position. If the cord is connected to the lever again, "need to kuljetk–jan, but to press the lever 31 Alae, sifctenkun he first has set an automotive equivalent of a stable position. As noted above, it is arranged in such a way that when the wheel is calculated by wire or kehoitettava, takes place in the same hand pyoeraeohjaukaen Letting automatic emergency, practical, and nlkytkertae.. For this purpose, as shown in Figure 4, the lever 50 mounted on the deformable control – 49 jauspesaean The lever 50 is elongated and do groove 51 having a rod 30 attached to the pin 52 when the rod 30 liikkuu.samalla 13lkiitetaeaen jihtopyoeraen float! ttami3eksJ or lower the lever 50 also rotates What follows here is laeherwuin shown in Figures 5 and 6 Control Valve body 49 is mounted on the steering shaft 53 *. In another Paananen is attached to the steering lever 54. | 'Thorn in the usual way has been yhdie axis of the tibia, ni I n the autornohi ili will be guided leuten usually screw: –. 55 allows the rod iota.. 56.1 via a Kslpyoeraen can – c3aan vaeaentaeae.la October is connected to the K1 eruKKapyoeraen 57 Kanssa.Taemae fcleruk–kapyoerae 5 / Off is not ohjausakseliasa 53.vaan it can be kiinnl and ir tikytkeae post 50 avulla.Pierukkapyoerae 57 is provided with a certain distance – rate of the steering shaft 53 around the wide ring 53. Oct is provided with internal teeth 59.jotka may have a second kosketufcsiin »ohjausalcselilla to 53, siirrelt.pvaen, but not Translating R3N t Vy * § ~ 61 Kinorn Dental tattooed "ring 60 around the coupling part Kanssa.Taemaen vair affect jouel 62, which receives the SAN kosketukseer teeth of the worm wheel 59 kanssa.1a try to keep it in the asennossa.Ky> 1 Nosa 61 can be moved However, fcftae back pressure, so that It dissociation herein Kosketuksesta.Taemae of the steering shaft 53 around the pin ft–tyvaestl not olerarvfjj, the ring 64 of the protuberance 63 avulla.Renkaan.la SNC–64–f 61 klnosan hedgehog found in another of the control shaft 53 arranged around the lolllnra ring 66 having a groove 6 (49 screwed into the pin housing 63 moves, then ETTI The ring 66 can be moved, but eil to translate. If the lever 50 is turned to the rod 30 by means of. Oct to convey roller 24 3I movement of the hand lever (kuv.4), so as to influence the protuberance 63 faces the kololliseen ring in such a way that it pushes the sitae.pes? ARJ direction (to the right paln) 5 kuvlossa. vulkanisoi.ui ring 66 to affect the fibers of the intermediate plate or the like manufactured by means of the switch 69.1 61 with the teeth 60 a contact with the helical wheel 57 hampaitten.59 ceases. The steering gear handwheel in yhfll st *,? screw 5c Come come off when the contact ohjausakseiir. Vanssa **, 1a control device is. n3 inrrvofloln disengaged, already? y * lever 50 is moved in the opposite direction to release the ring 66, Ia switch is set to its former position 60,59 of the spring 62 is then vaikutuksesta.Laite such ett? "followed by disconnection of the rod moves to the left (kuv.4) and the guide wheel 4 – settles service nections in and Off Switch seuraa.kuu rod idler 30 kohoitta–T3i3? KSI to the right. It is therefore achieved what haluttiin.ninlir tala, take for gauge is down to calculate t \ 'r? kaeslpyoeraeoujaos gi * off–on, and as soon as you already} * kohelletaan pulleys, kiinnifcy interrupted taesipyoerae control auto hi i? eoti. R? Hsn up–explained practice sovlttamis device H is an extract from the>.,. * U consider the fact that the use of grooved rail johtokiskona wire wheel from time to time you can jump off "because the groove is easily clogged. This is prevented as far as possible by placing uranpuhdistaja. But it may happen that this uranpuhdistaja ei.lakea to keep track clean so it does not go out, have SAE, of course, to put a mobile? v so that it can dodge those obstacles "that it can not be removed, 1a eyes cause I created an obstacle to the idler career derailment. If this happens, the car will have a mobile in danger, because, as explained above, the hand wheel control in the blink of an eye is disconnected or the driver not the car for mobile power. Job tarkaavainen.niin he is, he can not, of course, immediately turn kaesipyoeraeonjauksen, but need to be taken into account that the driver after having driven for a longer period of automatic control becomes more and more dangerous and does not notice tarkaamattomammaksl sllmaenraepysae. Hence the practice of this invention the following be agreed to live according to mi–arranged so that uranpuhdistajaen stumbleth the emerging–and pyoryn jumped urakiskolt.a place the hand wheel control automatic V_1 inrlkytkents.Taehaen purpose, use of the oscillations that occur when the urarpuMistaja encounters an obstacle that it can not be removed. construct which causes a change in the above–described device management control device for controlling the wheel, is illustrated in Figures 7–16 »Instead of the rod 30 Lock spring 39 is placed bets against the angle lever 42 by means of telkinha'an 37.33 (kuv.4), the lever 29 is fitted, by means of which, the rod 30 is moved, the lever 26 rises and falls. For this purpose the front axle 3 is fixed to the bracket / o / FIG.? /, In whom pivoting around a pin 71 telkinhaka sovitettu.Sitaepaitsi 72 has a pedestal 70 has a pin 73 around the swivel rod 74 – which forms the rod 75 rotating around the pin 76 vipunlvelen. rod 75 at one end of the lever 29 rotating around pin 77. Telkinha 'is now an aim of locking rod 30. If the seimittaein locks vipunlvelen 74.75 keskustapin 76, so will the lever 29 and with aa rod 30 shown in Figure 7 the position shown, wherein, the spring 39 against tension lever 26 is down and consequently the wire wheel of the rail urasBa and as a result the lever 50 position onjauspesaessae is knsipyoraeohjaus 3rtiky £ ketyksi. If, on the other hand, telkinhaka 72 is pulled back (to the right in Figure 7), the release kesKustappl vlpunivel and 76 turns, so that the rod 30 can keep track of bets spring 39 and de–energizes the idler K.1a. attached to the hand wheel steering pouring lever 50 Telkinha / an? 2 tapptnsa TI occurring around the lock, 1a irroittanilBeen the necessary business can be done in two ways, namely, in>. kJekonpuhdistaejasta No – Which will be explained later in more detail – the lever 73 through the or also in the driver's seat of the pedal M–3–a on page which atlaspa! nam for, just as in Fig causes the wire wheel kohoit.tamisen, 1a hand wheel control kilnnlkytkemieen. Namely, the lever 73 is provided with a pin 79, to which rod 80 is pivotally attached. Rod 30 is attached to the other end of the pin 72 telklnha'assa 31, the same pin 31 is not only attached to the trestle 70 due to Tonsa receiving the rod 32, which koepden 33 is connected via vlvun 6.85 kultna–3H–the one end of the cover and also its sons 47.1 8 * If the pedal is pressed down, the spring 36 against tension, the rope hydrogen telkinftakaa 33 to the right (FIG. /) and PTO lever is released », the same movement of the lever 73 is caused vipunivelelle pukatessa tank.oa SO right (Fig,.7). Both methods can therefore be vjpu much, and thus the «} 7–9 released, so that in both cases, the hand pyoeraeoh ja.us kiinnikytkeytyy. just explained for "Hand wheel steering kiin.niY.ytkennaen the actuating movement of the lever 73, starting from kiskonuranpuhdlstajasta, displaying tuvioissa 3 and 9 of the rail groove cleaner 6 is sovietu knaentyvssti tfohtopyoerae * 7 and the shaft 4 is firmly attached to the upwardly directed lever 37, at which the pin 33 is in communication with explanations for 39 o'clock position (kuv.9) of secondary shaft 90 with the same. The second shaft 90 Paar, «» cr spike '91 is opposite the tHS 92. Iok or closed–in hollow shaft 93 * This moves the carriage to the front activity?; Aliir (! <rotatably mounted around the shaft 27 and has its other end i – ing

said lever 73, a torsion right set (fig. 7) causes the lever pivot 7 i \? irttpaeaeston, as described above. uranpuhdistaja if the groove 6 increases due to an obstacle, jofca is so large that it salni of wheel 4 on the rail derailment, then perform the uranpuhdistajassa | lever 8 / torque corresponding to the right (kuv.3). as a result, the rod 90 moves to the right and nastoineen 91 pin fest lever clockwise 92.taelloein–ment hollow shaft 93 and attached to the lever 70 to the right to vipunlvelen 7h.75 separation occurs. of the device shown in Figures 10 to 12 it is apparent that the control lever bars and rods 5 are at their ends provided with lugs 9 * 4 –,. States four idler shaft 7 is journalled. Management Wheel rotates on the shaft 95 by means of a ball marker. The shaft 7 at the ends of the tappeihir nran 96 is attached to the 6–cleaner, 1a is molded in a suitable plate. The interlocking screw 97 "which is attached at one ear 9" v.eeser the protrusion r 93.1a.loka uranpuhdistajan lever 37 is up against a restriction of the relaxed–rnan kisfcoon other. Cleaners lowered until it's tip–99 is going to be very close to the bottom of the guide rail. The tip of the 99–channel c «The cleaner it is not only equipped with a projection tu TOO. If the cleaner slides in a groove in the barrier function so that it rises yet more first group of tip 59 and then through the projection IOO, and hi–t.smae lahdus is large enough to bring about 7.75 vipunlvelen release of the lever 87 via the. But as soon as this occurs »vefaeae spring 39.kuten above, the rod 30 back, and then it becomes not only klirmikytkettyae steering hand wheel, lever, but also lead wire 5 and the uplifted up roller 4. Thus, it becomes uranpuhdistaja completely elevated and there is no obstacle, if the driver wants to re–steer the car back into the groove of the mobile. 7H–lever joint.75 and nearby parts are shown on an enlarged right proportion and in different parts of the Figures 13–16, which needs little closer to the VAT–routing. It is noted only that the pedal 4–8 interconnected with the rod 101 through the groove 32 is closed tel–kinha'asea 72 so that the lever 78 ttVinha'an resulting from the movement may take place without the rod 62 and the pedal needs to follow this movement is involved, and elkinhaka 72 of the lever 29 attached to the spring 102 through Remains in the working position. When the driver presses down on the isaeeivipua 31 and thus. Tango 30 through to straighten vipunlvelen 74 –, 75.niin slipping the pin 76 telkinha'an 1? slip along the surface 103 and the paw–'an.jousen 102 against the action of takaisin.kunne? 76 TPPI achieve telkin–hook '. everyday life, after which telkinhaka the influence of the spring 102 and the hook falls to secure the pin and the lever will pivot taelloelr klirrltettyae. The device can be "as above, 1o: it has been observed to further develop the i::: hf.r direction that the leadership of the wheel due to the jump in auto k33ipyoeraeolijauksen again closed the connection and uranpuhdistajan business are given the ignition of the engine cut–off fence. jot. * a * transport ta.1a explosion suddenly Sien–l–iiiepfa FMM warning, 1a braking in order to facilitate the reset. But, of course, is a device tehiaua so that the ignition el break, | If ku33j.etta.1a deliberately pressing POLFIN 48 set (fig. 7) kohoit.taa management * wheel kiinnlkytkien kasipy3r and en.1 auksen, for then is the driver's hand wheel using controlled car mobile race and the engine quit attending dec.. adapted for this purpose, the device shown in Figure 7 and on a larger scale in Figures 17–19 * The angle lever 37, 38 which Johtovivun kohol germination and kaeslpyoerae control to turn again, Ui * s through 39 will be pulled to the right (in FIG » 7) where for one reason or another 7.75 pivot lever is released, the rod DEC. through the attached kytklnosan TO * 105 • The coupling arm portion 106 is attached to an automobile kaeaentyvaestl frame of the shaft 107 and is mounted on movable sideways. Due to the pressure of the spring 108 parts kiinnikytkeytyy portion 106 Io9 ", which is also teaaentyvastt arranged around the axis 107. K1 irtnikytkentae takes place by means of kytkinhampaitten TJO. Kytkirosaan is attached to the contact spring 111 on the plate two insulated from the shaft set apart portions of the contact against the TI? and more than 113. Contact II?, It is sokeakosketin, the contact 113 being connected to the tile II4 through the drawing el the drive motor Bytytysmagn? * 1 "'in the lyhytsulkukoskettimeen.Johtopyoeraen being lowered resting kosketinjousl 111 sokeakoskettlmella 112, already as it el affect the engine ignition. If, on the other hand, johtokisxolla an obstacle due to wire wheel, 4 –, 6 uranpuhdistajan increase in the residues, it is elevated by means of the spring 39, the torsion spring; cyli?. 37.38 t.ano–10U v.ir IQ 's intermediate 105, wk * »11 * kytkirm TQA mS« rs * yr angle relative to the axis of the IO /, and because of the coupling teeth 106 is connected to a part of the joy of using the 109 * Turns as this one, and kjtklnjousi 111 moves the keyboard, blind–112–Vopkt ttimelle 113 * Thus closes the engine ignition candle passing the magnetic current, n | »I t? f in the rotor in contact therewith to the vehicle frame and the contact II3 composite conductor 114 through the motor sytytyskynt.tllaet are, therefore, no power and r.oottorl battens from attending. Abstract:
Source: US2006055077A The invention relates to an extrusion method and to an extrudable metal polymer composite having increased density, improved viscoelastic properties, malleability and ductility and thermoplastic extrusion or injection molding properties.

