan toteuttamista varten tehdä veneen jonkun verran sas vaikeasti kä– siteltäväksi, ja pidetään sentakia edullisempana Käyttää välineitä veneen Käsittelyn heipoittamista varten ahtaissa paikoissa. Tässä tarKoituKsessa Käytän useita £ä sivupotKureita G keulassa ja perässä, Joiden sijoitus osoi– tetaan Kuvassa 3i »inka ohessa yfcsityiaosat esitetään Kuvissa 13 ja 14. Sivusiipipyörät G saatetaan paraiten toimintaan Kahdenkertaisina sen kautta että ne sovitetaan yhteiseen Käytettävään akseliin g,mikä kannatetaan kään– toliikettä varten kääntyvässä varressa g1 tappiyhdisteen avulla Kiinnitet– tynä käyttävään akseliin g2, mikä johtuu keulat and á Ja peräsSa ja jota Käyte– tään rungossa olevasta sopivasta Koneistosta. Liite siirretään täyttävästä akselista g2 täytettävään atseliin g Hammastetaun g avulla, ja siipipyörä k voidaan tonottaa tai lastea tarpeen mutaan nivelyhdisteiden g avulla, vas– taten eteenpäin täyttävien siipipyörien D niveiyhdlsteitä d. Sivusiipipyö– rät 0 eroavat tuitentin ratenteeltaaü siipipyöristä D siitä että tutin edel lisistä paralten valmistetaan ainoastaan neljästä lehdestä, tuten osoitetaa tuvassa 13, niin että, Kun näiden siipipyörien vaitutusta ei haluta, ne voidaan nostaa ylös, jolloin yt3i lehdistä tussatin siipipyörässä johtuu tannes3a olevan auton Kautta, samalla tun molemmat vieressä olevat leh– det pysytetään tiinni tannen alasivussa. Tällä tavalla voidaan siipipyörät G nostaa ylös vedestä, niin että ne eivät estä veneen eteenpäin tultua sen säännöllisessä toiminnassa. Kultentin tun tahdotaan panna vene telatalle voidaan siipipyörät G lastea alas toimivaan asentoon vedessä ja saattaa liitteesen tarpeen rautaan veneen tääntämistä varten sivusuunnassa telatal– le. Väline veneen täyttöä varten sivusuunnassa toimittaa inyöstin erään toi– sen tärteän tehtävän veneen täytännöllisessä toiminnassa. Jos vene tultee eteenpäin ja talaparvi on näkyvissä verrattain lähellä venettä, mutta sivu– suunnassa veneen tultusuuntaan nähden, on tärteätä että SSa vene voidaan panna nopeasti 2 liitteesen sivusuunnassa,siinä tartoitutsessa että se vä– littömästi tai suinpäin Kohtaisi talaparven. Tämän mutaisesti tetee tämä väline Jolla vene voidaan panna liitteesen sivusuunnassa mahdolllsetsl saa– vuttaa tämä tulos, on siten selvää että semmoinen väline vaituttaa muiden täysi ilãíSX elementtien yhteydessä, niin että saadaan täyttötelpoisuus yhdistel– mään nähden totonaisuudessaan. Kuten paralten osoitetaan tuvissa 1–4 täytetään veneen etupuoleen ja sen alle sovitettuna Kousajäsentä 1, jolla pääasiallisesti on suorataiteen– muotoisen suppilon muoto, jonta suurempi avonainen pää sijaitsee veneen etu – puolella. Kousalla l on tuten osoitetaan piirustutsissa luurangon muoto, mitä on sovitettu seneesen pittien nivelten J avulla jäytääti yhdistettyinä Hondasta tehytseen("j"mikä johtuu taatsepäin veneen alle Ja tääntyy tääntönaatassa molempien uitoisten runtojen sivustaan päin, tuten Kohdasta j1 vallan tea– tiiaivan peräpuolen tohdalta, tuten paraiten osoitetaan tuvissa l ja 3, niin että kousa voidaan saattaa veden alle tai upottaa pienempään tai suu– rempaan syvyyteen Kääntämällä sanottu tousa nivelissä J, Jotta vaituttavat nastan J1 ympäri. Kousa on säännöllisesti ripustettu, asianomaiseen syvyy– teen, useampiin nostaviirPltöygitn I, mittä ovat sovitetut

töysipyörien>5 Kannattavat KaKsi puomia K, Kuten paraiten osoitetaan Kuvissa 2 ja 5. Puomit pysytetään asianomaisessa, etälsyyssuhteeasa ultopäistään jäytän etäisyyden päässä pitävän yhdisteen t avulla, Ja täähtyvät niiden slseiumlss päissä olevissa nastoissa, tuten t1 tohdi3ta, veneen päätanteen. Sanotut* «–V ygiYggf puomit tuetaan myëstin sivusuunnassa Kääntyvään liitteesen.nähden sivutufcien t2 avulla, tlinnitettyinä etumaisista päistään puomien etumai– siin päihin Ja myostin tääntyen nastassa veneen päätanteen päin, tuten toh– dasta t, jolloin táitti nastat t1 Ja t ovat suorass viivassa, niin että puomi siihen tuuluvine osineen on vapaa tääntymään yhteisen at3elin ympäri (katso tuv* 1 ja 2). ¥lësno3tavat töydet i tultevat tëysipyäristä i1 yles– päin peräänpäin toimen onton maston L huippuun, asetettuina pääasiallisesti testilaivan tohdalie, Ja sanotut nostavat köydet ovat yhtäläisesti jaoitet– sisään tuma mastoihin, tuten osoitetaan tuvassa 2. Onttojen mastojen 3XS£3ä2XXÍ£X on Yjfy pysysuoria johdeteitä tasapainossa pysyttäviä painoja l varten sovitet– tu, Joihin ytsitylsten töysien päät ovat tiinnltetyt. Tämän osien tasapainon sovitutsen tatla tarvitaan hyvin vähän voimaa tou– san nostamista varten täysillä viivoilla tuvassa 1 osoitetusta asennosta jossa ae on upotettu veteen, piltutetuilla viivoilla osoitettuun asentoon, / jossa tousa on nostettu ylös vedestä* Tämä voidaan aitaanaaada monella ta– valla, mutta, tuvaamlstartoitutsessa, osoitetaan päätannen etusivustassa tatsi pystysuoraa pylvästä m asianmukaisesti vahvistettuina,tuten tohdas– sa m1, ja tannattaen huipuistaan poittipalttia m2, Jolloin sanottua laitet– ta, itse asiassa, täytetään Jäytän nostoranan tapaan jonta avulla tousa voidaan nostaa tai lastea täysien m välitytseliä tuten osoitetaan tuvassa 5. Jäämät töydet v? voidaan panna rän avulla, tai saattavat tultea sopivaan nostorumpuun* Kummassatln tapautsessa voidaan tousa nostaa tai lastea mielen mutaan täyttämällä verrattain –flygla vallan voimaa» Kuten tätä ennen on sanottu, on tousa luurangontapaisesti ripustettu Ja avonaiset osat vahvitteiden, pylväiden Ja bhk muiden ratenneosien välissä ovat suljetut verttolaitotsien tai silmien avulla, mitta päästävät veden tultemaan Kouaan seinämien kautta, mutta estävät siihen terääntyneiden ta– lojen polspääsemisen« Olen havainnut pittäaitalsten toteiden avulla, että hyvin tunnettu ristiin tai poltittain tulteva silmä Jota tavallisesti täy– tetään taiavertoissa synnyttää suuren vastutsen veden lävitsetultuun nähden esiintyen tämä siitä tosiseikasta että semmoista verttoa ainoastaan voidaan vetää vedessä täyttämällä meltoista voimaa* Jos tämän laatuista verttoa täytettäisiin K$jjcÏMX32ÜL selitetyssä tousassa, aiheuttaisi se semmoisen vastutsen että oii–v si mahdotonta täyttää venettä vedessä SXI2 and sillä verrattain suurella nope– udella, mitä on edutsi toiminnalle, ja minä olen tämän mukaisesti pitkäai– kaisten kokeilujen jälteen tetsinyt parannetun verttolaltteen, mitä muodos– taa osan keksinnöstä, tuten osoitetaan piirustuksissa. Tämä verttolaite on tavallisen talanluun nätölnen, tuten näkyy erikois– osista osoitetut tuvissa lo,ll ja 12* Verttolaite N, tuten osoitetaan liitteesen täsin tai jietaanisest.i vätipyö– hautta ja johtaa veneessä T H Kuvassa lo, muodostetaan Kiinnittämällä lankojen n päät kahden yhdensuun– taisen Kaistaleen n1 väliin Ja yhdistämällä tai kiinnittämällä sanotut kaistaleet yhteen pulttien tai niittien n2 avulla lankojen päiden pysyttä– mistä varten tiivisti kiinni kaistaleiden välissä. Kaistaleiden ylemmät reu~ nat ovat varustetut vinoilla uurteilla n, ja nämät lankojen– osat, mitkä Johtuvat sanottujen reunojen ulkolaitojen ulkopuolelle taivutetaan ales ja si3ään sanottuihin uurteisiin, niin että kun rakenne on täydellinen, sano– jat tulla rakenteella on määrätty yhtäläisyys kalan selkärankaan nähden. Vinot uurteet kaistaleissa n1 kulkevat risteyttäen toisiaan, niin että lan– gat jotka johtuvat kaistaleen uurteiden kautta tulevat kulkemaan vastakoh– taiset lankoihin nähden Jotka Johtuvat toiaen kaistaleen uurteiden kautta ja tekevät siten mahûolliEüai kaistaleiden sovituksen niin lähelle toisi– aan kuin mahdollista, katsoen siihen että kaistaleen langat eivät mitenkään yhdy toisen lankoihin. Sivu, huippu ja pohjarakenneelementit kousassa l laaditaan,kuten osoi– tetaan kuvassa 1, kukin johtavista langoista n siten sovitettuina että ne johtuvat vonosti taaksepäin kuten osoitetaan kuvassa 7a. Tässä kuviossa ovat osat varustetut osoitusmerkinnällä S laaditut kuvassa lo esitettyjen erikoisosien mukaisesti. Käy kuitenkin selville, että semmoista rakennetta ei voitaisi käyttää edullisesti kulmissa ja sentakia osoitetaan kuvissa 11 já 12 kulmarakenteita, Joissa verkkolaite o on laadittu langoista o 3ido– S tut kahden kaistaleen o1 väliin niitatut tai yhdistetyt toisiinsa kuten ennen, mutta kukin lamta o johtuu sekä sivusuunnassa että alaspäin sen kaistaleen reunojen ulkopuolelle jonka yhteydessä se toimii Ja taivutetaan pääasiallisesti suoriin kulmiin. Muuten on se sovitettu yhdessä toimivassa kaistaleessa o2 olevaan uurteesen o; langat ovat lujasti kiinnitetyt sa– nottujen kaistaleiden väliin ja kousan kulmarakenteesta. Kuvassa 7a on osilla jotka ovat tällä tavalla laaditut osoitusmerkintä 0. Pienempiä muun– noksia SBfigâüiXgXXXãSXSgX lankojen sovituksessa kaistaleiden väliin käyte– tään kousan eri osissa keksintöä toteutettaessa vaihteievissa olosuhteissa, koskapa on toisinaan välttämätöntä antaa lankojen johtua ainoastaan yhteen suuntaan, kuten kousan etumaisessa reunassa kuvassa 7a, jossa löytyy aino– astaan muutamia lankoja osoitettuina sovitetuiksi etumaiseen pylvääsen, jolloin nämät langat J and Hÿ Johtuvat ainoastaan yhteen suuntaan» Kun uaeäffipTätficälänluuvälppäelementtej ä •seitrtgfrfcy and r* oataai puutta on yhdis– tetty kuten osoitetaan kuvassa 7a, kaikki langat johtuen vinosti taaksepäi ja lankojen vapaat päät elementissä vapaina lankojen vieressä olevien päi– den yhtymyksestä rajäkkain olevassa elementissä, ei meriruoho tai muu sen– tapainen aine tule takertumaan kiinni lankoihin, vaan tulee se kousan nope– an kulun johdosta veden läpi kulkemaan lankoja pitkin niiden päihin Ja mf JS niiata kellumaan pois. Kousan sivu–, ylä– Ja alapinnat ovat laaditut kuten on selitetty niin että mitä pienin vastus muodostuu kousan kulussa veden läpi, Ja kuitenkin ovat sanotun kousan seinämät siten laaditut että kalat Jotka kulkevat sen etumaisen avonaisen pään kautta, eivät saata pääs– tä pola siitä kousan seinämien kautta, vaan ovat pakoitetut kulkemaan sen taaemman avonaisen pään kautta. Yhteistoiminnassa kousan taaemman avonaisen pään kanssa käytetään siir– tovyötä P, Jonia alempi pää kulkee Johtavan pyöräkkeen p ympäri sovitettu– na kousaan, ja jonka ylempi pää kulkee samantapaisen pyöräkkeen p1 ympäri sovitettuna paraiten veneen peräpuoleen. Tämä siirtäjä johdetaan pyöräkkei– l p den p p ÏÏÏÏÏKS välissä etäisyyden päässä pitävien välitelojen pc avulla sovitettuina sivujohteislin p jotka ovat sijoitetut kujein omalle puolel– leen siirtäjästä. Siirtäjävyö on, sen parempana pidettävässä muodossa, laadittu kahdesta üaâöfrfcomasta hammasketjusta p, mitkä kulkevan hampailla varustettujen ketjujen ylipyöräkkeiden p p1 vastakkaisissa päisaa, Jolloin mainitut c ffiammastetut ketjut ovat yhdistetyt toisiinsa tankojen p7 avulla muodostaen etumaisen pinnan* Pyöräkö p1 saatetaan liikkeesen Ja,yhdistetyn hampailla saattaa varustetun ketjun avulla, 3XXSX and liikkeen siirtäjään. Salat jotka Çydyst.e tyt kousaan ja kulkevat sen avonaisen taaemman pään kautta saatetaan siir– täjän avulla ylöspäin ja sen ylemmän pään yli ja putoavat toiseen siirtä– jään Q,, laadittu samalla tavalla kuin siirtäjä P Ja pidettynä liilckeessä samalla tavalla, siirtäjä percent Jättää kalat pääkannelle B Jonkun verran perä– puolelle ja asentoon jonsa KSZXÄliäääXialXiliaxiÄX veneen miehistö saattaa SS lajitella tai muulla tavalla käsitellä.ne. Jotta kalat niiden

kulussa ylöspäin siirtäjällä eivät voisi pää9tä pois tämän sivuista, ovat sanotun siirtäjän sivut varustetut verkkolaite– rakenteella, mikä on kousan yhteydessä selitetyn verkkolaitteen näköinen, koska Kuitenkin on,SMSX1SJS.M. k.ousa on laadittu kohotettavaksi ja alaslasketta– vaisi,verkkolaite siirtäjän sivuissa paraiten laadittu pystysuorasti ales– laskettavaksl semmoiseen määrään, että se tekee tämän, kousan liikkeen mahdolliseksi. SivukisXot tai johteet –g? ovat jäykästi kiinnitetyt etumaisista alemmis– ta päistään kousan runkokehykseen, ja ovat taaemmista ulkoisista päistään na3tayhdigteessä akselin kanssa joka kannattaa pyöräkettä p1. Tämän mukai– sesti Johtaa kousan kääntyvä liike nastan ympäri sanottujen slvukiskojen * Ja niihin yhdistetyn siirtäjän , p*5 samanaikaiseen samallaiseen liikkeesen. Kunkin sivukiskon $£X££ p–5 päi– den välissä on nastayhdisteessä toisen verkiolaite3ivun ylempi kisko R. Kiskot H johtuvat kousan taaempaan päähän, kuten osoitetaan kuvassa 7, ja tehdään paraiten Joko aineesta joia kelluu veden pinnalla, kuten puusta, XI?w tai ovat sopivasti varustetut ponttooneilla, niin että ne säännöllisesti tulevat nousemaan vedenpinnalle. sivuki and koihin R, Ja kunkin päiden välissä, on nastojen avulla kääntyvästi yhdistetty alemmat Jcisfcot R1 Jotka ovat yh– distetyt lähellä niiden vapaita päitä ylempiin kiskoihin R niveltävän pai– jinyhdisteen avulla johon kuuluvat RlïSiaï Jäsenet r.r1 Ja rt (katso kuv. 1 ja 7a)* Vinosti johtuvia lankoja, vastaten lankoja n Ja o, kannattavat kiskot R R1 ja jäsenet r,r* ja r2, kuten osoitetaan kuvissa 1 ja 7a, siir– täjän sivujen sulkemista varten,pääasiallisesti sen alempaan puoliskoon nähden, verkkolaitteella Joka on sennäkoinen mikä on selitetty kousan –sivu– jen yhteydessä. Siirtäjän ylempi puolisko or* suljettu sivuista lankojen avulla johdetut jäsenen S kautta, liikkuva nastassa sen ylemmässä päässä veneen rungossa, kuten kohdasta s, Ja sen alemmassa päässä yläkiskonn R nähden, kuten kosdassa s1* Tästä rakenteesta käy selville että, koska yläklsko on vedessä kelluva, langan silmä mikä ripustetaan siihen nivelten ja kiskojen avulla, kuten on selitetty, tulee säännöllisesti olemaan levitettynä kun kousa on aiespaine– ty/ssa ta upotetussa asennossa kuten osoitetaan kuvassa 1« kuitenkin on ylemmän kiskonvéohotua rajoitettu pidättävien jäsenten s2 avulla (katso kuv* 1), niin että sivuvälpan seinämien alemmat reunat eivät tule noste– tuiksi tarpeeksi tullakseen vedetyiksi pois Johteista ja päästääkseen kalat pois siinä Ä and saäXXaasSiÄXÄ muodostuneen välikön kautta* Kun kousa on nostettu pilkutetun viivan asentoon kuvassa 1, tulevat sivuvälpänseinämät siirtäjän avulla toisiinsa alespäin, Koska siirtäjä on ylösnostettuna, ta– valla mikä selitetään alempana lähemmin. työskenneltäessä matalassa vedessä, on mahdollista että kousan etumai– nen alempi reuna saattaa joutua merenpohjan kosketukseen, ja, jos ei väli– neitä käytettäisi estämään kousan etumaisen reunan sisäänkaiiva\itumi and t and, tulisi siitä epäilemättä olemaan seurauksena että se menisi rikki. Tästä syystä on kousan sanottu reuna varustettu eteenpäin johtuvilla varsilla t, joihin on sovitettu suuret pyörät tai rullat i laaditut kulkemaan merenpoh– jaa pitkin ja pitämään kousan etumaisen pään vapaana sen yhteydestä, öitä– paitsi –kousan etumainen alempi reuna varustettu eteenpäin johtuvilla nas– toissa liikkuvilla sormilla t* (katso kuv. 1,5 ja 7a), Joiden vapaat'päät ovat ylöspäin käännetyt alustan muodostamista varten merenpohjakohonnuksen ylitaemenon helpottamiseksi. Kukin sormi on varustettu pyörällä t2 sanotun sormen kulun helpoittamisekei, ja sivusuunnassa Ja taaksepäin Johtuvalla kalanluuverkkolaitteelia, jonka toimena on estää kalojen Joutumista kousan alemman reunan alle Ja Jotta niiden Johtuminen kousaan kävisi varmemmaksi. Kousan runkokeüys on varustettu useilla sisäänpäin johtuvilla veitsillä U, joiden terät ovat tehdyt Hyvin teräviksi. Käytettäessä näitä veitsiä tulevat kalat, Jouduttuaan kousaankirjaimeilisesti leikatuiksi kappaleik– si ja SS siten paloitetussa tilassa siirretyiksi laivan kannelle siirtäjän avulla. Pitkäaikainen kalastuskokemus ja kalan tapojen tutkimus ovat Johtaneet parannetun tavan keksimiseen kalastaa yöllä, minkä minä toteutan sen– kautta että sovitan veneesen yhden tai useampia vahvoja etsijavaloja V {katso kuv* 1 ja 2), mitkä ovat siten sovitetut, että niiden säteet leikki– vät vedenpinnalla veneen etupuolella Ja sen tiellä« KUn valonsäteet heite– tään eteenpäin, leviävät ne siten, että säde käy leveämmäksi aina sen mu– kaan kuin se johtuu kauvemmas veneen fi etupuolelle. Pimeänä yönnä saattaa tämä säde melkoisen kirkkaasti johtua useita penikulmia eteenpäin, valais– ten vedenpinnan tällä etäisyydellä r akeeflgfi*€>tse4?ia–iti.41–lola, jonka kär– jessä vene sijaitsee* On äyrin tunnettua että kala tulee valoon päin yöllä ja sentakia tulee houkutelluksi valon vaikutteesta vetäytymään rakeenmuo– toisesti valaistuun piiriin. Koska vene liikkuu eteenpäin tulee kartion leveys kustakin kohdasta veneen etupuolella SXSfiSSS kapeammaksi, niin että kalat tältä kohdalta, niiden pysyteiiessä valaistussa piirissä,tulevat lä– hemmäksi toisiaan ja, sinä hetkenä Jolioinka vene pääasiallisesti on niiden päällä, tulevat ne vedetyiksi kousan avonaisen SXSÿ etusivun rajojen sisä– puolelle. Lamput JS V pvat paraiten siten asetetut, että kousa ei ole va– laistu säteiden sattuessa veteen kousan etumaisen pään seutuvilta. Sinä het– kenä joliolnka kss vene on tullut kyliaksi lähelle kaloja jotka ovat välit– /ft2' töffesti sen etupuolella niin että valo Joutuu sanottujen kalojen ulkopuo– lelle, tulee kousa välittömästi ympäröimään ne ja nliâen pftlspääseminen käy mahdottomaksi. Tällä tavalla vetäytyvät kalat suurelta alalta yhteen lähenevän valon vaikutuksesta ja kerääntyvät välittömästi kausan tielle, lamput V voidaan sovittaa eri kulmiin tai voidaan ne'siten sovittaa että niiden säteet ris– teyttävät toisensa jotta säteelle saataisiin aita suurin hajaantuminen Ja leveys– Tämä tapa suunnata kalat veneen toiminnan piiriin muodostaa paran– netun menettelyn kalastaa öiseen aikaan. Patenttivaatimus. 1. KaJastusvene, tunnettu siltä että se on varustettu aleslaskettavalla kaloja keräävällä kousalla muodostettu suljetulla pohjalla ja on läpeensä ¦jäykkä, sekä välineillä pyydystettyjen kalojen siirtämistä varten kohtaan laivan sisäpuolella. 2. Patenttivaatimuksen 1 mukainen vene, tunnettu siltä että kaloja ke– räävä kousa on pohjasta suljettu ja varustettu lävistetyillä seinillä, //// läheten toisiaan taaksepäin menevään suuntaan. 3« Patenttivaatimuksen 1 mukainen vene» tunnettu siltä että siihen kuu– luu »laakin yksi aluslaite Joka Joutuu kousan etumaisen pään ulkopuolelle ja kuljetettuna eteenpäin kousan avulla Jotta kousa tulisi estetyksi va– hingoittumasta Joutuessaan uponneiden esineiden tai epätasaisen merenpoh– jan kosketukseen. if. patenttivaatimuksen 3 mukainen vene, tunnettu siitä, että siihen kuu– luu pyöräke yhdistettynä aluslaitteesen. 5. Patenttivaatimuksen l mukainen vene, tunnettu siitä että siihen kuu– luu välineitä nastoissa liikkuvan kousan vastaviiputusta varten Joina käy– tetään painoa Joka on toimivasti yhdistetty kouaaaa Ja sovitettu lui– sumaan ontossa mastossa varustettuna sisäisellä kulkutiellä avonaisena alapäästä mereen päin, Jotta senkautta, Jos paino sattumalta irtaantuisi, tämä paino voisi pudota mereen vahingoittamatta venettä» 6« Patenttivaatimuksen 1 mukainen vene, tunnettu siltä että siihen kuu– luu useita venerunkoja, Joiden väliin keräävä kouaa on nastayhdlateen avul– la kiinnitetty, Jolloin tämä Jälkimäinen on säännöllisesti upotettuna vedenpinnan alle. 7» Patenttivaatimuksen l mukainen vene, tunnettu siitä että siihen kuulu välineitä sovitettuna veneesen Ja vedenpinnan yläpuolelle Jotta kaikkina hetkinä voitaisiin heittää viuhkantaeainen valo eteenpäin vedenpintaan määrätyn etäisyyden päähäß veneen etupuolelle tarkoituksessa

saada kalat vetäytymään veneen tielle Ja samalla valaista sen kulkutietä. 8. Patenttivaatimuksen 1 mukainen vene, tunnettu siitä että siihen kuu– luu välineitä sen laajuuden rajoittamista varten Johon verkko tai kousa on upotettava. 9. Patenttivaatimuksen l mukainen vene, tunnettu siitä että kousan sei– nämät ovat yhdistetyt useista osastoista tehdyt kalanluurangontapaisesta verkkolaitteesta, Joista kukin osasto on varustettu sivusuunnassa ja taak– sepäin Johtuvilla etäisyystangoilla. 10. patenttivaatimuksen 1 mukainen vene, tunnettu siitä että siihen kuu– luu välineitä yhdistettyinä kousan etumaiseen päähän Jotta se estettäisiin kaivautumasta merenpohjaan kun vene on matalassa vedessä. 11. Patenttivaatimuksen 1 mukainen vene, tunnettu siltä että siihen kuu– suurten luu välineitä kalojen automaattisesti tapahtuvaa leikkaamista varten nii– den pidättävän tehon estämiseksi. 12. Patenttivaatimuksen 1 mukainen vene, tunnettu siitä että siihen kuu– luu välineitä veneen kuietusta varten sen pituus Ja sivusuunnassa, Jolloin sanottuina välineinä käytetään Järjesteltäviä kaksoissilplpyöriä. 13– Patenttivaatimuksen X nuhainen vene, tunnettu siitä että verkko– laitteen elementtiin kousussa Kuuluu jaettu tanko jonka osastojen väliin useampien lankojen päät ovat yhdistetyt, jolloin sanottujen lankojen suu– remmat osat Johtuvat tangon reunasta yhdensuuntaissuhteessa Ja vinossa suun nassa tankoon nähden, kuin myöskin välineet lankojen kääntyvän liikkeen estämistä varten tangossa. 1. Tapa kalastaa patenttivaatimuksien I–13 mukaisella veneellä, tunnet– tu siitä että voimakkaasti valaistaan määrätty pinta–ala vedessä valoläh– teestä joka sijaitsee vedenpinnan yläpuolella, minkä kautta kalat vetäyty– vät siten valaistuun, vyöhykkeesen, että saatetaan valaistu vyöhyke liikku– maan eteenpäin ja samaan aikaan saatetaan toimintaan kalankiin– niottovälineet vedessä valaistun alueen takana. Iyfceck Ocean Harvester Co., inc. r, – * 4. IOfIBUteslkaierafru and veneiaaae. an object of the present invention is a fishing boat and it means improvements in fishing activities and instruments. The main purpose of the present invention, although not exclusively, lyhykkaeisyydessae can be

summarized as follows: 1 To develop improved devices of the ship eteenpaelnkayttoeae for both the forward and lateral direction, of the ship as well as improved devices ohjaamls for these things, the operations. 2 means the fish collection of the ISA ship's path and its transmission on the deck on which the instruments on.edelleen connected to the means of transmission for the prevention of clogging. 3 power supply or the screen bar an improved structure, which means the fish collected mainly drawn up, which the AC adapter or the casing is constructed in such a way that it generates the least resistance to water flow in relation to the eyes or holes in said network device or Z and 5 vaelpaessae; and k means the fish collection of tools immersion depth of the regime, and tools combined with kalojakeraeaeviin instruments so that their tip should be prevented from digging into the bottom of the sea when operating in shallow in water '? "Furthermore, based on a feature of the invention, the improved procedure ka–loading at night, which is based on fish ISMAEaevetaemlseen using a strong seeker of light in the boat as a front vyoehykkeesen And in its path, collecting hours fish always possible to build in accordance with what the boat is traveling forward, and thus collected in the raising of fish in the boat. present invention further features, other than those listed in the inyoeskin its advantages will become apparent from the description here below, made in connection with the accompanying drawings. in the accompanying drawings, describes a variety of practical tote uttamismuotoja the invention, but their structures are assigned to Held–for–only illustrative of the invention and its rajaplirfcjae determinant. Figure 1 is a fishing boat who sivuoeievatsioni the invention. Figure 2 is a high level of it. Figure 3 is a bottom plan boat, shown in Figure 1 Figure 4 taken from the rear end of the boat elevatsioni. Figure 5 is a front elevatsioni, which shows the fish collecting means for hull and the upper part of the plant. Figure 6 is a cross–section through the vessel, pystysuoralstasossa, taken along the line 6–6 in Figure 1 Figures 7 and 7a are concentric cuts in the fish collection of instruments pa–ft r / observed as increased beta–held form in Figure 7a presentation of the front portion of said means, at the same time when ill. 7 shows a portion of the rear seems, said in Fig. JfiS 7 is an enlarged scale, a greater clarity to achieve. is to be understood that FIG. 7a is shown in Figure 7 Extension indicated structure. Figure 8 is an enlarged special part of the section line along the lo–lo in Figure 7a. Figure 9 is a similar special section line 9–9 of Figure a Figure lo is a special plane from a network or a fish bone motion of the screen element form, which I preferred to use, and makes the smallest resistor in the path of the water through. Figure 11 is a view of the lo–looking description, indicating a somewhat modified form of kalanluurakenteesta. 12 is shown in Figure 11 elevatsioni addressed to the structure. Figure 13 is a fragmentary sectional addressed in Figures 1–6 the ship, said section being taken along the line 13–13 in Figure 1 Figure 14 is a pltuusleikkaua of an stems, taken along line 1 H 14 along Figure 13 Figure 15 is a section along the line 16–16 in Figure 3, showing some of the received silpipyoeriae front elevatslonissa. Figure 16 is a section along the line 16–16 in Figure 15 Jixi Figure 17 is a plan view of one of the bars to get an external,'s who are used to support the kalojakeraeavaet tools. Figure IS is a special segment cutting through ynden siipipyaeraen, kuteo along the line 19–19 in Figure 15 Figure 19 is a bottom plan view of a single boat hull, discloses using novel features of the present invention "Figure 2o is essentially concentric, vertical section indicated in Figure 19, the boat through. Figure 21 is a front elevatsioni in Figures 19 and '2 No addressed to the water medium. Figure 22 is a section on the line 2G–23 finishes in Figure 2o. Figure 23 is a cross–sectional view along the line 23–23 in Figure k2, and Figure 24 is a section indicated in Figure 23 looking, but showing a modified form of the structure, connecting the ship's wings. reference to the drawings showing a number of ship hulls, asetettui as yhdensuuntaissuhteesen to each other, the side sivussahtelsen cover B through which the cover is because all frames over and extends paraiten somewhat sideways, I8ae the bow and stern side, as is clearly shown in Figures 3 and 6 All the frames are built equally and have the general structure, as shown in Figures 19–23. Each frame is provided with a substantially straight, vertical sides, but it is usually a small boat shape concentric, pituuslaepileikkauksoessa. Frame side numbers are skkljyrkae3tl ales and end emaepuihin essentially a horizontal, being under practical point of view, taken through the entire body length. The internal cutting such ones formulation thus forming a body having a lower 3ivu a longitudinal direction of the gutter equipped as in the relatively shallow groove at the bow and stern, such as paralten shown in Figures 2o, 21 and 22, and a relatively low groove midships, as shown in Figure 23 jQhtuon back of the boat nnja each of the four–ke3klemaepuusta kaytstaeaew pavaecHbttts, jotai supports the lower end of the standard euutoeiiaula cx, peraesinpylvaeaen Due to the upward and forward, and is mounted for swiveling the back cover.. It is essential that these two calcium–buting to the rudder either one or the other direction and X and H iS days and at the same angle ss is operating in parallel relationship at all moments, and so that the EV–visi paralten confident they are connected to each other between their ends by means of a rigid nivelSIT. If several frames A is set to each adjacent as shown in Figure 3 is niveTV * of dissipated across all of the rudders so that when one rudder is in operation, are all jaeieilae the same time, my revolution so that they remain in parallel relation to each other at all times. Available in different ways with the rudders can be activated, but mi as I prefer to use it as a general reconciliation, which is shown in figure 3, where the rudders to your shop available on ropes or chains g2 is used to attached my / eleesen c1 And due to the boat's stick saatettavik– si activities suitable guiding means. an improved trough body equipped with the present invention can be used to yksrunkoisessa or useampirunkoisessa the boat, and in all cases the blades can be called individually placed in circu one or more of the potkurislipien I–c5 using suitable compounds used, such as is shown in figure 2o. When the trough body equipped with ykaeirunkoisessa the boat structure is used in the designed for use in well–aaltoilevas in the ocean, the body may be a ship equipped with wings a1, as shown in Figure 24, though these may be omitted, if desired. When the number of frames described model of nozzles is arranged under the lid, as shown in Figure 3 and 6 can be called to your shop blades may individually or independently by means of propellers as described, or can be used to further drive means. I think this is according to the invention used with good boat speed and are, therefore, used using additional tools, so that the desired speed can be achieved. This instrument is shown with the number of impellers E form, which one y * 3l series has been adapted for a row with the limit advertising in between the hulls, Tuten shown in Figure 3 for each number of these impellers can be fulfilled, but, the presentation in relation to ogoi used two rounds of ammunition, mainly due to bow to stern, the two housing between the pair while the other is adapted to address pairs of seaweeds jaelellaeo between nautoparien. The use of multiple impellers, each other in the back, so that the whole series He has to bow to stern, YL and SlXX would be after another the following impellers viewed from bow to stern kept moving the