Abstract:
Source: GB875127A 875,127. Driving railed vehicles. F.N.R.D. Ltd. Sept. 23, 1957 [Sept. 24, 1956; Aug. 9, 1957], Nos. 29153/56 and 25259/57. Class 104 (2). [Also in Groups XXI, XXIX and XXXII] In an earth boring rig pipe sections are removed from or supplied to the drill string by hangers 100 running on a railway 10. The railway comprises an endless rail 107 having a removable section 116 forming part of a batcher 12, adjustable stops being provided for the rail at either end of the section 116. A number of hangers in excess of those loaded is carried by the railway, each hanger having a support arm 105 with roller 106, and a spring–loaded, projection 108 which is engaged by a conveyer chain 110 co–extensive with the rail. As each pipe section is removed from the string the spinning–off mechanism 44 swings the section so that its upper end enters a hanger and is held therein by catches 101. The loaded hanger is moved to the section 116 by the chain, the stop at the discharge end of the section 116 being operative. When the batcher is full the other stop becomes operative, and the section 116 together with the batch of loaded hangers is lowered by a cable 117. The lower end of the pipe sections are received in a trolley 6 running on rails 121. The trolley carries pipe separators 127 and has racks 123 engaged by pinions 124 mounted on the rig frame. If the trolley is loaded as shown in Fig. 12, the lower ends of the batch of pipe sections passes between separators 127^{A}, 127B. As the pipe sections engage the bottom of the trolley, cams 130 are lowered to move the separator 127^{A} into contact with the batch of pipe sections suspended from the hangers. The hangers are released from the batch of pipe sections by pressing rods 103, the batch of hangers is raised, and the cams move upwardly to move the separators 127^{A}, 127^{B} and the batch of pipe sections to the right to rest against the previously stacked pipe sections. During this movement a rack 132 on the cam moves a ratchet wheel 122 driving the pinions to move the trolley into position to receive a further batch of pipe sections. The section 116 is returned to the rail 107, the stops at the ends of the batcher are released, the empty hangers are removed from the batcher by the chain, and the stop at the discharge end of the batcher is operated so that the

batcher is ready for the next batch of loaded hangers. When used for supplying pipe sections to the string, the ratchet on the wheel 122 is reversed and means over the string are provided for the operation of the rods 103.

Abstract:
Source: US2004154715A The invention concerns a method whereby when the tyre reaches a wear threshold level, acoustic wear indicators emit a sound signal by coming into contact with the ground. Magnetic, optical and mechanical embodiments are also disclosed. A detector consisting of a microphone placed beneath the vehicle and a processing unit switches on an indicator placed in the instrument panel. In a more sophisticated version, the detector by matching the acoustic signal phase with the ABS data, identifies the tyre concerned. The invention is useful for detecting tyre deterioration, or that of any, other type of surface such as pads, and the like, and for detecting the presence of snow chains or nails.

Abstract:
Source: US2005186893A A fully automated apparatus and system for processing shellfish such as shrimp and crawfish including the cooking, drying and peeling thereof. The present invention utilizes excessive heat

generated by boilers and the like to heat the dryers. The product is cooked in a brine mix that once used is transferred to a broth processing system to make a seafood flavored broth and is also injected as a fine mist into a furnace where is crystallizes into a solid product to be used as a seafood flavored salt.

Abstract:
The invention concerns a set of devices of a dwelling module for meeting emergency and extreme emergency requirements for coping with submarine quakes, standard earthquakes, floods and a plurality of natural disasters. Said set consists of several subassemblies, namely a dwelling module and other elements such as a foot, a heel, a leg, an emergency anti–seismic air lock, an extensible telescopic air lock, a protective shield, a horizontal wind turbine and the like.

Abstract:
Source: US4228838A The invention relates to an anti−skid device for vehicle wheels for travelling on ice and snow with a disc−like casing connected to the wheel rim with resilient−elastic anti−skid arms, constructed in such a way that in the position of use their ends can be swung out radially into the tire tread area while adapting to the rolling shapes of the tire and can be swung in when not in use, so that a device is obtained which can effortlessly be fitted whenever required, which is inexpensive to manufacture and which permits higher speeds than are possible when travelling with snow chains or spiked tires.

Abstract:
The method involves feeding a current portion into measuring impedance/admittance of a circuit as a power source to reduce ideal conductive value of the impedance/admittance in proportion to ohmic loss of the impedance. The current portion is fed as a current drain in the impedance/admittance to increase the value. The value refers to a circuit inductivity or capacitance and to transformed impedance or admittance. Independent claims are also included for the following: (1) a method for coding measurement values; (2) an arrangement for measuring ohmic loss in impedance or admittance circuit; (3) a method for semi–automatic or fully automatic transport as well as for evaluation and addressing of goods; and (4) a shopping trolley for executing a method for semi–automatic or fully automatic transport as well as for evaluation and addressing of goods.

Abstract:
Source: US5197008A A motor vehicle output power control system quickly reduces the drive torque produced by an engine on a motor vehicle depending on the magnitude of a lateral acceleration which is produced when the motor vehicle makes a turn, or the amount by which drive wheels slips when the motor vehicle is accelerated. A target drive torque depending on the lateral acceleration and a demanded drive torque demanded by the driver of the motor vehicle are added at a predetermined ratio into a turn target drive torque, which is selected as a final target drive torque. The motor vehicle output power control system includes an electronic control unit for controlling an actuator to lower the output drive torque of the engine, independent from controlling action of the driver, such that the output drive torque of the engine is equalized to the final target drive torque.

Abstract:
High–powered powertrain of an electric car for boosting a motor output so as to operate a large–capacity generator and to drive car wheels comprises: traction pulleys (11, 11') and drive members (28, 28') of clutches (27, 27') mounted free on motor axles (10, 10') with first pulleys (11, 11') keyed to the axles and traction rods (13, 13') coupled from pulley hubs (12, 12') to other pulley rims (15, 15') for serving as levers in series to boost motor output; traction pulleys (11) and driven members (34) of clutch (27) mounted free on generator axle (43') with first pulley (19) keyed to axle (43') and traction rods (13) coupled to next pulley rims (15), with drive member (28), for operating clutch (27) easily and increasing the boosted output to rotate generator axle (43'); driven member (34') of clutch (27') keyed to drive propeller shaft (48), with drive member (28'), for operating clutch (27') easily in sending the boosted output to drive wheels.

Abstract:
Source: US2002149188A A vehicle anti–tire–slide onboard road gripping media dispensing safety system that dispenses road gripping media (such as salt, sand, and any other solid, liquid, or gaseous media which allows tires to grip the road during slippery road conditions (such as ice, snow, rain, mud, etc...). The vehicle anti–tire–slide onboard road gripping media dispensing safety system provides a safer, faster, more controlled deceleration of a vehicle when braking during slippery road conditions. It reduces potential accidents, reduces deaths, reduces insurance claims/rates, reduces salt truck expenses for cities and makes a driver feel safer when riding on slippery roads. It increases tire traction, allows for increased acceleration when taking off from a stand still, and it allows the driver to have more control on slippery roads at higher speeds. It allows a vehicle to become unstuck in snow, mud, on rainy, on icy ground and during other bad weather conditions. It also allows the driver behind you to stop safer and quicker due to releasing media from the rear of your vehicle. The vehicle safety anti–tire–slide onboard road gripping media dispensing safety system main parts generally comprise of a cover (10), container (60), and release mechanism (190), nozzle (400), road gripping media (450), trigger/selector switch (490), media low level display (500), media low level sensor (510), car movement sensor (520), wheel rotation sensor (530), heating element (540), connector (550), cable/wire (560), and controller/computer (570).

Abstract:
Source: GB958738A 958,738. Ratchet gear; securing gearwheels on shafts. CINCINNATI MILLING MACHINE CO. Nov. 13, 1962 [March 29, 1962], No. 42825/62. Headings F2Q and F2U. [Also in Division B3] In a grinding machine (see Division B3) a shaft 67 is rotatable in bearings located in a bushing fixed in a portion 48. An overrunning sprag–type clutch engages with a clutch bushing 72 keyed to the shaft 67. The clutch comprises a casing 73 rotatable relative to the portion 48 a limited amount. Inside the casing is a cylindrical sprag pin 74 held in close proximity with the bushing 72 by an adjustable plunger 75. The sprag pin 74 is held in simultaneous contact with the face of the plunger 75 and the bushing 72 by a spring–loaded plunger 76 urging the sprag pin 74 toward a fixed pin 77 attached to a bracket 78 secured to the portion 48. The longitudinal axis of the plunger 75 is slightly offset from the centre of the shaft 67 so that the space between the bushing 72 and plunger 75 is wedge shaped. When the casing 73 is rotated clockwise the sprag pin 74 is wedged and rotates the shaft 67, the amount of clockwise rotation being limited by the clearance between the pin 77 and the end of the cavity in the casing 73. When the casing 73 is rotated counterclockwise, the sprag pin 74 is released and is caused by the spring–loaded plunger 76 to follow back round the bushing 72 until it engages the fixed pin 77 which causes the plunger 76 to shift slightly and allow the pin 74 to stop slightly before the casing 73 is stopped. This moves the sprag pin 74 out of simultaneous contact with the plunger 75 and the bushing 72, so that the bushing 72 and shaft 67 may be freely rotated in either direction. Thus a slight relative rotation between the bushing 72 and casing 73 is required to move the clutch from a released position to an engaging position, the amount of movement being varied by adjusting the plunger 75. A spring 81 in compression between the portion 48 and the casing 73 urges the latter counterclockwise to the released position. A shaft 98 has a flat–sided end 98a loosely received in a sleeve 99 rotatably mounted by bearings in a depending yoke 48a. A gear 102 is integral with the sleeve 99. A roller collar 107 fixed to the end of the sleeve 99 has axles 109, 110, 111. A double ball bearing roller 112 rotatable on journal diameter 109a of axle 109 engages the flat surface of the shaft 98, and single ball bearing rollers 113, 114 rotatable on journal diameters 110a, 111a of the axles 110, 111 engage the cylindrical surface of the shaft 98. The journal diameters 109a, 110a, 111a are round but eccentric to the longitudinal axes of the axles. Rotation of the axles, which are releasably held in the collar by set screws, preloads the rollers 112.

Abstract:
Source: US2004021437A An adaptive architecture for electric motors, generators and other electric machines. An adaptive electric machine provides optimal performance by dynamically adapting its controls to changes in user inputs, machine operating conditions and machine operating parameters. Isolating the machine's electromagnetic circuits allows effective control of more independent machine parameters, enabling greater freedom to optimize and providing adaptive motors and generators that are cheaper, smaller, lighter, more powerful, and more efficient than conventional designs. An electric vehicle with in−wheel adaptive motors enables delivery of higher power with lower unsprung mass, giving better torque−density. The motor control system can adapt to the vehicle's operating conditions, including starting, accelerating, turning, braking, and cruising at high speeds, thereby consistently providing higher efficiency. A wind powered adaptive generator can adapt to changing wind conditions, consistently providing optimal performance. An adaptive architecture may improve performance in a wide variety of electric machine applications, particularly those requiring optimal efficiency over a range of operating conditions.

Abstract:
Source: US2007175951A A powered surgical cutting and fastening instrument includes a drive shaft; a motor; and a gear shifting assembly connected to the drive shaft and the motor. The gear shifting assembly may include at least a first stage gear assembly coupled to the motor and to the drive shaft for operating the gear shifting assembly in a first gear setting; and a gear coupling assembly for selectively coupling at least one additional gear to the drive shaft for operating the gear shifting assembly in a second gear setting.

Abstract:
Source: US2003231485A A tubular Electro−Luminescent panel(s) light device offer a desired bending directions with super brightness basing on certain width of panel incorporated proper invertor system. The said panel(s) with much narrow width than tube means to allow the panel(s) can be bend at any direction and angle within the tube means to offer a desired light effects. The said panel(s) can be flat or twisted within the tube means which may have the desired colored, transparency, wall thickness, diameter, shape, length for requirement. The said device may incorporated with non−elastic means, magnetic means, tube holder, sensor means, Integrated circuit to add a lot of desired variety features.

Abstract:
Source: US3117642A ‘Nhat is claimed is: 1, An auiomatic steering device for right or left–hgnd parking of dirigibic vehides comprising in combination, vehiclwdriven forward~trave1 measuring means adapted to be set in operation by the operator for Iefi CT figllt' hand parking at a prescribed vehicle position' relatiye to a pariccd vehicle for measuring a predetermmcd disumce the nmoving vehicle must move forward parallel to ihs parked vehicle in accordance with a prescribed par]–l~ ing csursc before the moving vehicle is intended ic 'be stopped and shifted imc reversc for reverse~tr;\vel parking movement along said course; impulse–generating pilot means rcsponsive to reverse–travel parking movements of the vehicle for generating position–prescribing impulses operative to cient a predetermined steering–wheel positicn for each geographical position of the vehicle in its reverse–travel parking movements, said pilot means comprising vehicie~driVen programming means positionaizle in response to said parking movements for programming ihe generation of said position–prescribing impulses in accordance with said prescribed parking csurse, and posi~ tion–sensing means responsive to the position of bcih said course–programming means and steering wheels for generating said position–prescribing impulses in accordance with said pzrking course and for interrupting said impulse at each said predetermined steering wheel posi_lt; tion, 'whereby thc steering Wheels may be caused to be turned by said impulsés, until their position is in balance with flue: posiiion of said course–programming means at which point said impulses stop and steering–wheel movement ceases, said balance being only momentary since as the position of said programming moans is :hanged by the steady movement of thc vehicle, said positicnsensing means is continuously sending impulses tending to restore a balance between the steeringwheel position and programming mcans position thereby to cause the steering wheels to follow automatically the parking movement prescribed by said programming means; and, steering–:nechanism operating means rcsponsivc to the positionprescribing impulses of said position–sensing means for causing the steering mechanism to position the steering Wheels in compliance with The prescribed impulses, said posidonabic programming means comprising vehicledriven rotary–drive means including a normally stationary rclary driven–member and a rotary drive–member fer driving said driven–member, said drive–member being normally out of driving engagement with said driverrmember, and means actuated by said forward–travel measuring means for effecting driving engagement of said drive member wiih said driven–member at the termination of said forward–travel movement, and said forward–travel measuring means comprising rotary electric switching msans adapicd to be rotated by said rotary drive–means durizg said forward–travel movement, for actuating said driving–engagement means at thc terminadon of said forwarcbiravcl movement, said forv/ard~trave1 measuring moans also comprising operator–confroiled means for initi~ ally placing, and temporarily holding, said rotary electric switching means in driving engagement Wifli said rotary drive–means. 2. An automatic steering device in accordance with claim 1 in which said normally stationary rotary–driven member includes a vehicle–driven cam means providing a cam pro§1e determining said parking course. 3. An automatic steering device in accordance withclaim 1in which said normally stationary rotary–driven

member includes a vehicle–driven electric rotary–switchpotentiometer ‘device having a position–voltage profile that determines said parking course. 4. An automatic steering device in accordance with claim 1 in which said normally stationary rotary–driven member includes a vehicle–driven cam means providing a cam profile determining said parking course and in which said position–sensing means comprises hydraulic– ‘/alve means, said hydraulic–valve means including reciprocably mounted valve–body means constituting a camfollower actuated by said cam means, and valve–stem means responsive to the position of the steering wheels. 5. An automatic steering device in accordance with claim 4 in which said position–sensing means also includes link means, said link means coupling said valvestem means with said steering–mechanism for countering movement of said valve–body means by said cam means. 6. An automatic steering device in accordance with claim 5 and in which said steering–mechanism operating means comprises a double–acting spring–balanced hydraulic ram actuated by hydraulic impulses from said hydraulic valve means and means for linking said ram to said steering wheels to position the steering wheels in accordance with prescribed impulses. 7. An automatic steering device in accordance withclaim 1in which said normally stationary rotary–driven member mcludcs :L vehicle–driven cam means providing a cam prohle determining said parking course, and in which said position–sensing means comprises electricswitch means having a reciprocably mounted switch–merrv ber constituting a cam–follower adapted to be actuated by said cam means, and a separate reciprocably mounted switch–mernher responsive to the position of the steering wheels. 8. An automatic steering device in accordance with claim 7 in which said position–sensing means also comprises link means coupling said separate switch–member with said steeringmcchanism for countering movement of said cam–follower switch–member by said cam means. 9. An automatic steering device in accordance withclaim 1in which said normally stationary rotary–driven member includes a veliicle~driven electric rotarycvvitchpotentiometer device having a position–voltage profile determining said parking course, in \vh.icl'1 said position–sons ing means comprises magnetically–actuated, steering wheel~ reversing electric–switch means, a separate potentiometer device responsive to the position of the steering wheels, and a pair of independently energized solenoid means for magnetically actuating said steering wheel reversing electric–sv/itcii means, one of said solenoid means being actuated through said electric–rotary–switch–potentiometer device and the other through said separate potentiometer device, and in which said steering meclianism–operating means comprises electric motor means and a solenoidactuated reversible driving means powered by said electric motor means and controlled by said steering wheel reversing electric–switch means, said separate potentiometer device and said rotary switclnpotentiorneter device being positionable to eiiect a condition of magnetic balance of said pair of independently energized solenoid means and electrical balance of no current How in said reversing electric–switch means. 10, /an automatic steering device in accordance with claim 9 in which said reversing electric–switch device comprises a spring–balanced, centrally–pivoted magnetic switching armature having a position of magnetic force balance between said pair of actuating solenoid means in which the circuits its switches control are open, said position corresponding to the electrical balance position of no eurrent iow in said reversing electric–switch means as established by said rotary–switch–potentiorneter device and said separate potentiometer device, do ll. An automatic parking device in accordance with claim 1 in which said position–sensing means comprises separate, independently movable, mutually co~acti.ng valving members having a zero impulse–sending position relative to each other in which said steering–mechanism operating means is maintained hy the valving members in a condition of rest, one of said members being dispinceable by said programming means, and in which said position–sensing means also includes means responsive to displacement of said steering wheels for elfecting displacement of the other one of said members. 12. An automatic parking device in accordance with claim 1 in which said position–sensing means comprises separate, independently movable, mutually co–acting electric switching members having a zero impulse–sending position relative to each other in which said steeringmechanism operating means is maintained by the electric switching members in a condition of rest, one of smd members being displaceable by said programming means, and in which said position–sensing means also includes means responsive to displacement of said steering wheels for effecting displacement of the other one oi' said members. l3. An automatic steering device in accordance withclaim 1in which said steering–mechanism operating means comprises electrically powered driving means and reversing clutch means for coupling said electricalb/–powered driving means to the steering–mechanism, said clutch means being controlled by impulses generated by said position–sensing means to position the steering wheels in accordance with the prescribed impulses. 14. An automatic steering device in accordance withclaim 1including a hrst solenoid–operated means for actuating said driving engagement means when said vehicle has moved forward said predetermined distance from said prescribed vehicle position, the solenoid circuit of said solenoid–operated means being normally open, ond in which said rotary electric switching means is rotated by said rotary drive–means during said forward–travel movement, from a starting position in which the solenoid circuit of said solenoid–operated actuating means is “open,” to a nnishing position in which said circuit is "closed,” for automatically closing the solenoid circuit of said solenoid–operated actuating means on reaching said finishing position, a second solenoid–operated means for initially placing and temporarily holding said rotary switching means in driving engagement with said rotary drive means in the starting position of said rotary switching mems, and operator controlled switching means for closing the solenoid circuit of said rotary switching means at will. 15. An automatic steering device in accordance with claim lrl– in which said operator–controlled switching means for closing the solenoid circuit of said rotary eicotric switching means comprises a depressible daslrboardniounted parking button, and in which said rotary driving–rnember is of a sirigle–tlirectional design effecting driving engagement of said rotary driven–member only during the vehicle reverse travel, whereby the steering device cannot function in the event of accidental or rnal–opcration in which the dash–board–mounted parking button is inanualiy depressed while the vehicle is traveling with no intention by the operator for automatic parking. 16. An automatic parking device in accordance with claim 14 in which said rotary drive means further includes a friction clutch designed to slip when the torque it transmits exceeds a predetermined value. 17. An automatic steering device for right or lofthand parking of dirigible vehicles comprising in combination, vehicle–driven fcrivarddravel measuring means adapted to be set in operation by the operator for left or right–hand parking at a prescribed vehicle position relative to a parked vehicle for measuring a predetermined distance the moving vehicle must move forward parallel to the parked vehicle in accordance with a

prescribed parking course before the moving vehicle is intended to be stopped and shifted into reverse for reverse−travel parking movement along said course; impulse−generating pilot means responsive to parking movements of the vehicle for generating position−prescribing impulses operative to eifecr a predetermined steering−wheel position for each geographical position of the vehicle in its parking movements, said pilot means comprising vehicle−driven programming means positionable in rcsponse to said parking movements for programming the generation of said position−prescribing impulses in accordance with said prescribed parking course, and position−sensing means responsive to the position of both said course−programming means and steering »v/heels for generating said positionprescribing impulses in accordance with said parking course and for interrupting said impulses at each said predetermined steering wheel position, whereby thc steering wheels may be caused to be turned by said irnpulses, until their position is in baiance with the position of said course−programming means at which point said impulses stop and steering−uvhoel movement ceases, said balance being only momentary since as the position of said programming mearzs is changed by the steady movement of the vehicle, said position−sensing means is continuously sending impulses tending to restore−a baiance between the steering−wheel position and programming means posi− tion thereby to cause the steering wheels to follow automatically xhe parking movement prescribed by said programming means; and, steeringmechanism operating means responsive to the position−prescribing impulses of said position−sensing means for causing the steering mechanism to position the steering wheels in compliance with the prescribed impulses, said programming means comprising a vehiclefciriven electric−rotary−switch−potentiometer device having n position−voltage proile determining said parking course, and said position−sensing means comprising magneticallyactuated steering wheel reversing electric−switch means, a separate potentiometer device responsive to thc position of the steering wheels, and a pair of independently energized solenoid means for magnetically actuating said electric−switch means, one of said solenoid means being actuated through said vehicle−driven electric rotary−switch−potentiometer device and the other through said separate potentiometer de'/ice.