ever−increasing speeds. That is, if ensimaeiaen slipipyoeraen to do loo will be the second wheel to make a greater number of thread−tion, for example, Joy tal 12o And the third slipipyoeraen should do 13o, to l4o: Een Etc. tfaemaet patterns are, of course, merely explain, but used them to make the action selvaeisi, seeing, If all the impellers affected at the same rate, would such a rapid water to pour into between frames, fitted with ensimaelsellae five rotating blades in the perceive;, on wheels should not be any Special Parts prefer to be held in the form of impellers shown in Figures 15.16 and IS. Each impeller D is equipped with a hollow hub d, prepared in a hollow, air−tight cylindrical form By whom Due for use in dA shaft, stiff kiinnikiilattuna ends of the hub. The hub opposite ends are provided with flanges d2, and due to the radially external perimeter of the hub circuit is used d5 leaf blade, as shown in Figure paralten S, wherein the opposed ends of the leaves are paralten rigidly assembled to the flanges d2. Used for the X axis d1 is arranged for pivoting movement of the two arms E, through which the second ends Due to kaeyttaeakseli E (kat3Q in FIG. Of 15 and 16). E Kayttoeakaeli adapted to be used suitable machinery of one or both of the abutting frame, and the rotary motion is transmitted to the driven shaft kaeyttoeakseiista E d1, the gear 1 2 e aetyailae and a co−operating tooth chain by means of e. This structure when using noticed that since slipipyoeraen hub d is air−tight, it's going to float, and to prevent the impeller from sinking utterly under the water. In practice, is mainly due to only half of the wheel under the water surface, and fitting the wheel, rotating shafts e, may be called at all times to adapt to the bike itself, turn the water surface, which clearly changes the boat, the fingerings. It may be on full alert can sometimes increase the impeller D batches surface of the water, and for this purpose as paid ii d, lifting the lower hinge wearing used for the shaft d * due to the upward through the deck of your boat B. Using a bolt dy / v / it.. O what works in connection with the joint d and d is connected to its guide, to the impeller, slttenkun it has been elevated as necessary, to prevent from getting into before the stipulated S item below. In order not to damage the impeller hylkytavarolsta, ice, etc. because of angle j ohon relates the input shaft E paralten tubular sleeve i via puts is rigidly fitted to a number of protective ribs f, which result from a short distance yhdensuuntalssuhteessa swivel arms with respect to e and, in relation to the part of the jaeleilaeoievaan ulottuvaisuutta, adaptive slipipyoeraen fUXfiiaeSSft the external periphery of the circuit, as shown in Figure 16 is due to the rod r1, all of these protective Through the bars and is anchored at its ends pivotally to the arms so as to maintain the slats in proper protective position in front of slipipyoeraen. Iiiinmuodoin olkoompa impeller at any operating position kaeytetaeaen'sanottuja ribs varjeluspoelkkyinae always protect a wing of the leaves in C? from damage. It is often necessary to be able to use the paddle wheels are already the kind described parittaln, and conduct a mince and considerably time to get this address is indicated in Figure 15, in which two sllpipyoeraeae D is arranged beside each other in a common driven shaft d1, which may be my revolution yhteiaeen drive shaft S, in which case a simple suspension members used to stay, understood, both wheels in the raised position, the rabbit is desired. Both blade wheels adapted as shown in Figure 15 will have an impact on individual manner and substantially in the same way as any single wheel, except that the more forward using the force will be generated impellers used Adjustment can be transmitted by the desired manner of any suitable axis line or the immediate compounds by means of several motors or machines, but it is not necessary to show these private parts, seeing Equipment for the operation of the impellers is well known and form no part of the present invention. boat dock with In implementing more of the already discussed laj1311−la trunks to all the parts of which are listed below in fishing activities for the implementation of the boat to make sas somewhat difficult to be handled, and is considered to be remarkable, allowing use of a less costly means of boat handling heipoittamista for tight spaces. For this purpose, I use a number of £ s sivupotKureita G fore and aft, With the rank is indicated as in Figure 3i »inka by yfcsityiaosat are shown in Figures 13 and 14 Page impellers G may be paraiten operation of the two; through it that they are within a common driven shaft g, which is supported either pushing movement of the pivotable arm g1 pin with the compound attached to the to the drive shaft G2, due to the bows and A and aft, and which Used for frame the appropriate machinery. Note transferred meets the axis G2 inflatable atseliin g of Hammastetaun g is used, and the impeller is standing or k may be necessary to lastea g of mud compounds of the joint by means of signals corresponding to full forward of the impellers D niveiyhdlsteitae d. Sivusiipipyoe volumes 0 differ tuitentin ratenteeltaaue impellers D in that the teat previous supplements paralten is produced only four newspaper Tuten shown to changing 13 so that, when the blade wheels vaitutusta not desired, they may be increased up to yt3i the leaves of faults impeller due to the tannes3a of the car Through, at the same hour, both next to the leaves that maintained tiinni Tannen underside. In this way, impellers G can be lifted out of the water, so that they do not prevent the entry of the boat ahead of its regular operations. Kultentin known not want to be put on a boat to telatalle impellers G lastea down to a working position in water and may need to iron boat in Appendix taeaentaemistae for lateral telatal−le. An instrument for filling the boat sideways inyoestin transmit a second task of the boat taerteaen taeytaennoellisessae operation. If the boat tultee ahead and talaparvi appears relatively close to the boat, but in the lateral direction of the boat arrived at the direction of, is that taerteaetae in the boat can be quickly sideways in Appendix 2, the tartoitutsessa that it immediately or headlong upon talaparven. As a muddy tetee boat With this instrument can be mahdolllsetsl lateral annexes to be achieved this result, it is thus clear that the instrument semmoinen full ilaISX velocities of the other elements, so that it can be taeyttoetelpoisuus with respect to the combination of totonaisuudessaan. paralten As indicated by the breeding 1−4 make up the front of the boat and arranged to less than 1 kousa Members having essentially the art of straight−shaped funnel shape, larger open end of the ply is located on the front − side. Kousalla l is Tuten shown piirustutsissa skeletal shape which is adapted to seneesen pittien the joints J of jaeytaeaeti combination Hondasta tehytseen ("j" which is caused taatsepaein under the boat and taeaentyy taeaentoenaatassa both uitoisten runtojen flank of the feet, Tuten From j1 power tea−tiia yeast rear side tohdalta, Tuten paraiten indicated by the breeding l, 3, so that kousa may be submerged or immersed in a smaller or to a larger depth of turning said tousa joints J order vaituttavat pin J1 round. kousa is regularly hung, the appropriate depth of at several nostaviirPltoeygitn I, the measurement of made toeysipyoerien> 5 strains Dual boom K, as paraiten shown in Figures 2 and 5 Bars maintained concerned, etaelsyyssuhteeasa ultopaeistaeaen also undermined the distance from the hold of compound T through, and taeaehtyvaet the slseiumlss at the ends of pins, Tuten t1 tohdi3ta, boat paeaetanteen. Abstract:
Source: GB600565A 600,565. Winding yarn and c. ABBEY, A. (Universal Winding Co.). Nov. 8, 1944, No. 21996. [Class 120(ii)] A yarn and c. winding machine of the type having packagesupporting means, driving means, preferably a driving drum, for rotating the package to wind on yarn from supply, end–finding means for finding an end of yarn prior to its being united to the yarn on the package and detector means for detecting breakage or exhaustion of the yarn, includes a composite structure comprising the end–finding means and a knotting means, the structure being controlled by the detector means to retrieve the yarn end and unite it automatically to the end of the yarn on the package, the composite structure being stationary in relation to the package–supporting means. Yarn y from a main supply bobbin s is led through a notch 240 in a guide plate 241, thence between tensioning discs 238, 239 and through a detection and reserve yarn supplying device 244, 288 to the opening of a slub–catcher 250. From the slub–catcher it is led under a guide wire 258 and beneath a bar 102 of a weighted yarn–breakage or exhaustion–detecting device 103. From this latter detector, the yarn is led by way of the traversing grooves 11, 12 of a package driving drum 10 to the cop tube C to which it is attached by any means, the tube C being carried by an arm 14 which may be swung upwardly away from the drum 10. A reserve yarn y<SP>1</SP>, to be used when the yarn y becomes exhausted, from a supply s<SP>1</SP>, is led over the limbs of a guide wire 263 and its end attached to a transfer arm 290 where it is held by a gripper 291, the end of the yarn y<SP>1</SP> being severed by a knife 295. The arm 290 is held in an inoperative position by a finger 283 on a shaft 280 engaging a detent on the arm 290, the amount of rotation of this shaft 280 being determined by fingers 288 which either grip the broken end lying on the top of the plate 244, or pass through gaps therein when the yarn y fails so to bring the reserve y<SP>1</SP> into position for connection to the package yarn. To begin a wind, a handle 206 is depressed to remove a detent pin 194 from an adjustable package measuring device 185 and allow the arm 14 to swing downwardly, under gravity, and the cop tube C to contact the drum 10. At the same time, an arm 134 on a member 122 is moved within the path of a stud 168 revolving with a shaft 65 to move a clutch–operating member 78 to remove a brake shoe 90 from the clutch member 22 and to engage the clutch 40 to cause the drum to be rotated from the drive shaft 16 at a relatively high speed. The turning of the member 122 about its carrying rod 110 moves an arm 115 to rock a member 107 so to swing the detector 103 downwardly and cause a bail–wire 272 connected thereto to engage the yarn y and draw it downwardly to take up slack therein (Fig. 3). The release of the handle 206 allows the arm 134 of the member 122 to engage a lug 138 on the clutch shifter 78 and the member 107 rocks to allow the detector 103 to engage the strand y and the bail wire 272 to resume its inoperative position. When a slub wedges between the plates 247, 248 of the slub catcher 250, the yarn y is broken. The detector 103 then swings upwardly under the weight 112 and the member 107 is rocked to position the wedge–shaped head 120 of an arm 116 on the member 107 against a collar 68 and sleeve 74 rotating with the drive shaft 65. Abutments 70, 75 on the members 68, 74 then co–operate with the arm 116 to move the clutch shifter 78 to disengage the clutch members 22, 40 and so disconnect the drive from the shaft 16 to the drum 10. At the same time, the member 107 is moved and, through the arm 115, moves the member 122, the brake shoe 90 being applied to the clutch member 22 to bring the drum 10 to rest. Continued movement of the sleeve 74 brings a rotating member 85 thereon into driving contact with the clutch member 22, to rotate the drum 10 in the reverse direction so that the package P is rotated in an unwinding sense, the brake shoe 90 having been released by a co–operating stud and cam–like slot. As the shaft 65 continues its rotation a lug 153 on the collar 68 thereon contacts the arm 116 to tilt the frame 107 backwardly to be held in that position by a latch 158 engaging a finger 111 thereon. The abutment 75 also contacts the arm of a bellcrank lever 435 which is rocked and through a link 438 swings a valve member to open suction to a hose 355 leading to the end–finding tube 325 and nozzle 326, the valve being maintained open by a detent 445. The end–finding tube 325, which also removes lint and dust from the slubcatcher and c., is attached to a carriage 328 connectable, when the yarn ends are to be retrieved, to a shaft 329 reciprocated longitudinally and oscillated about its axis by cam grooves 342. 346 cut in the periphery and end face of a rotating drum 335. With the movement of the clutch–shifter 78 a cam cage 389 thereon moves a detent 383 to permit a spring–urged latching–pin 370 on the carriage 328 to enter a recess in the shaft 329 to connect the carriage 328 thereto and so partake of its motions. The end finder 325, in its movement to the left (Fig. 2) first locates a pinion 357 thereon opposite a rack bar 367. The shaft 329 is then

oscillated to bring the rack and pinion into mesh and further movement of the carriage 328 then rotates the endfinder 325 to a position adjacent the slubcatcher 250. This rotation of the endfinder brings an ear 501 on the suction nozzle 326 to rock a detent lever allowing the shaft 280 to rotate and bring the detector fingers 288 to engage the yarn end lying on the plate 244. Further rotation of the end finder 325 brings the nozzle 326 into contact with a re−setting mechanism to raise the fingers 288 above the yarn y and at the same time, through a hooked member 319 to lift the upper tension disc 238 away from the lower disc 239, and relieve the tension in the yarn. Simultaneously the re−setting frame rocks the upper blade 247 of the slub−catcher 250 to enable the nozzle 326 to withdraw the yarn end therefrom, an arm 315 on the frame moving upwardly to contact the yarn y and bring it towards the nozzle. The cam grooves 342, 346 now reverse the operation of the carriage 328 to bring the end−finder 325 back to its starting position but carrying the yarn end from the slubcatcher with it. During this motion the nozzle 326 is rotated towards and drawn along the surface of the package P, which it engages resiliently at all diameters by reason of the flexible armouring of the hose 325, so that it retrieves also the broken end at the package; the slubcatching blade 247 and the upper tension disc 238 being returned to their. operative positions. The end−finder 325, carrying the two yarn ends, is now moved across the length of the package towards a knotter 296 and, during this movement, the clutch shifter 78 is slid to disengage the clutch members 22, 85 and apply the brake shoe 90 to bring to an end the unwinding rotation of the package. As the nozzle 326 approaches the knotter 396, it engages a pivoted spring − urged "anti − stitch" member 467, which, upon the nozzle 326 being swung away from the package P, pivots back and engages the yarn y to prevent " stitches " being drawn over the end of the package. The nozzle 326 now moves beyond the knotter 396 and draws the two yarn ends between tension plates on the knotter. An abutment on the carriage 328 now engages a gear segment 400 to initiate the operation of the knotter and the latching pin 370 is partly withdrawn to uncouple the carriage 328 from its operating shaft 329 so far as longitudinal motion is concerned. The nozzle 326 is now rocked, the yarn ends knotted and the projecting ends severed. The shaft 329 is now moved towards the right (Fig. 2), the catch pin 370 is again projected into the shaft 329, the carriage 328 and nozzle 326 moving therewith, and the knotter is re−set. Suction to the nozzle 326 is now cut off. Further motion towards. the right moves the yarn y, by engagement therewith of a hook 480 on the carriage 328, towards the centre of the traverse drum 10 so that it may be picked up later by the grooves 11, 12. The clutch shifter 78 is now operated to re−engage the clutch members 22, 40 and remove the brake shoe 90 to permit normal winding to beginagain. The detector 103 is now moved raising the bail 272 to engage the yarn y to take up slack therein and cause it to slide under the yarn guide wire and between the blades 247, 248 of the slubcatcher. The hook 480 is then moved to release the yarn and the latch pin 370 is withdrawn to uncouple the carriage 328 from its driving shaft 329. Upon failure of the yarn y, the detector 103 moves, as above described, to cause the end−finder 325 to swing towards the slub−catcher 250 and the shaft 280 is unlatched to allow the detector fingers 288 to move towards the plate 244 and, since there is no yarn end thereon, the fingers 288 will pass through gaps in the plate. The frame 285 is thus released and the reserve strand y<SP>1</SP> will be dropped into a position where it can be picked up by the nozzle 326 and knotted, as above described, to the package yarn, the reserve holding arm 290 being returned to its original position. The exhausted supply bobbin s is then replaced manually by a fresh supply. Winding continues until the adjustable sizing−member 185 rides off the knock−off member 190 which then rocks to cause its end to engage the abutments 69, 75, to move the clutch shifter 78 to disengage the clutch members 22, 40 and apply the brake shoe 90 to assist winding, the wound package still resting on the driving and traversing drum 10. Doffing is then effected manually. In a multiple unit machine, the above mechanisms are repeated for each unit except that a single reciprocating and oscillating shaft 329 moved by a single cam 335, grooved at 342, 346, actuates the mechanisms of each unit. Abstract:
Source: GB341017A 27021. [Classes 106 (i) and 106 (iv).] Recording–mechanism is set by liquid–delivery apparatus, actuation being completed and the mechanism returned to zero position by a single member. As shown in Figs. 3, 4, 5 a cam rotated by the pump crank closes a mercury switch once for each half gallon delivered. A solenoid 88 is thus energized ; a pin 84 on the armature 86 draws forward the arm 80 of a bell–crank lever and engages a pawl 76 with a ratchet wheel 72 inside the type–wheel 10. When the solenoid is de–energized, a spring 82 causes the pawl 76 to advance the wheel 10 by one–tooth space. A pin 108 then ceases to obstruct a three–armed lever 110 which rocks under the influence of a spring blade 112 and lifts the depending arm of the lever from engagement with a notch in a lever 18. The type–wheel is mounted in a pivoted frame 12 and may now be raised by depressing the lever 18 thus making contact with a paper strip 22 and ink–ribbon 28. A second pivoted frame 30 is formed with a bar 34 which bears on the frame 12 and carries on an extension 38 a spring–restrained pivoted hook 40. When the lever 18 is actuated, the hook 40 swings clear of a pin 42 and engages a pin 44 on which is a catch 46 engaging a notch in the edge of the cash drawer 36. As the hook 40 falls with the return of the lever 18, the catch 46 is withdrawn, and the drawer opens automatically due to the engagement with a part thereon of a spring–impelled bar 54. A pawl 58 on the bar 54 at the same time rotates a ratchet wheel 62 on the spindle of the paper reel which is thus advanced. A cam 66 rotated by an external knob serves for lifting the pawls 68, 58 to allow a completed reel to be withdrawn. The lifting of the wheel 10 permits the spring 82, after advancing the wheel by means of the pawl 76, to lift the latter from engagement with the ratchet teeth leaving it supported by the upper end of the projection 106 carried by the armature 86. A tail–piece 59 lifts the retaining pawl 74 and allows the wheel 10 to swing back to zero under the influence of a coil spring 70. The zero position is determined by the engagement of the pin 108 with lever 110, which also relocks the lever 18. The blade–spring 112 also 'acts as a switch contact for a lamp 116 illuminated during the recording operation only. Any number of type–wheels may be included in one casing, each wheel carrying corresponding type for indicating the amount and price of liquid delivered, together with the pump number. Duplicate records, one of which is to be torn off, may be provided by adding a reel 122, Fig. 11, carrying a strip which passes beneath a roller 124, through a curved guide 126, beneath the platen 24 and out through a slot 128. The roller 124 is geared to the spindle of the first paperreel so that the second strip moves about six times as fast as the first. The ink–ribbon is led between the type and the second strip and back between this strip and that to be retained in the apparatus. In a modified construction, electric control is replaced by a Bowden wire, and the lever 18 by a hollow lock–barrel actuated by any one of a series of keys, the record made indicating which key–user is responsible. The insertion of a key 140 into the pivoted hollow lever 158 first pushes aside a catch 162. The lever 164 is thus released and falls forward until its end snaps into a recess in the underside of the key and prevents withdrawal. The spindle 170 of arm 164 carries an arm to which is connected a pivoted hook held by a spring in the path of the pump plunger which is thus released for operation by the movement of the arm 164. A lever 182 pivoted to and passing into the hollow lever 158 has its upper end in the path of the key, while a pin 186 abuts against a second lever 188 also pivoted to the hollow lever 158. The movement of the key against lever 182 allows lever 188 to swing until a pin 192 on lever 164 is just above a notch 190. The pump–delivery mechanism sets the type–wheel through a lever 204 and slide 156 which acts on the lever 80 controlling the ratchet advancing pawl 76. The key is then depressed, lifting the type–wheel into printing position, and allowing pin 192 to enter notch 190. During the return downward movement the bar 188 swings down the arm 164 sufficiently to release the key 140. At the same time, the pawls 74, 76 are released by a weighted detent 208 formed as a bell–crank lever rocked by a cam on the slide 156, and the type–wheel returns to zero under the influence of its enclosed coil spring. The. paper reel is advanced by pawl 196 mounted on a slide 194, having a pin and slot connection with the end of the hollow lever

158. In order that the keys may print distinctively, type−levers 212 corresponding in number and outline to the keys are pivoted at 214. Printing and the return to zero position may be effected automatically by the return to initial position of an operating member of the delivering apparatus. Electromagnetic means may be so employed, or the hanging up of the delivery nozzle may be the actuating medium. The Provisional Specification describes a construction in which operation is effected by a sliding bar having a V−notch engaged by a link depending from the platen mechanism. As the bar is withdrawn, the end of the link is lifted, trails along a serrated portion and drops into a semicircular notch. A small pivoted dog is drawn along by the link, and prevents reversal except at the extreme positions by jamming in the serrated part of the bar. Rack teeth are also formed on the bar and mesh with a pinion for turning the paper feed rollers. A ramp formed on the bar disengages the pawl holding the typewheel, and permits the latter to return to zero. A small projection advances the ink−ribbon. The paper strips are wider than the type−wheel permitting signature by the attendant, and the use of different price−scales, and affording a blank zone for use where liquid is to be withdrawn for a purpose other than sale.

Abstract:
To facilitate road–side parking, a vehicle's dampers (2) are adapted to perform a second function, in the parking mode, in order to bounce the vehicle on its tyres by converting the vehicle's dampers (2) into hydraulic rams to produce vertical acceleration. Spring loaded, telescopic, struts, pivoted to the underside of the vehicle's body are lowered diagonally and, as the vehicle descends in the bounce cycle the struts grip the road surface and push the vehicle horizontally while it is intermittently airborne. The piston rod (16) of the damper (2) is composed of two coaxial pipes (50, 56) and conveys hydraulic pressure fluid sequentially to and from the damper's lower (54) and upper chambers (56). The escape holes, which control the passage of fluid through the piston (14) in the travel mode of operation, are automatically blocked in the parking mode.

Abstract:
Source: GB698868A 698,868. Differential switches. METROPOLITAN RAILCARS (GANZ PATENT), Ltd., and LEHEL, V. Dec. 18, 1950 (Sept. 24, 1949], No. 15027/49. Class 38 (v) [Also in Groups XIX and XXIV] A balk device responsive to changes in the relative speed of two rotating shafts, e.g. 5, 6, Fig. 1, comprises two or more friction clutches which release balk members in successive stages as predetermined speed ratios obtain between the shafts, permitting stepwise movement of a control number 3, which movement may merely indicate when a predetermined speed–ratio condition exists ; may be used as a safety speed governor where the shaft 5 is driven by a synchronous motor, or as part of a switch gear controlling paralleled alternators; or to control engagement of gears or dog–clutches in a vehicle change–speed gear. Fig. 1, which is explanatory only, has a single balk member 1 with limited circumferential freedom on splines 20, Fig. 3, associated with a gear wheel 8, driven by the shaft 6, and comprising one element of a cone or multi–plate friction clutch, the complementary element of which is a bevel 9 geared to the shaft 5. Relative rotation in the direction of the arrow 14 turns the balk–member 1 to one limit position, in which the apertures 23 therein are out of register with axial keys 21 on the control member 3 which latter is thereby prevented from axial movement, and pressure thereon engages the friction clutch. Relative rotation in the opposite sense turns the balk–member 1 to its other limit position in which its apertures 23 permit axial passage of the keys 21, thus allowing movement of the control member 3. The multi–stage balk devices are described only in relation to controlling engagement of gears and dog–clutches in a vehicle charge–speed gear (see Group XXIV).

Abstract:
Source: US2008161968A A unique piece of engineering device "BT' Smart Machine" (BTSM) is described with the capability of lawn mowing, leave blowing/vacuuming, snow blowing, and general purpose blowing/vacuuming with other extra functionalities such as vehicle jump starter, heavy duty air compressor, vertical trolley, horizontal trolley, and outlets for AC and DC devices. BTSM' uniqueness lies in the fact that it can be run in manual (semi–automatic mode) or automatic mode (hands free mode). In manual mode (semi–automatic mode) BTSM anticipates and helps you along the way while in full–automatic mode BTSM does the work for you while you are home away from home or simply use that time to do something else and with a minimum of 10 to 12 hr uninhibited rechargeable battery life, BTSM has more than enough power to traverse your entire compound. In addition to all that, BTSM also runs off of solar energy which further maximizes battery life.

Abstract:
Source: US2016030856A The distillation reactor consists of a reactor apparatus with corresponding method of upstream distilling and purification of carbon based liquid or liquidized streams for use as fuels, lubricating oils and or gaseous energy and electricity production. The distillation reactor consolidates the atmospheric and vacuum distillation processes along with desalting, defueling, deasphalting, fractionation, thin/wiped film evaporation and Hydro finishing into an advanced high velocity, high volume single reactor system. Carbon based feed streams include either a single stream or preferably, a combined stream of liquefied coal slurries, crude oils, spent oils, Pyrolyic oils and or peat or other plant carbon derived liquids, vapors, mists or gases. The method further consists of controlling the mix ratio, flow velocity, sequential fractionation and filtration technology and processing atmospheres of the carbon feeds with the reactor apparatus. The combined apparatus and method allows for a refinery to consistently produce a finished barrel of oil well below traditional costs and at a higher efficiency than current art and prior art.

Abstract:
Source: US2004093817A A foundation framework for structures in a reinforced setting material includes a foundation raft with a form having a plurality of modular panels and angular reinforcements for joining at least two faces of at least one right−angle dihedral formed by faces of the modular panels. A layout and positioning template is disposed on top of the form of the foundation raft for correctly dimensioning, positioning, and fitting walls, installations and reinforcements in the foundation raft. Adjustment legs for centering the layout and positioning template are provided, as well as self−centering clamps and a stabilizer having security pins and an anchorage mechanism for securing the form to a support surface.

Abstract:
Source: US1884510A 1 "Having described my –invention what ‘I claim as new and desire to secure by–Letters Patent is 1– ‘ ‘ ¢ ' = ~1.'In' a muiiled–retort o1'e–oxidizing furnace, the combination of supporting walls with a plurality of retorts mounted thereon and provided with a plurality ofnonlconductive floor members, heat conveying flues, electric current circuit wires extending into said furnace to the said non–conductive iioor members, a heat conducting casing embedded in said non–conductive floor' lnexnbersj and an electrode Within said casing arranged to heat said casing. ' ~ i V 2.']fn an orepxidizing muffled–retort furnace, the combination with side and ‘ end foundation wall members of sz, pluralityoi vm retorts each comprising opposite side members, a floor member and a roof member, said 'side members each comprising a straight rec~ tangularly shaped piece of metal provided with a right angle foot member extending outwardly therefrom and resting 'upon said side foundation Wall members and _an inwardly projecting shelf member, and having its upper edge releasably engaged by an edge of said roof member, said iioor member being dishshaped transversely of its length and consisting of a Hat wide horizontal portion and opposite short upwardly projecting side edge portions, and outwardly extending lug members projecting from said side cdgeportions over and resting uponshelf portions of said opposite side foundation Walls. 3. Inj a muiiiled–retort ore–oxidizing fun nace the combination of supporting Walls with a plurality of superposed retorts there» in each comprising side members, an`o1e–0xidizing Hoor member releasably supported by said side members and arranged to be removed therefrom, without tearing 'down said supporting walls, and a roof incinber fitting on said side members ; said ore–oxidizing floor member having upwardly projecting side edges With Hat track members extending therefrom to the inside surfaces of the adj acent side members; and an ore moving' and stirring endless chain conveying mechanism within said retorts comprising a pair of end, less link chains mounted along the opposite sides of said retorts and connected to ayariable speed poiver operated mechanism ar~ ranged to move said chains in different predetermined periods of time through said retorts; metal rods connected at their opposite ends to the links of said side endless chains and extending transversely across the orc oxidizing fioors of said retorts; and ore shovels mounted loosely' enough on said rods to have a short adjusting movement thereon, said ore shovels having shoveling edges bearing against said iioors; and means including .re~ silient members for takingup the wear of said endless chains and–holding them taut. _ ‘ degrees ‘ _ ` 4, A mu.1iied_lt;retort ore–oxidiiing furnace comprising a. plurality of superposed 'retorts S5 ice 'iso pus 14 _i»,BB4,51f)t each composed of separatelside, floor and roof meinbcrs, the said ore oxidizing Hoof member of each retort being releasably attached to its side members and having upwardly projecting side edges carrying' track nielnbors so arrangedthat each floor member is dish–shaped, an ore moving and stirring endless chain COIlVEyl1'1g~~1ll€Cl12IILISIl1, the chains of which are mounted on said track 'members and the stirring members of which are arranged to moveunder the ore to raise it u and cause some of it to drop down on the ilioor behind them while pushing some of the ore ahead ofthem as they are moved with a eontinuously forward movement through said retorts, meansfor feeding ore into the uppermost retort, means 'fOF`WltllCl1`H.Willg~ oxidized ore from the lowerinost retort, means for heatin the retorts, a variable speed power operated rrrechanisin arranged to move said Qre moving_ and stirring endless ~ chain conveying rneclianisin at different predetermined pcriods of time through said re–torts, metal rods coruiected at their opposite ends to the links of said side endless chain and extending transversely across the ore oxidizing floors of said retorts, shovels mounted loosely enough on said rods to have at short adjusting movenienttheren, saidshovel members consisting of a huh member and thin spokes that stand at right angles to the hub members and extend in opposite directions therefrom and thin shovel blades that stand at right angles to the spokes and bear with their ore slioveling edges against the floors of said retorts by gravity; the said shovel blades being positioned on the opposite ends of said spokes so that one of the shoveling blades willbear on the iioor of one retort and the other shoveling blade –will bear on the iloor of the next lower retort, means for adjusting the shoveling blades to 'any

predetermined angle of ore shovclilig inclination to the doors, ‘and means including springs for’ holding said endless link chains tant on said tracks and sprocket wheels as its joints Wear. 5. In an ore–oxidizing niuihed–retort furnace the combination of supporting walls with a plurality of superposed retorts therein having hoods at their ends, said retorts each comprising side nieinbers, a roof meniber on top of said side nicnihers and an oreoxidizing Hoon member having upwardly projecting opposite side edges With truck ,members thereon extending from them to the inside surfaces of the adjacent side incinbers _of .the retoirtpneans for releasably securing said ore oxidizing fioor members in operative relation to said side members, sprocket wheels journaled in said hoods, an ore moving and stirring endless roller chain conveying mechanism the rollers of which _are mountedon said tracks and the side chains of which passovei' said sprocket wheels means including spring controlled lever mechanism –for holding said endless chains under it resilient tension on said tracks; and sprocket Wheels, ,a variable speed power operated mechanism arranged to inovesaid chains in diliercnt predetermined , periods of time tlirozigh sa–id rctorts, metal rods connected at their opposite ends to the links of said side endless chains and extending transversely across the ore–oxidizing(floors of sa–id retorts, ore shovels mounted loosely enough on said rods to have a short adjusting _mo–veinent thereon; said shovelmembers consisting of a hub inemberand tliinyspokes that stand at right angles to the hub menibefrs and extend in; opposite directions therefrom, and thin shovel blades that stand at right angles to the spokes and bearwith their ore shoveling edges against the iloors of said retorts by gravity; the said –shovel blades _being positioned on the opposite ends ofvsaid spokes so that one of the sliovoling blades will boar on the floor of one retort and the other slioveling bla–do will bear on the floor of the next lower retort, and means for adjusting the shoveling blades to any predcterinined angle of, ore shovcling inclination to the floors(' , p _ 6. In a muffled–retort ore–oxidizing furnace the combination of supporting walls with retorts supportedthereby, Hues in said walls and between and above said retor1:s,orc moving and stirring mechanism in said retorts, hoods, on said retorts, doors" on said hoods hiugedatitheir top edges and extending to and releasably fastened to 'their lower edgesr tire clay floors in said retortssupported by skeleton metallic floorniembers, track members carried on said Hoorinem–~ bers, and asbestos side boards and root members in said retorts. ‘ , `7. In aiinuiiied–retort orc–oxidizing furnace ,105 the Coznbination With snpporting Walls of a pluraliiyot superposed retorts each havinga hood at its oppositcelicls, a pair of sprocket wheels rotatably rnountcd in each of said hoods, means for slidably moving one pair of said sprocliet Wheels, means for rotating the other pair of sprocket' wheels,–' a shaft "secured to the sliding pair of ,sprocket Wheels, a lever secured to the one end of said shaft, a bolt rod secured at one of its ends to the adjacent Wall and having its 'Free endrextending through the free end of said lever; springs mounted on said rod on the opposite sides of said lever, nuts threaded on the ends of said rod _and lC)€9\1'l.llg against thcends ot the adj acent springs, endless chains, ore moving members mounted on said chains, andnieans including slideways in the opposite sides of said hood for supporting slidably said shaft whereby said endless chains are 'automatically held taut in said retorts and hoods. » S. A, mullled–retort ore–oiidizing furnace comprising' supporting Wall members, retorts supported by said 'wall Ineinbers and; provided with non–conductive ore oxidizing floor no vll5 rzo 1,sa4,s rot 1 members,_gt;he21t~receiving fines arranged to convey heat to said rotorts, means including electric current conveying Wires extending through said Wall members to said non–con~ ductive floor members, electric current heated eosingsf embedded in said non–conductive iioor members, and _electrodes in said cusings connected tosaid current' conveying wires and arranged.to heat said csisings. 9. A 1l1LlH'i€(_i~l`9i`r(JICt ore–oxidizing furnace comprising supporting wall rneniberspretorts supported by said wall members and pro~ vided with it plurality of non~eonduetive ore» oxidizingiioor niembelsrheat receiving Sues below and between find above said retorts, and electrical current heating means disposed in recesses formed at the contacting edges of the Hoor members of the retorts. ` 1O.' In at I!1l.`lHl€d_gt;1`€t0ll`» ore–oxidizing furnace tho combination with supporting walls of retorts Within said walls and fiuos for heating said Walls and said retorts, said retorts being provided with opposite side members, and an ore~oXidizi11g floor member comprising ai flat Wide central iioor portion and upwardly projecting opposite side members carrying horizontally disposed terminal members extending to the opposite side members of said retorts, und means including the horizontally disposed tormin al members for supporting said floor member in operative relation to said retorts and its opposite side members. i ’ 11. In sr muiiied–retort ore–oxidizing furnace the combination with supporting Walls oi’ retorts within said walls and fines for heating said walls and said retorts, said re~ torts being provided with opposite side members and an ore–oxidizing floor member coniprisinga, Hat Wide central floor portion and vertically projecting opposite side men1~ bers carrying horiiontally disposed terminal members extending to the opposite side mombers of Sf|.i(lVY_tU1`tS, and menus for supporting said floor member in operative relation to, said retorts and its opposite side members, the 'said flat floor portion 'of said floorfmeinber being provided with large openings bounded by transverse ribs and longitudinal members. 12. In £1 mutl1ed~retort_ oreoxidizing furnace the fconibinntion with the supporting Walls of retorts Within said walls and Ilues for booting said Walls and said retorts, said retorts being provided with opposite side inemliers and an ore–oxidizing floor member, said. floor member comprising a Hot Wide central floor portion and vertically projecting opposite side members carrying horizontally disposed terminal members extending to the opposite side members of said retorts, moons for supporting said floor member in operative relation to said retorts and its opposite side members, the 'said flat Hoot portion of said Hoor member being provided with large openings, bounded by transverse ribs and _longitudinal members, and 11 re~ trnotory floor member laid on top of said fiat floor portion of said floor member and against its opposite vertical side members. In testimony whereof I affix my signature

Abstract:
Source: JP2099411A PURPOSE:To extend automotive spikes when a road is covered with snow during travel of a car and to retract it when the snow on the road is eliminated by operating a device capable of telescoping the pistons with claw from and into the periphery of a wheel during travel of a car by increasing or decreasing the hydraulic oil quantity remotely. CONSTITUTION:A rotary wheel 3 is closely fitted rotatably in a stationary wheel 1 and a hydraulic oil groove wheel 4 supplying hydraulic oil through a pressure oil feed pipe 2 is formed between both wheels 1 and 3. Multiple cylinders 5 connected to the hydraulic oil groove wheel 4 are formed in the rotary wheel in radial direction at equal angular interval and pistons 6 with claw are provided in these cylinders. Each piston 6 with claw is telescoped in the cylinder 5 hydraulically and a claw at the top of the piston is so provided that it extends from and retracted into the outer periphery of a wheel 7. The stationary wheel 1 is secured to an axle cover 8 and the rotary wheel 3 is secure to a drum 9.

Abstract:
Source: US3470799A ABSTRACT OF THE DISCLOSURE One or both cartridge chambers of a photographic still camera receive portions of feeler levers which can be displaced by cartridges to cause the generation of a signal or indication informing the user of the camera of the presence or absence of cartridges. That feeler lever which extends into the chamber for the supply cartridge can indicate the film speed and it may be used further to positively prevent operation of the camera when the supply cartridge is missing or when the film speed is not within the desired range. If the camera has two feeler levers, either of these levers can prevent operation if the respective cartridge is missing.

Abstract:
Source: US3613311A ABSTRACT OF THE DISCLOSURE In a device for opening and closing sliding roof sections of containers, such as two−section roofs of freight cars, each roof section is connected by two cables to a respective drum rotatably mounted on a cross connection of a freight car. Each of the two cables is connected to the roof section adjacent a respective end of the latter, and the two cables are wound in opposed directions on the associated drum. Manually operable crank means rotate the drums through transmission means interconnecting the crank means and the drums. Respective clutches are interposed between each drum and the transmission means, and clutch operating means connect the crank means to the clutch means and are operable, responsive to operation of the crank means in a direction to open one roof section, to engage the clutch means connecting the associated drum to the transmission means and to disengage, and maintain disengaged the clutch means interposed between the other drum and the transmission means. When one roof section has been moved to the open position, the other roof section cannot be moved to the open position until the one roof section has been returned to the fully closed position. Continued movement of the crank means in the closing direction for one roof section will, after the two roof sections are in the closed position, initiate opening movement of the other roof section. B

Abstract:
Source: US4745987A A slip−controlled brake system for all−wheel drive motor vehicles is provided with differentials (16,19,20) for balancing track difference between the individual wheels (VR, VL, HR, HL). Wheel sensors (31−34) and electrical circuits (9) for generating brake pressure control signals are provided to control the brake pressure in the event of imminent locking. A disconnecting clutch (37) is inserted into a driving split axle (25) connecting a wheel to the rear axle differential (20). The disconnecting clutch (37) can be actuated either electromagnetically or hydraulically. Upon commencement of the brake slip control or at a predetermined time thereafter, the disconnecting clutch (37) is disengaged thereby rendering the coupling between the rear wheels and/or between front and rear axles ineffective thereby to permit an individual slip control by way of the individual control channels.