Abstract:
Source: US1865014A 1. It hasbeen mentioned already that a pull wiLl_be exerted from the right upon rope 10§as will he shown later, and as this pull isrelatively strong it is evident that the pincer–like part 5 is bein ulled also to the right, but as pivot 7 hold? it, it means therefore also a hol ing of the plug 6. The 'so far described construction is made so that an occasional shock of the vehicle, such that happens when the vehicle moves with '6i1e or several of its wheels over a stone, or when it sinks into a hole in the road, etc., will not cause the moving of the pincer–like part 5 around its pivot 7 and therefore plu 6 will not be released. In this instance, sprglg 19. acts as a shock absorber and when a heavy shock takes place bars 1 and and associated garts therewith, such as rod 2, guide B, an part 4, will be moved somewhat around the pivot –ta without bringing the pincer–like part 5 out of its po ition in which it holds the plug 6, It is, however, diderent when bar 1 wil be pushed to the right say, by a person that is being struck thereby, or when somebody grasps t e har 1 or 15 ecans in the first instance of “pushing” ,bar 1, the guide 3 moves to the ri ht w ereby the left end of the guide pushes against part 4 which in turn exerts that pressure upon the pivot ic, thus bringing forcibly the rgncer–like part 5 out of its' normal position y moving the left end downward,'as indicated by the dotted lines in Figure 5, where– _bly the ri ht end of part 5 moves up and t ereby releases the plug 6 which then yields to the pull exerted upon it by rope 10. A similar function takes iplace when the bar 1 or 15 will he grasped ecause a push is exerted thereupon both from above and from the left and the spring 12 will be bent downwardly ancl will take an approximate position, as indicated IE 12' ésee also Figure 5). The downwardtgu 'ng o bar 1 or bar 5 acts directly upon e pivot 4a whereb part comes also out of its position in whicliit holds the plug 6 and it is therefore not necessary that the guide 3 moves so far to the right that ‘part 4 is touched by the left end thereof. In this case the pf–(essure upon pivot eta is exerted directly m above. _i The rope or chain or wire 10 is fastened by its other end to a device 16 that is held by rope 10 in a suspended position. This device 16, which is shown in igures 1 and 2 ' consists of two wooden or metallic curved bars or shanks 17 and 18 that are linked together or suitably held together at 19. They are supported near the point 19 by han rs 20, but they are not fastened to them. ii their extension towards the front of the vehicle they are so formed that they are separated more from each other in the parts that are situated in front of the front wheels of the vehicle. At this point theyunake a. large bow' so that the front wheels 21, 22 will not be hampered in making their movements ,when they are steered. The front ends of shanks 17 and 18 reach points that lie further outward than the vertical plane of the respective front wheels and those points may he even further outward than the vertical plane of the rear wheels a it will he the case wlttih a\;t‘E\krnol;11lesk¢;r1nz1oto‘1it;:‘é1filx?d 'glue iront enso e an an o eower corners of the blanket 23 that is stretched out by 1ts lower edge between them. The upger partof this blanket might be rolled up, ut it is preferable that it is only folded (lied) gp ln such manner that it will be unfolded in e most rapid manner when a collision, as aforesaid, occurs. The upper end of the blanket 2B_that may have a rectangular shape may be suitably fastened to the underside of the vehicle b _ y or to the front bumper al, or to bar 15 or to any other suitable part in the front of the vehicle. Rope or chain or wire 10 is ,fastened at the rib or crossbar 24 that holds the two shanks 17 and IS. From the previous description it is already seen that whenever plug 6 is released the front part of device 16 wi 1 fall immediately to the ground (see Figure 1) and will thus revent t e person that ha been struck by saidp vehicle from getting under the wheels of thislvehicle H0 D5 IIS because

blanket 23 forms then a protectineg curtain. The device 16 cannot be mov backwards when its front part lies on the ground because. books or teeth 184 that are directed somewhat backward and that are arranged on the underside of the shanks 17, 18 will hook in on the support 20 wherebrg these shanks are allowed to move forwu when pulled in that direction. In order to pre vent the blanket itself from getting under the wheels, the following arrangement– is made that is illustrated 'in Figures 1, 8 and 15. _It consists of two parallel arranged bars SB, 69 which might extendin the same direction as the front bumper, if there is ony, and they might be in front or somewhat underneath that front bumper. The bar indicated by 69, which is therear o11e,i|;srov'ided with teeth or hooks that are direc towards bar 68 which is comlpletel? even and –which should be prefers. ly 0 rounded shaie, as shown. Between bars 68 and 69 there ould be only as much room as to permit the blanket 23 (or 256, e Figures B and 9) that is passed between these‘t'wo hers 68, 69‘to move reely if pulled down in a vertical direction or forward by the device 16 1 and 2), or bglthe ham 17a and 1Sa o Figures 8 .and 9 w fch will be described later. ,however, the blanket 23 (or 234' of Figures 8 and 9) is pushed backwards ‘hy a 'prison that has been struck by the vehicle _ blanket will hook itself ful: on the teeth or points gli bar,69, the result beilggethe stretching of at portion of the bla t situated be# tween its lower edge then lyiplg on the –ground and the line on whxch the tee or points hook in on the blanket. Suliicient resistance is thus aiforded by the blanket for preventing its moving under the wheels and consequently also that of a, person prmsing agust it. lanket 23 (233 will be unhooined m the teeth 70 when e device 16 moves forward, as will be enshrined su uently, and in this instance sai blanket spread with its nearly full lexigth in front of–the vehicle. The rear –(or under) side of the blanket should be roughened Ol! Erovided with holes that ailow the teeth or p into 70 to penetrate therein. The foremost art of the shanks 17, 18 might be surrountfed by cloth or rubber or the underside thereof might be formed as brushes with strong Ebres so that 'these parts will be given a certain amount of give _ when they are in their relea.sefl_"position in which they encounter unevenness of the ground. ` _ _ . As it is desirable to protect the persons also softensthe fall of the person –that has been struck by the vehicle. The device that moves the hunks forward and thereby spreads out and stretches the blanket 23 consists of the following simple means. Connected to rope or chain or wire 10 is another rope or chain or wire 25 that is connected to al' pivnfed or linked lever 26. This lever 26 is so held in respect to one of the front wheels that its free end will strike the s kes of this wheel when rope 10 is released? The moving of !ever`26 'IJJ that manner may be obtaine in various ways as, for instance, by means of a spring, but I prefer to make it in a simpler way, as will be shown hereinafter _in –connection with rope or chain 'or wire 30 andfwegi shoe 31. O11 the free end of lever 26 a. h 27 is placed but not rigidly fastened theretoand t e po1nt of the hook IS so directed that it will hook itself on one of the spokes of that front wheel that is verticall positioned at that moment and above th axle of that wheel when ropes 10 and 25 will be released. In cases Where :no spoke are employed it might u well be the tire ,of the front wheel into which the hook may hook. Fastened to hook 27 i a 'rope or cha1n or wire 2S.which is also fastened to the rearmbst ends of the sbanks 17 and 18, that is at the int 19. Whenever ropes 10 and 25 are rellsased and the lever 26 moves towards the respective front wheel, which in Figure 2 inthe leftside one, hook 27 hooks itself on one of the s okes of that wheel in the aforesaid manner whereby the turning wheel separates the hook 27 from the lever 26 undmcves it around whereby the rope 28 will be phlled–_which slides then on top of t,he` wheel axle and in turn pulls the shanks 17, IIEc]f_lt;:5,'lw1{Jli§n;v;l;1ie;;therehy spread and also I I 8 _ .. _ So far the means have been _described that actuate the aizfety adgvicuis. it isnnhowevet necessa to rin o ve ice on 'nic stop bg as the driver of an automobile or trnclr or– of a trolley car may not have presence of mind enoughpto act nsropidly, auch action must be automatic and the followingiimple meEs?'emem1;lsoyedif1;thi]sires`pect., _nnected– ver , re rayv a sling near the point where? the bool: 2; is placed, isa rope, chain, or wire 30, which is astened to one of the wedgiqahc that serve for atoppinfg the vehicle. are are preferably two o these wedge shoes which are indlcahedhy 31, 32 when lt is the C253 mth automohil –or motor trucks, but on trolley ears and the like vehicles there may be more employed |.nd`the wedge sl10e will have a shape from injuries during the falling thereof, af 'that is somewhat diferent. from that of the mechanism is made in connection with the device 16 that will move the blanket 23 as far to the front that the person will fall upon it and as in this instance the blanket wlll be stretched there will he a space left between the ground and the blanket which wedge shoe employed for stoppingautomobiles and motor trucks (see Figure 7). The wedge shoe for the automobile and motor truck is shown in– Figure 3 and Figure 4 and consists of thepart 33 that clamps itself on the wheel, its tire, respectively, and B0 Sl –I0 IE 4 _ 1,sas,n14– the botteugnpart 34 that is provided with teeth of ailet angular shape for gripping on the ground without, however, digging in which might cause the vehicle to somersault. Part 33 can be made of Hexible steel while the teeth 35 can be made of iron. Both wedge shoes 31, 32 are held by– a wooden or steelbar 36. in such position in which they face the Wheel _rims or tire –with the broader part of 33 which is the rear end of the wedge shoe. Fastened to har 36 are ropes or wires or chains 37, 38 of certain length which are also fastened at fi suitable place of the vehicle body or at the inner edges of the mud–guards of the rear wheels. ~ To wedge shoe 32 (see Figure 2) is connected a rope or wire or chain 39 that is also connected to rope 10 and in case where rope will he released will also rogue 39 be released as wel] as rope 30, as has een pointed out previously. The wedge shoes 31, 32 then move to the ground and the turning rear wheel moves right into the space 40 (see Figilre 3) and clamps itself fast at the narrower part form by 33. The wedge shoes thus hold the rear wheels and slide on the ground for a distance that depends upon the momentum of the vehicle whereby the rear wheels will not touch the ground:–' In order to prevent these rear wheels breaking the ropes or chains or wires 30, 39 and simply' take the wedge shoes around them these ropes 30, 39 should be of great strength and besides that o special means must be employed in the form of rings 42, 43 through which the ropes 30, 39, respectively, arepassed. _ . Rings 42, 43–are fastened to the hangers 20; but they may be fastened to any other suitable part of the chassis or car body. At `a eertnin stretch in advance of the' rings 42, 43 plugs 44, 45 are. fastened .to the ropes 30, 39, respectively, and these plugs inust be'so big that they cannot pass through the ring holes of 42 and 43. The distance etween the plug 44 or 45 from its ring 42, #13, respectively, must correspond there ore with the distance that lies between tl1e”:Eront part of the wedge shoe 31, 32, respectively, and the lowermost part of the respective renr wheels when the wedge shoes are in their normal, suspended position(It wiil he noted from F`l,|!,'l11‘8 2 that lug 44 is not directlv–fastened to rope 30, Ent to a special branch rope. Torope 30 i therefore :Ea tened another rope. Lever 26 itself will not he engaged by anlylpart of the left side front whee w on it wi e released, but it will simply move backwards as far as rope 80 will pull it

whereafter rope 30 will slip out and separate itself from lever 26. – From the foregoin description it is shown that all–essential para are so su pended that they will éo to active position through the safest me ium in 'this respect. namely through gravity. and that it is performed in a most rapid manner. _ , It is necessary that for certain vehicles such as trolley cars, wedge shoes must he employed that have a shape diiferent from those emplqyed with automobiles, motor trucks, etc. n connection with them no teeth are necessary and it will not be necessary that they have a broadened and a narrow upgqrr part like those emplayehle for automo– 1 es. It is also necessary that there is protection for the Eedestrian when automobiles or ruotor trac s move backwarrls. In this respect a har 1' and another one 15' that is associated therewith may be employed and‘a, similar mechanism be in–ou ht in connection therewith, as has been discrihed previously. In order to indicate those parts that have similar functions or uses as has been set forth in connection with the parts in the front of the vehicle, the same respective numeral is employed with the addition of a prime. In genenal, the scheme is the some as described previously with the distinction that there is no confer–ation with the front wheels. The we ge shoes 31' and 32' are applied' to the rear wheels and a. blanket 23' will be spread out similar to that indicated by BB when a. person takes hold of bar 1' or bar 15', or when it will be. struck by these bers. ` Referring more pai–ti.cularl to Figures 8 and 9, it will be noted that tile invention is represented in mform that is more sirnplilied than that shown in Figures Land

Abstract:
Source: US5694812A A multi−functional apparatus employs an electromagnetic device. The electromagnetic device selectively causes movement of an intermittent motion mechanism thereby moving a mechanical device coupled thereto. In another aspect of the present invention, a single electric motor selectively actuates three intermittent motion mechanisms thereby causing three mechanical devices coupled thereto to operate. In a further aspect of the present invention, a clutch mechanism selectively drives a window wiper. A method for operating the multi−functional apparatus of the present invention is also provided.

Abstract:
Source: US2014041980A Systems and methods of the invention relate to transferring energy from a vehicle to a device via a track circuit. Embodiments of the present invention include a power source of a vehicle that can be utilized to transfer energy through a track circuit to a device coupled thereto. The track circuit can include a section of track having a first pair of insulated joints located on a first rail and a second pair of insulated joints on a second rail, each pair separated by a distance. Moreover, a signal can be communicated to the vehicle based on receipt of the transferred energy.

Abstract:
Source: DE2557729A1 Vorrichtung als Schnee– und/oder Eisfahrhilfe fuer Fahrzeuge, durch G e h e n n z e i c h n e t, dass sie aus mehren einzelnen Greiferarme (4), diese am inneren Ende in einem drehbar angeordneten Flansch ring (1) drehbar gelagert, nach aussen in ein federndes Glied, wie in einem Federo@gel (6) ueberrgeht und dann ueber die Laufflaeche des Reifens als den Reifen bis auf die Rueckseite desselben umfassende Greiferbuegel ausgebildet sind. The snow grip has a set of metal hoops at the ends of sprung arms linked to a flange ring secured on the wheel hub. As the flange ring is turned relative to the wheel hub the hoops are pulled into the tread. The hoops are strung with grip chains and are designed to flex with the tyre movements so that the system can be used to drive on snow covered roads, no just used to pull vehicles out of snow drifts. The grips are simple to fit, with simple tools, and do not require the wheel to be rotated while fitting. They store in a folded conditions and are readily removed when reaching clear roads. By flexing with the tyre they are not loosened easily, with the sprung arms made from spring steel, either in flat or profiled form.

Abstract:
Source: US2002189139A A vacuum boring and mud recovery method comprising a vacuum container, a vacuum producing device to create a vacuum within said container, a conduit to vacuum solid particles and liquids into the vacuum container and a dispensing device to dispense the liquid or solid particles from the vacuum container without eliminating the vacuum environment within the vacuum container. Vacuum container contents are stored within the container while simultaneously dispensing the solid particles and or liquids. The vacuum container method may also have a separating device disposed within it to separate solids and liquids by category. The vacuum container method is a continuous operation vacuum container which can simultaneously fill, store and dispense solid particles and liquids with the added ability to simultaneously separate the solids and or liquids before they are dispensed from the vacuum container. This is accomplished without eliminating the vacuum environment within the vacuum container. The vacuum container method can also include an articulated powered vacuum conduit boom, a vacuum conduit tractor or purification means.

Abstract:
Source: US5970821A It is an object of the present invention to provide a control system for an automatic transmission, which operates so that when slipping of drive wheels is generated at the starting of a vehicle on ice or the like, upshifting from a second gear shift stage to a third gear shift stag is prohibited. However, when the pseudo slipping state of the drive wheels is detected with the locking or unlocking of the drive wheels, the undesirable prohibition of the upshifting of the automatic transmission is avoided. A slip rate of a torque converter is determined on the basis of an engine revolution–speed (a torque converter input rotation–speed) and an automatic transmission input rotation–speed (a torque converter output rotation–speed). When the slip rate exceeds, for example, 102 percent, so that the driving force is transmitted from the drive wheels toward the engine, it is determined that the pseudo slipping state attendant to the locking or unlocking of the drive wheels has been detected, thereby canceling the prohibition of the upshifting of the automatic transmission.

Abstract:
Source: US6240660B An attachment for use with snow handling equipment such as a snowplow blade or a wheel loader bucket or similar implement, the attachment comprising a plate pivotally mounted at each end of the implement and movable between a forwardly projecting horizontal deployed position and a retracted position wherein the plate extends upwardly and does not interfere with normal operation of the implement. In the deployed position the plate is freely pivotal upwards and has a rounded front lower corner so that it can readily ride over curb stones and similar obstacles without damaging the mechanism. The attachments have the effect of greatly increasing the snow handling capacity of the implement without significantly detracting from its normal utilization.

Abstract:
Source: US4576214A An anti−skid device is intended for use on pneumatic tires when the tires are used on ice and snow. The device includes a supporting disk with anti−skid arms pivotally displaceable about axes extending parallel to the axis of the wheel on which the pneumatic tire is mounted. The supporting disk is fixed to the wheel by a fixing disk and a retaining ring mounted on the wheel rim. The combination of the fixing disk and the retaining ring secure the supporting disk on a hub formed on the fixing disk. The supporting disk is arranged so that there is a certain amount of clearance relative to the hub for performing eccentric rotary movement for adapting the device to any elastic deformation of the pneumatic tire.

Abstract:
Source: US2008148549A Method and system for manufacturing small wind energy gathering devices, for example, of geometrical dimensions tip to $1/8^{th}$ of an inch (microdevices), employing micro−fabrication techniques. For example, three−dimensional single chemical composition parts of a small wind energy gathering device are manufactured using two−photon three dimensional lithography. Preferably, a plurality of such parts are manufactured in parallel, thereby optimizing the production process. The plurality of parts may be handled and assembled using precision instruments such as micro−tweezers, micro−scissors, and holographic lasers. Nanowires may be used to interconnect a plurality of the microdevices together, or to connect components of a particular microdevice. These nanowires are produced in nanowire arrays and are attached to a common base structure. Additionally, a form of injection molding and polymer materials may be utilized in the manufacturing of the small wind energy gathering devices (microdevices), which provide protective coatings and surfaces of reduced friction.

Abstract:
Source: US2005168320A One or more lock or key units of a secure entry system is equipped with a radio receiver. The receiver permits a memory in the lock or key unit to be updated with new data that is modulated onto a radio frequency signal. By this technique, system−wide changes of programming data, such as changes of lockout lists and access codes, and changes targeted to specific units, such as disabling a particular key, can be implemented simply and quickly.

Abstract:
A drive system for a motor vehicle having at least one driven wheel (1, 7) on each side of the longidudinal axis of the vehicle comprises an internal combustion engine (13), an electric generator (11) driven by the internal combustion engine (13), an electric motor (9) for each driven wheel (1, 7) and an electronic control system (15, 19, 21) that controls the amount of electric power supplied by the generator (11) to the individual electric motors (9). The control system (15, 19, 21) controls the power and the distribution of the driving torques to the individual wheels (1, 7) so that the roll steer effect of the vehicle is controlled by conferring a yawing moment that depends for example on the transverse acceleration of the vehicle or on the extent of a yawing moment generated by a side wind. By measuring the wheel pressure of the individual driven wheels, the road grip limits of the wheels may be detected and the electric motors may be controlled in order to improve traction.

Abstract:
Source: US2007203727A One provides (101) a plurality of carriable containers having emergency supplies contained therein wherein each of these carriable containers is readily carriable by an average adult human. These carriable containers are then placed (103) within one or more corresponding controlled access containers as are provided at one or more publicly accessible locations (102). Prior to a triggering catastrophic event, one or more specific authorized beneficiaries are then preauthorized (104) to have catastrophic event–based access to one or more of these carriable containers. So configured, the authorized beneficiary(s) will in turn have access to the corresponding emergency supplies that are contained within the carriable container when a triggering catastrophic event occurs.

Abstract:
Source: US2040449A ’I claim: ' 1_. In 5, machine of the character described, a. work head, a tool head, Iced gnechanism, means for operating the feed mechanism hi onédirectum to produce B relative feeding movement ol approach between the heads, mechanism independent of the.1'eed mechanism and comprising A cylinder and piston unit directly connected to one of the heads for separating the heads in the line of feed, and mechanism for operating the feed mechanism in the opposite direction; substantially as described. ` 2. In s machine of the' character described, a. work hand, a. tool head, a feed screw, mechanism for turning the feed screw In one direction to meet, a relative teedinz movement ot approach between the heads, mechanism independent of the feed screw and directly connected to one of the heads for separating the heads in the line of feed, and mechanism for turnlnz the feed screw in the opposite direction; substantially as described. » _ 8. In a machine pf the character described., work head, B. tool head. 5 feed screw, pawl an# ratchet mechanism for turning the feed screw in une direction to effect 9, relative feeding movement d! approach between the heads, mechanism independent of the feed screw for shifting one o! the heads with respect to the screw and so separating the heads in the line of feed, and fluid pressure mechanism for turning the feed screw In the opposite direction; substantially as described. " 4._ In a. machine of the character described, a work head, a tool head, mechanism for etfeetinz feeding movement of approach between the heads, mechanism for effecting a. minor movezixmt ot separation between the heads. and mechanism for meet–1.11: a. maior movement of geparatlpn between the "heads, said last two meclmnisms comprising B piston having B piston rod with a. threaded portiomand a. rockable nut on the threaded portion; substantially .ns described. , ~ `. 5. In a machine ofthe character described, a, work head, a tool head, a feed sctew, mechanism Ior turning the feed screw to elect a relative feeding movement 01' approach between 'the buds, mechanism for eiectinl 5 minor separation of the heads in the line of feed, mechanism for causing a relative shifting movement of the henda in another direction for a. machining operation, and nutomntic mechanism for thereafter effecting A majo; sepscratiun–of the heads in the line of feed: substantiplly as described. 6. In a. machine ot the charncter‘described,.;n workhead; A f/oo) head, a feed screw, mechanism for turning the feed screw 00 elfect B. relative feeding movement ol' approach between the heads, niechsnlsm for effecting a. minor separs#_ tion of the heads in the line of feed, mechanism for ef1'ebtlng.a XUBJUI' separation of the heads, and mechanism for reversing the feed screw; substantially as`descr1bed.» ' '_ 7. In a machine of the character described. a work headja tool head, a. cylinder, and vane for effecting a minor movement of separation be– – tween the heads, a. jump–back cylinder and piston unit for eiiectlng a major movement of separation between the heads, and_me'ans for causing a relative shifting of' the heads to occur in a longitudinal direction between the operatlun of the two separating mechanisms; substantially as described. ' –_ _ ' 8. In' a machine of the character described. a workhemd, a– tool' head, means for causing– relative movement of the heads and comprising a piston, a. piston rod and. a. cylinder, a. portion of the piston rod being threaded, a nut threaded 'on the piston rod, and means tor tuming the nut for gausing s subsidiary relative movement of the heads; substantially as desgribed. 9. _In s. machine of the character described, a. head, a. plate having sliding engagement with the head, means for causing relative movement between the head and the plate and comprising a piston, a. piston rod, and a. cylinder, the piston rod being threaded, n. nut threaded on the piston rod l!1d'Sl1DPO!'bEd by the plate, and means for causing relative rotation between the nut and the rod tor eflectinz a