Abstract:
Source: KR20170075681A In company that manufactured objects should be shipped, it is why even without knowing it. He must know where the fundamental reason should come from. In one example, we use the wrong. In general passes is a vehicle such as a bus or a different passenger vehicle wheels are when I was a whimper, there is a difference. The first condition is to create a vehicle wheel zooms up to the stratosphere, there is a need to know. According to the weight of the vehicle is the difference of the intensity impinging on the wheel rim in the road surface it can be seen that. Vehicle weight, less weight than cars and buses, leaving the vehicle is operated, the roar from generating the sejoing wheels are smaller than a car, but when the contrary to occur a sound that occurs in the bus passes are made more, larger the wheel roar cars. The reason is that the vehicle weight is less out or the front passenger cars is now hitting upside–down to the ground, the air and free up, relative to the weight of the weight of the car in his car wheel relative to the intensity of the sound to hit the road surface size can be seen that it would be more significantly. Car bus as a vehicle, such as when the weight is more effective than air is not good, it can be seen that. Of course, the front glass of the vehicle bus, such as the effect to lower the air. Further they think the human to gravitational acceleration of air. Only the air vehicle proceeds without considering gravity it encountered in front of vehicles such as cars, buses and dispersed than the air, but might occur less noise, to the contrary, the roar cars bus as a vehicle wheels are greater than the sounds that occur when proceed. That is, appearance is not in the car. In cars so far in such a manner as to distribute air to the front glass, and distribute the air it is not up. Dispersing the front passenger vehicle proceed, upside–down, up, to distribute the windshield of the vehicle than the upper surface of the shape to the front further out forward to the air of the air encountered in a dispersion, it is possible to reduce the weight of the gravity. Now, as a vehicle fuel economy but the lower speeds, in accordance with the vehicle speed by the weight of the vehicle fuel consumption is lowered rather prevents the accumulation of snow in winter, preventing the vehicle windshield. The speed at which the vehicle is proceeding normally has a downward according to further reduce vehicle weight as dispersing, rather as also better fuel economy. Thus, experts are more cars exterior shape of cars in weight to further reduce the vehicle speed On the road had said comb. In addition, the asphalt road surface is in contact with the wheels of the vehicle area is greater than the force to more wheels that occur in the vehicle, it is not transmitted to the side of the tire and the road is how strongly the contact force of the engine, depending on the further well passed the wheels. So far behind the front glass shape as vending cars it is not enough to be laid in front of the windshield, and make laid. In addition to the US, there are many things that are in reverse. For example, to distribute the passenger cars spoiler is available now as the front fairing so worried vehicles it is not rounded. As shown front portion to distribute the air knife blade and have greater effect. In addition, as an airplane wing. The front part of dispersing the air will be sure to have sharply. Two years now, an airplane wing" the reasons that could be rounded birds such as swallows, and that he could not help thinking of shape and mimic. Wings of birds is not a strong material, such as a strength is weak hairs from weak flesh is distributed to the force of the air in the streamlined would automatically changes that we distribute air to a rigid material such as metal, it is not enough to forward the preserves in the fairing. And pointed toward the front of the knife blade made as described above. Moreover helicopter loud gareumyeo the air, it can be seen that. Now with air to ground the wings, which means that the loud blow to the next. The helicopter also like wings as arc through the air toward the front part so as to be among the most sharply as soon as the blade reduces fuel consumption and do. In addition, screw the vessel through water. So as now before contacting the water could be rounded so that the cross–section of the screw, as shown in the front side of the sharp knife blade must have sharply, engine fuel consumption is less. [Index terms; dispersing effect. Whimper. Fluid. The cross–sectional area.

Abstract:
Source: US2005158554A Disclosed is a multilayer article assembly comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) an uncured thermoset or uncured cyclic oligomer substrate layer, wherein the coating layer is in contiguous contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for preparing said multilayer article assembly.

Abstract:
Source: US2012186947A A device principally used for loading and unloading the standing surface (3') of the drying chamber (2) of a freeze drying installation, which standing surface is located at a defined height position, the unloading position, is characterised by a carriage (8), which is disposed slightly thereabove, extends transversely to a movement direction (8') during a loading or unloading process and in parallel with the standing surface and forms a movable guiding edge for the drying vessels (5), and by guides (7) which are disposed on both sides of the standing surface (3'), extend in parallel with the said movement direction and form fixed guiding edges for the drying vessels (5). The carriage (8) is driven by two linear motors, the respective primary parts (9) of which are fixedly connected to both side ends of the carriage (8) and are supported on the guides (7) which at the same time receive the secondary parts. All of the components of the devices thus defined are located within the drying chamber (1), wherein a mechanically extremely simple and low−wear construction is achieved.

Abstract:
The drive has an automated gear box including transmission input shafts (W–1, W–3) and a transmission output shaft (W–2) axially arranged parallel to each other. Switchable idle gears (z12–z15, z31–z34) and association of gear switching devices (S1–S4) are arranged on the input shafts. The input shafts are coupled together on an input side of an input wheel set plane (Z1). The input shafts are rotatably arranged in one of the switchable idle gears via the respective gear switching device. The input wheel set plane is provided with non–switchable intermediate gears (z21, z21a).

Abstract:
Source: GB696637A 696,637. Change–speed gear. MAYBACH, K. Dec. 30, 1949 [Dec, 30, 1948], No. 33307/49. Class 80 (ii). [Also in Group XXIX] On a rail–car or heavy road vehicle, a mechanical change–speed gear, of the type having claw clutches with inclined faces for pre–synchronous ratchet action, is driven through a hydrodynamic torque–converter 59 which, is operative only in the first–speed starting ratio, being mechanically by–passed in all other ratios, the converter being permanently filled and enclosed in a cooling jacket 61 in which cooling water may circulate. The converter has a permanently fixed stator. Control of the fluid–to–meehanical drive may, as with the change–speed gear, be automatic, under common control and operating in response to engineand vehicle–speed and load–torque. As shown the torque–converter 59 provides a split–torque hydromechanical drive operative only up to a predetermined engine speed in the first gear only of a four–speed countershaft gear having aligned input and output shafts 97, 102 and inclined–faced selector claw–clutches 101, 103, 110, 112. A common control of the fluidto–mechanical, as well as of subsequent ratioshifts, is provided by centrifugal governors 161, 162, producing respectively upshift and downshift and both driven only by the engine. During a shift in the mechanical gear, the torque–converter is temporarily clutched in to act as a brake for rapidly reducing input speed, and the setting of the engine fuel–control lever 138 is also increased or decreased as appropriate for retardation or acceleration synchronising of the selector–clutches. Mechanical or fluid–drive is selected by a, double friction clutch 70, and the split–torque hydromechanical drive is combined in a three element planet–gear 63. An engine 1 drives, through a free–wheel clutch 52, a primary input shaft 55, which, through a pinion 56, drives the planet–carrier 63 of the torque–combining planet–gear, which comprises also a ring–gear 65, driving the changespeed gear input shaft 97 mechanically through a gear–pair 89, 90; and a sun 66, integral with a hollow shaft carrying the centre–disc 70 of the double clutch, engagement of which with a right side disc 77 drives the impeller 59 of the torque converter, the turbine 60 of which is fast on an inner shaft 80, which, through a gear–pair 83, 84 and free–wheel clutch 85, or controllable dogclutch, drives the input–shaft 97 of the changespeed gear, conjointly with the mechanical drive of the same shaft 97 by way of the ring–gear 65. Disengagement of the clutch centre–disc 70 from the converter–driving disc 77 and its engagement with a left–side disc 67 disconnects the converter 59 and clutches the planet–gear solid for the purely mechanical drive. The double–clutch 70 is actuated selectively by supplying oilpressure to spaces 68 or 78 through passages in the hollow shaft and supply–ducts 91, 93. The selector–clutches 101, 103, 110, 112 of the changespeed gear are paired together on the mainand counter–shafts and operated by two doubleacting pistons 241, 242, integral with which are valves 249, 250 controlling the fluid shift–circuit as described below. Where a controllable dogclutch replaces the free–wheel clutch 85, this may be directly operated by the main control (described below) and its axial movement may control the fluid pressure operating the double friction clutch 70. Operation. Change from fluid to mechanical drive. As shown ready for starting, the changespeed gear is in first speed and the hydraulic drive is clutched in at 70, 77. Increasing the engine–speed from idle by operating a single manual lever 131 acting on the fuel control 138, starts and accelerates the vehicle. The input driven downshift governor 162 expands and rapidly passes through its operative position without effect. With increase in vehicle speed up to aproximately 40 Km/hour the inputdriven upshift governor 161 expands, moving to the right its valve 163 to supply oil–pressure from an inlet 196 to an upshift piston 181, which, through a pawl 187 and ratchet–wheel 189, turns one step clockwise (viewed from the left) a selector camshaft 193 controlling three spring–lifted valves two, 205, 206 of which are associated with the respective ratio–shift pistons 242, 241, whilst the third, 207, controls the double clutch 70 which selects fluid or mechanical drive In this first step of the selector camshaft 193 the two shift–valves 205, 206 are not moved, 205 remaining up and 206 down, as shown, so that first speed remains engaged, whilst the third valve 207 is lifted by its spring from the depressed position shown, which movement reverses the pressure inlet 225, 228 and exhaust 208, 218 valve–connections with the pipes 91, 93, so that the clutch–space 78 is exhausted, releasing the converter–drive clutch 70, 77, and space 68 is pressurised, clutching the planetgear 63 solid at 67, 70 for a gradual change to a purely mechanical drive to the change–speed input shaft 97, with consequent reduction in engine speed (about 15 per cent). The converterclutch control valve 207 remains

in this depressed position for all subsequent ratio−positions of the selector camshaft 193. Upshift first to second speed. With further increase in vehicle speed the input−driven upshift governor 161 again reaches its operating speed and supplies pressure to the piston 181 to ratchet the selector camshaft 193 another step forwards, in which position the shift−valve 205 and converter−clutch valve 207 remain raised whilst the shift valve 206 is also moved into the raised position. This reverses the pressure−inlet 225, 228 and exhaust 208 connections through pipes 231, 232 to the opposite sides of the shift piston 241 which commences to move from left to right, movement of the other shift−piston 242 not being required. Initial movement of the shift−piston 241, permitted in advance of disengagement of the selector−clutch by virtue of a lost−motion pin−and−slot connection 245 between the piston−rod and the selector−clutch operating lever, closes the engine fuel−supply to idle, unloading the selector clutch 110 of the drivetorque, and introduces braking by the torqueconverter for synchronising the upshift by the following circuit. At the beginning of the rightward movement of the shift−piston 241, a groove, Fig. 5 (not shown), in the piston−stem breaks communication between a fuel−control line 277, leading through a port 305 of a valve 150 to a space under the fuel−control piston 142, and a line 273 leading through a groove, Fig. 7 (not shown), in the stem of the other shiftpiston 242 to an exhaust port, and at the same time connects the fuel−control line 277 to the pressure−inlet 225, 227 through the stem−groove, a stem−passage 253 and body−groove 290. The space above a fuel−control piston 142 is vented through a valve 150 and ports 308, 317 in a converter−brake control−valve 301, so that the piston 142 moves upwards in its fixed cylinder, compressing the upper spring 135 of a link to the manual lever 131 and moving the fuel control 138 to idle, thus unloading the selector−clutch 110. The converter−brake valve 301 remains in its rightward position shown, in spite of a temporary application of leftward pressure from the inlet 225, 227, through the piston−stem passage 253 and a line 271, since this pressure is later over−ridden by the rightward spring plus rightward pressure supplied through a stem−passage 254 and line 272 after disengagement of the superseded selector−clutch 110. This pressure in the line 272 also passes through the converterbrake valve 301 and a line 311 to a spring−loaded piston−valve 127 under the fluid−drive controlvalve 207, which piston−valve is thereby moved to the left, cutting out the exhaust 218 and pressurising the converter−clutch space 78 from the line 311 through a groove 130 in the pistonvalve 127. This engages the converter−drive clutch 70, 77 causing the converter to brake rapidly the input shaft 55 to synchronise engagement of the selector−clutch 101. Completion of the rightward movement of the shift−piston 241 disengages the converter−drive clutch by exhausting the line 311 through the converterbrake valve 301, line 278, passage 262 in the stem of the other shift−piston 242, line 276, passage 255 in the piston−stem 241 and outlet 282. At the same time the fuel−control line 277 is exhausted by reconnection, through a second groove, Fig. 5 (not shown), in the piston−stem 241, with the line 273, still exhausted through the other piston−stem 242. The upper spring 135 of the manual control link then restores the fuel−lever 138 to its set position and the vehicle proceeds in second speed. Upshift from second to third speed. This requires shift of both shift−pistons 241, 242 from right to left for disengagement of selectorclutches 101, 112 and engagement of selectorclutch 103 which requires input retardation for synchronising, and also of selector−clutch 110 which now requires input acceleration for synchronising, achieved by increasing the fuelsupply, the required sequence being automatically determined by the order of disengagement of the superseded selector−clutches. The shift is initiated, as before, by the upshift governor 161 stepping the selector camshaft 193 forwards, to raise both shift−valves 205, 206 and reverse the pressure and exhaust connections to the respective lines 231, 232 and 233, 234 of the shift pistons. If the clutch 101 disengages first so that the shift piston 241 moves to a meshrejecting central position before the shift−piston 242, pressure passes from the inlet 255, 227, through stem−passage 253 and line 271 to the right face of the converter−brake valve 301, which now, in the absence of rightward fluidpressure, moves to the left and supplies pressure from the line 271 past the valve 150 above the fuel−control piston 142, the valve 150 simultaneously moving to the left to

Abstract:
324 Mr Edmond–Pierre PICARD _____ Natural turf, means and process for manufacturing such a natural turf. ABSTRACT The invention relates to a natural turf intended to be used for sports and comprising a layer (1) of leaves and exposed parts of grasses or other natural turf plants and at least one substrate layer (3) in which these plants are rooted. The substrate layer (3) comprises a first part of particles (4) having the particle size of sand, between 80 mm and 3 mm, and means formed in order to be able to ensure that the water content of the turf is kept at a constant level. The invention also relates to means and to a process for manufacturing such a natural turf, to a surface comprising such a turf, to a sports shoe suitable for such a surface, to a sports system comprising such a turf or to a sports system comprising such a turf and such a shoe and also to a protocol for evaluating such a surface or sports system comprising such a surface and such a shoe. Figure 1

Abstract:
Source: JP58118403A PURPOSE:To ensure safe running on a frozen road surface by making a side slip preventive claw provided on the inner frame of a tire chain device automatically bite in the frozen road surface to prevent a side slip when a car is running on the frozen road surface, etc. CONSTITUTION:Outer frames A made of wire ropes and formed in an annular shape by coupling a metal piece provided with a U–shaped groove 1 on one end with another metal piece provided with a push–in protruded button 2 on the other end are fitted to both side faces of a tire D, and inner frames B are fitted by using the outer frames A. A biting claw 5 biting in the snow surface is provided in one body with the inner frame B and is fitted to the outer frame A by means of a binding metal H. A side slip preventive claw 7 provided with a plate spring 8 brought into an elastic contact with the tire D is fitted to the inner frame B, and the preventive claw 7 is made movable up and down by means of an expansion spring E. According to this constitution, in case a side slip occurs while running on a frozen road surface, the side slip preventive claw 7 bites in the frozen road surface, thus the side slip can be prevented effectively.

Abstract:
Source: US2004028907A Disclosed are weatherable multilayer articles comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) a substrate layer, wherein the coating layer is in contiguous superposed contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for making the multilayer article.

Abstract:
Source: DE2025520B2 The snow tack is made up of an elastic band to encircle the tyre, with a pattern of grip teeth fitted to the band. The track is normally housed in a special container on the car and is released by a dashboard control. This feeds the track towards the tyre, which is rotating slowly. The leading edge of the track is fitted with hinged clamps which grip the tyre by swinging into an upwards position i.e. towards the hub. A special coupling pad is fitted to the rear of the band, extending over the leading edge so that the trailing edge is automatically clipped in place. Extra security can be obtained by fitting a clamp after the track is in place.

Abstract:
Source: GB763593A 763,593. Knitting–machines. COTTON, Ltd., W. July 3, 1953 [Jan. 28, 1953], No.17398/55. Divided out of 763,591. Class 74 (2). A straight–bar machine comprising a number of divisions and a central non–knitting division having control mechanism as disclosed in Specification 763,591 has two lead screws 81, 82, for controlling the right– and left–hand selvedge fashioning points of each division, disposed in the central non–knitting division such that they overlap one another. The lead screws may be connected to screws 79, 80 for controlling the main carrier drive. Auxiliary lead screws 85, 86 are also provided for controlling additional fashioning points, these latter lead screws overlapping the main lead screws 81, 82 and being in alignment with each other. The screws 85, 86 are also coupled with the carrier drive mechanism 31. Specifications 628,527, 742,650 and 742,655 also are referred to.

Abstract:
Source: GB329735A Moulding pulp.–In a machine for forming receptacles such as caskets, baths, c. from wood or other liquid pulp having a foraminated former 38 and platens 26, 27, 28 movable towards and awav from the former the platens are each actuated by a separate hydraulic ram and toothed gearing connects all the rams so that the platens are uniformly advanced, depositing walls of equal thickness. The foraminous former 38 is surrounded at the sides and top by perforated platens 26, 27, 28 slidable in chambers 23, 24, 25 and operated by rams 30, 31, 32 secured to the bed–plate 20 and cover plate 21. Racks 57 rigid with the rams mesh with pinions 53 56 on shafts 45 48 operatively connected by bevel gears 49, 50, 51 and a countershaft 52. The pulp valve A adapted for continuous circulation of the pulp comprises a seating 66, Fig. 5, secured to the wall of the chamber 25, a casing 65 supplied with pulp through a pipe 67 and a return pipe 68 through which the pulp may pass back to the source of supply when the plunger valve 70 closes the entrance to the chamber 25 as shown. The valve may be shifted by a handle 79 to close the return pipe 68 and allow the full capacity of the inlet pipe 67 to discharge into the chambers 25, 24, 23. After the shell has been formed and the platens 26, 27, 28 retracted the supporting platen 33 is freed from locking connection with the bed plate 20 by retracting bars 34 from grooves 340 in the bed plate, the bars 34 being linked to crank plates 35, Fig. 4, linked to a plate 36 operated by a lever 37. A three–way valve 89 is then turned to permit the hydraulic ram 86 carrying the supporting platen 33 to descend, the water from the cylinder escaping through a pipe 90 to the waste main 44. During the descent a stripper 39 on which the formed shell B rests engages ledges 103 on opposite frames 102, Fig. 8, the ram with the platen 33 and foraminous former 38 continuing to descend, and as it reaches its lowest position a pawl 170, Fig. 11, on the platen engages a lever 174 to turn a valve 147, starting 'the transferring mechanism. As soon as the former 38 has descended clear of the path of movement of the stripper 39 the operator lays a wooden rack C on the shell B, which has been moulded bottom upwards. The valve 147 supplies water from the hydraulic pressure main to a cylinder 141 in which reciprocates a ram 140 connected with parallel radius levers 95, 96 pivoted to beams 100 carrying pivotally at 104 the frames 102. Normally the lever 95 rests against an abutment 106 and at the start of the swinging movement the arm 112, Fig. 8, of a dog 107 pivoted at the lower corner of the frame 102 leaves a stop 115 allowing it to be turned by a spring 114 to clamp the stripper 39 to the frame 102. A link 110 connects the dog 107 to a similar dog 109 at the other side of the frame which is thus also operated to clamp the stripper 39. As the swinging movement continues a lever 122 pivoted to the frame 102 is turned by a swinging abutment 127 into a horizontal position operating through links 121 dogs 116, 118 having blades 125 to clamp the wooden rack C to the shell B. In the clamping position the lever 122 and links 121 are in dead–centre position. Rigid with the trunnion 104 of the frame 102 is a three–armed element 130 the arms of which successively engage abutments 131, 132 on the standard 99 to rotate the frames 102 with their load through 180 at the end of the swinging movement. A stop 134 on the support or truck 133 acts on the left–hand lever 121 to release the dogs 116, 118, depositing the rack C and shell on the support. The motion of the radius arms 95, 96 is then reversed, the valve 147 being turned to reverse the ram 140 by a link 155 pivoted to an arm 154 rigid with the shaft 97 of the radius arm 95. In the return movement the element 130 reverses the frame 102, the lever 122 swings the abutment 127 about its pivot and the stop 115 finally releases the dogs 107, 109. The valve 89 is then turned to raise the supporting platen 33 which in its upward movement picks up the stripper 39 from the ledges 103 and when returned to the normal position is locked by operating the lever 37. The return movement of the radius arms also closes the valve 147 by a link 156 pivoted to the arm 154. During the upward movement of the platen 33 the pawl 170 swings past the lever 174 of the valve 147. The reversing valve 147 is always turned in the same direction, the links 155, 156 being provided with pawls 149, 150 acting on a ratchet wheel 148 rigid with the valve plug and the lever 174 being duplicated at the opposite side, at 174<a>. To continue the swing of the radius arms 95, 96 when the ports in the valve 147 have been closed, the movement of the slotted lever 164 connected to the ram stem 160 is transmitted to the shaft 97 through springs 168 between extensions 167 of the lever 164 and a

projecting lug 166 on the shaft 97. The springs 168 also cushion the parts at the ends of the travel. To prevent rocking of the frame 102, a leaf spring on the beam 100 bears against the frame. The truck or support 133 may be transferred to a drying kiln. The rams 30, 31, 32 are returned –to starting position by a counterweight 60 on a cable 59 secured to a sheave 58 on one of the gear shafts.

Abstract:
The design has two booms arranged either alternatively or equilaterally, where the booms are temporarily connectable with each other in a pair as well as variable. Multiple sliding guides are fastened between the booms and a hull side, where the sliding guides are alternatively regulatable in a potential manner. The two booms are elongated and located opposite to a boom hull. A kite e.g. towing kite, is connected in a top deck of an e.g. ferry ship, in a distant height and range with a rope, where the rope is specifically adjustable in the length and force.

Abstract:
Source: FR1465990A 1 Procede pour la fabrication de sacs a provisions en materiau soudable avec une paire de poignees fixees par soudage a l'extremite ouverte et un joint de soudure fermant le fond, caracterise en ce qu'une feuille en gaine continue en materiau soudable se deplace en avant suivant un mouvement de preference intermittent et recoit des lignes de perforation transversales dans les zones prevues pour les orifices de remplissage des sacs, en ce qu'ensuite des poignees sont fixees par soudage sur la feuille en gaine des deux cotes de celle–ci, de telle sorte que, dans chaque poignee, l'element de prehension se trouve, par rapport a l'emplacement de soudage, de l'autre cote de la ligne de perforations correspondante, en ce qu'ensuite le premier segment de feuille en gaine est separe par dechirement le long des lignes de perforations et en ce qu'enfin le nouvel orifice de gaine qui en resulte et qui n'est plus recouvert par les elements de prehension des poignees est ferme par soudage. 20 Dispositif adapte a la mise en oeuvre d'un tel procede caracterise par un dispositif d'avancement de feuille travaillant par intermittence, un dispositif de perforation transversale, deux dispositifs d'alimentation en poignees, disposes derriere le dispositif de perforation transversale dans le sens de deplacement de la feuille, places respectivement de part et d'autre de la feuille et mettant en place chacun une poignee de chaque paire, un dispositif de soudage pour la fixation par soudage des poignees comportant une plaque de contre–pression maintenue a l'interieur de la feuille en gaine et deux outils de serrage venant s'appliquer de part et d'autre contre la feuille, un dispositif de soudage pour fermeture par soudage de l'orifice, de la feuille en gaine et un dispositif d'evacuation pour separer de la feuille, par dechirement, les sacs a provisions finis successifs et en assurer l'acheminement ulterieur. 3" Un tel dispositif, remarquable, en outre, par les points suivants, pris isolement ou en combinaison a. Les dispositifs d'alimentation en poignees se composent de magasins a poignees avec poussoirs automatiques b. Chacun des dispositifs d'alimentation en poignees se compose d'une roue en forme de roue a chaine, a mouvement intermittent, assurant l'avancement d'une bande formee de poignees raccordees les unes aux autres par de minces barrettes de raccordement, et une lame destinee a separer de la bande la poignee a fixer par soudage est associee a chacun des outils de serrage mobiles. 40 Dispositif de soudage faisant partie d'un tel ensemble, destine a fixer par soudage des pieces en materiau thermoplastique sur la face exterieure de feuilles en gaine de materiau thermoplastique, avec une plaque de contre–pression maintenue fixe a l'interieur de la feuille en gaine et au moins un outil de serrage venant s'appliquer de l'exterieur contre la feuille en gaine et contre la piece a fixer par soudage, caracterise en ce que la plaque de contre–pression renferme une tringle de soudage et en ce qu'il est prevu a l'outil ou aux outils de serrage deux aiguilles reliees chacune a un pole d'une source de courant de chauffage qui, apres avoir perce la feuille en gaine, penetrent dans des douilles de contact de forme voulue prevues dans la plaque de contre–pression. 50 A titre de nouveaux produits industriels, les sacs a poignees obtenus par la mise en oeuvre du procede et des dispositifs decrits. 1 Process for the manufacture of bags has provisions in weldable material with a pair of handles fixed by welding the open end and a solder joint closing the bottom, characterizes in a continuous tubular film material weldable moves forward in a movement of intermittent preference and receives transverse lines of perforation in the holes provided for in bag filling areas that then the handles are fixed by welding to the leaf sheath on both sides of thereof, so that in each handle, the handle is located, relative to the

place of welding, the other side of that line of perforations, in that subsequently the first segment leaf sheath is separated by tearing along the perforation lines and finally the new sheath port that resulted, and which is not covered by the elements of gripping the handles are closed by welding. 20 device adapts to the implementation of such a process characterized by a sheet feeding device working intermittently, a device cross perforation, two feeders handles, which run behind the device in the direction transverse perforation of movement of the sheet, places respectively on both sides of the sheet and setting up each a handful of each pair, a welding device for attachment by welding handles with plate against pressure maintained at the interior of the tubular film and both clamping tools being applied to both sides against the foil, a welding device for welding the closure orifice of the tubular film and a discharge device for separate sheet, by tearing the bags has finished successive provisions and ensure delivery LATER. 3 "Such a device, remarkable, moreover, by the following, taken alone or in combination.'s Supply handles devices consist of stores with automatic push handles b. Each of the feeders are handles consists of a wheel−shaped wheel chain, has intermittent movement, ensuring the progress of a trained band handles connected to each other by thin terminal strips, and destiny blade separate the handle of the band is fixed by welding is associated with each of the movable clamping tools. welding device 40 as part of such an assembly, intended to fix by welding parts in thermoplastic material on the outer surface of leaves sheath thermoplastic material with a against pressure plate held fixed in the interior of the leaf sheath and at least one clamping tool which is applied from the outside against the leaf sheath and against the piece to be fixed by welding, in that characterizes the against pressure plate includes a rod−welding and in that it is provided on the tool or tools needles each clamping both connected to one pole of a current source for heating, which, after having pierced the sheet sheath, penetrate into sockets contact form provided for in the desired plate against pressure. 50A as new industrial products, bags, handles obtained by the implementation of the process and described devices.

Abstract:
Source: GB751953A 751,953. Sewing–machines. JONES and SONS (MACHINE PARTS), Ltd., G. E., and HUGGIN, F. B. HOLMES–. Dec. 1, 1952 [Nov. 30, 1951], No. 28197/51. Class 112. [Also in Groups XXIV and XXXV] The work is held on a carriage which is reciprocated, by a rotary cam, on a primary carriage moved along a guide by a rotary cam against the force of restoring means, the two carriages moving in mutually perpendicular paths and the two cams rotating uni–directionally in unison, each cam being formed in two separate relativelyadjustable halves so that the length of the effective portion may be varied. Means are provided for actuating the stitch–forming devices, and for controlling and cutting the threads at the end of an operation. The work may be trimmed during sewing. In the machine shown, for stitching together layers of material to form a collar, a clamp C, Fig. 4 (rear view), of the kind described in Specification 734,835, formed in the shape of the collar, is closed on the layers of material to be sewn and is then attached by locating–pins 90 and electromagnets 91 to a carriage 12 mounted on rollers between upper and lower rails 14 of a second carriage 11 which is guided on a fixed vertical rail 8 by means of a roller 16a engaging the rear face of the rail and a pair of grooved rollers engaging the front corner an anchorage 57, the pulleys 54, 56 being mounted in a block 41 sliding on a rail 42 provided with a follower roller 40 acted on by a cam 23; the anchorage 57 is formed by a lever which bears against an adjustable stop 60. The cam–shaft is driven through change–speed gears, to vary the rate of feed of the work, by an electric motor which also drives the other parts of the machine, and it also carries a cam 25 which imparts horizontal movements to the carriage 12 by means of mechanism 76, 80, 82 against the force of a spring 74 acting on a linkage 67, 69, 70 connecting the two carriages. The cams are removable from the shaft for interchanging with others of different form, and are secured by a hand–nut 31 and a locating–pin; in order to provide for stitching lines of similar form but different overall dimensions, each cam may be formed in two relatively–adjustable parts, such as 23a, 23b in Fig. 21, which shows the block 41 provided with two follower rollers 40a, 40b, for actuation successively by the two cam parts, the roller 40b being adjustable on the block 41 to suit the varying step between the two cam parts. A horizontal needle–bar is reciprocated in fixed guides by a crank on a shaft connected through an electromagnetic clutch with a shaft on the input side of the gearbox driving

the cams; a shaft 139, Fig. 4, connected by bevel gearing with the needle–bar shaft, carries a loop–taker 140 to co–operate with the needle in forming lock–stitches. Thread passes to the needle between two discs of a tension device pressed together by a spring in the usual way, and over take–up pins carried between two discs on the end of the needle–bar shaft; the flat end of a solenoid–actuated lever lies between the spring and the adjacent disc of the tension device, whereby the tension is released when the machine stops. The needle of the rail. The carriage 11 is urged upwards by a weight attached to it by chains passing over pulleys, and is moved downwards as required by a chain 50 passing over pulleys 51... 56 to and locking threads are cut at the end of a stitching operation by scissors comprising two blades 197, Fig. 18, formed on the upper end of a vertical lever 195 mounted on the carriage 12 and two pivoted blades 200, 202 biased to the open position by a spring 211; the movement of the carriage 12 near the end of the stitching carries the lever 195 into contact with a fixed member whereby the lever is rocked against the action of a spring to bring a nose 209 on the blade 200 into engagement with a lug on the work–clamp C, whereby the blade is given a closing movement which is also transmitted to the blade 202 by interengaging parts on the two blades. Operation of the machine is started by reversal of a manual switch which energizes a clutch in the main drive to start the movement of the cams 23, 25, whereupon a pin on one of the cams allows a mercury switch 158, Fig. 4, to reverse, thus energizing the needle–driving clutch and the magnets 91 securing the workclamp to the carriage. At the end of the stitching operation the carriage 11 engages the manual switch to restore it to its initial position, thus disconnecting the driving motor and energizing a brake to stop the motor; the pin on the cam restores the mercury switch 158, de–energizing the needle–driving clutch and the clampsecuring magnets and energizing the tensionrelease solenoid and an eddy–current brake (see Group XXXV) which stops the mechanism with the needle clear of the work and with the cam 23 clear of its follower roller so that the carriage 11 is allowed to return to its upper position under the action of its counterweight. In a modified arrangement of the machine, the layers of material are fed in continuous lengths, passing together over a roller at the top of the frame, this roller being movable endwise to allow for the lateral movement of the carriage 12; the work–clamp is permanently secured to the carriage, and its hand closing–levers are dispensed with, the magnets 91 being used to close it instead. According to the Provisional Specification, the cams may be actuated through an intermittent drive, so that the work is moved only when the needle is clear of it; the work may be fixed and the stitch–forming devices mounted on the carriage; the needle may be actuated by a cam from which the follower may be retracted, against a spring by a solenoid energized at the end of the stitching to carry the needle clear of the work, this solenoid being de–energized by insertion of the clamp into the carriage for a new operation; a number of switches may be arranged around the cams for actuation by a member on the latter to start and stop stitching in order to produce several disconnected sets of stitches in the work; the cam–follower which is not required to be effective at a given time may be retracted mechanically or electromagnetically under control of the cams; the needle carriage may have attached to it a trimming knife acting at each needle stroke to cut the work at an adjustable distance from the line of stitching; the workcarriage may be arranged in an inclined or horizontal plane; for a long line of stitching several cams operating successively may be used to avoid the need for very large cams, and the cams for transverse movement may move more slowly than the others so as to have the same effective length.

Abstract:
Source: GB2221499A A buoyant structure comprises an anchored stator SRC surrounded by a rotatable ring of buoyant wings (SSW, SHW WW, DSW,DBW, BFW and BW, Fig. 2). Water flow acting upon the wings causes the ring to rotate thereby generating power. The structure is stated to function as a city and is serviced by floating roads NFR, SFR. Each road FR (Figure 1) is provided with breakwaters and wave power generators 13. The roads and structure can be used to span a stretch of water. Various functional details are disclosed.

Abstract:
Source: US4811824A A hub clutch used for a four−wheel driving free−wheel device in which, when a knob for manual operation and mounted on a casing is set to an automatic position, a pawl portion of a retainer becomes disengaged with a cam surface defined by a boss portion of the knob so that the device operates in the automatic condition, while when the knob is rotated in a manual lock direction, the pawl portion is engaged by the cam surface of the knob and is cammed to a lock position. When the pawl portion is in the lock position, the device assumes a manually locked state so that a drive gear and a clutch ring are maintained in an engaged condition with each other and stationary system members are separated from rotating system members. Accordingly, no contact force is applied to stationary system members when in the manually locked state.

Abstract:
Source: US2002018009A An apparatus and method for tracking aircraft wingtip position during taxi operations to prevent collisions with nearby obstructions. A patterned illumination source is attached proximal the wingtips to project a readily discernable target pattern in the direction of taxi travel. At least a portion of the target pattern is reflected off of any obstructions that lie in the straight−line direction of travel, such that the pilot can maneuver to avoid striking the obstruction. By way of example, the patterned illumination source comprises a laser module positioned with the navigation and/or strobe light of the aircraft that is configured to project a circular pattern in front of the wingtip. The device may be retrofitted to existing aircraft without additional wiring with the control of activation being selectable via power cycling of existing aircraft lighting controls.

Abstract:
Source: EP1007320B1 (Claim 1) 1. A method for manufacturing a starch−bound sheet comprising the steps of:(a) mixing together water, ungelatinized starch granules, a cellulosic ether, a fibrous material, and optionally an inorganic aggregate filler to form a moldable mixture;(b) forming the moldable mixture into an initial green sheet by passing the mixture between at least one set of forming rollers (40) having a temperature such that a portion of the cellulosic ether thermally precipitates so as to reduce adhesion of the initial green sheet to the forming rollers upon gelatinization of the ungelatinized starch granules in step (c);(c) passing the initial green sheet between at least one set of rollers having a temperature such that at least a portion of the ungelatinized starch granules become gelatinized and in order to form an intermediate green sheet; and(d) heating the green sheet in order to remove a portion of the water from the intermediate green sheet in order to form a hardened sheet having a binding matrix including dried starch and cellulosic ether.