subsldlmjy rektive movement of the head and the plate; substantially as described. . 10. In 5 machine of the character described, s. work head, a tool head, a feed screw. mechanism at one end of the feed screw for turning the feed screw in one direcylon to effect 5 retatlve feeding movement of_ approach between the heads, mechanism at the other end of the feed screw for turning the screw in the opposite direction, the intermediate portion of the feed screw having threaded connection with one of the heads; substantially as described. V 11. In a machine of the character described, a work head, a tool head, a._1'eed nut, a. feed screw, means tor turning the screw in one direction to edect a relative movement between the heads, 3 cylinderjand n vane in the cylinder and having a one way connection with the feed screw tor turnlng the screw in the opposite direction; substantially as described. 12. In a machine of the .character described, a, work hesd, a tool head, d feed screw, s. cylinder, a vane rockahle on the feed screw. and means tor clutchlng the vane no the feed screw; substantially as described. , 13. In a. machine of the character described, 2 work head, a. tool head, a. feed screw, a. cylinder, la. vane rocksble on the feed screw, and means for clutching the vane so the feed screw and cnml prlsinz a. ratchet wheel carried by one of said last members, and a movable dog connected to the other; substantially asniescribed, 14..In n machine of the character described, n, work head. s too! head, a feed screw, a. cylinder, a. vane, and means for clutching the vine to the feed screw Bhd comprising a. ratchet wheel car– A . s,o4o,44s ' '_ 9 rled by one of said last members and a movable dog connected tothe other, and a. cam for controlling the dog; substantially as described. 15. In a machine of the character described, a work head, a tool head, a feed screw, a. cylinder, a. fluid pressure operated member projecting from the cylinder, said member forming a :loumal support for the feed screw, and means for clutching the member to the feed screw; substantially as described 16. In a machine of the character described, a. work head, a toll head, a. feed screw, a cylinder, a liuid pressure operated member projecting from the cylinder, and a pivoted dog carried by said member for connecting the member to the feed screw; substantially as described. 17. In a. machine or the character described, A work head, e tool head, a feed screw, a. cylinder, a liuld pressure operated member projecting from the cylinder, a plvoted dog carried by said member, a ratchet wheel carried by the feed screw, and a. cam for swinging the dog; substantially as described. 18. In e. machine of the character described, 9. work head, a tool head, a feed screw for effecting a, relative feeding movement of approach between the heads, n cylinder and vane for effecting a minor movement of separation between the heads, and a. cylinder and vane for eifecting a reversal of the feed screw; substantially as described. 19. In e machine of the .character described, a. work head, a tool head, a cylinder and piston unit for causing' a movement of separation between the heads, 9. screw shaft, a nut threaded on the shaft, means connecting the nut to one member of the cylinder and piston unit, and a cylinder and vane for causing a relative turning of the shaft 'and the nut to increase the movement of separation; substantially as described. 20. In la. machine of the character described, a work head, a tool head, a cylinder, a vane turning in the cylinder, a. shaft connected to one of the heads and having a threaded connection with the vane for elfecting e. movement of separation between the heads, a screw shaft, and a cylinder and vane for turning the screw shaft to effect another relative movement of the heads; substantlally as described. . _ 21. In a machine of the .character described, a work head, a. tool head, a feed screw for eifecting a. relatiye feeding movement 'of approach between the heads, mechanism for etecting a minor movement of separation of the heads to separate the tool from a. completed portion of the work and pleee it in machining relation to another portion of the work, .automatic mechanism for causing a. relative shifting of the heads to effect a further machining operation after said minor movement of separation, and mechanism for ei'– fecti.ng»a reversal of the feed screw; substantially as described. ,_ 22, In a, machine of the character described, a work head, a. tool head, mechanism for causing a. minor movement' of' separation between the heads, mechanism for causing a major movement of separation between the heads, 9. screw shaft, and mechanism for tufning the screw shaft to further effect separating movement of the heads; substantially as described. 23. In a machine of the character described, 9. work head, a tool head, a cylinder and piston unit for causing a major movement of separation between the heads, a. cylinder and vane for causing a. minor movement of separation betwem the heads. and a cylinder and vane for effecting s further relative movement of the heads; substantially as described. ` Q 24. lu a machine of the character described, E work head, a tool head, mechanism for causing 9. relative feeding movement of approach between the heads, mechanism for reciprocating one' of said heads to machine one portion of the york, mechanism for causing 9, minor movement of separation between said heads in the line oi(feed to place the work and the tool in a didferent ma– \ch.ining relation and mechanism for thereafter moving one. of said heads–substantially transvexsely' to the line of feed for a further machining' operation upon another portion of the work; substantlally as described. _ .. 25. In a machine of the character described, a work head, s. tool heed, mechanism for causing s. relative feeding movement of approach between the heads, mechanism for oscillating one of said heads in a curved path– for broduction of a curved surface on the work, mechanism for causing a. movement or separation between the heads in the line of feed, and mechanism for moving one of said heads substantially transversely to the line of feed to produce a straight surface meeting the curved surface; substantially as described. 26. In a machine of the character described; a work head, a tool head, mechanism for causing 9. relative feeding movement of approach between the heads, mechanism for oscillating one of said heads in s. curved path for production of H. curved surface on the work, mechanism for stoppiné the relative feeding movement and thereafter continuing the oscillation for a predetermined number of_ strokes, and mechanism operable after the termination .of oscillation for moving one ot said heads substantially transversely to the line ot feed to produce a. straight surface on the work; substantially as described. 27. In 9. machine of the character descrlbedpa work head, e. tool head, mechanism for causing a relative feeding movement of approach between the –heads, mechanism for oscillating one of said heads in a. curved path for production of a curved surface on the work, mechanism for stopping the relative feeding movement and for stopping the oscillation, and mechanism for moving one of said heads substantially transversely to the line of feed to produce a straight surface on thework; substantially as described. 28. In a machine of the character described, a work head, a tool head, mechanism for moving one of the heads in a curved path with respect to the other head, withthe work and tool in contact, automatic mechanism to stop said movement with the work and tool in contact, and .automatic mechanism for thereafter giving a. runuut cutting stroke to one of the heads In e. straight path with respect to the other with the work and tool in contact; substantially as described, 29. In a machine of the character described, a work headf. e tool head, mechanism for

moving ‘one of the heads in a. curved path with respect to the other head, with the work and tool in contact, mechanism to stop said movement with the work and toe] in contact, automatic mechanism for thereafter giving 9. single run–out cutting stroke to one of the heads in a straight path with the work and tool in contact, and automatic mechanism to separate said work and tool in a direction transversely of the run–out cutting stroke; substantially as described. 30. In 9. machine of the character described, as head, mechanism for feeding the head comprising a pair of feed members, a plunger for actuating each of the feed members, an arm engaging one of the plungers, s. lever engaging the other plunger, and means for causing the arm and the lever to actuate the plungers alternately; substantially as described. ~ 31. In a machine of the character described, a head, mechanlsm for feeding the head comprising a pair of feed members, a plunger for actuating each of the teed members, an arm engaging one of the plungers, a lever engaging the other plunger, means for causing the arm and the lever to actuate' the plungers alternately, and means for restricting the movement of the feed members; substantially as described. 32. In a machine of the character described, a head, 9, ratchet wheel for advancing the head, a pair of pawls, a _lever carrying each pawl, a plunger engaging each lever, an oscillating arm engaging one of said plungers, a lever engaging the other plunger, and means for connecting the last said lever to the arm whereby one of the phmgers is actuated by a swing of the arm in either dlrectlon; substantially as described. 33. In s. machine of the character described, a head, a ratchet wheel for advancing the head, a pair of pawls, a lever carrying each pawl, a plunger engaging each lever, an oscillating arm engaging one of said plungers, a lever engaging the other plunger, means for connecting the last said lever to the arm whereby one of the plungers is actuated by a swing of.the arm in either dlrection, and a stop movable into the path of the pawl carrying levers to shorten the stroke thereof; substantially as described.– 34. In a machine of the character described, a head, a ratchet wheel for advancing the head, a pair of pawls, a lever carrying each pawl, a plunger engaging each lever, an oscillating arm engaglng one of said plungers, a lever engaging the other plunger, means for connecting the last said lever to the_arm whereby one of the plungers is actuated by a swing of the arm in either direction, a stop movable into the path of the pawl carrying levers to shorten the stroke. thereof, and a member for moving the pawls away from the ratchet wheel: substantially as described. 35. I_n a machine of the character described, a bead; a ratchet wheel for advancing the head, a pair of pawls, a sliding plunger for advanclngeach pawl in' one direction,–means for retractlng the pawls, an arm engaging one of said plungers, a lever engaging the other plunger, and means for causing the arm and the lever to actuate the plungers alternately; substantially as described." 36. In a. machine of the character described, a work head, a tool head, mechanism for feeding one oI_ the heads comprising a pairof movable members, means for alternately giving the feed members a feed stroke, and a work gauge controlling a shortening of the stroke of the feed members; substantially as described. 37. In a loading mechanism, a work holder, a carrier for a work–piece, a spring pressed plunger movably mounted on the carrier, means for limiting the movement of the plunger towardsvthe work–piece, and means for advancing the carrier towards the work holder to bring the plunger and the work–piece in contact; substantially as described. 38.In` a loading mechanism. a work holder. H carrier for a ,work–piece, springs holding the work–piece on the carrier, means for advancing the carrler towards the work holder, and the work ' ` g 2,040,449 _ ~ ' holder havlngspring engaging means to release the holding springs; substantially as described. 39. In a loading mechanism, a work holder, a carrier for a work–piece, springs holding the workpiece on the carrier, a yleldable plunger movably mounted on the carrier, and means for advancing the carrier towards the work holder; substantially as described. 40. In a loading mechanism, a work holder, a carrier receiving a work–piece, a piston and cylinder unit for bodily advancing the carrier towards the work holder, and means operable on the advance ofthe carrier for yleldably presenting the work–piece to the work holder; substantially as described. 41. In a loading mechanism, a work holder, a carrier receiving a work–piece and having work holding springs projecting beyond the work towards the work holder, means for advancing the carrier towards the work holder, and the work holder having means for gripping the work–piece and another means to engage the projecting springs for releasing the piece from the carrier; substantially as described. 42. In a loading mechanism, a work holder, a carrier receiving a worképlece, means for advanc–_ ing the carrier towards the work holder, the work holder having work gripping means, and means controlled by the advance of the carrier for initiating the operation of the work gripping means; substantially as described. 43. In a machine of the character descrlbed, a‘ work holder having work gripping means, mechanism for releasing the gripping means from a work–piece, a loading mechanism, and means controlled by the releasing mechanism for initiating the operation of the loading mechanism; substantially as described. 44. In a machine of the character described, a work holder having work gripping means and a work ejector, mechanism for releasing the gripping means from a work–piece and operating the ejector, a. loader for the work holder, and means controlled by the said mechanism for lnltiatlng the operation of the loader; substantially as described. 45. In a machine of the character described, a work holder having a work elector, mechanism for controlling operation of the ejector, a loading mechanism, and means operated by the ejector controlling mechanlsm for initiating the operation of the loading mechanlsm; substantially as described. 46. In a machine of the character described, A work holder having a work ejector, mechanism for controlling advance oi’ the' ejector, a loading mechanism, means operated by the ejector controlling mechanism for inltiatlng the operation of the loadingmechanisxn, and mechaniszn jor retractlng the ejector; substantially as described. 47. In a machine of the character described, a work holder having work gripping means and' a work ejector, mechanlmn for releaslng the gripping means from a–work–piece and operating the ejector, a. loader for the work holder, means controlled by the said mechanism for initiating the operation of the loader, and mechanism controlled by the loader for lnltlating a gripping operation of the work holder; `s\1hstantlally as described. 48. In a machine of the character described, a work holder having work gripping means and a work ejector, a cylinder and piston unit for controlling the operation of the work gripping means, and a cylinder and piston unit tor controlling the operation of the ejector; substantially as described. ` » ' 49. In a machine of the character described, a work holder having a work engaging member, a movable plunger, a trip dog carried by the plungeffor moving the member ln one dlrectlon, means for tripping the dog, and a spring for moving the member ln the opposite direction; substantially as described. '50. In a machine of the character described, a work holder having a work engaging member, a spring for moving the member Ln one direction, a plunger, a dog pivoted to the plunger, and an arm in the path of the dog and connected to the member; substantially as described. 51. In a machine of the character described, a work holder having a work engaging