Abstract:
Source: CA2818475A I am the founder of the Ultimate Martial Art (UMA) which has upgraded the Mixed Martial Art (MMA) in many aspects, especially in the aspect of emotion control because only UMA has been qualified to completely free any UMA fighters from fear, anger, anticipation, nervousness, anxiety, stress, and other emotions–that often hinder MMA fighters from applying their skills effectively, let alone harnessing their maximal potential of both the mind and body– particularly during and prior to their fights, and also in the aspect of ultimate speed because only UMA has been qualified to so overcome the challenge and problem of becoming possible to hit the opponents/adversaries prior to their biological reaction time of about 1/2 of a second (consisting of 1/4 of a second needed to perceive a threat and 1/4 of a second needed to react to the threat) to the hits that any fighter mastering UMA can always hit opponents/adversaries prior to their biological reaction time capability to react to the hits. It is because the damaging kinetic energy = 1/2 x (the mass of the objected used) x (speed of the object used)2 that any increase of the speed of the object used with its mass unchanged can exponentially increase the damaging kinetic energy to be inflicted upon the target. Hence, UMA fighters effectively have become technically invincible over any MMA and other fighters of the same or similar weight categories. For example, because by and large the biological reaction time of most wild animals is faster than that of normal human beings, it is almost impossible for people to catch wild animals without assisting instruments even at a very close distance, considering that the reaction time of a gopher, say, is only about 1/10 of a second comparing with the reaction time of 1/2 of a second of a normal human. For another example, even one of the MMA top fighters and UFC current light–heavy weight champion Mr. Gorge St. Pierre had publicly admitted in magazines and TV news that he had been scared prior to one of his championship belt defending bouts against a challenger whose name may be spelt as Mr. Carlos Condit. This is because MMA has never ever been qualified to disencumber its MMA fighters from fear or other emotions, especially during and/or prior to fights. On contrast, only UMA has been qualified to enable its UMA fighters to apply, embody, and exhibit their human potential to the maximum by living, fighting, and performing devoid of fear, anger, anticipation, nervousness, anxiety, stress, or other emotions, especially during or prior to any fights. UMA had also completely cured my serious shoulder joint pains that cortisol injection by the doctor at Miramichi Hospital in the Province of New Brunswick in Canada had failed to cure, and physical therapist had also failed to cure, and medication had also failed to cure. And only UMA can sustain a person's constancy, consistency, desire, interest, motivation, and penchant for exercise for life while people pursuing any other systems of exercise often give up sooner or later. Many MMA fighters have lost their bouts to ground pound whenever and if their opponents/adversaries wrestle grapple them down and then atop pound them, just as the Russian fighter whose name is probably spelt as Mr. Fedor Elemencko had lost one of his bouts to Antonio "Bigfoot" Silver due to ground pound only because he is nescient of UMA. On the contrary, UMA fighters can take the advantage of being more stable underneath the opponents/adversaries, so that a UMA fighter can execute reversed ground pound against his or her opponents/adversaries upward while from underneath them by so rock shaking his or her own body in redundancy as to destabilize the opponents/adversaries atop in order to facilitate pound striking them. To more effectively train martial art fighters, I have invented life–like and various weight–and–size–category mannequins that resemble real individuals as much as possible, or a trainee's specific opponent or adversary, and that are used for the trainee to so drill strike as to effectively hone skills including punches, kicks, elbow strikes, knee strikes, wrestling, grappling, locks, submissions, take– downs, spinning strikes, etc. Ever since the invention of nuclear weapons, nuclear wastes have been threatening the human race as a whole. Furthermore, nuclear accidents have also actually demonstrated mankind the detrimental effect of nuclear wastes. Therefore, instead of hiding dangerous nuclear

wastes indefinitely in canisters to wait disasters to bear down on us, I have invented the De–radiation Processes both enabling any nuclear wastes to be transformed into harmless materials and enabling nations to de–radiate the already radiation–poisoned vast territories such as the ones in Japan's Evacuation Zone and Russia's Chernobyl. The Law of No Largest, or Smallest, or Any Other Absolute Limit established by me states that throughout the universe nothing can be the smallest or the largest. There is never either upper or lower physical limit to anything throughout the universe. There is perpetually something smaller than the smallest particle that can ever be found; there likewise is perpetually something larger than the largest bound and expanse that can ever be found. Therefore, Higgs Boson (or God particle) sought in the Hadron Collider in Switzerland, or any other particle can never ever be the smallest particle because there perpetually is something even smaller than the smallest particle that can ever be found according to this Law; therefore, any effort attempting to seek the smallest particle or the largest bound is but foolish wastes of life. The Law of Time Delusion established by me states that in fact time is but a delusion because there is no reality in any time. It is only because time is but a delusion that other animals live in perpetual non relativity with no concept or sense of time. And it is also only because time is but a delusion that the selfsame number of hours or any other periods of time to the selfsame person are felt and perceived differently whenever and if he or she falls asleep and whenever and if he or she is troubled. And it is also only because time is but a delusion different people can agree on an arbitrarily set or assigned time. Albert Einstein and a plethora of other scientists are absolutely wrong about the nature of time. Because time is but a delusion, any attempt to seek any form of time travel is foolishness, failure, and waste of life in the making. Time travel, Einstein's Rosen Bridge, wormhole, Higgs singlet, time travel portal, and any other form of time manipulation are absolutely impossible though people can always so fantasize, just as a lot of people would always waste lives fantasizing immortality though it is impossible. It is likely foolish for anyone to believe that the Nazi Bell could somehow manipulate time by spinning red mercury, etc because of the fact that time is but a delusion. And then the Law of Uniqueness likewise established by me states that, at the level and scale tending to either infinitely large or small and no matter how adamantly a person desires otherwise, everything throughout the universe must be and can only be unique; accordingly, there cannot be another planet or any other heavenly body which sustains lives in the way by which Earth does. There has not been, and is no, and will not be any life anywhere throughout the countless centillions of galaxies of the universe except Earth. The Law of Inevitable Randomness established by me states that only by involving randomness in one fashion or another rather than regulated or calibrated actions and/or processes any ultimate state can be attained. For example, in order to polish any mirror to its ultimate resolution possible, random polishing process must be implemented. To expand this law to other realms, according to this law Albert Einstein's Spooking Communication Theory is also a fraud because it is but random coincidence by which two distant objects sometimes exhibit entanglements, same behaviors, etc, not any dictating law or regularity. But Einstein had mistaken the random coincidence between two distance objects for the act of law or regularity. Furthermore, ultimately on the one hand anything must encompass an element of randomness; on the other hand, only randomness can cause anything or state to achieve the culmination thereof, much as only hand–polished or random–action–polished lens can attain the ultimate resolution of their sizes. And smooth surfaces can be achieved from randomly–distributed rough grits on sand papers. The Law of Uncertainty also established by me states that there perpetually exists an element of uncertainty in any human affairs (especially whenever and if relatively great interest becomes at stake), any phenomenon, and any existence. The quality of uncertainty is one of the integral qualities of all things in the universe where we exist. For example, albeit parasite faith predators Popes have always done their best to conceal their secrets from their donor faith victims for decades, these laws had not long ago dictated a unique butler of one of the Popes to have just divulged few unimportant Vatican secrets against all their ardent desires to hide the truth from their faith victims. Their unrevealed ultimate secret is that they are but deceit–based frauds whose ultimate effect and result are only to brainwash and defraud more and more faith victims off their money, materials, children, and–most important of all–the opportunities to ever enjoy any truly happy and fulfilled lives. And it is the noblest duty, obligation, and calling for me to wake up and save the human race from the spiritual plague of ubiquitous delusional faiths. I am proud of my selfless and fearless courage and action to expose the human race the truth about the deceptiveness and fraudulent nature of faith predators without being concerned about selfish interests or the harm to be done to me by those powerful faith predators. For another example, it is impossible to predict exactly when and where tornadoes will strike because the uncertainty in their being formed. It is because the inherent qualities of randomness and uncertainty that nothing in the universe can strictly conform to laws and regularity except probability. Though in fact there is no reincarnation in any shape or form, faith predators Dalai Lamas have successfully fooled and defrauded the human race into believing their falsified reincarnations from preceding Dalai Lamas in order to justify their theft of power and control lorded it over their faith victims, and they have also successfully radicalized some of their faith victims into committing self– murder by killing themselves ablaze, and then they have also successfully befooled and defrauded the Nobel Prize Committee off the Noble Prize of Peace though they are but frauds only dragging out existences from their delusional fakery of reincarnation that in fact does not exist. Instead of lying against true reality when things do not go their ways, people of any true honor and dignity should acknowledge and certify it as it is, especially whenever and if it goes against their personal desire or penchant. By and large faith predators are conniving and accomplished frauds who are highly skilled at adapting, embellishing, smoothing over, and amending their lies according to ever changing situations, circumstances, events, etc once their old lies become untenable or unconvincing. For example, whenever and if their faith victims' desperate prayers are of no avail or not fulfilled, they may adapt, embellish, smooth over, and amend their old lies into fresh ones that God works in mysterious ways beyond human's capacity to comprehend. But whenever and if their prayers coincide with the occurrences or happenings prayed for, they may then adapt, embellish, smooth over, and amend their old lies into different new ones that God does answer grant faith victims' prayers. The correct truth always is just as independent and unchangeable as space that is omnipresent in everything and everywhere but can never ever be altered or corrupted by anything or anywhere. A truly correct and hence functional belief system–the ultimate faith–is not only integral for any individual to live any suffering–free and hence happy and fulfilled life, but also integral for world peace. For example, the USA and some other countries have been wasting thousands of human lives of

American troops and trillions of US dollars killing people who have radicalize become terrorists exclusively by delusional faiths around the world, but they will always fail to kill them off because no one else has been qualified to solve the problem of terrorism and crime at their root causes. In reality, the ultimate root cause to both terrorism and crime is exclusively delusional faiths which are incorrect and hence dysfunctional belief systems. Any truly correct faith must function and work; otherwise, it must be and can only be fraud or error. Without the ultimate faith, these delusional faiths will always rear new and young terrorists and criminals that can never ever be killed off as long as these delusional faiths keep indoctrinating and brainwashing everyday normal people into becoming new terrorists and criminals. By striking lasting fear into the hearts of its victims, terrorism is the ultimate weapon of lasting devastating insecurity against its victims because–at the lowest costs for the terrorists–it can not only mangle its victims' sense of security, happiness, etc, but it also can bankrupt nations' and/or its victims' financial resources being wasted on chase killing something like ghosts. Conventional systems of government have only been qualified to attempt to retaliate and punish those who are responsible for criminal acts but have never ever been qualified to prevent ordinary people from radicalize becoming terrorists and/or criminals. Conventional Reward and Punishment Way of treating people has often failed because it has never ever been qualified to resolve issues at their root causes. For example, some years ago according to the news of Canadian Broadcasting Corporation, a Canadian father had taken away the X–Box video game system from his very own son with a high hand in an attempt to control and stop his son's video game addiction/obsession, but instead of having his video game addiction/obsession cured, his son had run away from home and ultimately ended in death. Apparently, this is a foolish and even deadly way to cultivate or educate children. For another example, the late USA singer and movie actress Miss Whitney Houston had been addicted to drugs prior to her death though she had attempted to save herself by attending conventional rehab centers and by resorting to being baptized by a famous faith predator in the real Jordan Rive into the popular conventional delusional faith of Christianity. Notwithstanding her genuine desire to attempt to extricate and redeem herself from suffering in her addiction she had never ever been able to salvage herself from her drug addiction which had ultimately contributed to her famous and sensational death at very young age. And there are countless such examples demonstrating the failures of conventional Reward and Punishment Systems and delusional faiths. In such or similar cases, only the ultimate faith has ever been qualified to cure and resolve any additions at their root causes. So long as the root cause rearing terrorists and/or criminals has not been eradicated by any correct and hence functioning belief system, it is impossible to kill them off no matter how much money of nations and how many human lives of the troops are wasted simply because it is impossible to kill off ordinary people who–exclusively by delusional faiths–have always been continuing being radicalized or self–radicalized to become terrorists and/or criminals. It is because the root cause to terrorism and crime is delusional faiths that they always linger so long as these delusional faiths are not superseded by the truly correct and hence functional belief system–the ultimate faith. In the long run, delusional faiths can but render all their faith victims' lives ruined, and their money ripped off, and above all their opportunities to have any fulfilled and happy lives stolen and deprived. Faith predators' any acts of "kindness" equate any pedophiles' acts ensnaring children with candies, etc, or equate any drug dealers' acts ensnaring their addicted customers with free drug samples. Their ultimate common aim is to harm and exploit their faith victims with deceptive "kindness" in aid. Delusional faiths are analogous to exquisite counterfeit goods. Though they can easily defraud and befool all victims ignorant of the goods into dumping money for their fakes, they cannot defraud or befool anyone of true qualification and insight. About 600 billions of US dollars are wasted every year in the USA on addiction related problems, such as addictions to morphine, Fentanyl, heroin, cocaine, nicotine, gambling, sex, video games, etc, and about 300 American addicts die each and every day in the USA alone. All these deaths and wastes only root in the misleading counseling and teaching of psychologists and other so–called addiction therapists because none of them has been qualified to resolve addictions at their roots. In fact, the only root cause to addictions is conventional delusional faiths and hence the addicts' incorrect perceptions, beliefs, choices, decisions, and living their lives by their state of mistaking apparent reality for true reality. Human lives with no correct faith are likened to floating debris adrift in the ocean with no aim and hence they can become radicalized in countless ways and corners at random. The noblest human life is the one that bestows upon others the true insight and wisdom for them to become qualified to enjoy fulfilled lives, not the ones that selfishly aggrandize and secure their own wealth, fame, power, social strata, mates, ego–extensions, vanity, and other selfish gratifications. Since the emergence of the human race on this planet, trillions of people have been falling faith victims to faith predators always disseminating their delusional and hence dysfunctional faiths. Delusional faiths have been inflicting the human species as worldwide pandemic spiritual plague from which billions of people have been enduring tremendously. Ultimately, all delusional faiths are racket–based and deceit–based frauds no matter how holy, sacred, divine, and sacrosanct their facades, veneers, pretenses, or make–believes are; hence, in one fashion or another they shall malfunction and/or foil to liberate or deliver any faith victims from their suffering. In reality, all the followers (faith victims) of any delusional faiths have been betraying their very own faith, allegiance, fealty, human dignity, and humanity for none other than lies, deceits, pretenses, and frauds. It is because the life compass of such faith victims always misleads them by delusional faiths into malfunctioning paths that all their beliefs and actions are harmful or sometimes even detrimental to themselves, their loved ones, and/or others in one way or another. Then why the trillions of people would always both dump their hard–amassed money and squander their limited lives in order to pursue delusional faiths and to bankroll the expansion of pandemic spiritual plague and the fraud racket of delusional faiths ensnaring, victimizing, ruining, and plaguing more and more unsuspecting and inscient people into fresh faith victims? This is mainly because of two factors. On the one hand, people experience sufferings as integral components of living: as, the gradual losing the unsalvageable youthful appearances, diseases and pains, losses of the treasured and the beloved, unavoidable interactions and/or associations with the repulsive against their will, failures to gain the craved, mind vexations, the powerlessness and hopelessness over inevitable and unstoppable aging and death, etc; on the other hand, they have been inscient as how to correctly liberate and emancipate themselves from their pains and/or sufferings. And hence their desperation arising from pains and/or sufferings propels them to clutch at a straw fantasized and hoped as potential to salvage and extricate themselves from these pains and/or sufferings, just as sex addicts or maniacs would trash their money on strippers with whom they fantasize sex though not

actually performing it. It is because of this perpetual state of desperately fantasizing and hoping for solutions and cures–to their pains and/or sufferings–which can never ever be actually materialized or realized by any conventional faiths due to their deceitful and sham premises, forms, substances, and accidents that the trillions of people having been continuing dumping their money and squandering their limited lives for those delusional faiths. Delusional faiths are but the states of constantly breaking promises. It is because all conventional faiths are but, ultimately, delusions that it is never ever possible for them to deliver what they always promise except their continuing defrauding, victimizing, and exploiting their faith victims off their money, properties, and even their innocent in–between children. It is because trillions of people for thousands of years have always been accustomed to compulsively lying that there is reincarnation, soul, ghost, God, or other supreme beings that they have brainwashed themselves into losing sense and sanity which may enable them to distinguish lies from the truth, just as the people of North Korea are brainwashed into their delusional faith that they are certain to win a new Korean war against the USA and South Korea though their actual military power proves the contrary. Actually North Korean people's lives would become meaningful for North Korea to lose a new war, so that these brainwashed people can become able to wake up into lives of sanity with fewer delusional faiths. Though those people's delusional faiths can serve them as honest lies, unintended frauds, mistaken–for–wisdom stupidity, etc, ultimately their delusional faiths must malfunction and fizzle out in one way or another in being unable to liberate themselves from pains or sufferings. The difference between faith predators and robbers is that the former steal from people by lies, persuasions, pretenses, make–believes, etc; the latter steal from people by telling the truth yet by violence. The only way to avoid falling faith victims to the former is to live the correct faith–the ultimate faith which is the trailblazer of correct belief system and spirituality for the humankind; the only way to avoid falling victims to the latter is to establish unbreachable security. Those faith predators' acts of kindness: as, wash kissing faith victims' feet, etc are but pretenses and shows designed to draw in their faith victims deeper and deeper: any predators can pretend to be kind and merciful to their victims. On the other hand, anyone living the ultimate faith is even qualified to unconditionally forgive and be kind to the most hated person whom no other individual on the planet is able to forgive. In reality, Jesus Christ had never ever been resurrected because his corpse was probably cannibalized by his faith victims at the time; therefore, even today at communions his faith victims still share eat bread and drink wine to symbolically mimic the cannibalization of Jesus Christ. His faith victims must fraudulently claim his resurrection in order to conceal the repulsive act of the cannibalism of Jesus Christ and to continue batten on newly preyed–on faith victims by brainwashing them and pretending holy, though at that time the act of cannibalism was not considered as repulsive as it is today. And his so–called healing power actually is selfsame as internal energy (termed chi, qi, or taich'i in China) whose control can be acquired by anyone who practices esoteric arcanum. The ultimate motive for the faith predators to always lie that he had been resurrected is so that they can continue defrauding their faith victims off their money and properties, and even exploiting the in–between innocent children of the faith victims. The most evident of the truth is that truly correct faith must work and function in delivering any followers from their sufferings; otherwise, all faiths and their proponents must be and can only be delusional and hence dysfunctional frauds. All conventional faiths/belief systems with their delusional and hence dysfunctional faiths have always been predicated on the diffusions of lies, frauds, deceits, misinformation, deceptions, make–believes, and brainwashing that are devised to batten on, defraud, and abuse their parishioners, other followers, their very own innocent children, and other faith victims. Ever since the split second on such a birthday when the human species had emerged onto Earth, people have killed and harmed one another to establish empires, wealth, power, predominance, social strata, fame, successes, etc for selfish aggrandizement; but none of such lifetime have been wisely spent because all conquerors and/or winners have died, much as all ordinary people and losers do. Therefore, all their cunning, brutal, and hell–for–leather rampages, campaigns, maneuvers, intrigues, duplicities, chicaneries, deceptions, escapades, etc eventually have been but foolish and meaningless dissipations of lifespan in vain at the pursuing for anything but that which can last. Furthermore, with their delusional and hence dysfunctional faiths endless faith predators have been defrauding, deceiving, brainwashing, victimizing, and inflicting billions of innocent people dragging their innocent children along in respect to the authentic and genuine truth and true reality of universe containing life, mind, and other existences. And as the faith frauds these faith predators have defrauded, batten on, and exploited these misled innocent faith victims and the victims' children off their money, properties, innocence, and opportunities for true happiness. Even as recent as December 2012, delusional faiths in the country of India of multiple dysfunctional faiths had driven many Indian men into gang–raping and/or murdering women in their country in the most uncivilized manner. Moreover, according to CTV news on or about 22 April 2013, the delusional faiths in India have even rendered some men in India kidnap raping and killing their fellow citizen girl of only five years old. All people's any uncivilized conducts and inner sufferings can only ultimately root in delusional faiths because only their deceptive faiths, beliefs, and hence mindsets drive them into their behaviors of foolish way of life. Conventional faiths are delusional and hence dysfunctional, just as the wrong medication; on contrast, just as the correct medication, the correct and hence functioning belief system–the ultimate faith–never ever malfunction under any circumstances or situations. Perpetually motivated and controlled by their lifelong laziness, ignorance, and inability in making any honest living; and hence by their lifetime subsequent compulsion and greed to batten on, take advantage of, and victimize their fellow inscient human beings, faith predators plaguing humankind with their delusional and hence dysfunctional faiths have always been defrauding, victimizing, and brainwashing countless faith victims and even their innocent in–between children into believing that the universe and its existences have been created by a Big Bang singularity, God, or other supreme beings; into believing killing many tigers, sharks, bears, etc only to eat their penises, fins, pawls, etc to hallucinate attaining virility, longevity, etc; into insist claiming that they have been abducted by aliens or witnessed aliens; into lying that they have experienced deaths only to have returned from their near death experiences; into believing that the Earth is hollow with aliens living inside; into believing that the world would end on a certain day though I know that it is impossible to accurately predict future events with certainty from the perspective of the totality of the universe; into believing that lives have been integrated with and associated with recyclable souls, afterlives, reincarnations, hells, heavens, ghosts, selves, egos, and innumerable other delusional beliefs and concepts; into even committing mass suicides as the 39 brainwashed faith victims of the Heaven's Gate cult in California of the USA had actually dumped their

very own lives together; into becoming suicide killers as the 19 brainwashed hijackers' delusional faith had engineered their act of 9/11 Event, etc; into lying and canonizing someone's coincidental events as interceding miracles, etc; and–above all–into forever mistaking apparent reality for true reality, and hence acting on living, suffering, and squandering their entire lives in the self–deceit of such a state of mistaking apparent reality for true reality. And some years ago at a 1996 press conference NASA had even deceived and defrauded our human species for enthusiasm and government founding by having fraudulently claimed that a piece of rock–containing evidence of life and arriving from Mars–had been found on Earth, but in fact it can never ever be probable for any life to ever exist or to have ever existed anywhere else throughout the entire universe. And it can never ever be probable for anyone to find any evidence of life on Mars or anywhere else except Earth. In the history, churches used to employ the trickery of crying statues, lactating statues, magnetic force levitated chariots, fake sounds of thunders, etc in order to intimidate and defraud their faith victims into dumping their hard–earned money, properties, etc for their delusional and hence dysfunctional faiths. Of course, all these faith predators plaguing their faith victims can for life box themselves in delusional faiths and blind themselves from true reality, but by so doing they can never ever become qualified to tap into their human potential to the maxima. And one of the most practical potentials is to enjoy lifelong true happiness, peace, etc. It is because faith predators and their faith victims have lied so much with their ingrained delusional faiths that their deceptive mindset gradually strikes root in their entire being so much so that they can only redeem and salvage themselves with indomitable resolve and effort to seek the truly correct belief system–the ultimate faith. Ultimately, it is because it is impossible for any delusional faiths to function except perpetually fantasizing and dreaming about extricating, delivering, or redeeming anyone from pains and/or sufferings (such as stress, anxieties, compulsion, depression, PTSD, mind vexation, insomnia, obesity, addiction, vainness, emptiness of aim, anger, figment, vanity, powerlessness and hopelessness over the inevitable and unstoppable aging and death, etc) that certainly the faith predators plaguing their faith victims and even their innocent in–between children choose to become diehard frauds till the end of life by enduring them, living them, and boxing themselves up with them, much as billions of their ancestors had already suffered and died in ignorance. But while they are alive it is impossible for them to lie away their inner sufferings, just as no patients suffering from mental retardation can lie and pretend enjoying any life of intellectual or joy. About 7 March 2013 a doctor on Dr. Oz TV show has just deceived the world public with his delusional theory and book: women are more intelligent than men. He has shored up his delusional theory with his claim of thousands of brain scans. But in reality, it cannot be more obvious to me that the deceptiveness of his delusional theory ultimately roots in the fact that intelligence is inherently invisibile, and that intelligence is more than the physical brains. To qualify or quantify invisible intelligence with visible brain scans is bound to fail. In addition, he is totally ignorant about the human internal energy (termed chi, qi, or taich'i in China) that is the main driving force and energy in any living beings despite of its invisibility. The invisible can be more powerful than the visible: though radiation is invisible, it can kill any living creatures on Earth. The only ground why more men are incarcerated than women are is not that men are less intelligent than women, but that conventional men have always been indoctrinated and brainwashed by mainstream yet delusional faiths so that they have never ever lived the truly correct and hence functional faith securing mind freedom including emotional freedom. The flux intensity and induction distribution of the internal energy in the human body and outside human body can be most easily felt by me or anyone else who has mastered the manipulation of his or her internal energy. As I had felt for days, any true masters of internal energy can also feel what I had felt for days as an invisible belt of about 5 cm wide of internal energy had flow pulled down from the crown of my head to my face, down along my chest, and then down along my abdomen, and then back up from my lower back, and up from my upper back, and up from the back of my neck, and then back to the crown of my head. This pivotal experience of watershed juncture in internal energy practice is termed as opening up small circle (in Chinese, Datong Xiaozhoutian). And the internal energy can be stored and accumulated in the region about 5 cm below the belly button (in Chinese, Dantian). And internal energy if radiated by any master can be very easily felt by anyone else. Though ft is invisible to the naked eyes, the internal energy is visible via infrared camera, etc. In fact, women are never more intelligent than men. This has been repeatedly demonstrated by the facts that most advancements for human civilization have been contributed by men instead of women, and most Nobel Prize laureates have been men instead of women. It is but 100 percent stupidity for any doctors or any scientists to determine human intelligence by brain scans simply because human intelligence is invisible. And it is also but 100 percent stupidity for anyone to claim that women are more intelligent than men for any reason because the fact is not so. In addition, Dr. Oz had also misled the world as to the optimal way to treat migraine. The optimal way to cure migraine is to practice the manipulation of internal energy instead of medication, etc, unlike his misleading the world. After anyone acquires even some extent of control of internal energy and if and whenever he or she experiences headache or migraine, all he or she needs to do is to sit still for about 10 minutes to allow the internal energy to flow reset itself, and then the headache or migraine always disappears after such a sitting session of stillness. Therefore, the optimal way to cure headache and migraine is not medication but is to acquire certain extent of freedom and control of one's internal energy by practicing manipulating the internal energy so as to let the body's very own already existing internal energy cure the body itself. My internal energy at about 10 minutes of sitting session of stillness has always consistently cured my any headaches whenever and if they occur; therefore, I have never ever ingested any medication for headache or migraine in my life. On the other hand, for decades, Dr. Phip with his TV shows, other psychologists, Oprah Winfrey OWN shows, etc have always been misleading and deceiving the whole world into believing that anger, addictions, and many other human sufferings root in what happens externally to a subject. It is because their beliefs and faiths are predicated on falsehood, fraud, and delusional faiths that their audience and believers have continued suffering. But in fact, it cannot be more evident to me that any anger, addictions, and any other human sufferings do and only can internally root in faiths, beliefs, perceptions, information, knowledge, conventions, etc that ultimately are incorrect and hence dysfunctional, considering that no one living the truly correct and hence functional faith–the ultimate faith– suffers no matter whatever he or she is subjected to, and considering the fact that the selfsame occurrences, circumstances, situations, events, etc do not drive or cause anyone else to experience the same except the subject. These public misleaders also detrimentally advise divorcing and breaking couples to cut off communications by restraining orders, etc; hence, they have

actually deteriorated these couples' situations and even have brewed murders in some cases. In reality, the Principle of Defusing Hostile Tension by Civilized Communication established by me states that it is because divorces/break−ups between couples are one of the greatest, drastic, and sudden shifts in humans relationships, interdependences, and emotions that they are best to be done by secured gradual divorces/break−ups where the couples can still communicate in any secured settings−such as a police station or a court house where the tendency of violence is usually stifled−so as to gradually become accustomed to their new lives detached from their accustomed interdependence and bond already foster grown in each others until they feel confident that their divorces/break−ups will not end up in abuse, violence, or even murder. Moreover, the Principle of Defusing Enmity by Civilized Communication also established by me states that enmity, hostility, animosity, hate, and other antagonistic emotions are best deescalated by civilized communication. Therefore, hostile countries can prevent wars by pre−active and productive communication. Even sham communication is far better than no communication. These public misleaders and psychologists have also been further misleading and deceiving the world into believing that PTSD, stress, etc root in the activating events, situations, circumstances, etc; but in reality, they exclusively root in people's delusional faiths−the state of mistaking apparent reality for true reality and hence acting on apparent reality instead of true reality. In fact, conventional love is fraud because it is predicated upon the deception that the quality and/or reason of love originate from the side of a subject receiving love instead of observers giving love. Why so? The fact is that different people often love and dislike the same subject simultaneously. If the quality of loving or disliking had rooted in the subject, all different observers must love or dislike the selfsame subject in one accord. In fact, true love must be a subjective conscious or unconscious choice from the side of an observer giving love instead of any subject receiving love. Therefore, conventional love is misguided self and mutual deception and discrimination rooting in delusional faiths and hence wrong perceptions. As a result, over 50 percent couples actually end up in family disharmonies and/or breakups. There has never ever been true love in conventional sphere, domain, and realm because conventional people always mistake self and/or mutual deception for true love. Moreover, conventional lovers always mistake for love their good feelings induced by hormones like dopamine and endorphin and so on, just as drug addicts always mistake for happiness their brain excitements induced by electrochemical brain stimuli induced by drugs so that they would sell their dignity and everything else for deceptive happiness−drugs. To summarize, conventional people are accustomed to deceiving themselves into mistaking for love and happiness their fleeting brain excitements induced by hormones like adrenalin, endorphin, dopamine, etc. Only by living the ultimate faith anyone can become qualified to attain and enjoy true lifelong love and happiness−mind freedom including emotion freedom and omniscience in the expanse of true reality beyond apparent reality. Only the correct knowledge, insight, and faith about mind, life, and universe can be qualified, on all terms for anyone, to harness and/or manifest−to the ultimate maxima−the human potential of the mind and/or the body; otherwise, all talents, knowledge, knowing, faculties, etc are perpetually limited and confined within the spheres of apparent reality without ever becoming qualified to be expanded to, upgraded into, or evolved into true reality transcending apparent reality. Only by living true reality guided by the ultimate faith (the truly correct and hence functioning faith/belief system) anyone can become qualified for life to enjoy mind freedom−including emotional freedom, etc−and omniscience in the sphere of true reality beyond apparent reality, resulting in becoming qualified to harness to the maxima of his or her human potential of both the body and mind. To live true reality is selfsame as to live genuine 'Virtual paradise/heaven" without the requirement of deaths that must be required for all people plagued by conventional and mainstream delusional religion/belief/faith systems to fantasize their delusional paradise, heaven, resurrection, reincarnation, etc. Had these inventions not come to fruition, and so long as the human race can still endure the living conditions on this planet, people will continue enduring countless faith predators that will continue defrauding, brainwashing, victimizing billions of faith victims with their delusional and hence dysfunctional faiths, as since the emergence of humankind on this planet they have always battened on their faith victims throughout the world and even have sexually exploited/molested the innocent children of their faith victims in none other than the places of worship. The places of worship are also sometimes used as their bases for other crime: as, some faith predators have actually been charged for selling child pornography, etc in none other than the places of worship. My qualification cannot manifest it clearer that the effective ways and strategies to prevent or reduce the sufferings of innocent lives from continuing being misled, brainwashed, victimized, and/or harmed are to live the correct faith−the correct belief system. As a member of true integrity and righteousness of the human species, we are stumbling across one another on the universal yet against−our−will−journey of aging towards inevitable death instincts, I am behooved and honor−bound to provide the humankind with these inventions to upgrade the human thought, culture, intellect, intelligence, knowledge, vision, sphere, perception, faith, and capability in totality about the universe, mind, life, etc−so as to dispel the worldwide spiritual plague and precipices of delusional faiths, misled beliefs, misled perceptions, misled preconceptions, misled information, misled knowledge, misled science, etc that have been deluding, victimizing, and/or afflicting the humanity since its emergency tens of thousands of years ago. Only in so doing, said deceits, frauds, whoppers, delusions, etc against humankind can be so lifted and dispelled that mankind will no longer suffer in ignorance, delusion, deceit, pseudo−science, etc. Therefore, these inventions are of unprecedented and historic significance, practicality, and value since they can help to prevent future billions of innocent human beings from continuously being defrauded, brainwashed, victimized, and/or harmed by faith predators with their delusional and hence dysfunctional faiths, and they revolutionize and upgrade the human thought, culture, intellect, intelligence, knowledge, vision, sphere, perception, faith, and capability in totality about the universe, mind, life, and other existences. In conclusion, it is impossible to eradicate human sufferings by delusional faiths because only the correct knowledge, insight, and faith about universe including mind, life, and all other existences can deliver true happiness, peace, joy, etc. Delusional faiths can only draw their faith victims in and then inevitably inflict upon them unending sufferings and hopeless deceptions no matter where they are or who they are: even if they are princes, princesses, etc their sufferings and deceptions can only be embellished with more deceptive facades. No sufferings can convalesce with delusional faiths in aid, no matter whichever popular kahuna faith predators have disseminated them. Delusional faiths can only plague and sink their faith victims into deeper and deeper snares and precipices of deception and suffering in the long run. Only the truly correct and hence functional belief system−the ultimate faith−can be qualified to deliver any believers

mind freedom (the ultimate happiness) and omniscience in the sphere of true reality beyond apparent reality. Some inventions that qualify to materialize and bring to fruition the rarest opportunities which can correct and upgrade humankind's thought, culture, intellect, intelligence, knowledge, vision, sphere, perception, faith, and capability in totality about the universe, mind, life, and other existences are to be articulated in the specification hereinbelow.

FIELD: railway transport; track machines. SUBSTANCE: proposed sweeper has mounted equipment and its control systems. Machine is made on base of truck on rear driving shafts of which rail way wheels are installed. Front part of base chassis is connected with two–axle railway bogie on which platform is mounted. Platform is furnished with blades installed for turning in vertical plane, and manipulator for loading and unloading operations. Automatic coupler, rotary auger snow remover and manipulator for loading and unloading operations are mounted on rear part of chassis. Brush gear is installed in wheel space. EFFECT: enlarged range of railway cleaning machines. 20 cl, 3 dwg

Abstract:
Source: US2003005634A A method for producing clean energy from coal by feeding the coal in a reactor which is sealed to the atmosphere and moving the coal in the reactor while injecting oxygen to combust a portion of the coal in a substoichiometric mode to devolatilize the coal and yield a pressurized hydrogen rich raw gas which contains coal–derived cancer causing distillates and hydrocarbons together with a hot char. The distillates and the hydrocarbons are cracked to result in a cracked gas of essentially 2H2 and 1CO which after desulfurization becomes an ideal synthesis gas that can be synthesized to a liquid fuel for heating and transportation as an alternate to petroleum. The hot char is gasified in an air blown gasifier to produce a fuel gas and a molten slag which are jointly directed out of the gasifier through a common port which is maintained open for the free flow of both. The fuel gas and the molten slag separate from each other by flowing both gas and slag through a molten bath in a submerged manner in order to effectively scrub the fuel gas in the molten bath while it bubbles out of the bath. After separation the fuel gas is treated for sulfur removal and is in condition for use as an efficient gas turbine fuel for power generation by virtue of its mass, while producing very low NOx emissions when combusted. This fuel gas can also be used for raising steam and for clean burning in industrial heating. The method is capable of making coke and/or activated carbon.

Abstract:
Source: IN03873DN2006A Disclosed is a multilayer article assembly comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) an uncured thermoset or uncured cyclic oligomer substrate layer, wherein the coating layer is in contiguous contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for preparing said multilayer article assembly.

Abstract:
Source: US2014306799A Methods and systems for a detecting an intruder near or within a vehicle are disclosed. Specifically, a method to detect and identify a person near or within a vehicle as an authorized or an unauthorized user is provided. In the event an unauthorized user is detected within a vehicle, the system may take a number of actions. In one embodiment, the actions comprise providing notice to one or more authorized users of the vehicle, disabling the vehicle, notifying emergency personnel or police, and emitting a visual or audio alarm.

Abstract:
Source: US2014265431A An aerodynamically optimized drag−reduction means and method for optimal minimization of the drag−induced resistive forces upon a terrestrial vehicle wheel, where the drag−induced resistive moments on wheel surfaces pivoting about the point of ground contact are reduced, and the vehicle propulsive forces needed to countervail the resistive forces on the wheel are reduced. The drag reduction means includes: a streamlined wheel cover positioned on a vehicle to shield the faster moving upper wheel surfaces from headwinds; a streamlined wind−deflecting fairing positioned on a vehicle to shield the faster moving upper wheel surfaces from headwinds; an engine exhaust pipe diposed on a vehicle whereby exhaust gases deflect headwinds to shield the faster moving upper wheel surfaces of an automotive wheel; an automotive spoked wheel having streamlined oval−shaped wheel spokes arranged in one or more rows for greater axial strength; a streamlined tailfin rotatably attached to a wheel spoke, which thereby may pivot about the spoke in response to varying crosswinds; and a tire having streamlined tread blocks arranged in an aerodynamic pattern.

Abstract:
Source: US2004144001A A plow mounting assembly is provided for removably attaching a plow blade to the front end of a vehicle. The plow mounting assembly includes a frame assembly semi−permanently connected to a front end of an associated vehicle. A blade assembly includes a plow blade and a grasping assembly in a closed position removably connected to the frame assembly.

Abstract:
Source: US2005120715A What has been created is a plurality and a variety of processes and a variety of devices correspondingly supportive to each process, wherein, a new partnership between; (1) a heat absorbing radiator compressed air pipes/tubes and (2) a gas turbine engine or a reciprocating piston engine,–is used to recapture and reconvert the, otherwise wasted, heat energies expelled by engines, by factories, by smelting plants, by distillation plants, by chillers/coolers/freezers, by cooking ovens, by lamps/stoves, by trash burners, and the heat energies created by the solar heat on the desert/ocean water,–into electric power and finally into hydrogen–deuterium fuel,–by having the engine's tailpipes submerged in cold compressed air inside the heat absorbing radiator pipes in reverse air flow, to further drive and re–drive the same engine; wherein, in order to capture fusion heat energy the hydrogen bomb is detonated in the deep ocean to catch the flames by the water and the hot water is used to energize the compressed air inside the heat absorbing radiator pipes; wherein, in order to produce fusion energy, an abundant electric arc is passed across liquid deuterium or across gaseous deuterium by the electro–plasma torch and sparkplug in the internal combustion engine, and by detonating a dynamite inside a liquid deuterium; wherein diamond is produced by placing carbon inside the hydrogen bomb; and wherein, deuterium fusion flame is used first in smelting glass to large sizes before running an engine.

Abstract:
Source: US2779942A (Claim 1) 1. In a shoe machine, the combination of a tack driver, means for actuating the tack driver, an arrester for preventing the actuation of the driver, a tack drum for supplying the driver, an actuator for rotating the tack drum, operating connections from the actuator to the drum including an element which is retractable in order to break said operating connections, a hand lever, and connections fro_n the hand lever which operate first to retract said element thereby to render the dr−um iiibperative and second to advance the arrester into jo onerative position thereby to prevent the actuation of the tack di−,'ver.

Abstract:
Source: US2008071429A A supplemental control system for a materials handling vehicle comprises a wearable control device, and a corresponding receiver on the materials handling vehicle. The wearable control device is donned by an operator interacting with the materials handling vehicle, and comprises a wireless transmitter and a travel control communicably coupled to the wireless transmitter. Actuation of the travel control causes the wireless transmitter to transmit a first type signal designating a request to advance the vehicle in a first direction. The receiver is supported by the vehicle for receiving transmissions from the wireless transmitter. A traction control of the vehicle is responsive to a receipt of the first type signal by the receiver to cause the vehicle to advance.

In zz uenterless grinder the eornbimition of it bose; ri grinding Wheel mounted To J _lt;1 0 M) (IQ thereon; a member slidable on said base toward and from said grinding Wheel; a Work support mounted on said ineinberg a carriage slidable on said nieinloer toward and from said grinding wheel; means for locking said carriage to said ineniher; nieuns for locking said menilier to said base; a regulating Wheel and £L}llOtO1`COI1l1€C`t(LLi to drive the sa1no,lJoth niornited on said carriage; and Incchanisni for shifting said carriage relatively to said base coninrising' in inzmaallv rotatable screw swiveled on the base, means for locking said screw against rotation, a nut engaging said screw and swiveled on said carriage, and means actuated by said motor and arranged to rotate said nut. IS. In a Centerless grinder the combination of a base; a grinding Wheel mounted thereon; a niemloer slidable on said base toward and from said grinding wheel; 3, Work support mounted on said ineinber; a carriage slidable on said ineinher toward and from said grinding Wheel; means for locking said carriage to said member; means for locking said inemher to said base; a regulating Wheel and a motor connected to drive the saine, both mounted on said carriage; and nieehanisin for shifting said carriage comprising a ooaoting screw and nut one swiveled in the base and rnannally operable, the other swiveled in the carriage, connections 'For driving by said motor the member swiveled in the carriage and means operable to lock the other meinher against rotation. 19. In s centerless grinder the cmnliination of a grinding Wheel; means for driving said Wheel; a worlc support; and a regulating wheel unit Comprising a slidable carriage, a regulating wheel, a driving motor therefor, both mounted on said carriage, and niecha~ nisin operated by said inotor for shifting said oarriage. 20. In a centerless grinder the combination ot a grinding Wheel; means for driving said Wheel; a Work support; and a regulating wheel unit comprising a slidable carriage, with fi regulating wheel, driving motor therefor, variable speed transinission between said motor and wheel, all mounted on said Carriage, inechanisin for shifting said carriage and means for actuating said nieclianisin from said motor. Ql. In a centerlcss grinder, the eornbination at a grinding Wheel; means for driving said Wheel; a work support; and a regulating Wheel unit comprising a carriage, with a regulating Wheel, driving inotor therefor, variable speed transmission between said inotor and wheel all mounted on said carriage, and moans for supporting said Car'rir.ge with said wheel skewed relatively to said grinding Wheel. In a centeriess grinder the combination of a grinding Wheel;

means for driving said Wheel; a Work support; a regulating wheel unit comprising a carriage, a rog11lat~ ing Wheel, and a driving motor therefor, both mounted on said carriage; and a reinovable inclined support for Said carriage. 23. In a centerless grinder the coinhination of a grinding Wheel; means for driving said wheel; a Work support; a– regulating Wheel unit comprising a carriage, a regulating wheel, and a driving motor therefor, 'both mounted on said Carriage; and means for guiding said carriage toward and [ruin said grinding wheel and for imparting a definite angle of skew to the regulating Wheel relatively to the grinding Wheel. 24. In a Centerless grinder the combination of a base, a grinding wheel, a carriage in ` which said grinding Wheel is Inountod to ro~ tate, said carriage being mounted on said base and being shiltahle thereon in the direction of the axis ol said grinding Wheel; means for driving said wheel while said carriage inoves on said base; a nieohanisin for shifting said carriage back and Forth; a second carriage rnounterl on said base and guided thereon in a direction transverse to the motion of the lirst Carriaife ' 'L revulatinv' wheel inounted in' fl 7 K PJ D said second carriage in opposed relation to said grinding wheel, the inoveinents of said second carriage serving to shift said regulating wheel toward and from said grinding Wheel; a inotor mounted on said second car~ riage; and driving connections between said motor and said control wheel. 25. In a eenterless grinder the combination of a base; a grinding Wheel niounted thereon; a control Wheel opposed to said grinding Wheel; and ineans for fixing the angle ot skew of said control wheel comprising a. laterally inclined niember upon which said control wheel is reniovably mounted and which is itself removably mounted on said base. 26. In a oenterless grinder the Cuuibiuation of a grinding Wheel and a regulating Wheel both inounted in bearings; a main base supporting the bearings of one wheel; and an intercliangoable interinediate base interposed between said base and tliolieariugs of the other Wheel and serving to fix the angular relation of said wheels. V 27. In a centerless grinder the combination of a grinding wheel and a regulating Wheel both mounted in hearings; a main base supporting the bearings ot one Wheel; an interchangeable intermediate base interposed between said base and the l_gt;earin,–:gs of the other wheel and serving to tix the angular relation 01' said wheels; and a Worl; support 1`L10Lll1f6_lt;]. on said intermediate base and removable therewith. QS. In a eenterloss grinder the combination of a grinding wheel and a regulating wheel both mounted in bearings; a main base supporting the bearings of one Wheel; an interchangeable intermediate base interposed hetween said base and the bearings of the other as ics Wheel and serving to Liz; the zinguiiir relation of said wheels, said inie1'|11e_lt;,liate base being adjustable l\o'»\=ai'_lt;i and |f1'_lt;_gt;i1i the first Wheel :incl the bczariligs of the other wheel being acijustable on said iiiterizrierliaue base 't»o\viird and :from said first wheel. 29. The combination with an centerless ,2`1`§i11Lii]'lg nmchiiic having ai work support, of il, blallk–feeding lueciizlnisnl comp1'isin,q ax magazine tube; n c:u'1'ier movable between two positions, in one of which it receives zz blank from said tube and in the other of which it presents said blank azdjziceui, said work support; and Huial, pressure means emitrolled by the movements of suinl ciu'1ssie1' and operative when the latter is positioned mlim cent said work support to disciizwge a Work blank therefrom unto said supiaorn. 30.ss The combiiiation with ax. centerless grincling' machine ililvlillg él Work rsupport, of u biaiiicfeecling 111(%H1i)C1`IIlOV§lbiC to and from fx, position ailjacent, said su|Jpm“t in which ii; serves to feed u work blank to said eupporb; au ejector operable to remove sm I i uishecl 'i\'o1'i_lt; piece from said suppori ulfuig a path :i pproxiinuteiy coiucidelin with the path Gi' e1'1t1'a11–:ze oif the Work biuuk from said feeding meiuber; :md automatic means iL1'l'L`II]f{_lt;!(i to move said member mvay from S2Li£`iSl1D`|3Ol`i.– and to {L(2`ZU~ atc said ejector. $14 The combiuaiioll with ai uenterinss {l1`1}1f.ier including an grinding wileel, a reguiiltlpg Wheel and fi Work silpporiz, of ai Work ssfeeding meluber vzolistriicted and fll`1'_l!1,Q_”€{i to be moved into and out of pmxilnity to mid support and to deposit 11 work blzuik i;hei'_lt;'0n when adjacent thereto; u l;O]Tli_gt;i11{?(i swp aiicl ejector iinlapiied to arrest the eiitering pieve fliI1d_1`('!i1il1D lt in grinding pneitioii; mul ;mf0_ matic means arrmiged first to move said member 011% Of proximity to said supporti and then te shift said stop and ejector to 'Fei–ce the finished work piece out on the side gt which it entered. XS. ln apparatiis of the character duscribed, in coinhinaticzx, a grinding Wheel rotated at a relatively high speed, fl regulating Wheel rotated at a relatively low speed and in si, mlirectien to present an operative Surface traveling in a direction relative to that elf the operative surface of said grinding Wheel to contre] the rotation of round work, a Work support for holding xvorli in ojgerative rela» tion said two wheels, means for Withdrawing one Wheel From the other in recurring scquenee, means for positioning a Work piece on said Work support, ineans for ejeeining a Work piece froni said werlf support, and means having: separate connections with and operating; said wheel–'withdrawing means and said work–poeitioning means and said Workejecizin means in timed relation. 39. In apparatus of the character described, in combination, a grinding wheel rotated at a relatively high speed, a regulating wheel rotated at a relatively low speed and in za, direction to present an _lt;:pei‘ai,ive surface traveling in a direction relative to that of the operative :sui'l'aee of said grinding wheel to control the rotation ot round wbrk, a work support, having a work supportinfg surface inclined toward the regulating Wheel, one of said Wheels being shaped with respect to the other to Zlform a tapered W0='k–wceivixig and grinding tliroat, means for positioning a Work piece on said inclined surface of said Work support and into open ative relation to said regulating Wheel, said regulating Wheel and said work support being relatively inclined to cause the 1'egulut_lt; ing Wheel to move the Work piece axially in a direction lroin the larger end ol' said ta~ pered grinding throat toward the 1'1_1‘]fO\'\T9l‘ end, a stop for limiting; the movement of the work piece along Said work support, and moans for moving one wheel away ,i'i–run the ether to release the Work from the grip of the wheels. V ill). In apparatus of the character described, in combination, a– grinding Wheel rotated at a relatively high sgced, a regulating wheel rotated all a 1‘elal,ively low speed and in a direction to presient an operative surfaee traveling in a direction relative to that of the ope1'ai;ive suri`ace of said grinding wheel to control the rotation of round work. a work support having a Work supporting surface inclined toward the regulating Wheel, one of said wheels being shaped wilh respect to the other to form a tapered \vorlz–receiving and grinding throat, Ineane :tor positiulv ing a work piece on said inclined surface of said Work support and into operuti ve relation to said regulating wheel, said regulating Wheel and said work support being relatively inclined to cause the regulating wheel to me cc the Work piece axially in a direction train the larger end of said tapered grinding throat toward the 1'1i1,T`]`0VVQ1‘ end, ejecting means positioned in the path of movement of the W_lt;_gt;rl~: piece along said work support and adapted to limit thc inovcmcnt ot the Work piece, and means for actuating said Wnrlr–pogitiening means and said ejeciing means in timed re~ lation, ell. In apparatus of the character _lt;;le~ scribed, in combination, a grinding wheel retatcd at a relatively high speed, a regulating wheel rotated at a relatively low speed and in a, direction to present an operative surface traveling in a direction relative to that ef. the operative surface ot said grinding wheel to conirol the rotatinn of round Work, a Werk :support having a work–supporting surface inclined toward the regulating Wheel, one of said wheels being shaped with respect to ihe other to form a tapered \V0l'l_lt;–1‘€C{£iVi?l§;f and griniliiig throat, means for positioning a work piece on said inclined sin~l`a_lt;_gt;e oi’ said Work support and into operative relation to said regulating Wheel, said regulating Wheel and said Work support being relatively inclined to cause the regulating Wheel to mme the Work piece axially in a directioii lrmii the larger end of said tapered grinding threat toward the narrower end, cjecting nieans sitioned in the path of inevexnent 03 the work piece along said work support and adaprecl po– U _lt;_gt; EG o li io limit the moveinent of the work piece, iufmiisi i'or moving one wheel toward and avfay troan the other, and inuanis tor actuating siaicl \\’Ul'ii'–1103itlO1_\l1léL' means and said Wl1l3t5l~1l`lO‘/l11§§ ineiazn; and said ejeeting means in timed relation, »l2. li; :ipperatus of the cliaracter des:ui‘il_gt;ed, in eoinliination, :L bane, a ggrinding wlieirl rotated at zi relatively high S1)l?O1'l., a rogjiilatiiipj Wheel i'ot:ifod at a irlalisfely lov: rig;–eerl and in ai, rlirecztion to presient an oper~ iitive :5i,1i"t;u:c traveling in a di rention relzttive to tliat 1; t the oper:iti‘,'e surface of said ggrinfling wlieel to control the rotation ct round \rorlz, a work support for holding; work in oiieraitire iniatioii to euid two Wheels, a incinlier slidable on said base toward and from said grinding wheel, eaid work fnippe–rt lieing inounte–Ll upon said nieinher, a nirxinlier by xrhiuli said regulating Wheel rotatably :_gt;n,ppoi‘te:l, srnid las–it–nientioiieil ineinlier lw» fngr sliclaol–3 on said Sret–iuention–firl inemlaer toward and from said grEii_lt;'llng vfliexfli anef–li~ ariifé‘in adapted in i'eciiz'rin5g sequeiufe to :=:hi'tt siairl eocond–niontioned nieinlier und the regulating; wlioel carried i§l1ft1`€:l_)}' iowai‘fl and uirny from said grinding; wheel, and ineszns opei'alJle» at will for locking; said two muffin– bers; 1;o;`§e1;lier, thereby ro canoe i,iO'.'r2nit‘ii€ or :mid ivorlc support with said regiilaling whiicl, or to loclc said SC_lt;i0Il\l~i11Gl1flOll(‘(l ineniljier to said base, thereby to online iu_lt;_gt;‘:eincnt ot' :mid regulating

Wheel to be aleo relative to Said \\'orl_lt; support. 43. In apparzitus of the character dcseribed, in coinliination, a haue, a gniziiliiifi; wheel rotated at a relatiifely high speed, a regulating wheel rotated at– a 1'elz1ti\'ely len' speed and in a L:li.1`i}l,'i'i_lJ¥`l to prea–:ent an operattive :==ur'l'ncc traveling in a direction rela~ tive to that of the operative surtacc of Said grinding wheel to control llie rotation ot round work, u Work Support 'tor liolilinij work in operalive relation to solid tivo wlieels, si, nieniber slidable on said bane, zz second niernher slidable on said base, one of said nieinliers lining slidable in a direction trainsvorsely to the axis of il Work piece, nioafis rotatalily mounting sfftirl Q'r.indiug Wheel upon one ol' said ineinliers, inezinfs rotatably mounting :said i–egulaliing wheel upon the other of sziir! ineinlicrs, means lliifltlllliillff said Work support upon one of snifil ineziiliwsir, and xneizns :i_lt;il:1ptc_lt;l in i'e;~urrin;1 neriiief–:ice to shift one of said ineznljiers. 44. In apparatus olss the character doscrilved, in cfzinliinattion, ai griixiliiig wlieel ro~ tated at a relxitively high sqieerl, a regliiatizig wlieel i"_lt;:l.:i.te_lt;l at ii i'elativel_v lon' speed and in a dizieeti on to present an operative sziu–l's,eo traveling in ii ili1'c_lt;,'tion relative to that of the operative siirfiice of Said §_§l`ill_lt;llI}g \rln:~;rl_ to control the rotation of round work, a work siipporti having a Woi'k~suppr.rting siirfaee inclined toward the regulating Wlieel, a slidable meinlier supporting said work s;up~ port and said regulating Wheel for niovenient in a direction toward and uway from said g'i'inding wlieel, ineehanisni ailapted in reeurring cycles to inove said ineinlner toward and away from said grinding wheel, :said iu» clincd surface of said nforlz support; causing the Work liliereon to be maintained in Contact with the operative surface of said rep;ulat.ing wheel when the grinding Wheel :ind the Work :ire out of operative con tact. L!–5. In $L]Q1f)UiI'£L|.Llf5 of the character described, in coinliination, ri grinding wlieel rotated at a relatively high speed, a regul:it~ ing Wheel 1'Oill'iICll at fi. relatively lonss speed and in a direction to presenr an operative surface tra'.'elinp§ in a direction relative to tlizi li of the operative surface ot said Q,i'in_lt;liiig ivliecl to control the rotation of round Work, a Work :support liavirig a worl_lt;,»supporting surface inclined toniziiwl the regulating irlieel, a slidable ineinher supporting said n'orl_lt; support :uid said reggulatiug Wheel for ili(?\`CZl1CIlt in :ii direction toivaiil and away f"oin mid griiitliiigg wheel, iiieclienisni adapted in recurring cycles to move said nienilier toward :mil uwajv from said grinding wheel, maid inclined surface of said Work support titllikflflef the worl; thereon to be inaintained in conlanzi \,ri5£'li the operative surface of said regnuiting wheel when the grinding Wlivawl and the 'ivoi–li are out of operative contact, s–:aid \'.'o;~l_lt; support and sai d regulating Wheel lining; related to each other so that the reguialiii 'ivlicel urges the ivorli in an axial direc~ tion along said Work support, means for rociprocatingf said grinding wheel in a ilirecl tion leiig.liwis;e ni the work, and ineans forming ni stop for limiting axial movement of the work. 46. In apparatus of the character _lt;`!e~ scribed, in coniliination, :iv grizidiiig wheel rotated at a relatively high speed, a rcgulat~ ing wheel rotat;ex,l at a relatively low speefl und in ri. tlirection to present an operatiife :nirfaec traveling in a, ilirocrion relative to that of the operative siirfafzo of said grinding Wheel to control the rotation of round work, a wort: support having a \\'(._gt;!'i{~?§'|]f)}?£'JI.`§– ing surface inclined toward the regulating wheel, a slidable meinber supporting said work Support and said regulating wheel lfnz' inoveinent in a direction toward and away from said grinding wheel, meclianifsiii adapted in recurring cycles to more said ineinlier toward and away ironi said grinding xvheel, said inclined surface of Said work support causing the Work thereon to be maintained in contaet; with the operative surface of rufd 1'e;;fului;ing wheel when the grintliiig wheel and the work are Out– of operative contact, said Work support and Sai d regulating wheel being related to each other so that the regrir l,flt1]'1§§ Wheel urges the Work in an axial direc~ tion along said work support, ojecting moans positioned in the path of axial movement of the Work, and means Operating in timed relation to the movement of said regulating wfhegl and work support for actuating said ejectmg means. 47.]l1 grinding apparatus, in colnblnationf EL grinding throat aclapted for simultaneous grinding and rotating action upon Work of round Section and colnprisiug three means, Que of which means is in the form of a grind~ 111g wheel adzzprefl to be rotated at ; relutively high speed, another of said means being in the form of :L 1'cgu]s1Ling Wheel adapted to be rotated at u relati\'e1y low speed and in :L direction to present an operative surface traveling in a direction relative to that of the operative griI1ding Wheel surface to control the rotation of the work, and the third of which rueans includes a]H('Zl1lb{€1' for holding Work of round section in operative relation to said two Wheels, and fluid pressure nlezzns for effecting 1X1()V()lYlC1'lt of fb Work piece relative to said grinding throat. /18. In apparatus of the character described, in combinsltiou, a grinding Wheel rotated at a relatively high speed, u l'0gLl12Lti11g wheel rotated at a relatively low speed Lo control the 1'OL€lliOD of the Work, tha portion of the work surface coniacled by the regulating Wheel movi 11 g the same. Clirection as the operative surface of the regulating wheel and the grinding wheel being rotz1\i,ud su uhm its operative surface moves past, and in the smnc direction as, the portion of the work surface being gl'0\ll1d by Said g1'ill(1iHQ,` \Y]_\(3€]_, a, work support for hoiuling work in operative relation to Sui d two wheels and with which a peripheral portion of the Work engages, means mounting said regulating Wheeland work support, on the one hand and said grinding wheel on the other hand to permit relative movement therebetween in directions Lo permit operative engagement and disengagelllent between said gri11d1x1g wheel and the work, uwchfuuism adapted upon operation to ciiect said relative movement, and means for operating said mechanism to cause said relative movement to take place in ex direction to effect gripping of the Work by the wheels for rotation by said rcg11laiing wheel and grinding by said grinding Wheel and then to cause said relative movement, to Lake place in El direction to effect disengagement between said grinding Wheel and the work, said Work support and said regu~ lutiug wheel being related to Said grinding wheel so as to ulaintain operative Contact between the Work and said regulatillg wheel when said grinding wheel and the Work me out of engagement. 49. In grinding appamtus, in combination, a grinding throat adapted for eimultaneoug grinding and rotating action upon work oi round section and comprising three means, one of which means is in the `fO1'll1 of a\ gyinding Wheel adapted to be rotated at :L relatively high speed, anolher of said means being in the form of a regulating Wheel adapted to be rotated at u, rehltively low speed and in a direction to present an operative surface traveling in 21. d§1`(!Cfi0ll wlativu to that of the opcraézive grinrling Wheel surface to control the roiznxion oif the work, and the third of which means includes il member for holding work of round section in operative relation to said two Wheels; 1NCL2hiU1iS1I1 for Uyclically changing the relation of che grinding throat to the Work and for effecbillg u, movement; of a Work piece relative to the grinding throat, and interchangealuie means for varying the pe1'imli¢:ii,y uf operation of said lncchzmisnl. 50. A ceuterless grinding machine compris~ ing an Work regulating Wheel and Q grinding whcc17 moans for rotating the regulating Wheel, slowly and the grinding Wheel rapidly

respecLi vely to rotate and grind the Work positioned tl\u1'cbeL\ve_11, 111921115 for suppo1'_,ing work of romul section bctwceyl s;zidwhee1s,u positively operated Jrecision 1m:s:h:u1§sn1 for moving one of the W eds cyolically towards the other wheel to grind the Work to il i)1'3dUL_]l1DiI16£l size and t11er0:1_7fte1' \Vi\11L'[!`£L\V ihe wheel, a separnte 1`H9Ch8.I`1iS1`I`l coustz~11_lt;'tscl and arranged to move Work picces separately and successive–` ly into operative relation to said Work supporting moans and to said reggulnting Wheel to zz position for grinding, and means for operating the work 1110 viug 1'HGL5h_lLliSl11i1l an uni £'o1'111– ly periodic and properiy timed 1`€1fl–H011 rel:–,~ iive to the _lt;:_y¢;]i_lt;; \\fhe®l movement effected by said wheel–moving 1116C}E2Ei\i_gt;1)1 so as to position a Work piece for grinding while the Wheels are sep mated. 51. A centerlcss grinding mznchinc comprising il work regulating Wheel and 21 grinding Wheel, means between said Wheels for supporting Work for free rotation, means for rotating the regulating Whacl and the grinding Wheel at speeds respectively to rotate and grind the work, a lnechfmisln constructed and arranged to move pieces of Work successively into operative relation to said work Supporting muans, power– operated means for moving one of the wheels tmvavfls and away from the other to effect rotation by the regulating Wheel and grinding by the grinding Wheel oif the Wovk to zu given size, lneans for reciprocating the grinding wheel axially during grinding, and means for operating the Work moving meclmuism Eu a, llniformly periodic and prpperly timed relatiou rclutivc to the wheel move~ IIIGH1(eifcctccl by said Wheel–moving 111321119 to position work for rotation and grinding by said wheels respectively and to permit discharge thereof. 52. A centerless grinding machine comprising Work FQ§;'L11HfE11Q wheel :md a grinding Wheel, menus adzxpted to support Work for free rotation bctwecu said Wheels, means for rotating the regulating Wheel and grinding' Wheel at speeds respectively to rotate and 1 3 me :rrind the worli. a wzrrlt ineviugg 1l1C1I11l)(fl"_lt;`lll!" structcd and ai'ra,ngo_lt;l to carry nfork pieces separately into operative relation to said WIWCYS and Said WMI; suppox–tin; means, and a cam operated nieeliauisnr tor i\nw2;ig saual member cyciieaily. _ ¢ 53. A grinding machine comprising a work regulating wheel and at grinding Wheel, means tor rotating the regulating wheel and grindingivheelat.speeds respectively to rotate and grind the work, a work supply source, a eyclieally operated Work moving meinher constructed and arranged to more worli pieces separately from said source to a position Sl.llJStlLlllllltlll_';' between said wheels. liuid pressure means for renioving a work piece troin Sai d meinber, and means opera tive when said member has moved a Work piece substantially between said Wheels tor making effective said fluid pressure means. 54, A grinding; machine comprising a work regulatiiig Wheel and a grinding wheel, means for rotating the regulating ivhcel and the grinding wheel at speeds respectively to retate and grind the work, a cam operated inechanisrn constructed and arranged, to more work relative to the ;{rinc;l_inq throat torined by Said Wheels, cam operzited means tor innvu ing one of the wheels towards and alwav from the other wheel, and means tor reciprocating the grinding wheel axially flus'in,w1 grinding. said work–in oving niefrhanism being operated in a uintormly periodic and properly timed relation relative to the wheel movement etlected by _said wheel–moving means. In Qrlnrlingg apparatirs, in eoinbinatifm, a_ Work regulating wheel rotatable at relatively low speed, a grinding wheel rotatable at relatively high speed, said wheels presentlflif ?1(lj41CGlll3 operative surfaces traveling in opposite directions, said regulating Wheel acting to rotate work of round section interposed between said two wheels, means for lioldmg work of round section between said tvfo Wheels, a member movable in the general direction tov/arcl said work–holding means and adapted to carry a tvorl; piece substantially _between said Wheels, and means tor reTnoving said work piece from said member and moving it into operative relation to said \VO1`l{~l`|Ol(lll1,Q means. 56. In grinding apparatus. in coinbina tion. a Work regulating Wheel rotatable at relatively low speed. a grinding Wheel rotatable at relatively high speed, said wheels presenting' adjacent operative surfaces traveling in opposite directions, Said regulating; wheel acting to rotate work of round seetion interposed between said two wheels. ineans 'tor holding Work of round section betvreen said Wheels, ai inagjaziixe for holding a supply of work pieces, means including a meinher movable in the general direction toward said Work–liolding means and adapted to receive work pieces one at a time from said magazine and move them individually between said wheels, and means for removing a work piece l'i–ein said member and eilcetingg its lnovement into operative relation to said work–holding' means. _ _ 57. In ;_gt;;rindin,;f apparatus, iu combination, a arin_lt;li_n;; throat adapted tor simultaneous griiiiiliiigg and rotating aetion unon work oft round section and comprising three means, one of wllieli mczzns is in the form of a. grindwvlieel adapted to be rotated at a relatively bi,4;'l\ speed, another ot said means being; in the form ot a regulatiiig Wheel adapted to be rotated at a relatively low speed and in a direction to present an operative surface traveling; in a direction relative to that of the operative Qrimlingr Wheel surface to eonLrol the rotation of the work, and the third oi' \vlii1'l1 means includes a member for holding wvork olf round section in operative rolation to said two Wheels; power driven means adapted in recurring sequence to change the ielatioii ot the ;_frin_lt;lin,fr throat to the Work, tliereby to permit insertion or removal of a vforlf piece with respect to the grinding throat; and intercliangeable means for varving the periodicity of operation of said power _lt;,l;'iven means. 53. In grinding apparatus, in combination, a §{l`ll](lll1i§§ throat adapted for simultaneous ggrifitling and rotating action upon work of round section and comprising three moans, one ot 'Which means is in the form of a grindin 'rlieel adapted to be rotated at a relatively high speed, another of said means being in the forni ot a rennlatinu wheel adapted to be rotated at a relatively low speed and in a flirection relative to that of the operative grinding Wheel surface to control the rotation of the viorlc, and the third of which means includes a member tor holding Work ot round section in operative relation to said two Wheels; power actuated means operatin,–;f reeurrently 'tor eontrolling the movement ot a work piece with respect to said grinclimr throat; and intereliangeable means for varyinfr the periodicity of operation of said power actuated means. 59. Tn grinding apparatus, in combination, a grinding throat adapted for simultaneous grinding and rotating; action upon Work of round section and COIY1]3l'lSl]1,Q` three means, one ot whirh means is in the form of a grinding Wheel adapted to be rotated at a relatively high speed, another of said means being in the itorm of a regulating wheel adapted to be rotated at at relatively low speed and in a direction to present an operative surface lZ`€!_\'Cll|\?Q' in a direetion relative to that of the operative grinding wheel surface to control the rotation of the Worln tlllfl U10 l"hl1'f1 ot \'.'liich means includes a member for holding work of round section in operative relafi() tion to said two wheels; a magazine for holding a supply of Work pieces; power driven means adapted in recurring sequence to effect movement of a work niece from said magazine into said grinding throat; and interchangeable means for varying the periodicity of

operation of said power driven means. 60. In apparatus of the character described, in combination, a frame, a grinding wheel and a regulating Wheel mounted on the frame in opposition to each other to provide a Workrccciving throat therebetween and to permitmovement of one wheel relative to the other to Vary the Width of the grinding throat, means tor feeding work into the grinding throat, means for ejecting Work from the grinding throat, means for varying the width of the grinding throat to permit feeding of work thcrcinto for subsequent operation thereon by said Wheels and for ejecting of the work from the throat, and a single cam member having portions for actuating the throat–varying means, the work–feedinfv means, and the work–ejecting means, in timed relation. 61. In a Grinding apparatus, in combination, a grinding throat including a grinding Wheel, a regulal ing wheel memloer for controlling the rotation ot work of round section, and a member for holding Work in operative relation to said wheels; a magazine; a movable carrier adapted in one position to receive a work piece from said magazine and in another position to present said work piece adjacent one of said grinding throat members; means operative substantially when said carrier has presented a Work piece adjacent one of said grinding throat members to give the Work piece a movement in a general direction lengthwise of one of said grinding throat members; an ejector operable to remove a finished Work piece from said grinding throat along a path substantially coincident with its path of entrance; and means for actuating said ejector and moving said carrier out of the path of the Work piece being ejected. GQ. In grinding apparatus, in combination, a grinding throat including a grinding Wheel, a regulating wheel member for controllingthe rotation of work of round section, and a member for holding work in operative relation to said wheels; a carrier pivotally mounted to swing about an axis such that movement of said carrier about its axis carries a Work piece to a position adjacent one of said grindin throat members; means for giving a Wor piece thus carried by said carrier a movement in a general direction lengthwise of one of said grinding throat members; an ejector operable to remove a finished work piece from said grinding throat along a path substantially coincident with its path of entrance; and mechanism for oscillating said carrier, actuating said Work piece–moving means, and actuating said ejoctor in timed relation. 63. In grinding apparatus, in combination, a grinding throat including a grinding Wheel, a regulating Wheel member for controlling the rotation of Work of round section, and a member for holding Work in operative relation to said wheels; a Work piece carrier; means mounting said carrier for oscillation about an axis such that a Work piece carried thereby is moved to a position adjacent one of said grindinfr throat members; means for supplying Worth pieces individually to said carrier; means for oscillating said carrier about its axis; and means operating in timed relation with said last–mentioned means for giving a work piece a movement in a general direct–ion lengthwise of one of said grinding throat members substantially when said carrier has positioned said Work piece with respect thereto. 64. In grinding apparatus, in combination, a grinding throat including a grinding Wheel, a regulating wheel member for controlling the rotation of Work of round section, and a member for holding work in operative relation to said wheels; a Work piece carrier; means mounting said carrier for oscillation about an axis such that–, upon movement of said carrier, the latter delivers a work piece to one of said grinding throat members from a. point displaced therefrom and in a position to permit movement of the work piece into said grinding throat; and means for oscillating said carrier. In testimony whereof I have signed my name to this specification

Abstract:
Source: US2005133244A A method and apparatus for handling and/or stringing energized conductor for a high voltage power line conductor for a high voltage power line is provided. The method includes bringing components and workers to the same electrical potential and transferring power from one contractor to another. Associated apparatus is also described.