member, an arm connected to the member, a plunger, a. dog plvoted to the plunger and engageahle with the arm, and means in the path of the dog for disengaglng the dog from the arm; substantially as described. 52. In a machine of the character described. a hollow spindle having a chuck with a work locatlng shoulder, work gripping means on the chuck, a work ejector mounted on the chuck, a. sleeve slidably mounted in the spindle, a. rod slidably mounted ln the sleeve, the sleeve and the rod having connections one with the work gripping means and the other with the ejector, and means for actuating the sleeve and the rod in two directions; substantially as described. ~ 53. In a machine of the character described, a hollow spindle having a chuck with a work locating shoulder, work gripping means on the chuck, means extending through the spindle and connected to the work gripping means, a work ejector, means extending through the spindle and connectedto the ejector, springs for actuating said means ln one direction, and mechanism acting against the springs to actuate said means in the opposite direction; substantially as described. ` 54. In an oscillating grinding machine, a work head having a chuck, work engaging means on the chuck, means extending through the work head for operating the work engaging means, a Support separatejrom the work head, and mechanism on said support for controlling said operating means; substantially as described. – ‘ 55. In a machine ofthe character described, a head, means for reciprocating the head, means for locking the head, and means associated with the locking means 'for locating the head in a predetermined position; substantially as described. 56, In a machine of the character described, a head. a support, cooperating means carried by the head and the support and comprising a plunger and a notch, means_1’or reciprocating the head, and means for advancing the plunger to locate thehead in a predetermined position; substantially as described. 57. In a. machine of the character described, a head, means for reciprocating the head, a. latch plate, a locking plunger, the latch plate and the plunger having cooperating cam surfaces, and means for advancing the plunger to locate and lock _the head in a predetermined position; substantially as described. _ 58. In a machine of the character described, a head, means for reciprocating the head in a curved path, a support, cooperating means carried– by the head and the support and comprising a notched plate and a plunger, and means for advancing the plunger to locate the head in a predetermined angular position; substantially as described. ' 59. In a machine of the character described, a work head having a chuck with a work engaging member, means for reciprocating the head, a support, means carried by the support for actuating the work engaging member, and means for locking the work head in a predetermined relation to the actuating means; substantially as described. ` I '60, In a machine of the character described, a work head having a chuck with a work engaging member, means for oscillating the head in a curved– path, a support, means carried by the support for actuating the work engaging member, and means for locking the work head in a. predetermined relation to the actuating means; substantially as described. 61. In a machine of the character described, a work head having a work engaging member, a. rod for operating the member, a support, rod actuating means on the support, means for reciprocating the work_head, and means for stopping the work head with the rod in substantial alignment with the rod actuating means; substantially as described. ` 62. In a machine of the character described, a work head having a chuck, a work gripping member and an ejector carried by the chuck, means for reciprocating the work head, a support, means carried by the support for actuating the work gripping member and the ejector, and means for locking the work head in operative relation to the actuating means; substantially as described. 63. In a machine of the character described, a work head having a chuck, a ,support,_chuck actuating means carried by the support, and means tor adjustably locating the support to place the chuck actuating means in operative relation to the chuck; substantially as described, 64. In a machine of the character described, a work head having a chuck, means for oscillating the head in afcurved path, a support, chuck actuating means carried by the support, means for stopping the work head in a predetermined angular position,–and means for adjustably locat–' ing the support with respect to the stopped position oi the work head ; substantially as described. 65. In a machine of the character described, 9. work head having a chuck, means for oscillating the head in a curved path, a support, chuck actuating means carried by the support, a tool head, means for stopping the work head in a predetermined angular relation to the tool head, and means for adjustably locating the support with respect to the work head; substantially as described. 66. In a machine of the character described, a work head having a chuck, means for reciprocating the work head, a loader,–means for advancing the loader towards the chuck, and means for locking the work head in a predetermined relation to the loader; substantially as described. 67. In a. machine of the character described, a work. head having a chuck, means for oscillating the work head in a curved path, a loader, means for advancing the loader towards the chuck, and means for locking the work' head in alignment with the loader; substantially as described. 68. In a machine of the character described, a work head, a tool head, means for reciprocating one of the heads, a movable support for the other head, means for lock_ing~one of the heads in a predetermined relation to the other head, and means operated by the locking means fo? initiating a 1 2 ` ' z,o4o,449 , _ movement of the movable support; substantially as described. 69. In a machine of the character described, a work head, a tool head, means for oscillating one of the heads in a curved path, 5, slide for the other head, means for locking the oscillated head In a, liredetennined angular relation to the other head, and means operated by the locking means for initiating the movement ~of the slide; substantially as described. _ 70. In a machine of the character described, a. work head having a work engaging member, means for reciprocating the work head, a support, means carried by the support for actuating the work engaging member, a loader, means for advancing the loader towards the work head, and means for locking the work head in operative relation to the loader and the actuating means; substantially as described. – 71. In a machine of the character described, a work head having a Work engaging member, a support, means carried by the support for actuating the work engaging member, a loader for applying a work–piece to the work head, means for reciprocating the work head, and means for stopping the work head in substantial alignment with the loader and with said actuating means; substantially as described. 72. In an automatic machine of the character described, a work head having a chuck, a tool head, means for reciprocating one of the heads, means for feeding one of the heads towards the other, means for controlling the separation of the heads, means for removing a finished workpiece from the chuck, loading mechanism, means for actuating the loading mechanism to apply a new work–piece to the chuck, and means for causing the actuation of the loading mechanism to initiate an operation on the new work–piece; substantially as described. ' 73. In an oscillating grinding machine, a work head, a wheel head, means for oscillating one of the heads in a curved path, means' for ieeding one of the heads towards the other, means for controlling the

separation of the heads, means for removing a finished work–piece from the work head, loading mechanism, and means for causing the loading mechanism to apply a new workpiece to the work head' and initiate a renewed approach of the heads; substantially as described. 74. In an oscillating grinding machine, a Work head, a wheel head, means for oscillating one of the heads in a curved path, means for removing a nnished work–piece from'the work head, loading mechanism, and means ssfor causing the loading mechanism to apply a new work–piece to the work head and initiate a renewed grinding operation; substantially as described. 75. In an oscillating grinding machine, a work head, a tool head, means ‘for oscillating one of the heads in a curved path, means for locking the oscllllated head in a. predetermined angular position with respect to' the other head, and means for causing a relative movement of the headsdn a. direction which maintains the heads in said predetermined angular relatlon;,substa.ntially as described. , '16'. In an oscillating grinding machine, a work head,'a tool head, means for oscillating the work head around an axis to procure a curved surface on the work, means for locking the work head in a predetermined angular position with respect to the tool head, and means for causing a run–out cutting –stroke of the tool head in a 'direction which maintains the heads in said predeter– . "l mined angular relation; substantially as. de–_ scribed. – 77. In an oscillating grinding machine, a work head, a. tool head, means for oscillating the work head around an axis to procure a curved surface on the work, means for locking the work head in a predetermined angular position with respect to the tool head, means for causing a run–out cutting stroke of the tool head in a direction which maintains the heads in said predetermined angular relation, and means for causing a separation of the heads; substantially as described. '18, In a machine of the characterdescribed, a work head, a tool head, mechanism comprising a jump–back cylinder and piston unit for causing a movement of separation between the heads, a valve controlling said unit, a. slide for one of the heads to provide for a run–out cutting stroke of said head, and mechanism controlled by the slide for initiating the action of the valve; substantially as described. 79. In a machine of the character described. a work head, a tool head, feed mechanism for causing a relative movement of approach betwccn the heads, feed retraction mechanism for causing separation of the heads, a device controlling said _retraction mechanism, a movable support for one of the heads. and mechanism controiled by the movable support for initiating the action of said device; substantially as described. 80. In a machine of the character described, a work head, a tool head, a gauge having a work engaging feeler, mechanism for causing a, movement of the feeler into operative contact with the work, a movable support for one of the heads, and electromagnetic means controlled by the movable support for initiating the action of said mechanism; substantially as described. Bl. In a. machine of the character described, a work' head, a tool head, means on the work head for gripping or releasing a work–piece, mechanism for actuating said means, a movable support for one of the heads, and means controlled by the movable support for initiating the action of said mechanism; substantially as described., 82. In a machine of the character described, a work head, a tool head. means on the work head for gripping or releasing a work–piece, mechanism for actuating said means, a movable support for one ot the heads, means controlled –by the movable support for initiating the action–_ or said mechanism, a loader, and means controlled by the releasing means for initiating the operation of the loader; substantially as described. 83. In a machine of the character –described, a work head; a tool head, means foroscllllating one of the heads, a slide for the other head, a spindle carried by one of the heads, driving means for the spindle, means for stopping theoscilllation, and means controlled by the slide for 'starting and stopping the driving means; substantially as described. –` ' V , _ » 84. In _a machine of the characterdescribed, a head having a reciprocating– support, fluid pressure mechanism for reciprocating the support, a reversing valve controlling the fluid pressure,– electromagnetic means for actuating the _reversing valve in two directions alternately. and means carried by the reciprocating support for alternately and repeatedly controlling the energizetion of the electromagnetic means; substantially as describedr 85. In'a machine of the character described, a head, a reciprocating support for the head, fluid pressure mechanism for reciprocating the sup– do G5 io V . ' 2,040,449 13 port, a reversing valve controlling the fluid pressure, va shut–oi! valve for stopping the operation of the iiuld pressure mechanism, electromagnetic means and a spring for controlling the operation of the shut–oft valve, and means operated by the reciprocating support for making the electromagnetic means lneffective and the spring effective to close _the shut–od valve; substantially as described. ‘ 86. In an oscillating grinding machine, a head having an oscillating sulllport, fluid pressure mechanism for _oscillating the support, a reversing valve controlling the fluid pressure. a shutoi valve for stopping the operation of the fluid pressure mechanism, and means for operating the shut–oi valve with the head in a predetermined angular position; substantially as described. – 87. In a machine of the character described. a work head, a tool head, means for reciprocating one of the heads, a counting mechanism, electromagnetic means for actuating the counting mechanism, means actuated by the reciprocating head for control1i.ng`the electromagnetic means, and means actuated by the counting mechanism for stopping the reciprocation; substantially as described. » 88. In a. machine of the character described, a work head, a tool head, means for reciprocating one ol the heads, means for feeding one of the heads towards the other, a counting mechanism for controlling the stopping of reciprocatlon, electromagnetic means for actuating the counting mechanism, means actuated by the reciprocating head for controlling the ‘electromagnetic means, and means for stopping the feeding mechanism and starting the counting mechanism; substantially as described. _ – 89. In a machine of the character described, a work head, a tool head, means for reciprocating one of the heads. means for feeding one.ol! the heads _towards the other, a counting mechanism for controlling the stopping of reciprocation, a gauge having a feeler engaging a workpiece on the work head, and mechanism for causlng the feeler to control the stopping of the feeding mechanism and the starting of the counting mechanism; substantially as described. ‘ 90. In an oscillating grlndingmachlne, a work head, a tool head, means for oscillating one of the heads ina cuwed path, means for feeding one of the heads towards the other, a counting mechanism for controlling the stopping 'of 05– clllation, a. gauge having ai feeler engaging a. work–piece"on the work head, mechanism for causing the feeler to control the stopping `o1' the and the startin of the leedlng mechanism g counting mechanism, and means for–locking the oscllllated head in a predetermined angular relation to the other scribed. 91. In.a machine of the character described, a work head,_a tool head, means –for reciprocatingone of the heads, a coimting mechanism for head; substantially as de– controlling the stopping of reciprocation, a. lock, and lock actuating 'means controlled_ by the colmtlng mechanism for securing one of the heads in a. predetermined relation to the other; substantially asfdescrlbed. 92. In a machine of the character described, a