Abstract:
Source: EP1149038A1 A media storage system for an automated banking machine (10) inlcudes a flipper member (90, 178) which is rotationally movable to engage sheets. A gripper member (138, 182) is movably mounted relative to the flipper member. The flipper member further includes an arcuately extending slot (92, 180). The sheet extending in the slot is held in fixed engagement with the flipper member by the gripper member. Rotation of the flipper member to a releasing position causes the sheet to be engaged with a stop surface (160, 188) as the gripper member moves to release the sheet. Sheets released by the flipper member are positioned in a stack (94, 184). The flexible flap (160) engages each sheet after it has been released by the flipper member to conform the sheet to the stack. In alternative embodiments a flipper member (178) includes a picker portion (202). Picker portion is selectively operated to remove sheets from the stack.

Abstract:
Source: US2001034583A The invention detects the loft time and/or speed of a vehicle, such as a sporting vehicle, during activities of moving and jumping. A loft sensor detects when the vehicle leaves the ground and when the vehicle returns to the ground. A microprocessor subsystem converts the sensed information to determine a loft time. A display shows the recorded loft time to a user of the system. In addition, a speed sensor can detect the vehicle's speed for selective display to the user. The invention is particularly well−suited to sporting activities such as snowboarding where users loft into the air on ski jumps and catch "air" time but have no quantitative measure of the actual time lapse in the air. Therefore, users in skiing can use invention to record, store, and playback selected information relating to their sporting day, including the total amount of "air" time for the day and information such as dead time, i.e., time not spent on the slopes.

Abstract:
Source: US5385440A Lift truck accessories for stacking and moving stacks of tires are disclosed. The tire–stacking device includes an elongated platform upon which a plurality of tires may be placed side by side when the device is in its horizontal position. The tire–stacking device can be raised by the lifting apparatus of a lift truck from its horizontal position to a vertical position. When in its vertical position, the stack of tires is supported by a clamping arrangement that is attached to the base end of the tire–stacking device. A second embodiment of the invention is a tire transporter that is always maintained in a vertical position but includes a clamping arrangement which is similar to the tire–stacking device. The tire transporter is relatively shorter than the kite–stacking device and enables a lift truck operator to move stacks of tires through low–clearance areas such as under doorways as well as into and out of trucks.

Abstract:
Source: US2005034763A A fluid delivering hydrant providing a valve actuated assembly with enclosing shroud and water resistive doom handle assembly to protect the assembly from exposure to the weather while preventing entry of rainwater into a building structure upon the roof of which the device has been installed.

Abstract:
Source: US2001056544A This application describes completely in many unique ways and detail all the devices to reduce a vehicle's speed and/or reduce a machines RPM's and/or stop any piece of equipment's as well as guide it if mobile through automated controls. First to slow it down, and guide it and/or control it if necessary (i.e., other pieces of equipment). Secondly it discusses how to stop any piece of equipment completely. And thirdly, the invention secures it in a safe stationary position either entirely or any number of specific moving parts. Many of these systems are initially here described to slow, reduce speed, steer, stop and/or secure equipment functions. However, they also can be used to increase a piece of equipment's functions. In other words their variations are completely capable to serve any remote or automated controls on a vehicle in the future to provide full robotics systems, e.g., for automated transportation systems, automated manufacturing, etc., either through individually isolated remote control systems and/or interfaced with other off−board systems through communication links, gateway computers, computer networks and the world wide web for inexpensive long distance monitoring and remote control. The invention focuses on the automobile industry but as has always been maintained throughout all these applications these devices and systems are designed to control every piece of equipment. The invention includes various accountable protocols and commercial developments to control speed, brake and steering for an automobile shut down to be performed through automation to a safe controlled secured deactivated state to be considered as a basis for a standard in aggressive vehicle remote control and/or to control and guide a vehicle and/or piece of equipment through many different automated systems.

Abstract:
The novel process makes it possible to adapt the tyre tread band pattern to varying road surface conditions, especially to icy or wet surfaces, while largely eliminating the negative effects on the tyre of dirt and icing and at the same time minimising the conversion time. The main feature of the novel process is the facility for adapting the tractive effort distribution of the tyre over different parts of the tread by using the tyre pressure. Adapting the tyre quality to icy road surfaces may, for example, in accordance with the drawing, be produced via the tyre–pressure–controlled projection (DELTA R) of special studded tyre areas (1.2) by means of pressure increases in tyre chambers (1.3). The air chambers may be activated: (i) with the vehicle stationary or moving, (ii) in a short time, (iii) by manual or automatic controls, e.g. via sensors and the wireless transmission of the sensor pulses (3) through receivers (4) and pulse guides (5), the ignition of gas cartridges (8) or the admission of compressed air from containers inside the wheel (10) controlled by valves (9) and lines (11). Control units (6) facilitate readaptation to changes in road suface conditions.

Abstract:
Source: US2011016756A An auto−powered mobile machine with controls for a riding operator and a system for carrying and making efficient use of a variety of attachable tools. Most of the tools operate in a linear fashion and are most effective when held to one side of the machine with respect to its direction of movement. The machine includes wheels or tracks, a mounting base for attaching a controllable tool and, above the mounting base, a swivel on which sits an operator's seat and controls. An articulating arm is attached above the swivel so the operator may operate in a coordinated way a lower tool which does not swivel and an upper tool which does swivel to accomplish a job more efficiently than it could be accomplished using tools separately mounted one at a time. Wireless radio communication from the controls to the lower tool may allow the swivel to spin any number of times without limitation. A tool mounting base, which may also be an earth moving blade, moves vertically up and down staying plumb rather than pivoting and not remaining plumb. Hydraulic tool position controls respond to a string datum line, a curb, or GPS data. The system is completed by a variety of tool attachments, including a novel fence installer.

Abstract:
Source: US4854359A The antiskid device includes a fixing disk, which can be mounted on the wheel rim of a motor vehicle and can remain thereon during the winter months, and a supporting disk mountable on the fixing disk and lockable therewith by means of a retaining ring on putting the antiskid device into operation. The supporting disk is provided with a plurality of radially arranged support arms, which engage over the tire tread and which carry a chain grid as the snow chain which, in the operating state, engages over the tire tread, so as to provide an antiskid device which can be effortlessly mounted on a wheel and provide a snow chain−like action.

Abstract:
Source: US2004124605A An articulated equipment position control system and method are provided for equipment consisting of motive and working components. The components are connected by an articulated connector, such as a pivotal hitch. GPS−derived positional data is utilized for power−articulating the hitch to maintain the working component, such as an implement, on a predetermined course. Operator−induced course deviations can thus be corrected. The working component can also be positioned to follow the course of the motive component. The system includes a microprocessor control subsystem, which interfaces with a steering guidance system.

Abstract:
Source: US5670375A A sample card transport station moves a test sample card from an incubation station for the

card to a transmittance and fluorescence optical station in a sample testing machine. The sample card transport station has a drive belt and an associated stepper motor. The belt supports the card from one side of the card. A ledge having a card slot is disposed above the belt. The card is snugly received within the card slot, and supported from below by the drive belt and rollers for the belt. When the motor turns the belt, the belt grips the card and slides the card along the slot to the optical stations, without any slippage between the belt and the card. This construction provides for precise control over the movement of the card.

Abstract:
Source: AU2002302091A What has been invented is a series of scientific applications of the wideface energy converter device, be it in the form of a wideface solar heat receiver or a wideface fluid impeder device. The wider is the solar heat receiver, the more solar power is available for conversion. The wider is the sail of the boat, the more wind is available to push the boat. Wherefore, the wideface solar trap made up of multi–layer transparent roofs covering a heat insulated box is used to heat up a radiator tubings that contain water. The multilayer transparent roof, having spaces in between sheets, prevents solar heat from backing out hence the trap becomes hotter and hotter because the inner sheet is not in contact with the cold wind. This solar trap is now used to heat up radiator pipes of compressed air coming from a gas turbine engine and then returned back to the exhaust turbine of same engine. Applying the principle of the wind sail, the turbine blades of the compressor and the turbine blades of the exhaust turbine are made wideface as much as possible to produce maximum impedance against the expanding exhaust hot air and to produce maximum push upon the fresh air being compressed. This wideface fluid impeder is now expanded into an underwater platform from One Acre or much more and attached to floating hotels, large/small boats, and floating sea walls, to prevent oscillation by the surfs. 36 9 Fig.1 104 Fig.l

Machine translation: Human–centric to interpret the earth natural eggs human world and its surrounding celestial bodies (space) mountains (nature), plants (a plant), animal (an animal) ttawi all the world as a collection of all that the nature of physical exercise lives in the law, and also receive rule are living. And all the time natural ecosystems is not spatially stationary wind (wind), cloud (cloud), non (rain), snow (snow), heat (hot waether), cold (cold weather) and so changes in the physical state another is constantly acting. Each component state nature of each pressure (atmospheric pressure), temperature (temperature), moisture (humidity), wind (the direction of the wind), wind speed (the velocity of wind), etc. can be measured. In addition, the percentage change in time according to the schedule it does not know the amount and quality of human beings by themselves because you can not go against the earth (earth) the limited environmental capacity (dynamic capacity) in a rapid increase in car usage and industrial facilities such accelerated expansion, caused by environmental pollutants, natural physical systems circular order of nature itself appropriately in clean air of loss (carring capacity of the earth) and the playback controls to push the boundaries of extreme weather, and weather conditions create a serious future of mankind leads to the question of the survival of the crisis was Such abnormal climate, and weather conditions into the cause of a car accident (a motoring accident) in a wide variety of symptoms continued to increase human dignity (human) life (life) and limited the earth's resources (global perspective) continued to resulting in loss of all our fellow human beings are placed the unfortunate reality is true, be regarded. This problem is real and a personal or social organization to be a specific problems in the country sueopgo, our fellow human beings (man kind) that need to be addressed in common to all (commonness) challenge (a task) is More car traffic accident caused by human–created life from the human resources and human effort to take measures to protect the (effort) in nature, a limited variety of other countless acts of life through a relationship with a durable life (permanence of life) as human beings not only to maintain an absolute four people to pursue (on appointed task), and because it also can have a human is not only an existential destiny (destiny) is a. Therefore, efforts to seek a means for solving problems of the automotive technology sector are not specific to the unique creative skills, and not all of mankind has achieved the culmination of the various philosophical disciplines have been observed in the confines of human ideological in nature, the results derived in the changes in physical conditions in the earth and all living things and the human condition and human–created all the fruits of human civilization can not banguhal jikyeonagaryeo means nobody will be able to do so is self–evident haengwiil. Our man–made car (automobile) on the road (a road) Award motor vehicle crashes that occur (a collision) due to traffic accidents (a motoring accident), the purpose of safe and smooth movement, and established traffic regulations (traffic regulations) in the human free will (free will) according to the judgment (judgment) while being used by the traffic regulations (traffic regulations) breach of (a traffic offense) and driving operations immaturity (unripe) And do not care to stand a little careless enemy actions and, natural and artificial changes in climatic conditions combined with a car driving environmental change are occurring in the relationship. it beyond the reach of human will and capacity of the area irresistible natural weather conditions that may occur sporadically in the car in the form of a crash in a car accident caused a car crash that caused a traffic accident earlier in the components from the human physical safety and the ability to defend proprietary safety devise means trying to give the car a very desirable feature for your patience will be. Cars on the road, the car pursuant to its original manufactured state, depending on how the use of common natural environment in using the week (day time) and night (the night time) (changing light environment), spring, summer, autumn and winter (four seasons) (temperature change) and non (rain), wind (wind), fog (fog), snow (snow), etc. have been used in severe weather conditions. These changes in the natural environment (natural environment) in the automobile road of artificial road traffic and car driving by car to the driver a number of humans, has caused unexpected problems. Because of these problems in human and vehicle safety by presenting a way to ensure the millions of people working for human development as well as the man who owns the car in the history of all mankind, all the technology (new technology) on the purpose (an object)

based on (the basic) will be. In addition, a number of safety features such chain technology decisions are now producing a car packed with a technique called weak, and although the house constantly that require research and development is a fact. How to use such vehicles now comes to technology–intensive chain of human passively by relying on (handworked) operated by the operation as directed passively by sensors without being directed automatically (automatic action) as a function has to be working. Operating instructions of human passively relying on the features that a car engine (an engine) maneuver, since according to the road car suspension (suspension) and dongryeokgi relationship (a dynamometer) to break down the relationship between driving on the deulyigo each angle, in humans directed by passive manipulation capabilities in the automotive lighting system (a lamp device) a signaling device (optical signal devices) and the braking device (a damping device) etc. In general, cars driving cars on the road to observe the state of natural snow and rain in the weather, such as abnormal weather conditions until the end time in hours, and hours more than non–weather (rain), snow (snow) and naturally made huroseo Natural materials are scattered on the road you are driving a car on the road wheels of the car by the Thai portion of the rotational motion generated by the rotation in the locomotion and the friction between natural substances deposited on the road (frictional) under the direction of a car (fixed direction) against the direction (in the apposite direction) of a car on the road back up the finely dispersed natural substance is sprayed on the front and rear car of a car crash caused by physical exercise is an artificial nature. These artificial physical exercise is a very common phenomenon observable phenomena as rain, snow vehicles on the road to driving a car that appears to be a common phenomenon in Figure 1 are organized into. This is the same direction (fixed direction) the same lane (a traffic land) continuously traveling in a car driving by is identified as a unique phenomenon. Figure based on the car when b, b–round car in the driving wheels to spin–off from a car the size of the fine natural materials by the state to drastically speed omni–directional clock b motorists a bad state (go out of sight) will lead to. Such a bad state of the clock driver in the car b visceral (instinctive) in order to ensure forward visibility, window dakyigi device (wiper mechanism) for work on the instructions of the window switch ON dakyigi device will conduct manipulative behavior. And it's about the physical location of a and b are placed in motion relations are applied to all vehicles will be able to do. Such spontaneous changes in the natural environment, and then, depending on road conditions and vehicle driving characteristics automobile physical exercise reasons, caused by the positional relationship between the driver's driving environment in all directions when gyebulryang (man–made environment) routine observed through the car for display lighting system (tail lamp) on the operating state (situation) using the two kinds of forms (two type) are present as are characteristic. An indication of the backward equalization device (tail lamp mechanism) is used taillamps ON state OFF taillamps use a car and another car in the state is using the form on this general interpretation as feasible using the taillamps ON Cars are driving a car that car drivers driving a car motor skills due to road conditions, taking into account the display backward by lights, etc, taillamps and progress in the same direction by using the hubangwi hayeogeum car a more aggressive drivers to drive safely Glucose hubangwi car to a car crash with a possible location for a positional relationship gwangyesang hubangwi recognize that motorists in their cars in a full range of motion status of the poet to give and ensure maintaining relations with each other based on the distance to ensure the safety safe distance to avoid a car crash on the human body to obtain any hubangwi motorists (body) far away from the signal coming from the body (a signal) that accepts a sense receptors (receptor) of the special senses (special sensation) of vision (vision) in the light (light) stimulation caused by road vehicles to suit your environment by sending the signals to detect (perceive) and the reaction by the judge to ensure a safe distance by actively trying to keep above may occur in the posterior For a car crash in an active preventive safety measures used in the lighting system for displaying backward depending on how aggressively the driver is applied, if the other one did not apply, or scrutiny... or is it reverse.Those motorists driving cars due to changes in the natural environment due to road conditions, slip (slide over the rain, slide over the snow) by increasing the braking distance and vehicle movements on the physical change of state for defense when driving a car that must be reflected in the concept of physical exercise, red state (a defensive measure) is vital to (recognize) and consequent need for seasonal (an opportunity), situational (the state of things) lack of proper equipment operation skills for new drivers and old physical and mental decreased ability to exercise the body will be the driving state. Climate change than in the natural environment since the car you are driving a car on the road due to the characteristics of physical exercise on the risk of problems and driving in a state of such an experience in driving motorists to recognize anyone, and also to the rear of a car full spectrum lights taillamps light up and off of state used in the form of two moseupjung anyone easily in such situations to their own sense of omnidirectional vehicles receptors (receptor) of eyes (eyes) are secured through the street poet, visual check of the tubes counted in, taillamps light up the car can be more easily could see the gamgakhal. And it's high–speed driving (at high speed) Highway takes place (an express high way) to keep a very long distance between cars is especially true in the state. Used in these backward taillamps deunghwain indication in the night of the Road Traffic Act Article 31 is referred to in paragraph (1) sunrise until after sunset, lights that turn on is the ability to use force. However, in circumstances described jigeumgeot human, subjective judgments by the operator acts done by manually manipulating the instructions, so to lose is not as efficient in its use will be able to. Dakyigi car window while driving device (wiper mechanism) to a working state in a car requires the driver to forward the clock to ensure that the situation can be interpreted as the logical, the status of these drivers to drive a car (driving) on the concentration (concentrate) with a low forward visibility due to bad road conditions, and omni–directional vehicles for state changes in the physical exercise and cognitive decline as a braking geupchaseonbyeongyeong (a sharp curve) etc. can lead, it's a series of cars driving normal highway bridge You are in the form of flat gwangyesang (dimensional analysis) before, after, left, right, is common to let a car can be Rough around the edges, in such a situation, lighted taillamps sokeseoneun smooth road traffic and safety for the driver and the car will be very necessary. Describing the operational definition of jigeumgeot (operational definition) in the context of work on the device as long as the window dakyigi proportionally lit taillamps driver needs to mothayeotgeon not injihayeotgeon automated manner of backward light is intended to be lit taillamps. Indication on the backward equalization taillamps hit by cars most climate since at least with respect to the use omni–directional vehicles from the road wheels that rotate (rotating system) of a tire (tire) on the road and snow (snow) or stagnant rainwater (rain) and other natural substances friction (frictional force) is dispensed by the (direction of tangent line with constant velocity along the blown) as a result of collisions

hubangwi apyurichanggwaui hubangwi car driver's forward visibility is poor, the anterior clock in order to secure an instinctive (instinct), the window dakyigi device (wiper mechanism) as the time needed to work on the backward equalization Chapter indication polled taillights (tail lamp) Automatic light (auto lighting) sikimeuroseo hubangwi distance drivers (distance) and position changes, and information about a safe distance and braking distance determined in accordance with the information that corresponds to the pre-warning measures for the transmission of light (light) through the visual stimulus (make a signal) may occur in the rear of the car by implementing from a collision with a car driving safety features to aid in advance of rain or snow on a car road traffic aggressive prevention and smooth traffic alone how to use various kinds of flat (degrees of freedom) of a car accident (a motoring accident) on can be said too inefficient. More advanced for the prevention of car accidents (progress) Technology Development (technical developments), depending on your needs through the development of new operational definition of efficient technology (undefined notions) for a specific car driving situations (natural environment) and intrinsic a car driving conditions (man-made environment) to provide priority to the human in the protective function (a defensive measure) Many different forms are as follows: Humans, omni-directional clock to secure the window in the driver dakyigi device (wiper mechanism) tells the action (command) from the state by the stable clock backwards until the time of driving on the same road (trial run) inside your car to the driver to provide information on car driving backward directed indication taillights passive switch operation by judging their own actions even if they do not have a car tail light automatically illuminates backward indication (auto lighting) is to: And this is the name of the safety circuit is called the Intelligent Vehicles. It exists in various forms of information that is built around the car to handle the logical development of the concept design. This is a car engine stops or biunjeon state agencies focused on the human temporal changes in work (time sequence) according to the analysis on the order of the logical design work is about relationships. Effect relationship between the different dimensions of each phase angle, human psychology (a mental state), mental (mind), act (action) and the related physical changes in the state (state variables) according to the human psyche, spirit, one trillion kinds of behaviors by an ordinal information on the operation unit circle (cycle) among the acts that formed on the logical interpretation is designed. It is in the driver forward visibility visual stimuli such as poor health and the natural world (natural environment), and of physical phenomena, such as rain and snow janjaehan substances according to the state after the exercise the different dimensions (degrees of freedom) of binding to explore the cause (intermediate steps), taking into account the time change occurs in the process of the phenomena and a car accident (a motoring accident) combined with the cause makes the relationships established. Depending on the cause (a major cause) blended effects (interact) in accordance with functional changes due to vehicle value of time, obtain information on the state, acting on a car accident according to the new defense relationship in the logical system is designed for the purpose of theory building. Organized a variety of information resources based on the object in view of the car on a real car production machinery (mechanism), electricity (electricity), electrical (an electron system) dongjakgap strains (data) to induce, any such information to the consistent Electrical and electronic order forms, depending on the physical interpretation in the yard as possible by switching to the combination of components provided in the form means that the functional design. Natural weather conditions (natural environment), road conditions (man-made environment), human (a human), automotive (automobile), a traffic accident (an automobile accident), these multi-dimensional information in the form of a set of mathematical tools for cleanup (set) can be summarized to borrow. It's different dimensions (degrees of freedom) of the object (an individual) to the set (set) is. X is an element within a set of set of people, cars, nature, weather climate, elements such as roads that contains a set (set) is It means a different level of elements (an element) deulyijiman fundamental elements that make up an automobile accident must be. This could be the following proposition. The set of X, causing a car accident is a collection of the underlying cause. And this proposition is easy to see chamimeul. Because motor vehicle accidents make up the elements that emerged as common to all phenomena deulyimyeo, but also among them, assuming that there is only one element in a car accident can happen because: You look at it again, logically, human beings do not exist or is not related to motor vehicle accidents. Car does not exist or is not related to motor vehicle accidents. Intangible nature of natural space weather climate that does not exist or are not related car accidents. And the road does not exist or are not related accidents. These are not ordinary common sense can understand, and also from that meeting a set of X in a car accident that will be able to identify the underlying cause. In this set of elements and dimensions to the conceptual meaning of the common physical concepts (physical) that corresponds to a dimension to the definition (a definition) is. The physical quantities defined for the dimension physical (physical quantity) is the number two kinds of change that can be. Between different objects to solve complex problems, regardless of the number units or when high-level understanding that would be useful in the analysis because the set is very important. And this extension of the principle of comprehensive (generic extension principle) Let us apply to. the concept of a comprehensive set of x (geneticist) and the dimension is set. Human (a human) What? Physiological (human physiology) organisms capable of structural analysis, but according to the physical action sokseongjeok component instincts (Instinct) will be. For a definition of instinct acting signals in the concept of ecological stimuli (Sign stimulus), haebalin innate mechanisms (Innate Releasing Mechanism), fixed patterns of behavior (Fixed Action Patten) and formed the center, and behavior (one trillion kinds of driver behavior), the external signals coming from the environment caused by some very unusual.Instinctual behavior and environmental factors that cause stimulus is called the signal, the signal stimulus itself, which corresponds to a small part of the situation, and the innate human nervous system, usually mechanism called haebalin any nerve center (central nervous system) have, and this stimulated by the impact caused by the signal when stimulated by nerves and muscles chain reaction (consecutive reaction) causing, this series will appear in the reaction of instinctive behavior. Fixed behavior (Fixed Action Patten) of the act, there are already born, or scheduled fixed action as having to adjust it according to the stereotactic spatial variation (Orienting) is called. In other words, every human being is a driver for a county to mean the same person all the same these days because the driver briefly define what you are all operating according to the analysis sample is assumed to be human. Meteorological nature (natural environment) and to the Earth (earth) on the space and the atmosphere (the atmosphere) on the physical phenomena change initiative deulroseo rain (rain), snow (snow), heat (hot weather), cold (cold weather) and it belongs to. The energy to start up the car starts acting mechanical structure from the starter motor vehicles generally (starting motor) in

the rotation due to the action agency with power suction (intake stroke), compression (compression stroke), explosion (expansion stroke), and exhaust (exhaust stroke) four kinds of the repeated cycle (cycle) within the Power Authority is repeated by the combustion of fossil fuels at the same time continuing the piston (piston), coupled with the crankshaft (a crankshaft) rotational movement of the (rotational motion) as powertrain (transmission), respectively, prior to undergoing addition, electro–mechanical devices are connected to the Power Authority Power Authority re–machine the physical kinetic energy into electrical energy by converting institution relating to the power intake system, exhaust system for the sensor (sensor) and facilitate the operation of various devices and device drivers and control device (controls) and a pointing device for each kind of electrical energy to the smooth (electric power) is to supply, all installed in the car constitutes a unique cycle of organic gineunggye Sikkim complete and up to that point is assumed to contain the expansion. Since humans rely on for the purpose of moving the spatial position and movement of energy inside the car hit the accelerator gyee Chapter one trillion kinds (accelerator) neurological change through the driver's body movement is passed through a road point from one point to another location outside the energy that can move independently, without regard to means. Road vehicles on the road with another car that changes in real–time obstacle (an obstacle), signs (traffic sign), signal (a traffic control signal), such uncertainties constantly changing mix of physical exercise that is defined sokeseoui. These different dimensions mean conceptually meaningful words in a traffic accident phenomena that make up the relevant elements (element), and this common people of biological sensory receptors (somatic receptor) through the collection of information (information gathering) in accordance with rational logic system (intellectual construction) will be available through the emotional cognition. Y is the set of elements in the set X (element), who used them as human–centric, cars made in the structure function relationships established many relationships (relational) and substituting (correspond) to the set of things is derived. It is also produced in a real car based on the behavior of the structure and the general public can find out anyone. X to Y and work out a set of sets of the elements whose car use and interpret the human good to be induced to begin. That make it a car accident due to the interaction of four elements combine to cause the relationship to start by relying on a human is due to take place, normally dependent on humans to terminate the relationship is contacting. Human element in the set X itself about the relationship, yet at the same time a car is required to establish a combined volume–based (bond energy) has. It–dimensional (degrees of freedom) in the property or the human element (component) can be called. Such dimensional elements (dimension analysis) need to work with a willingness to move in accordance with the purpose of positional and dimensional coupled with car sikige relationship is established. Independent of human free will, according to the action integral, coupling relation in humans and vehicles in the car for the ride will be. However, the internal motion characteristics (property) and the component (component) jeokeuroneun car with a unique combination of athletic ability is an unfulfilled state. Independent of human will become bound to the car and under any subsequent changes achieved in the automotive mechanical compositionally athleticism and ability to manipulate human biological coupling in the singyeonggyejeok is, this car boot (starting) or cranking (a crank) powered by the behavior of institutions and systems that work for the adjuncts from the starting point that can be. In addition, since this point in human biological functions (health state) to a car involved in physical exercise capacity and through that they need to think together in the same state, and also to afford a true sports car physically. Therefore, X is a set Y to a set of human wonsojung start (starting) can be flagged as a. Set of Y elements (an element) of start–up (starting) your vehicle according to a human running a passive activity is completed, the temporal point on its production vehicles pursuant to the exercise capacity associated with a unique kinetic energy of internal organs, the circulatory system (cycle) will be. It is due to start work on the power at the start of electrical energy from mechanical structural starter motor vehicles generally (starting motor) in the rotation due to the Power Authority operates with a suction (intake stroke), compression (compression stroke), explosion (expansion stroke) and exhaust (exhaust stroke) repeated the four kinds of fossil fuels in internal combustion engines by the agency at the same time repeated continuous piston (piston) coupled to the crankshaft (a crankshaft) rotational movement of the (rotational motion) to the driveline (transmission) Prior to each underway for each. In addition, agencies attached to the power electrical machinery and related sensors (sensor) on the Power Authority re–machine the physical kinetic energy into electrical energy by converting institution relating to the power intake system, exhaust system for the sensor (sensor) and the behavior of various devices, And the convenience of the driver unit and control device (controls) and a pointing device for each kind of electrical energy to the smooth (electric power) to supply and installed in the car all the unique gineunggye organic cycle is complete and that point constitute a sikimeul assume that expanded to include. Since humans rely on for the purpose of moving the spatial position and kinetic energy systems inside the car to hit one trillion kinds Chapter accelerator (accelerator) neurological change through the exercise by passing through a body to exercise and road cars from one point to another location point Regardless of the external energy and will enter at the beginning of an independent movement. The beginning of the road movement of vehicles along a fixed direction of the car because it is bound to exercise undongsang that one should have jayudoman, this road to explain the vehicles in a single variable (variable) explained by assuming only according to various criteria to interpret inaccessibility (difficult), avoiding the more accurate because a consistent interpretation is available. Bekteoryang car to start it (vector quantity) can be determined by two saenggyeo remain on the inside of the driver his visual sense (the sense of sight) through the speed indicator (tachometer) through the recognition (recognize) may be. Instructions such representations speed analog (analog), digital (digital) can be sent to, but it can be said to be equal to the sensory organ. Vehicle speed indicator (tachometer) on the changes mean that the real driving cars on the road, and this man in the car and started to enter into the state road traffic rush by that time will be able to interpret. Such visual instructions to the driver inside the car in relation to the state elements as a set of X–car speed (tachometer) ?? observation (observe) can be found at: In general, electrical, mechanical and electronic consists of describing the process based on electronic and understand. Electronic speedometer (electronic tachometer) the wheel (a wheel), etc. Field installed sensors or inductive sensors (induction sensor), etc., obtained by an electrical pulse (pulse) is generated in the form. This vehicle running speed is proportional to the noise in the low–pass filter for removing an element and then through a Schmitt trigger pulse is rectangular. Selling only two rectangular pulses of equal length in stable multivibrator is converted to a square wave. Movable type coil instrument connected analog (analog) speed is proportional to the integral rectangular pulses

gyeyongeuro instructions (integral function) accounted for as a process operator and visual instructions to check that the driver will change. Element for these cars in the set point X on Y can be seen as an independent movement in the aggregate elements (element) is the speed (velocity) that leads to the relationship between the elements (the system of proportional representations), and am in the set Y physical movement of elements of the speed of the vehicle components are included.X to a set of elemental nature, the weather (change of natural environment), the situation (man–made environment) which of the driving situation and road interpretation to take precedence beneficial coincidence of two things (at the same time), depending on families of the foregoing nature of Meteorology climate of snow and rain in the context of a natural phenomenon that occurs after the car driving safety's sake to build defenses are described in the first bar is the procedure the natural world. X to the set of natural elements as intangible as a spatial concept that the state was determined in the context of understanding the meaning. In general, a visual check can be intangible, and that's where this place is the atmosphere (the atmosphere) is called. The atmosphere (the atmosphere), a place conceptually atomic configuration (microscopic point of view) in the Earth's gravity (gravity) is a set formed by the atmospheric water vapor (steam), including the composition of nitrogen (nitrogen) 78 percent, and oxygen (oxygen) 21 percent, Ar (argon) 0.9 percent, carbon dioxide (carbon dioxide) 0.03 percent, and consists of unseen things that can be seen by anyone. The space (space) generated from the sun through the solar (the sun's ray), by temperature (temperature), etc. Circulating ten mechanical energy (cycle) is being made. These changes in temperature inside a car in the direction from the outer surface to the temperature change is required, this is inside the car on the driver aboard the physiological (body) sensory receptors (somatic receptor) stimulate (a stimulus) cause (a cause) invisible to the action of (element) as it will require a significant reaction. Over such a natural atmospheric effects due to the heat in the car with the driver about the relationship status of the natural temperature of the cold when a driver heading towards the direction of the heat (hot weather) to the car being made inside the space temperature control device operations, and vice versa nature: when the temperature in the direction of heat, cold, driver direction (cold weather) to the car interior space temperature control devices that can be seen followed by attempts to manipulate. According to external temperature effects on the reaction conditions applied to the law are being carried out in the actual car used in the check, and it gyejeolsang (the time of the year) when assigning the summer heat (summer) is, the car naebugye eeokeondisyeongye of (cooling) cycle is maintained by the low temperatures, cold winter (winter) to the opposite inside the car as a hiteogye (heating) cycle that is maintained by the high temperatures inside a car gyee state of human results of the operation will be regarded by the body is given. So what about the natural world on climate meteorological element for a set of X, Y set of climatic conditions on natural weather heating (air conditioning) and induction should be listed. This is so that two of the heater (air conditioning) due to the action in the manner of its composition is as follows. (However, only the heater will be described in the text, but about the behavior of the two electronic components (electricity) that together are the same.) Heating method, the power authority (an engine) according to the type water–cooled (liquid cooling engine) and air–cooled (air cooling engine) is slightly different depending on, and water–cooled (liquid cooling engine) power, most agencies (an engine) that passes through the coolant heat exchanger (heater radiator) heating the air to the heating and air–cooled (air cooling engine) in some cases the air heat exchanger installed in the exhaust pipe (heater radiator) heating is a way to pass heated. How to adjust the quantity to it by the wind blowing the electric motor (air conditioning of vehicle), depending on the operation of the control (control) the common form in which (commonness) is applied to. Now, home heating systems in aggregate X Y wonsojung natural collection, weather, climate, and meaning in nature, including climate change. Now the rest of the set of X elements wonsojung car was with the road conditions, On the information routinely observed (observation) according to the result (result) only assume (assumption) deployed to the theoretical situation, because of natural climate phenomena rain weather (rain) snow (snow) on the progress or completion of phenomena defined huran time there was an understanding expressed in content according to the description of the road and vehicle movement on sanjeokdoen materials that will be limited to the Recall action. Substances on the state of the road sanjeokdoen rain, nundeungeun car (automobile) in the physical movement (motion) with the action (interact) are interrelated. Power transmission system according to the chain of the final act of a car wheel (a wheel) to the rotational motion (rotational motion) and the relation jineunde, this car in the center of the wheel (center point) outside (outside) portion of the tire on the configuration and materials and contact with the physical exercise, according to the microscopic size of the transfer of energy in the direction opposite to the direction of automotive injection phenomenon (direction of tangent line with constant velocity along the blown) occurs through the same road you are driving straight on board vehicles Watch where space is typically secured to the front of the glass part of the driver (windshield) and collision (collision between element particles) is. As a result of collisions of glass (windshield) unique to the visible transmittance seongjilin (clairvoyance) by causing a rapid deterioration in the rain, nundeunge phenomenon by the end doeeoteumedo changdakyigi device driver (wiper mechanism) know that the action is. Changdakyigi device (wiper mechanism) behavior on the switch inside the car to the driver on board (switch) is based on the value can be manipulated, and also because the actual car is the same set X of elements of Y to a set of road conditions and driving a car window dakyigi device (wiper mechanism) is induced by the assignment. Changdakyigi jangchigye (windshield wiper system) in the configuration, operating principles generally electric, compressed air and are classified, general electric motors in the expression (wiper motor), links, and cancer (wiper arm), blade (wiper blade) is to switch to the ON position if changdakyigi device, the motor rotational movement (rotational motion) is associated with partial rotary motion by the power to install the front glass area of the ashes in a car that corresponds to a portion of material forces in the area is to remove the form. And primary energy (power) in the form of electricity (electricity) is So now the set X to a set of Y–dimensional relationship between elements and the assignment and the actual daily guided automatically by the judge in the visible–board meeting in a verifiable form was lodged in the. In addition to human hearing (a mental state), mental (mind), physical (body), psychological features related to physical quantities (psychophysical quantity) can be called things, it causes the X in the collection of elements derived by means of As a result of the unique properties that can be found that the state can be included. Use their cars on the set of Y elements that operates according to the assignment in time to analyze situations in order of when, due to time changes may know others. That type of information processing does not apply on the concurrent processing in a sequential form of state enable it to

trying to achieve, because as easy. The temporal order of such circuit design (circuit design) in a logical map (logic map) and that as such due to the set of elements Y, respectively, into two distinct understanding as a signal that can be obtained. This component is defined as the set of elements accordingly to becoming a yirueojigo the system design, logic design (system design), so Z is naturally a set of configuration elements in the temporal behavior of the element X set of conditions defined by the value of the final action (a definition), and elemental way to mark a common Arabic numerals (arabic numerals) should be listed as. Y to a set of elements (element) as a four start-up (starting), speed (velocity), heater (heating), the window dakyigi device (wiper mechanism) is the basis of the foregoing information, you will wooseonil startup. It means a combination of humans and vehicles, and driving a car on the preparation phase corresponds to the physical exercise, and all cars should mean circulation in the internal energy system. Set of Y and Z set the startup element is assigned to an element. Then start up (starting) in the rate since the actual car (velocity), heater (heating), the window dakyigi device (wiper mechanism) work on the driver (a driver) in a random order determined in accordance with free will, but you are driving a car If the speed (velocity) can see that the second order. Rate set Y Z elements are assigned to a set of two elements. Weather conditions in the natural world as the weather and then a set of Y elements (an element) heater (heating) is assigned to the Z-set of three elements. Finally, a set of windows in a car driving road dakyigi devices yellow Y Z elements are assigned to a set of four elements. Z is the purpose of this organized according to a set of logical order (sequence), and X, Y, Z set the X set to clean up a traffic accident (a motoring accident) on the component causes (element) is set to, Y set of causes components for the automotive action (element) is set to, Y set of components for causing a car to work on a set order, and also use the car for a set of Z order of the temporal behavior (time sequence) is Each element on each element of the set Y by analyzing the electrical properties have the same nature as that produced in the form of a real car on the check so that configuration can be seen gyereul.Start (starting) Iran gidongjangchigye in a real car (starting system) and dongryeokgi relationship (an engine system) can cost in relation to interpretation. Typically by rotation in the key way in everyday life and electricity (electricity), by the way that wireless electronic switch inside the car on the way, can be divided according to the actions. These three ways Hillsbrad car battery power source (battery) power to start the motor (electric motor) in the rotation (rotational motion), the initial power to exercise authority and aims to induce a prototype of the entire operation because all of the same things can be seen. In addition, during operation of the primary energy jeongieneojiim work (electricity power) can see. Speed (velocity) What physical exercise (physical quantity) to be related to the status of physical exercise on a car driver in the car to be able to recognize each sensor (induction sensor) in the final driver sigyesang Km / h in the instructions state that the purpose of the unit, and this also in the structure electricity (electricity), based on the electronic behavior guseonggye, and energy were significant differences in the principles of operation of electrical energy (electricity power) can be seen that as the default. Cooling, heating (ventilation system) What? External heat ever about the status of a car inside the driver's action are based, as air-conditioning (cooling water) and heating (heating) a different direction ten enemy origin (the origin) have, but inside a car in the temperature change, the purpose and configuration that meets the criteria for gyeyigie Heating, Power Authority (an engine) coolant (cooling water) to pass through a heat exchanger (heater radiator) using a heated air blower motor (fan motor) controlled by the vehicle interior heating This form consists of controlling the behavior of the electrical switches also operate according to the blower motor, which is based on work found in the form of electrical energy as the primary energy (electricity power) is Window dakyigi device (wiper mechanism) according to the driving situation in a car on the driver a visual watch mokjeokdoen important to ensure that functions as a switch located inside the car electric motor rotates by the action (generate electricity) and it is connected to the glass unit (windshield) while in contact with substances (snow or rain) in a manner that eliminates this action by also achieving electrical energy guseonggye (system) can see that. Organize a set of four kinds of elements when qualitative aspects, Y has a set of electrical properties of elements, and their own work in gyega circulation and can be seen that the electrical energy involved. It stopped as they work with each element with regard to the state, electricity (electric current) is flowing or not flowing, the, the switch is turned ON to OFF state are you'll notice. Each angle is the set of Z elements, ie ON, OFF, or stop (stop), and logically operate in an unknown state (logic) ON the "0" OFF "1", and it may be written in reverse (converse) also possible can see that. Organize them on the basis of intelligent vehicle driving safety circuitry produces behavior made. Drawing an intelligent car driving safety circuit that operates from inside a car can be understood by the whole concept As a general electrical circuit diagram in relay or relay configured as a playground. Relay (relay) is a 4pin type relay, in multistage guseonggye enjingye (engine), Speedometer (tachometer system), I'm collateral (air conditioning system), Windows dakyigi jangchigye (windshield wiper system) are connected to the voltage (voltage) and current (electric current) is the same for both the home and will be described. Each one of the internal relay Re1, Re2, Re3, Re4, Re5 and Re4 in the center consists of Re1 each at the bottom of each S1 input terminal (input) A, B, C, D through the enjingye, speedometer, heating systems and window systems are connected with dakyigi device. Intelligent vehicle driving safety circuit behavior (action) and action are as follows: Relay (relay) is like all four of the terminals, respectively, B, S1, S2, L is the terminal. Re1 b terminal on the power (battery) is connected to. It starts with the actual car and the driver intended to be used inside a car while on board, start-up (engine starting) hang power agencies (an engine system) is a circular ?? make quite a unique energy system, the electrical input terminals a and electronic signal is input through the input terminal S1 to Re1 (input) and, S2 output from the terminal (output) is S2 terminals grounded (earth) is connected to. Therefore, in this state, the relay Re1 B terminal and L terminal unique dongjakin inside S1, S2, because current flows between the electromagnetic (an electromagnet) stimulation pulled jeopgeukjareul contact (a point of contact) climbs up pushed point B. L circuit closed (close) in accordance with the principles of operation S1, S2 signal is input to the B terminal in its current form is associated with the current through the power of L is the terminal goes into. In the multistage to Re1 Re2 B to the L terminal is connected to the terminal. However, the power obtained from the current Re2, B is the standby terminal contacts. This is the start of the intelligent vehicle driving safety circuit (engine starting) information about (starting information) is only (recognize) that the state can be treated. Since start-up operator for the purpose of moving the car, due to the kinetic energy remaining in the tachometer (tachometer system) so you can see it in action on the motion on the speedometer in the car a certain amount of movement when the inputs change state ryange true (input) b signaling through

(signal) input (input) is Intelligent vehicles driving through the input terminal b, the input signal to the safety circuit is connected to terminals S1 to S2 Re2 output terminal and ground (earth) flows. Re2 B terminals by the action of the distinguished L current output terminal of the L Re2 and Re3 terminal is connected to the B terminal. These conditions in the car boot (engine starting), speed (velocity) such a state of two pieces of information processing can be made, and added that together with the information processing Re3 is waiting to be processed in the B terminal. Re3 information on it yet because it was not according to the input signal. Followed by a car driving under natural climatic conditions Weather drivers in the temperature inside the car (a change of temperature) as a vehicle for the displacement operator Heating gyega by switch operation by relying on its own energy cycle begins, the input terminals (input) C signals are being input to enter S1 to S2 is listed as Re3 ground (earth) flows. Re2 behavior and also inside the same signals S1 and S2 during the Re3 flowing currents in the B terminal is output to the L terminal to B terminal is facing in Re4. In this state, start the car (engine starting), speed (velocity), due to natural weather conditions weather information (data) processing the input corresponds to the state, and that information is processed in Re4 B terminal is in the standby state. Then, the processing status information from the driver's car driving according to road conditions in order to ensure directional clock and window dakyigi gyee switch operation by the device a unique window dakyigi device gyee circulation is established, through the signal input terminal d being input, the input terminal d to enter information into the terminal Re4 S1 to S2 is output to ground sikimyeo flows. Re4 B, the information you were waiting in the terminal is output to the L terminal. Relay Re4 Re5 the L terminal is connected to the terminals S1 and S2 output is grounded. This is all the information (data) is done in the treatment process. And in the B terminal and L terminal Re5 respectively tadane a 'b' is connected to the. a 'and b' in between the taillights light switch SW1 (tail lamp switch) and, Re5 Re5 in the S1.S2 the signal flowing in during the L terminal and B terminal, because the conduction tail lights (tail lamp) lights up (on lighting) is This function is performed as a mokjeokhan. Drawing on a description of the content and information processing in the form of AND logic based on intelligent vehicles driving in a manner designed to operate in safety circuits is the effect on the way. Weightlifting is the same as him. Drawing two boxes for the automotive driving safety circuit behavior and acts in accordance with the actual level of automobile manufacturing technology and the power consumption of the product in production efficiency (efficiency) to reflect, a semiconductor device (transistor) and resistor (resistance) and relay (relay) circuit is designed to bind to. It constructs the input information to the difference between the drawing and not a function of information processing and action for the same meaning to it according to the output (output) to provide. 2 drawings in content and logical flow of information processing by the AND operation is that the form–oriented, and it is weightlifting. Circuit in FIG Information.This Minister s1 input (input), s2 processing unit (process), s3 output (output) can be divided into input wealth composition, the corresponding device input terminals S1, A, B, C, D, and each of each resistor connected to the top elements R1, R2, R3, R4 are connected to the input terminal to the bottom of the sidonggye (starting system), Speedometer (tachometer system), nanbanggye (air conditioning system), Windows dakyigi jangchigye (windshield wiper system) and each of each is connected.A seolmyeongsang the sidonggye (starting system), B the speedometer (tachometer system), C the collateral I (air conditioning system) and D dakyigi jangchigye the window (windshield wiper) connects to an addition built connection between description it does not matter if the mubangha. S2 is denied treatment T1, T2, T3 and T4 are a four spikes of small semiconductor transistor (transistor) is composed. Mokjeokdoen in the selection of a semiconductor device features a rectangular ones for the various forms may be expressed replaces. In this circuit, bipolar (Bipolar) NPN–type transistor in series (Transistor) is Transistor (transistor) of basically three terminals, and each angle of the emitter terminal (Emitter), database (Base), collector (Collector) is called the emitter, base, collector, respectively, E, B, C symbol is represented by And B, T1, R1 and is connected to the bottom, E a ground terminal (earth) is connected to. R2 and T2 are connected to the B and E at the bottom of the ground terminal (earth) is connected to. T3 is connected to B, and E at the bottom of the R3 and the ground terminal (earth) in the R4 and T4 are connected to the B and E at the bottom of the ground (earth) is connected to the altar. Output (output), and device configuration corresponding to the S3 R5, R6, R7, R8 and output terminals connected to the F relay (relay) B consists of a relay terminal and L terminal switch for each light, each taillight (tail lamp switch) is connected to the multi–stage. It includes deulkkaji. Device, the resistor R5, R6, R7, R8, so that each of the connection at the bottom of each R5 is connected to terminal T1, the collector. R6 at the bottom of the collector terminal is connected to T2. R7 at the bottom of the collector terminal is connected to T3. And at the bottom of the T4 R8 to the collector terminal is connected to. R5, R6, R7, R8 to the top of the output (output) F are connected by R9 it up voltage (voltage) is at stake. This circuit operates on the circuit analysis is the reverse inference. First output (output) when based on the R4, T1 at the top of the resistor R4 is connected to the collector and the sunbanghan voltage is affirmed. T1 internal structural relationship in the forward voltage for D1 or, D2 on the dotted line because the reverse voltage and no current in the same direction. This NPN type transistor (transistor) on the internal structure of two diodes (diode) because the fitted understood that help to explain, which takes the voltage to the terminals T1, even though the collector emitter current is not flowing into the state by default is. T1 and T2, T3, T4 are all the same state. These conditions intended to be used on the driver's car, and start–up (engine start) on the T1 base (base) terminal through the information (data) input (input) and will be. T1, then the base (base), emitter (emitter) is made between the voltage drop, the base (base), emitter (emitter) between the current (electric current) is the flow. It is the base emitter diode between the internal (diode) because the forward. At this time, the collector (collector), emitter (emitter) Novelties current flowing between the base, due to the flow of current between the emitter current in diode D2 (electric current) flows are over. This is a real collector, the emitter between the current flow by measuring to check and as a result, T1 and the base, emitter between the current flow to the collector, the emitter between the current flow transistor (transistor) of the special behavior takes advantage of the startup (engine start) the information (data) will be written to the treatment. However, information on the entire circuit elements on the rest of the three did not enter the relay mokjeokdoen behavior is not done. Since the speed (velocity), I'm collateral (air conditioning system) and dakyigi jangchigye window (windshield wiper system) information on input terminals, respectively, B, C, D are input through the voltage drop, respectively, T2, T3, T4 treatment that has been entered into in accordance with its output relay (relay) operation on the tail lights lit (on lighting) switch in the ON operation has a value. Therefore, passive rear lights lit on the

driver circuit before the automatic light switch operation (auto lighting) and performs functions mokjeokhan. Intelligent Vehicles in safety circuits in everyday life with the invention snow, rain on a car driving over the duration of the driver on the road motorcade driving snow to the driver in an environment (eyes) in order to ensure forward visibility through the window visual dakyigi device (wiper mechanism) dongjakhu to switch ON, the rear of a car accident that may occur in order to secure themselves from the act of active conflict prevention activity for the purpose of backward light is lit and the switch instructs the operation amount of time it takes to operate 1sec Assuming that jam. 100 Km / h based on a car driving by. A second driver tells the operating time for the actual road distance from the car during the move that you know 27.7m 27.7m What car because the mileage interval corresponding to the driver and vehicle safety features for the car itself, first by providing a quick road For rain to snow–facing car slip (slide over the snow), etc. for the preventive effect of collisions (prevention effective) there. In addition, in such a situation analysis on the use of light according to the layman on how to use for beginners (a beginner) and elderly (senior citizen) in their defensive driving skills by driving aggressively because it complements the standing crisis that may occur in posterior vehicle prior to or at risk of aggressive defense by running the best cars in the smooth road accidents due to communication and actively contribute to the effective preservation of life (effective) to provide. contained in this application form for the word meaning and reference books, electronic information and communication engineering dictionary: book publishing wait and physicochemical Iwanami Dictionary: daegwangseorim, 2004 daebeopjeon: Code Publisher, micro–electronic circuits Design: Mechanism Researcher, Life Science Dictionary: Academy Books, Electronics Dictionary: occupy almost same proportion, Human Physiology: Publishing the effective date, and biology: Eul Press, younghan Medical Dictionary: sumunsa

Abstract:
Source: US4984161A The present invention relates to a method for controlling an automatic transmission of a vehicle which is capable of continuously changing a transmission ratio (Rt) and transmission coefficient (Ct). The method is three fold, that is, an initial stage control procedure, a special stage control procedure and a normal stage control procedure having priority in operation in this order. At the initial stage control procedure, Rt and Ct are determined, according to a plurality of indices representing a state of the vehicle, so that the vehicle is accelerated effectively, in general. At the special stage control procedure, Rt and Ct are determined, when a propelling force transmitting path for transmitting propelling force from an engine to the ground is disconnected at least at one part, so that a shock due to a recovery of said propelling force transmitting path is minimized. At the normal stage control procedure, Rt and Ct are determined so that the vehicle responds to the operation of the driver swiftly.

Abstract:
Source: CO4480005A 1. PROCESO PARA LA ELABORACION DE CONFITURAS HE– LADAS CARACTERIZADO PORQUE CONSISTE BASICAMENTE DE LA ELABORACION EN FORMA INDEPENDIENTE DE UNA MER– MELADA DE FRUTAS Y DE UNA MEZCLA DE AGUA Y AZUCAR LAS CUALES POSTERIORMENTE SE UNEN PARA FORMAR UNA MEZCLA TOTAL QUE SE LLEVA A MADURACION DE DONDE SALE PARA SER MOLDEADA COMO PALETA. 2. PROCEDIMIENTO PARA LA ELABORACION DE CONFITU– RAS HELADAS DE ACUERDO CON LA REIVINDICACION No. 1 CARACTERIZADO PORQUE PARA HACER LA MERMELADA SE LLEVAN A CABO LAS SIGUIENTES ETAPAS: A. RECEPCION Y SELECCION DE LA FRUTA, ESTE PROCE– SO SE HACE MANUALMENTE TENIENDO EN CUENTA TAMANO, ESTADO DE MADURACION Y OPTIMAS CONDICIONES FITOSA– NITARIAS. B. LA FRUTA UNA VEZ SELECCIONADA Y YA COLOCADA SOBRE UNA ESPECIE DE ZARANDA SE SOMETE AL LAVADO CON CHORRO DE AGUA FRIA. C. LUEGO PASA A UN PROCESO DE ESCALDADO EN AGUA A 50 GRADOS CENTIGRADOS DURANTE UN TIEMPO DE 10 A 15 SEGUNDOS. D. EXTRACCION MANUAL DE LA PULPA, QUEDANDO LA PULPA SEPARADA DE LA CORTEZA. E. PROCESO DE LICUADO MEDIANTE EL CUAL LA PULPA SE FRAGMENTA COMPLETAMENTE QUEDANDO SEPARADA DE LA PEPA O SEMILLA. F. DESSEMILLADO POR MEDIO DE FILTRACION UTILIZAN– DO UN FILTRO DE LIENZO TIPO MANGA. G. AL CONCENTRADO DE PULPA DE FRUTA ASI OBTENIDO SE LE ADICIONA AZUCAR EN UNA EN UNA PROPORCION DE DOS PARTES DE FRUTA POR UNA DE AZUCAR, ESTA MEZCLA SE ELABORA EN UNA MARMITA PARA LUEGO SER LLEVADA LENTAMENTE HASTA UNA TEMPERATURA ENTRE 60 Y 85 GRADOS CENTIGRADOS, DONDE UNA VEZ ALCANZADA LA TEMPERATURA SE MANTIENE EN ESE PUNTO DURANTE UN TIEMPO DE 10 A 15 MINUTOS, PARA OBTENER UNA MERME– LADA DE FRUTA. H. LA MERMELADA ASI OBTENIDA SE ENVASA EN TAMBO– RES PLASTICOS O ENVASES DE VIDRIO HERMETICAMENTE CERRADOS Y SE DEJA EN REPOSO POR LO MENOS DURANTE 24 HORAS. 3. PROCEDIMIENTO PARA LA ELABORACION DE CONFITU– RAS HELADAS DE ACUERDO CON LA REIVINDICACION No. 1 CARACTERIZADO PORQUE SEPARADAMENTE SE PREPARA OTRA MEZCLA COMPUESTA DE AGUA Y AZUCAR, DONDE EL AGUA SE PASA PRIMERO POR UN FILTRO DE CARBON ACTIVADO Y LUEGO POR UN FILTRO DE ARENA, PURIFICADA EL AGUA SE LE ADICIONA EL AZUCAR EN PROPORCION DE CUATRO PARTES DE AGUA POR UNA DE AZUCAR. 1. Process for the production of confectionery HE– LADAS wherein it consists basically PROCESSING INDEPENDENTLY OF A MER– ROAN FRUIT AND A MIXTURE OF WATER AND THEREAFTER WHICH SUGAR TOGETHER TO FORM A TOTAL MIX THAT TAKES WHERE DOES matured to be molded as a palette. 2. PROCEDURE FOR THE PREPARATION OF RAS frost CONFITU– according to claim No. 1, characterized MARMALADE TO TAKE OUT THE FOLLOWING STEPS: A. RECEPTION AND SELECTION OF FRUIT, this process is done manually BEARING NOTE size, stage of maturity and optimal conditions PLANT PROTECTION nity. B. FRUIT AND ONCE SELECTED AND PLACED ON A KIND OF ZARANDA SUBMITTED TO WASH WITH COLD WATER JET. C. THEN GO TO A PROCESS WATER scalding 50 degrees Celsius for a period of 10 to 15 seconds. D. REMOVAL MANUAL PULP AND ARE SEPARATE PULP BARK. E. blending process whereby fragments PULP being completely separated from the PEPA or seed. F. DESSEMILLADO by filtration UTILIZAN– DO A FILTER BAG TYPE SLEEVE. G. TO CONCENTRATE FRUIT PULP OBTAINED ASI is added sugar in a ratio of TWO PARTS OF FRUIT BY A SUGAR, this blend is made in a pot TO BE BORN THEN SLOWLY TO A TEMPERATURE BETWEEN 60 AND 85 DEGREES CELSIUS WHERE After reaching the temperature is

maintained at that point for a period of 10 to 15 minutes to obtain a MERME– LADA FRUIT. H. MARMALADE thus obtained is packaged in TAMBO– RES PLASTIC OR GLASS CONTAINERS sealed and allowed to rest for at least 24 hours. 3. PROCEDURE FOR THE PREPARATION OF RAS frost CONFITU– according to claim No. 1, characterized OTHER MADE SEPARATELY WATER AND SUGAR BLEND, where water is first passed through a charcoal filter and then filter PREPARES ARENA, PURIFIED WATER is added sugar ratio of four parts water to A SUGAR.

Abstract:
Source: US2001024671A The invention is an apparatus for producing pizza by a mechanical, automated system without using baking tins for the dough bases and without using pre−prepared or pre−shaped bases. Dough bases are individually prepared from fresh pre−proportioned dough ingredients by a kneading and extrusion device. The dough base is then passed through a series of processing stations, such as a shaping press, a metering and distribution device for tomato purees or sauces, at least one metering and distribution station for garnishing (topping) ingredients and a baking station. The dough bases pass through the series of stations on a preheated or continuously heated transportation sheet. No pre−produced or pre−cooked, semi−finished products are used in the method. Each dough base is prepared and provided with toppings according to individual orders selected from a list.

Abstract:
Source: US4733878A A four−wheel steering system for a vehicle comprises a steering wheel, a front wheel turning mechanism for turning the front wheels in response to operation of the steering wheel, a rear wheel turning mechanism including a rear wheel steering ratio determining circuit for determining the rear wheel steering ratio and an actuator for turning the rear wheels according to the rear wheel steering ratio determined by the rear wheel steering ratio determining circuit. The four−wheel steering system is provided with a road condition sensor for detecting road surface conditions which can weaken the road gripping force of the wheels and a rear wheel steering ratio controller for changing the rear wheel steering ratio determined by the rear wheel steering ratio determining circuit so that the rear wheel steering ratio is increased when the road condition is such that the road gripping force of the wheels can be weakened.

Abstract:
Source: US2004011031A Two motors are arranged on opposing sides of a common shaft, drive plates of the pump/motors being rigidly coupled to each other, for example by being in hard contact with opposing sides of the shaft. By providing hard contact between the pump/motor drive plates and a common shaft, the drive plates and shaft act as a substantially solid element under compression, thereby substantially canceling axial loads generated by the pump/motors directly through the shaft. Residual axial loads are handled via bearings positioned on the shaft adjacent the drive plates in such a manner that the drive plates are in light contact only with the bearings. As a result, friction experienced by the bearings is substantially reduced as compared to conventional systems, thereby improving the efficiency of the system. To further reduce loads on the bearings, the pump/motors are arranged to ensure that they generate radial forces in a direction that is opposite to that of a separation force generated by a torque transferring device carried on the shaft and transmitted to the bearings. A common housing surrounding the two pump/motors, bearings and torque transferring device is divided into three regions, to segregate the bearings and torque transferring assembly from the pump/motors. In this manner, the regions containing the pump/motors are substantially filled with oil to, for example, fully lubricate the pump/motors, while the central region containing the gears and torque transferring device contains a significantly smaller volume of oil to simply splash lubricate the contents of the region, thereby reducing drag on the bearings. Control means are provided for selectively moving the two pump/motors substantially simultaneously to a selected displacement angle, using mechanical systems alone and in combination with hydraulic systems.

Abstract:
Source: GB775856A 775,856. Grinding. GARRINGTONS, Ltd. July 20,1953 [April 18, 1952], No. 9817/52. Class 60 [Also in Group. XXII] Apparatus for surfacing an elongated work blank, such as a gas turbine blade, which is of irregular cross–section and provided with a groove, recess or shoulder disposed at an angle to its longitudinal axis comprises means for subjecting a matrix of form corresponding with the desired form of the finished work piece and a work blank to synchronized rotation or oscillation about spaced parallel axes, means for engaging a tracer with the matrix surface and for utilizing the relative movement between the tracer and the matrix ta control the relative position of a surfacing tool in operative engagement with the work blank so as to shape the surface of the same to a configuration identical with that of the matrix, means for advancing the work blank and tool relatively longitudinally of the blank so that the tool describes a helical path thereon, the means operative when the tool is at the inclined groove, recess or shoulder for changing the angle of the helix so that it corresponds with the inclination of such formations. As applied to the grinding of a blade 15, Fig. 1, which projects from the inclined face 21 of a shoulder platform 18, a tool in the form of an abrasive band 38, Figs. 4 and 5, and the tracer constituted by a roller 44 are supported in a hollow head 39 carried at the ends of parallel liriks 45, 46 so as to be disposed above the work blank 15 and matrix 30 which are mounted on a longitudinallymovable slide 25. Chucks 27, 28, Fig. 7, on the slide receive the root ends of the matrix and work blank, respectively, the opposite ends of which are supported in tailstocks 31. The drive of the chucks from an electric motor 37, Fig. 4, is through infinitely–variable gearing 36, chain drive 34, shaft 33 on the fixed frame and gearing 32 so arranged as to effect the drive while permitting movement of the slide 25. The gearing 36 is controlled by a pneumatic or hydraulic ram so as to maintain a constant linear relative velocity between the band 38 and surface of the blank which it engages, this effect being produced by a cam 77b, Fig. 7, which is shaped peripherally to correspond with the cross–section of the blade, rotates with the chuck 27, and actuates the control valve of the ram. The band 38, which is driven by a motor 42, passes over idler pulleys 40 and(at the point of engagement with the blank, a barrel–shaped roller 43. The tracer roller 44, which is also barrelshaped, is rotatable on an axis parallel with that of the roller 43 and carried by a vertically–adjustable slide 50. The inclination of the head 39 to the vertical is continuously varied during each revolution of the blank so that the band makes substantially point engagement with the blank and its operative surface is maintained tangential to the blade surface. For this purpose, the pivot 52, Fig. 4, of the upper pair of links 45 is formed as an eccentric rotatable by a pneumatic or hydraulic ram 56 as controlled by a valve 56a, Fig. 7, actuated by a cam 56b which rotates with the chuck 28 and is shaped peripherally to correspond with the variation around the cross–section of the blade of the inclination of the blade surface measured longitudinally of the blade and relatively to its axis. The control valve 56a is carried by an arm 56c pivotable about the axis of the chuck and engaging at its outer end a sine bar 56d which is mounted on the fixed frame for adjustment out of the horizontal whereby the action of the cam may be advanced or retarded 'in accordance with the degree of twist of the blank. The roller 43 is given one to–and–fro oscillation about a vertical axis during each rotation of the blank so as to provide a smooth surface finish and ensure that, when the band is dealing with that part of the blank adjacent the inclined face 21 of the platform 18, it lies parallel to such face when operating on both sides of the blank. For this purpose, the roller 43 is supported on a vertical spindle 58, Fig. 8, having a lateral arm 60 engaging an inclined cam slot in a plate 61 on a carrier 62 which is movable vertically by pneumatic or' hydraulic ram 64; the control valve of the ram is actuated by a cam rotating with the chucks 27, 28.

The slide 25 is advanced slowly to feed the blank and matrix past the band. and tracer during the finishing of the main portion of the blank (so that the tool and tracer describe helical paths on the blank and matrix) by an electric motor 68, Fig. 4, which drives a crank disc 67 carrying an adjustable crank−pin 69 connected to the slide by a rod 70 incorporating a doubleacting pneumatic or hydraulic ram 71; during this operation, the ram is ineffective and one of a pair of adjustable stops 73 on the rod 72 of the ram contacts an abutment 74 on the ram. When the band 38 reaches a position adjacent the inclinedplatform face, the slide is reciprocated to and fro for the distance a, Fig. 1, once for each revolution of the blank by the sole action of the ram (to provide the desired change in the angle of the aforesaid helical path); the control valve of the ram which acts through a servo−valve is controlled by a cam 71b, Fig. 7, rotating with the chuck 27. The ram is rendered operative for this purpose when a dog 88 moving with the slide acts through a stop 86 to slide coupled bars 82, 84 whereby an abutment 81 opens both a switch 79 to stop the motor 68 and a valve 78 to permit the supply of pressure fluid to the control valve of the ram. To achieve this effect, the slide bar 82, which is coupled by cranks or eccentrics 83 to the bar 84, had previously been set by a hand knob 90 to its extreme right−hand position so that the abutment 81 is correctly placed to operate as described above under the action of the dog 88. At the end of the operation, the hand knob 90 is turned to slide the bar 82 leftwards so as to actuate the valve 78 and switch 79 to stop the ram 71 and start the motor 68 in reverse for the return of the slide 25. When the slide reaches its extreme withdrawn position, the dog 88 acts through a stop 87 to slide the bars 82, 84 whereby an abutment 93 opens a switch 95 to stop all the motors; the actuating member of the switch also actuates the control valve 49a of a ram 49, Fig. 4, which by its connection to the lower pair of parallel links 46 lifts the head 39 clear of the blank and tracer. After the insertion of a new blank, the turning of the knob 90 slides the bar 82 to cause the abutment 93 to actuate the switch 95 to re−start the motors and lower the tool head The above arrangement may be modified by providing a separate abrasive band for operating upon each of a number of parallel blanks or one band passing around a series of pulleys for action upon all the blanks, and, if desired, the abrasive band may be replaced by a grinding wheel or milling cutter. Specifications 777,857, 777,858, and 777,859 are referred to. The Provisional Specification describes also the actuation of a trip arm on the slide 25 at the appropriate time in the machine cycle to bring a follower into engagement with the cam 71b which thereafter controls the ram 71 to reciprocate the slide in the neighbourhood of the shoulder platform.

Abstract:
Source: US2002023700A In a tire for vehicles, the formation of each bead reinforcing structure envisages that, after laying of a first series of elongated sections defining axially inner terminal zones of a carcass ply, an annular anchoring insert consisting of a wire wound in axially adjacent turns is formed on an end portion directed axially towards the outside of the respective zone. A stiffening element tapering radially away from the axis of the tire is then formed on each inner terminal zone. A second series of elongated sections is then laid, completing the manufacture of the carcass ply with the formation of axially outer terminal zones which are superimposed on the stiffening elements. An additional annular insert is formed on an end portion of each outer terminal zone arranged radially superimposed on the anchoring insert. The tire according to the invention may be associated with a symmetrical rim which has two lateral portions designed to form the bead seats for engagement with the corresponding tire beads, which are defined by frustoconical surfaces converging towards the axis of rotation of the rim, away from the equatorial plane thereof.

Abstract:
Source: US5562066A An amphibious vehicle is disclosed designed to have its ground engaging wheels retracted in response to manual switch activation only if there is a detection of sufficient thrust by the marine motive device to impart motion to the vehicle. The vehicle includes a land motive device and a marine motive device. An engine is positioned within the vehicle to provide power to the land motive device and the marine motive device. The ground engaging wheels are part of the land motive device. A directing device operatively connected to the engine directs engine power selectively to one of the land motive device, the marine motive device, and the combination of the land motive device and the marine motive device. An operator actuable switch is positioned within the vehicle for manual activation to switch the vehicle between land operation and marine operation. A pressure sensor also is provided to determine when the marine motive device provides sufficient thrust to impart motion to the vehicle. Means are also provided for deactivating the land motive means in response to manual switch activation only when the pressure sensor indicates there is sufficient thrust by the marine motive device to impart motion to the vehicle.

Abstract:
Source: US2009320713A The Application discloses People and Cargo Transit Systems and Vehicles (PCTSV), using Narrow Vehicles (NV), which can have the form of a Bus, Train, Tram, Maglev, Mono−Rail or even Car or Truck. A preferred version of which is Single Seat Wide or below 70 cm wide, preferably a Bus type to need no Rail, using Dedicated Narrow Lanes adjacent to Curbside of existing intra−city streets or limits of inter−city roads. Said NV and Lane have Anti−Roll Over Means to stabilize such a narrow vehicle, which also eliminate NV Swaying even when NV is a Bus or Car with has no inherent Sway Limiting. Being Ultra Narrow with No Sway and Running at Curbside results in Negligible or No Blocking of other vehicles by NV.Said Lane/Tack, Anti−Sway and Anti−Roll Structures all Allow being Run Over by other Traffic and have structures not to be damaged, thus can be crossed over at Crossroads and other entrances and exits along said Lane. NV has enough Doors and is Narrow, hence each Passenger can reach a seat or exit, with No Isle inside it to walk along. So it can have Low Profile, like a Sports Car, some 120 cm tall. Hence it is easy to have Covered Trenches at cross roads for non−stop crossing. Trenches can run along most or all the Track, in which case adherence to streets and roads is relieved. Such Narrow and Shallow Trenches take a tiny fraction of time and costs of Skyways or Subways. Each Passenger thus can have her own door, own seat, in a small Cabin, which can be opened and closed to next Cabin, have reclining seats to join to that of next Cabin to sleep on, have laptop tray, etc. All those make PCTSV much more appealing to user's, even better than private transport. There are many Variations other than above. There is an NV Car for the last mile and or long distance use, which can integrate with NV Public Transit. Also modifications to NVs for use in Cargo and Parcel Transit.

Abstract:
Source: US2004058432A An organ perfusion apparatus and method monitor, sustain and/or restore viability of organs and preserve organs for storage and/or transport. Other apparatus include an organ transporter, an organ cassette and an organ diagnostic device. The method includes perfusing the organ at hypothermic and/or normothermic temperatures, preferably after hypothermic organ flushing for organ transport and/or storage. The method can be practiced with prior or subsequent static or perfusion hypothermic exposure of the organ. Organ viability is restored by restoring high energy nucleotide (e.g., ATP) levels by perfusing the organ with a medical fluid, such as an oxygenated cross−linked hemoglobin−based bicarbonate medical fluid, at normothermic temperatures. In perfusion, organ perfusion pressure is preferably controlled in response to a sensor disposed in an end of tubing placed in the organ, by a pneumatically pressurized medical fluid reservoir, providing perfusion pressure fine tuning, overpressurization prevention and emergency flow cut−off. In the hypothermic mode, the organ is perfused with a medical fluid, preferably a simple crystalloid solution containing antioxidants, intermittently or in slow continuous flow. The medical fluid may be fed into the organ from an intermediary tank

having a low pressure head to avoid organ overpressurization. Preventing overpressurization prevents or reduces damage to vascular endothelial lining and to organ tissue in general. Viability of the organ may be automatically monitored, preferably by monitoring characteristics of the medical fluid perfusate. The perfusion process can be automatically controlled using a control program.

Abstract:
Source: US2015005982A Smart Active Tyre Pressure Optimising System [TPOS] 102 is a highly time sensitive design and technique that acts instantaneously in sensing and controlling the tire pressure particularly in imminent and inevitable critical driving situations to reduce emergency and high speed breaking distance, mitigate–loss of traction, hydroplaning, roll over, loss of stability, over and under steering, break failure, loss of control due to puncture by smartly sensing, perform context aware computing and directing the Tyre Pressure Control Units [TPCU] 104 to instantaneously control the tyre pressure in right time with right pressure on right tyres thereby actively controlling the footprint and sidewall deformation rate to enhance traction and stability simultaneously sustaining drivability or steerability ultimately to avoid or reduce the impact of collusion and overcome or mitigate critical situations for protecting the vehicles, occupants, pedestrians and other objects around or on the way; also according to design, configurations and scenarios the system instantaneously optimises the tyre pressure on all tyres for further safe driving till next restoration else restores the pressure to optimum preset value utilising inbuilt reservoir or other external restoration systems immediately after the vehicle overcomes the critical situation to continue with safe and comfortable driving. In critical situations TPOS performs sensing, pre computing, current computing for controlling the tire pressure during critical situation, post computing to optimise tire pressure after

overcoming accordingly. TPOS 102 utilise smart and adaptive closed loop processing algorithm with predetermined and tested lookup table to instantaneously check and compare the effects between predetermined and tested real world scenarios to the actual real world scenarios for actively sensing, computing and controlling the tire pressure accordingly to mitigate the critical situations. The controlling of tyre pressure is computed mainly based on parameters comprising of sensor system, vehicle safety and stability systems, nature of breaking and break force distribution, tires upper and lower cut−off pressure values, sensing reservoirs and tires internal and external pressure, temperature, moisture, humidity, wheel and tire specifications, vehicle and wheel speed, acceleration and deceleration, vehicle orientation and axial rotation, transverse motion and lateral acceleration, tires position or angle of attack, load and torque distribution, tire traction, steering position, cornering effects, change in Centre of gravity, over and under steering, hydroplaning, sensing road conditions, etc and to further enhance the efficiency, the system interoperates with vehicles existing safety and stability systems like ABS, EBD, ESC, TCS, Rollover mitigation systems, ECU, BA, Precrash systems, suspension and vertical dynamics, radar assisted auto breaking, cruise control system, aerodynamics and airbrakes etc. Other aspects of present invention are controlling the tire temperature according to environmental temperature, moisture and humidity thereby to enhance traction and vary tire pressure according to change in centre of gravity and load, driving modes−comfort, standard and sports modes.

Abstract:
Source: US5423406A An epicyclic train operates as a speed reducer between an input and an output when a clutch is released, and as a direct drive connection in the contrary case. The selective clamping is obtained by centrifugal weights, counter to biasing springs and to an helical teeth reaction force, which is proportional to the torque transmitted during speed–reducing operation. The reaction force promotes speed–reducing operation when the torque to be transmitted is high. Means are provided for applying a force pulse to the weights when the driver depresses the accelerator pedal. Since, upon a ratio change, the reaction force and the friction forces in the clutch vary so as to stabilize the newly created transmission ratio, a force pulse is enough for initiating a ratio change which will then be stabilized by a spontaneous variation of the reaction force and the friction forces.

'\–I August Scherl, Berliini, Saksa. Ohjauslaite automobiilelhin « Tämä Keksintö tarkoittaa voimavaunujen (automobiilien) ohjaus– laitetta,.1a on sen multaan ohjauslaite yhdistetty ohjausvipuun, joka väli*lcytkimen avulla pitää kiinni johtopyörää tai ohjaustankoa maan– tiehen tai katuun upotetussa johtokiskossa, niin että vaunu tämän joh– tokiskon avulla tulee ohjatuksi ja pakoitetuksi kulkemaan määrättyä ra– taa pitkin.Tällaisen laitteen tarkoituksena on voida järjestää suhteei lisen kapeita kulkuratoja, joilla pyörät kulkevat.Fämä kulkuradat voi– daan nimittäin varustaa tavalliseen katukatteeseen upotetulla »sileällä katteella, esim. litteärautakiekoilla. sementillä, asfaltilla ja sen– tapaisilla ja täten saavutetaan se,että automobiilit voivat kulkea tyy– nee8ti ja nopeasti tavallisilla maanteillä,ilman että tietä koko levey– deltään tarvitsee varustaa erikoisella katteella* Jos tällaisella ohjauslaitteella varustettu automobiili laite– taan niin,että vaunuShjaaja milloin taliansa voi kohottaa ohjausvivun ohjauskjskosta Ja jälleen laskea sen siihen ja niin,että vaunua,ohjaus– vivun ollessa kohoitettuna, voidaan tavallisella tavalla ohflata kasi– pyörän avulla, niin on tästä se etu,että vaunu jälkimäisessä tapauk– sessa voi kulkea mitä tietä tahansa, esim. väietääkseen tai mennäkseen sivu tai kulkiessaan pitkin sellaisia teitä »jotka eivät ole varustetut kysymyksessä olevilla johtokiskoilla, jotavastoin ohjausvivun ollessa kytkettynä kuljettajan työ lakkaa, koska hänellä ei ole mitään tekemis– tä automobiilin ohjauksen kanssa. Sovitettaessa tällaista laitetta käy– täntöön ilmaantuu kuitenkin useita vaikeuksia ja on tämän hakemuksen tarkoituksena voittaa itämä vaikeudet. Nämä vaikeudet ovat eeuraavat: Kuten tunnettua on aut.omobiHeissä käsipyörävälitys laitetta– va niin,että se jm enemmän tai vähemmän itsepidättävä,niin ettei Jokainen pieni tiellä oleva este voi saada icul.letta.1aa Kadottamaan herruuttaan automobiilin yli.Automaattisesti ojattaessa ohjauslaittee– seen yhdistetyn onjausvivun avulla, joka kulkee lauskî ukossa, el sen– sijaan välityksen tarvitse olla itsestäänpidä+.tävs, vaan täytyy sen päinvastoin olla mahdollisimman vastuskyvytkin – Pkslnnön mukaan saa– daan nämä molemmat vastakkaiset käyttöehdot aikaan siten,että käeipyö– ravälitys Johtovivun painuessa kiskoon automaattisesti irtaantuu, se– kä Johtovivun kohotessa kiskosta Jälleen automaattisesti Kiinnittyy. Käsipyörävälitys voidaan niinmuodoin mielivaltaisessa määrissä laittaa itsepidättäväkel, ilman että automaåttlsta ohjauslaitetta ohjausvivus– ta tarvitsee käyttää.tsmän ollessa toiminnassa. Toinen vaikeus on se »että, niinpiankun on kysymys johtokiskon asettamisesta Julkisille maanteille, Joita muutkin kulkuneuvot käyttä– vät, täytyy käyttää urakiskoa, Jonkaattassa Johtopyörän laippa pyörii. Tällöin on kuitenkin aina otettava huomioon se mahdollisuus, että pyörä uran tukkeutuessa voi hypätä pois Ja tästä syntyisi vaara,koska, kuten yllä mainittjjrJohtovlvun välityksellä tapahtuvan automobiilin auto– maattisen ohjauksen aikana käslpyöräohjaus on Irroitettu Ja kuljettajan on se ensin kytkettävä, Jotta kiskolta suistumisen tapahduttua auto– mobiilin Johtopyörä Jälleen voii saada vaunun kiskolle. KeksiraiÖn mu– kaan voitetaan tämä vaikeus siteç., että.lohtopyörän hypätessä diskolta talloi olevar tukkeutuman tähden, käsipyörakytkln Jälleen automaattises– ti kytkeytyy,nlin että kuljettaja heti saa herruuden automobiilin yli. Keksinnön mukaan auttaa tällöin kuljettajaa myöskin ge.että au– tomobiileihin, Joita rä.Jähdysmoottorit käyttävät, on tehty sellainen laite,että moottorin sytytys automaattisesti lakkaa heti kun Johtopyö– rä tarkoittamattomasti hypppp Johtokiskon urasta. Moottorin räjähdyk– sien äkkinäinen lakkaaminen herättää silloin kuljettajan huomioon,niin että hän voi pystyttää automobiilin ta) kytkeä sopivalla tavalla käsi– pyöräohjauksen. Sitäpaitsi vaikuttaa moottori, sytytyksen lakatessa, Jarruttavasti automoblHiin, niin että vau nun pysäyttäminen käy hel– pommaksi. Mutta tietysti on lait.e niin konstruoitu,että sytytys ei lak– kaa silloinkun kuljettaja tahallaan Kohottaa.lohtopyörän.koska vaunun tällöin melkein aina on Kuljettava edelleen, Mukana seuraavissa piirustuksissa on v–avainnollistettu. Kuv.l on yleiskuva itse käyttösyeteemistä, johon keksintö kohdis'v. Kuviot 2–4 osoittavat ohjausvivun laakerointia etumaiseen vaunun akse– liin, sekä sen Kohoitus–Ja lasku la i teitä Kuljettajan palkalta.Kaviot 5 ja 6 esittävät sitä laitetta, jonka avulla johtovlpua ki inni kytket– täessä. käslpyöräohjaus irtikytkeytyy, Ja päin vastoin.Kuviot. 7–19 näytt"iv'!'t kasipyöräohjauksen automaatti sen Ylirjú kytkennän lohtopyör and n hypätessä Joht.okiskon urasta, 1* kuviot 15–19 näyttivät erikoisesti käyt– tömoottorin eytvt.vHvirran automaattisen katkaisun johtopyöran hypätessä Johtokiskolta. Kuviossa 1 esitetyn käyttÖflvsteejnJr mukaan on kadulle tai maan– tielle.npetpttu kaksi kulfcukiskoa 2, Joitten etäisyys on yhtäsuuri kuin automobil lei £P3 tavallisesti käytetty pyöräv?li ja näitten välillä on Johtokisko 3» jokaon muodostettu urakiskoksi. Tässä pyörii pyörä 4, jc– ka on laakeroitu automobiilin ohjauslaitteeseen kytkettyyn vipuun 5.Jol– lei automobiilin KäsiohJauKsenta ole entett.g, niin tulee automobiili Johtokiskon avulla ohjattua fculkukiskoja 2 pitkin ja kuljettajan el tarvitse silloift huolehtia ohjauksesta. Joa r\y* o>\1ausvJpu 5 on laitet– tu niin,että kuljettaja milldin tahansa voi Kohoittaa sen ylös, niin että vaunua voidaan ohjata käsipyörsn avulla, niin voi kuljettaja milloir, tahansa poiketa kulkutieltä, esim. kun hän tahtoo ajaa toisen vaunun sivu tai, silloinkuin löytyy ainoastaan yksiraiteinen tie, väistää vas– taan tulevaa vaunua.Kuviossa 1 otaksutaan »että rata on asetettu taval– liselle kadulle tai maantielle. Luonnollisesti voi laitos myöskin olla sellainen »että asetetaan erikoinen rata tien sivuun ja voidaan johto– kiskona silloin käyttää n.?.. vt<?nolkiøkoa,Jolla Johtopyörä pyörii. Vas– '.aantulo–ja sivuutuskohtiin pitäisi silloin laittaa erikoiset lavat. Kuten jo on mainittu, +£ytyy lnrjestää niin,että kuljettaja paikaltaan mielin määrin voi kohoittaa ja laskea loMopyörää Ja ettei silloin synny mitään vaikeutta käsipyöräohjauksen Jtsejarrutuksesta. Eräs käytäntöön sovittamistapa tämän tehtävän ratkaisemiseksi näytetään kuvioissa 2–4, joista kaksi ensinmainittua esittävät. Vipu 26 on kiinnikiilattu akseliin 2/,.joka on laakeroitu etummaisessa akselissa 3 oleviin korviin 23. Likellä akselin 27 päätä on siihen kiinnitetty vipu 29,Jonka kanssa tanko 30 on Yhdistetty. Tästä käynee setvi Ile,että,kun. tankoa 30 on siirretty pituussuurmas– saan,vivun 29 vaikutuksesta myöskin vItm 26 Ja sen vanssa rulla?H ko– i.oaa tai laskee.J03 rulla 24– liikkuu ylöspäin, m i... 3e asettuu Johtovivussa H kiinni olevaa paikfcitankoa 23 vastaan Ja edelleen IUkVuessa koinolttaa Johtovivun Ja JohtopyfirÜn 'J– irti kiskosta Jousien Vj painetta vastaan. Tanko 30 on kytketty Tipuun 3I(kuv.U), jr,>.a on 32iden 'Kohdalla laakeroitu vaunun rungon suojus–seinään 33.Kytkentä aikaansaadaan tangon 35.1 and siihen kiinnitetyn 36:den kohdalla laakeroi– dun kulnuv 1 /un 37.38 avulla. Kuviosta 4 käy selville,että johtovipu tulee irtikytketyksi heti kun ksivlpu JT liidin;n ylämäin. T>1ltute– tuilla viivoilla osoitettuun asentoon,muïia että johtopyöra –py'–rl1 jc– tokiskolia, osien ollessa tavallisilla viivoilla piirretyin* asemoi* i«a. johtopyorän irtlkytkemisen täytyy nyt keksinnön umkaan voida tapah– tua Hyvin nopeasti ilman voimanponnistusta lcul.1etta.Jan puolelta,tosia irtikytkeminen: tavallisesti on välttämätön ainoastaan silloin, kuin tiellä–on.Jokin este.Ja kuljettajan niinmuodoin ne ti täytyy olla val– miina ryhtymään ohjaama?n vaunua fcästpyörän avulla.Ja hänellä nl lnmuo– d–>in el ole kädet vapaina vivun 3 r kääntämiseen. Tätä. tarkoitusta var– ten löytyy vahva vetojousi 39» joka 40:nen kohdalla on laakeroitu vaunun runkoon Ja MI:den kohdalla on kiinnitetty kulmavipuun 33. Jousi koettaa vetää vipua 38 ja n,4n*nnodoin myöskin tankoa 30 oivalle,kuv.U. ja kyt– keä irM 1ortoT»yör?r..Osat pysyvät kuitenkin normaali asennossa vastus– taen jousen 39 vaikutusta teitinha'an U2 avulla,joka ulokkeen 43 väli– tyksellä pitää ti1nni kulmavipua 37.38. TlVinfcaYa on kHnnikl?lattu lyhyeen akseliin 44,.joka on vääntyvästi laakeroitu korvaan 45 ja jonka toisessa pääesä on sivu/ipu 46, johon tar)0 47, joka on varustettu y?'–~ r.\T. rakoon sovite+vllq poikine 11a 43, on yhdistetty.Poljinta 43 alas– painattaessa kääntyy telkinhaka U2 sillä tavalla,ett?: loke 4? yppqntnn, Tällöin alkaa jousen 39 vntlpihns Ja saa se aikaar tovivun kehoituk– sen. Käsivipu tulee –in o in kuviossa a pilkutetuilla viivoilla osoitet– tuun asentoon. Jos johtovipu on jälleen kytkettävä, »tarvitsee kuljetk– jan vaan painaa vipu 31 alae,sifctenkun hän ensin on asettanut automo– biilin vastaavaan asentoon. Kuten edellä on huomautettu, on Järjestetty sillä tavalla,että kun johtopyörä on laskettava tai kehoitettava, samalla tapahtuu käsi– pyöräohjaukaen automaattinen Irti–ja kiir–nlkytkertä..Tätä tarkoitusta varten on,kuten kuviosta 4 näkyy, vipu 50 vääntyvästä laakeroitu oh– jauspesään 49. Vivussa 50 on pitkula and en uurre 51,jossa tankoon 30 kiin– nitetty tappi 52 liikkuu.samalla kun tankoa 30 13lkiitetään jihtopyörän koho!ttami3eksJ tai laskemiseksi kääntyy myöskin vipu 50. Mitä tästä seuraa on esitetty läherwuin kuvioissa 5 ja 6. Ohjauspesässä 49 on ohjausaksell 53 laakeroitu*. Sen toiseen päänän on Kiinnitetty ohjausvipu 54,.¦'oka tavallisella tavalla on yhdie tetty akseli sääreen,ni I n että autornohi ili tulee ohjattua leuten tavalli– sesti ruuvi:–. 55 avulla..iota tangon 56,1a Ksslpyörän välityKsellä voi – c3aan vääntää.la loka on yhteydessä K1 eruKKapyörän 57 Kanssa.Tämä fcleruk– kapyörä 5/ ei ole Kiinni ohjausakselîasa 53.vaan voidaan se kiinnl–ja ir tikytkeä viran 50 avulla.Pierukkapyörä 57 on varustettu määrätyllä etäisyy–– della ohjausakselin 53 ympärillä olevalla leveällä renkaalla 53,.loka on varustettu sisäpuolisilla hampailla 59.jotka voivat joutua kosketufcsiin toisen» ohjausalcselilla 53 olevan, siirrelt.pvän,mutta ei Käänne + t§r3n Vy*~ Kinorn 61 hammastatu" renkaan 60 Kanssa.Tämän KytKinosan ympärillä vair– kuttaa jouel 62,joka saa sân kosketukseer kierukkapyörän 59 hampaitten kanssa.1a koettaa pitää sitä siinä asennossa.Ky+>1 nosa 61 voidaan Kui– tenkin siirtää takaisin fcftä painetta vastaan,niin että se irtaantuu täs– tä Kosketuksesta.Tämä tapahtuu ohjausakselin 53 tapin f.t ympärillä kaan– tyvästl olerarvfjj, renkaassa 64 olevan nystyrän 63 avulla.Renkaan 64–.la kyh– klnosan 61 f siiliä löytyy toinenkin ohjausakselin 53 ympäri sovitettu lolllnra rengas 66,jossa olevassa urassa 6(pesään 49 ruuvattu tappi 63 liikkuu,niin etti: Rengasta 66 voidaan siirtää, mutta eil kääntää. Jos vipua 50 käännetään tangon 30 avulla,.loka välittää rullan 24 liikkeen käsivivusta 3I(kuv.4),niin vaikuttaa nystyrä 63 vastassaan olevaan kololliseen renkaaseen siten,että se työntää sitä.pes?ärj päin (oikealle päln)kuvlossa 5.Rengas 66 vaikuttaa vulkanisoi.ui sta Kuiduis– ta tai sentapaisista valmistetun välilevyn 69 avulla kytkinosaan 61 .1a tämän hampaitten 60 kosketus kierukkapyorän 57 hampaitten.59 kanssa lakkaa. Ohjauslaitteen käsipyörään yhfll+st*;? ruuvi 5Ç irtaan– tuu silloin kosketuksesta ohjausakseiir. ** vanssa,1a ohjauslaite on. n3 inrrvofloln irtikytketty, jo? y *pua 50 siirretään vastakkaiseen suun– taan vapautuu rengas 66, ia kytkin 60,59 asettuu entiseen asentoon jousen 62 vaikutuksesta.Laite on tällöin sellainen, ett?» irtikytkentä seuraa tangon liikkuessa vasemmalle (kuv.4)ja johtopyörän 4– asettuessa pal– koilleen ja Kiinnikytkentä seuraa.kuu tankoa 30 johtopyörän kohoitta– T3i3?ksi siirretään oikealle. On siis saavutettu se mitä haluttiin.ninlir tala,öttä johtopyorän ollessa alaslaske–t+\'r? käslpyöräoujaos gi* irti– kytketty, ja heti kun jo}*topyörää kohelletaan,kiinnifcÿ+keytyy täsipyörä ohjaus automaat h.i i.?eoti. T?hsn asti selitetyssä käytäntöön sovlttamis– laitteessa H ole ote>.;.u huomioon* sitä,että käytettäessä urakiskoa johtokiskona johtopyörä ajoittain voi hypätä pois »koska ura helposti tukkeutuu. Tämä estyy mikäli mahdollista laittamalla uranpuhdistaja. Mutta voi sattua että tämä uranpuhdistaja ei.lakea pitää uraa puhtaana, jotta se ei menisi rikki, täytyy sä tietenkin laittaa liikkuvaksi?niin v että se voi väistää sellaisia esteitä» joita se ei voi poistaa,1a sil– loin aiheuttaa este johtopyörän urasta suistumisen. Jos tänä tapahtuu, joutuu automobiili vaaraan, koska,kuten yllä on selitetty,käsipyörä– ohjaus siinä silmänräpäyksessä on irtikytketty eikä kuljettajalla ole automobiili vallassaan. Job hän on tarkaavainen.niin voi hän tietysti heti kytkeä käsipyöräonjauksen, mutta täytyy kuitenkin ottaa huomioon, että kuljettaja ajettuaan pitemmän ajan automaattisella ohjauksella tu– lee yhä tarkaamattomammaksl eikä huomaa vaarallista sllmänräpysä. Tästä syystä onkin tämä keksintö seuraavan käytäntöön sovitta– mi elävän mukaan järjestetty niin, että uranpuhdistajän suistuessa oras– ta ja pyôrÿn hypätessä urakiskolt.a tapahtuu käsipyöräohjauksen automaat– tinen V_1 inrlkytkents.Tähän tarkoitukseen käytetään sitä heilahdusta, joka syntyy kun urarpuMistaja kohtaa esteen, jota se ei voi poistaa. Konstruktioni, joka aiheuttaa muutoksen edellä selitettyyn laitteeseen johtopyörän

käyttölaitteen säätämiseksi, on Havainnollistettu kuviois– sa 7–16» Sensijaan että tangon 30 lukitseminen jousen 39 vetoa vastaan asetetaan kulmavipuun 37,33 telkinha'an 42 avulla (kuv.4–),sovitetaan se vipuun 29,jonka välityksellä, tankoa 30 liikuteltaessa, vipu 26 nousee ja laskee. Tätä tarkoitusta varten on etummaiseen akseliin 3 kiinni– tetty pukki /o/kuv.?/, johonka tapin 71 ympäri kääntyvä telkinhaka 72 on sovitettu.Sitäpaitsi on pukissa 70 tapin 73 ympäri kääntyvä tanko 74–, joka tangon 75 kanssa muodostaa tapin 76 ympäri kääntyvän vipunlvelen. Tanko 75 on toisesta päästään vivussa 29 olevan tapin 77 ympäri pyörivä. Telkinha 'an tarkoituksena on nyt tangon 30 lukitseminen. Jos seimittäin lukitsee vipunlvelen 74,75 keskustapin 76,niin pysyy vipu 29 ja sen kans– aa tanko 30 kuviossa 7 osoitetussa asennossa, jossa, jousen 39 vetoa vastaan,vipu 26 on alaspäin ja niinmuodoin johtopyörä Kiskon urasBa ja seurauksena vivun 50 asennosta onjauspesässä jää knsipyoräohjaus 3rtiky£ ketyksi. Jos sitävastoin telkinhaka 72 vedetään taaksepäin (kuviossa 7 oikealle),niin vapautuu kesKustappl 76 ja vlpunivel kääntyy,niin että tanko 30 voi seurata jousen 39 vetoa sekä irtikytkee johtopyörän k.1a. kiinnittää käsipyöräohjauksen kaatamalla vipua 50. Telkinha/an?2 tapptnsa TI ympäri tapahtuva lukitsemiseen,1a irroittanilBeen tarvittava liike voi tapahtua kahdella tavalla,nimittäin,jo>.o kJekonpuhdistäjasta – Joka myöhemmin selitetään tarkemmin – vivun 73 välityksellä tai myöskin kuljettajan paikalla olevan polkimen M–3 a– vulla, jonka atlaspa! nam inen, aivan kuten kuviossa saa aikaan johto– pyörän kohoit.tamisen,1a käsipyöräohjauksen kilnnlkytkemieen. Vipu 73 on nimittäin varustettu tapilla 79, johon tanko 80 on kääntyvasti kiin– nitetty. Tangon 30 toinen pää on kiinnitetty telklnha'assa 72 olevaan tappiin 31. Samaan tappiin 31 on sitäpaitsi kiinnitetty pukista 70 joh– tonsa saava tanko 32, joka köpden 33 välityksellä on yhdistetty kultna– vlvun 6,85 toiseen sakaraan 3H– ja sen kantta myöskin poikineen 47,1+8* Jos poljin painetaan alas, jousen 36 vetoa vastaan, niin vetyä köysi 33 telkinftakaa oikealle (kuv./) ja vipunivel vapautuu» Sama liike johtuu vipunivelelle vivun 73 pukatessa tank.oa SO oikealle (kuv,.7).Molemmilla tavoilla voidaan siis vjpu ja sen välityksellä jon«} 7–9 vapauttaa, niin että molemmissa tapauksissa käsi pyöräoh ja.us kiinnikytkeytyy. juuri seli– tetty 'Käsipyöräohjauksen kiin.niY.ytkennän aikaan saava vivun 73 liike, läh– tien kiskonuranpuhdlstajasta, näytetään tuvioissa 3 ja 9. Kiskon uran puhdistaja 6 on sovietu knäntyvssti tfohtopyörä* 4 akselille 7 ja on siihen lujasti kiinnitetty ylöspäin suunnattu vipu 37, joka tapin 33 vä– lityksellä on yhteydessä 39:n kohdalla (kuv.9) johdetun tangon 90 kans– sa. Tangon 90 toisessa paar,«» op nasta' 91. Vastapäätä tHS on 92,.iok–i or kiinni ontossa akselissa 93* Tämä liikkuu vaunun etummaiseen ak–?;aliir (!< laakeroidun akselin 27 ympärillä ja on sen toisessa päässä en– nen mainittu vipu 73,jonka vääntö oikealle (kuv.7)saa aikaan vipunivelen 7, i\? irttpääston,kuten yllä on selitetty. Jos uranpuhdistaja 6 kohoaa urassa olevan esteen johdosta, jofca on niin suuri, että se salni aikaan pyörän 4 kiskolta suistumisen, niin suorittaa uranpuhdistajassa oleva ¦ vipu 8/ vastaavan väännön oikealle (kuv.3). Seurauksena tästä liikkuu tanko 90 nastoineen 91 oikealle ja nasta pukkaa vipua 92.Tällöin vään– tyvät ontto akseli 93 ja siihen kiinnitetty vipu 70 oikealle, jolloin vipunlvelen 7H.75 irtaantuminen tapahtuu. Kuvioissa 10–12 esitetystä laitteesta käy selville, että ohjaus– vivun muodostavat tangot 5 päissään ovat varustetut Korvilla 9*4–,.loissa johtopyörän 4 akseli 7–on laakeroitu. Johtopyörä pyörii akselilla kuulaakerin 95 avulla. Akselin 7 päissä oleviin tappeihir 96 on nran– puhdistaja 6 kiinnitetty,1a on se muovailtu sopivalla tavalla levystä. Asetinruuvi 97» joka on kiinnitetty toisessa Korvassa 9“+ olevaan ulok– v.eeser–r 93.1a.loka on uranpuhdistajan vipua 37 vastassa, rajoittaa tä– rnan rentoa kisfcoon nähden. Puhdistaja lasketaan niin alas, että se–n kärki 99 tulee olemaan hyvin lähellä johtokiskon pohjaa. Kärjen 99 ta– kana c«n puhdistaja sitäpaitsi varus++tu ulokkeella TOO. Jos puhdistaja liukuu jonkun urassa olevan, esteen päälle, niin kohoaa se vielä enem– män ensin, kärjen 59 avulla ja sitten ulokkeen IOO avulla, ja t.smä hei– lahdus on kyllin suuri saadakseen aikaan vipunlvelen 7,75 vapauttami– sen vivun 87 välityksellä. Mutta hetikuin tämä tapahtuu »vefää jousi 39.kuten yllä on esitetty, tangon 30 takaisin, ja silloin tulee, ei ainoastaan käsipyöräohjaus klirmikytkettyä, vaan myöskin johtovipu 5 ja johtorulla 4 kohoitettua ylös. Täten tulee uranpuhdistaja kokonaan kohotettua eikä ole esteenä, Jos kuljettaja uudelleen tahtoo ohjata automobiilin takaisin uraan. vipunivel 7H–.75 ja sen läheiset osat ovat esitetyt suurennetus– sa mittasuhteessa ja eri puolilta kuvioissa 13–16, jotka tuskin kaipaa– vat lähempää reititystä. Huomautettakoon ainoastaan, että polkimen 4–8 kanssa yhteenkytketty tanko 32 uurteen 101 välityksellä on kiinni tel– kinha'asea 72, niin että ttVinha'an vivusta 78 johtuva liike voi tapah– tua ilman, että tangon 62 Ja polkimen tarvitsee seurata tämän liikkeen mukana ja että elkinhaka 72 vipuun 29 kiinnitetyn jousen 102 avulla Pysyy työasennossa. Kun kuljettaja painaa isäeivipua 31 alaspäin ja si– ten. tango n 30 välityksellä suoristaa vipunlvelen 74–,75.niin luisuu sen tappi 76 telkinha'an 1? luisua pintaa 103 pitkin ja paw– 'an.jousen 102 vaikutusta vastaan, takaisin.kunne? tppi 76 saavuttaa telkin– haan «.arjen, jonka jälkeen telkinhaka jousen 102 vaikutuksesta putoaa hakaan ja kiinnittää tapin ja vipunivel tulee tällölr klirrltettyä. Laite voidaan» kuten edellä,1o:on huomattu, kehittää edelleen i:::hf.r suuntaan, että johtopyörän hyppäyksestä johtunut automaattinen k33ipyöräolijauksen jälleen kiinnikytkentä ja uranpuhdistajan liike saa– vat aitaan moottorin sytytyksen Katkaisun. jot.*a kulje*ta.1a räjähdyk– sien äkkiä l–iiiepfa fMM varoituksen,1a jotta jarruttaminen helpot– tuisi. Mutta tietysti on laite tehiaúâ niin, että sytytys el katkea, ¦Jos ku33j.etta.1a tahallaan painamalla polfinta 48(kuv.7)kohoit.taa johto–* pyörän kiinnlkytkien kasipy3r and en.1 auksen, sillä silloinhan on kuljetta– jan käsipyörän avulla ohjattava automobiili radalta eikä moottori oaa lakata käymästä. Tätä tarkoitusta varten sovitettu laite on näytetty kuviossa 7 ja suuremmassa mittakaavassa kuvioissa 17–19* Kulmavipu 37, 38, joka Johtovivun kohol itämiseksi ja käslpyörä– ohjauksen jälleen kytkemiseksi, je Ui*n 39 avulla tulee vedettyä oikeal– le (kuv»7),kun syystä tai toisesta vipunivel 7,75 päästetään irti,on tangon JOU. välityksellä kiinnitetty kytklnosan TO* varteen 105• Kytkin– osa 106 on kääntyvästl kiinnitetty automobiilin kehyksessä olevaan akse– liin 107 ja on se laakeroitu sivuttain liikkuvasti. Johtuen jousen 108 paineesta kiinnikytkeytyy osa 106 osaan Io9» joka myöskin on –teääntyvastt sovitettu akselin 107 ympäri. K1 irtnikytkentä tapahtuu kytkinhampaitten TJO avulla. Kytkirosaan on kiinnitetty kosketinjousi 111, joka laattaa kahden eristetysti akselista asetetun toisistaan erillä olevan kosketti– men TI? ja 113 yli. Kosketin II?, on sokeakosketin, koskettimen 113 ol– lessa yhdistetty kaakelin II4 välityksellä,piirustuksessa el esitetyn käyttömoottorin Bytytysmagn?*1'"in lyhytsulkukoskettimeen.Johtopyörän ol– lessa alaslaskettuna lepää kosketinjousl 111 sokeakoskettlmella 112,jo– ten se el vaikuta moottorin sytytykseen. Jos sitävastoin johtokisxolla olevan esteen johdosta johtopyörä,4–, uranpuhdistajan 6 kohoamisen täh– den, tulee kohotettua jousen 39 avulla,niin väänt??. 37,38 t.ano–n 10U iq v.ir«n 105 väli t,vk*»11* kytkirm tqa mS«rs*yr kulman suhteessa akseliin IO/, ja koska kytkinosa 106 on hampaitten Ilo avulla kytketty osaan

'\–l august scherl, berlin, germany. Drive automobiilelhin «This invention relates to a power cars (automobiles) the control device,.1 a is its mold control device connected to the control lever, which interval * lcytkimen makes keeping with the guiding wheel or handlebars of the–road or street embedded johtokiskossa, so that the carriage of this due to tokiskon allow Guest access is guided and walk down the ra–pitkin.Taellaisen device is designed to be able to arrange suhteei tion of narrow flow lines with wheels kulkevat.Faemae orbits can be in fact be equipped with the usual margin of the street with embedded "with a smooth margin, for example, litteaerautakiekoilla. cement, asphalt, and the like on and the hereby achieved that the automobiles can travel satis–nee8ti and quickly ordinary road, without any path across the width distance thereof needs to be equipped with a special margin * If such a control device as a car equipped with the mobile device so that an vaunuShjaaja at taliansa can lift control lever ohjauskjskosta And again, count it, and so on, the wagon, the control lever in the uplifted, to be the usual way ohflata eight–wheel, so this is the advantage that the wagon In the latter case, can travel any road may be, for example, vaeietaeaekseen or go to the page or passing along such roads "that are not at issue in the lead with the rails, while the control lever is connected to the driver ceases to work because he does not have the makings of any of the auto–mobile control. When fitting such a device in the practice occurs, however, a number of difficulties and this application is intended to overcome the difficulties itama. These difficulties are eeuraavat: As is known, aut.omobiHeissae hand wheel gear–ing device so that it is running meters, more or less self–locking, so that each small road to the barrier can get your lost hegemony icul.letta.1aa an automobile steering equipment yli.Automaattisesti ojattaessa – to the combined onjausvivun passing through a lauski Ukko, el it, instead of mediation have to be a self–hold. taevs, but have the opposite to be as vastuskyvytkin – Pkslnnoen that obtained by these two opposing terms of time, so that the kaeeipyoe–ravaelitys Johtovivun pushed forward rail automatically dissociation, as well Johtovivun rises again automatically attaches the rail. Hand wheel broker can then put in an arbitrary amounts itsepidaettaevaekel without automaattlsta control device needs to ohjausvivus–kaeyttaeae.tsmaen is in operation. Another difficulty is the fact "that, niinpiankun is a matter of

setting the guide rail to public roads which other vehicles will use the, need to use a grooved rail, Jonkaattassa Idler flange rotates. However, you must always take into account the possibility that the wheel groove blockage can jump off and turn this into a hazard, because, as the above mainittjjrJohtovlvun via an automobile automatic control during the kaeslpyoeraeohjaus is removed and the driver is connected to the first, order derailment occurs, auto–mobile Cord Wheel Again, can 't get the trolley rail. Keksiraioen according to the Sitec to overcome this difficulty., Ettae.lohtopyoeraen jumped diskolta stomped olevar obstruction star, kaesipyoerakytkln Again automat–ically switches, NLIN that the driver immediately gets domination of an automobile over. According to the invention help then the driver is also ge.ettae au–tomobiileihin, By the rae.Jaehdysmoottorit use is made of such a device that automatically stops the engine ignition as soon as the amount Johtopyoe, not intended for hypppp management of the rail groove. Engine explosion–Sien abrupt termination of the driver at the time of the wake, so that he can set up an automobile s) connected to a suitable manner the hand–wheel steering. It not only affects the engine, the ignition fail, the braking automoblHiin, so that the damage will stop the nun it easier. But, of course, is lait.e so constructed that ignition does not cease silloinkun the driver intentionally Kohottaa.lohtopyoeraen.koska trolley case almost always Shipping is still included in the accompanying drawings is a v–avainnollistettu. Kuv.l itself is a plan view kaeyttoesyeteemistae which the invention kohdis'v. Figures 2–4 show the operating lever to the front carriage bearing shaft, as well as a decrease in Kohoitus And you sat in the driver's palkalta.Kaviot 5 and 6 illustrate a device that allows johtovlpua ki Inni–ed. kaeslpyoeraeohjaus is disengaged, and the vastoin.Kuviot. 7–19 VISIB 'iv'! 'S casinos wheel steering to the automatic switching Ylirju lohtopyoer and jumped Joht.okiskon's career, 1 * Figures 15–19 seemed to especially drive motor eytvt.vHvirran automatic cut–off for gauge jumped Johtokiskolta. shown in Figure 1, the kaeyttoeflvsteejnJr the street or the two–tielle.npetpttu kulfcukiskoa 2, scholars are finding the distance is equal to the automobil cut £ P3 normally used pyoeraev? phenyl between the piece and their Distribution Management 3 »jokaon formed in grooved rail. This spins the wheel 4, jc, which is mounted on an automobile control unit connected to the lever 5.Jol–lei an automobile KaesiohJauKsenta not entett.g, so will the automobile cable rail using guided fculkukiskoja 2 along with driver el silloift need to worry about control. Joa r \ y * o> \ 1ausvJpu 5 is placed in a base so that the driver can milldin any Kohoittaa it up, so that the truck can be controlled by means of kaesipyoersn, so the driver can milloir, deviate from any of the path, for example, when he wants to drive a second vehicle page, or, where is found only in a single–track road, dodge against future vaunua.Kuviossa 1 is assumed "that the track is usually set to flow to the street or highway. Naturally, the facility can also be a kind of "special track that is set off the road and can be wire–kiskona about when to use?.. Vt <? Nolkioekoa in which management wheel is rotating. Against '. Aantulo and sivuutuskohtiin should then put the special blades. As already mentioned, the £ Inrjestaeae have to, so that the driver can place ad libitum kohoittaa and calculate loMopyoeraeae And then there would be no difficulty in the hand wheel control Jtsejarrutuksesta. A by adapting to solve this task is shown in Figures 2–4, which show the first two.