spindle having a head provided with a plurality of tapering surfaces, means for supporting the spindle for rotation, and wedges movable along said surfaces for expansion ln a hollow work–piece; substantially as described. 93. In a grinding machine, a feed pawl, a lever connected to the pawl, means for swinging the lever, a swinging arm having a stop to restrict the lever' movement, and means for llxlng the stop in selected positions along the arm towards or from its axis to vary the restriction; substantially as described, ' ' 94. In a. machine of the character described, a hollow spindle having a head– provided with a plurality of tapering surfaces, means for rotatably supporting and driving the spindle, wedges shiftahle along said tapering surfaces, and means extending through the spindle for actuating the wedges; substantially as described. 95. In an oscillating grinding machine, a head having an oscillating support, fluid pressure mechanism for oscillating the support, a reversing valve controlling said mechanism, a shut–off valve for stopping the operation of the fluid pressure mechanism, electro–magnetic means for controlling operation of the shut–off valve, and means for causing a controlling action of the electro–magnetic means and a stopping of the head in a predetermined angular, position.. – _ 96. In an oscillating grinding machine, a head; having an oscillating support, fluid pressure mechanism for oscillating the support, a reversing valve controlling said mechanism, a. shut–oil' valve for controlling the action of the iiuld pressure mechanism, a spring for urging the shutof! valve ln_one direction, a solenoid connected to the shut–on valve to act in opposition to the spring, and a switch controlling the solenoid. 97. In an oscillating grinding machine, a head having an oscillating support, fluid pressure mechanism for oscillating the support, a reversing valve controlling said mechanism, a shutoff valve –for stopping the operation of the lluld pressure mechanism, a spring for urging the shut–oil! valve ln one direction, and electrc–magnetlc means for controlling a movement of the shut–oi valve in opposition to _the action of the Y spring. . 98. In an oscillating grinding machine, a head having an oscillating support, Huld pressure mechanism for oscillating the support, a reversing valve controlling said mechanism, a shlltable valve having fluid connections with the reserv– .lng valve, a spring for urging the shittahle valve ln one dlrectlon, and a solenoid connected to the valve to control the shifting movement thereof

Abstract:
Source: US2001022245A A motor vehicle has a combustion engine as a primary drive source, generating an engine torque (302) which is transmitted along a power train containing an input shaft (320), a main clutch (308), a gear−shifting transmission (310) with gears (316, 318, 324, 326), shift clutches (328, 330), and an output shaft (322). The power train includes a superimposed additional transmission (312) with a planetary gear device (314), and a secondary drive source in the form of an electric motor/generator with a rotor (342) attached to the ring gear (332) of the planetary gear device (314) and a stator (344) attached to a stationary part of the vehicle. The secondary drive source generates an additional torque (346) to supplement or replace the engine torque (302) as needed, e.g., to eliminate gaps in vehicle traction during gear shifts or to propel the vehicle electrically in stop−and−go traffic. The secondary drive source may also be used in a generator mode, e.g., to recycle energy from decelerating or coasting downhill.

Abstract:
Source: IN00549MU2010A An apparatus, system, and method for automated production of sport video using expert sports video production rules. Methods and systems for automated rule based real and live sports video or film or movie productions by merging pre–created standardize video clips as per administrator score or points or goal settings and domain or subject specific film or movie production rules by domain and subject specific rule engine and real time or near real time live broadcasting or telecasting or streaming or screening or transmission or playing or recording live or real sports match event via multiple communication networks on multiple types of user(s) device(s) to viewers, e.g. real and live sports comprising cricket, baseball, golf, football, soccer, basketball, hockey, tennis, racing.

Abstract:
Source: US2015005988A A traction control system and method are provided for electric vehicles with at least one drive wheel powered by an electric drive motor to maintain optimum maximum traction while the vehicle is driven on the ground. The traction control system includes drive means capable of transmitting torque through a vehicle drive wheel and controllable to move the vehicle over a ground surface. A preferred drive means is an electric motor designed to move the vehicle at desired ground speeds in response to operator input. Operator input requests a desired speed, and the system determines drive wheel torque required to produce the desired speed and provides maximum current to produce maximum torque to drive the vehicle with optimum traction at the desired speed. The system uses constant feedback to find maximum current corresponding to torque required for an inputted speed request to automatically control traction in any electric powered vehicle.

Abstract:
Source: GB503276A 503,276. Fluid–pressure servomotor–control systems. GENERAL MOTORS CO. March 11, 1938, No. 7622. Convention date, March 15, 1937. [Class 135] [Also in Group XXIV] In an epicyclio gear for motor vehicles and the like wherein a clutch is engaged and a brake disengaged by fluid pressure, while the clutch is disengaged and the brake engaged by springs on release of the fluid pressure, so as to obtain solid and reduced drives respectively, the fluid pressure at which the brake is released and the clutch takes up the drive is varied according to the degree of actuation of the engine control device. On operation of a control valve 168, Fig. 9, pressure fluid can pass from a supply conduit 238 to a port 264 and to a conduit 272 leading both to a clutch cylinder 75 and to a brake cylinder 261, whereby the clutch is engaged through the agency of a piston 76 against the action of disengaging springs 89, Fig. 1, and the brake is disengaged through the agency of a piston 291, secured to a rod 290, against the action of engaging springs 97, 97a, and 97c. From the port 264, fluid has constant access to the interior of a sleeve 326 which is urged down towards the limiting position shown by a spring. A valve 320 is urged up towards the sleeve 326 by a spring, the abutment 323 of which is controlled by an arm 122 which is moved up as the accelerator pedal is depressed. With slight depression of the latter, a maximum opening exists between the members 320 and 326, and pressure fluid passes to a conduit 277 leading to a cylinder 295 to act on a second piston 294 secured to the rod 290. As the accelerator is further depressed, the opening is reduced until, at full depression, pressure fluid is prevented from passing to the conduit 277. The pressure at which the brake is disengaged and the clutch engaegd is therefore greater according to the degree of depresaion of the accelerator. The invention is applied to the rear unit M, Fig. 1, of a changespeed gear comprising two epicyclic units A and M in series, a reversing gear B being interposed between the unit A and the engine clutch shaft 5, as described in Specification 484,301. The unit A also comprises a clutch–engaging piston 72 and a brake–disengaging piston 281, pressure fluid being supplied through a conduit 278 from the conduit 238

under the control of a toggle valve 150. A branch 318 from the conduit 278 leads to the space beneath a flange 327 of the sleeve 326. Thus, when fluid is being supplied through the conduit 278, that is when the unit A is giving solid drive, the sleeve 326 is lifted to increase the opening between the latter and the valve 320, whereby the pressure at clutch engagement in the unit M is further modified. The valve 150 is operated by a rod 113 under the conjoint control of the accelerator 303 and a governor G driven from the output shaft 8 of the gear B. A rod 110, moved to the left by the governor upon increase of speed, is connected to one end of a floating lever 111, the other end of which is connected to the rod 113. A rod 361, moved to the left as the accelerator is depressed, is connected to an arm 132, another arm 131 of which has a portion constituting the arm 122 referred to above. A pin 118 on arm 131 engages with play in an aperture 127 in an arm 121 loose on the shaft 120, a spring 125 being interposed between the arm 121 and a lever 116 loose on the shaft 120. A pin 115 on the lever 116 abuts against an intermediate part of the lever 111. Thus, after a slight depression of the accelerator, during which the play of the pin 118 in the aperture 127 is taken up, depression of the accelerator tends to close valve 150, to give reduced speed in unit A, while increase of speed tends to open valve 150, to give solid drive. Below a certain speed, the governor control insists on reduced drive in unit A, and, above, another certain speed, insists on solid drive, while between these limiting speeds the governor and accelerator jointly control the drive. The valve 168 is actuated by a lever 160 having a pin 159 engaging a cam slot 155 in a plate 126 rotated by movement of a control lever 301. The latter may occupy four positions, namely: (1) position R, in which gear B is put into reverse through a lever 102, valve 168 is closed so that unit M gives reduced drive, and a hook 156 on plate 126 prevents opening of valve 150, so that gear A also gives reduced drive; alternatively, the hook 156 may be omitted so that unit A can change automatically; (2) position N, in which gear B is in neutral and valve 168 is open; (3) position L, in which gear B gives forward drive and valve 168 is closed, giving reduced drive in unit M; and (4 position H, in which gear B gives forward drive and valve 168 is open, giving solid drive in unit M. The lever 116 has an arm 123 coacting with the cammed periphery of plate 126 so as to limit the counterclockwise movement of lever 116, consequent on depression of the accelerator, when the lever 301 is in position L. The conduit 238, together with a conduit 220 (shown in Fig. 12) leading to lubricating passages in the gear, is supplied by a double gear pump draining oil from a sump 219 and delivering past a spring–loaded check valve 200, which latter also functions as a relief valve. The larger unit of the pump is driven from the countershaft 20 of the gear B, while the smaller unit is driven from the shaft 8, so that a supply is ensured whenever either the engine or the vehicle is in motion. The springs associated with each brake are arranged as shown so that disengagement of the brake involves a successive stressing of a 'composite spring system. In the form shown in Fig. 12, the interior of the sleeve 326 communicates directly with the conduit 238, and the supply therefrom to the conduit 277, through the variable opening between the members 320 and 326, is controlled by the valve 168, which is modified accordingly. Pressure fluid also passes through the said variable opening into a conduit 277<1> to act on a piston 285<1> secured to the operating rod 280 of the brake associated with unit A, so that the amount of depression of the accelerator also has a modifying influence on the pressure in the clutch cylinder 71 of the unit A. In this form, also, an arm 131<1>, secured to the acceleratoroperated shaft 120, coacts with a plunger 413 movable, under the action of fluid supplied through a conduit 410 branching from the line 272, in a cylinder formed in a lever 116<1> which is pivoted at 411 and which carries the pin 115 acting in the floating lever 111. Thus, when unit M is put into direct drive, plunger 413 moves out, thus increasing the influence of the accelerator on the lever 111. Further, the plate 126 is rotated by the lever 301, not positively as in Fig. 9, but through a spring 416, and an arm 420 is moved anticlockwise by the rod 110, upon the occurrence of a predetermined speed, so as to prevent clockwise movement of plate 126 and thus prevent a change of unit M from solid to reduced drive. In a modification, the sleeve 326 is omitted, the valve 320 being urged upwards by the accelerator–controlled spring and downwards by the fluid pressure supplied through conduit 318. In the modification shown in Fig. 17, the plate 126 is formed with an arm 130 co–operating with the pin 115. The lever 301 is capable of occupying a fifth position; marked 3rJ, beyond position H, and in the corresponding position of the plate 126, in which the valve 168 remains open, the arm 130 moves the pin 115 so far to the left as to maintain the unit A in reduced drive below a predetermined speed. Above this speed, the unit A goes solid. Specification 503,312, [Group XXIV], is referred to.

Abstract:
Source: US2002039657A Thermally stable polymers comprising resorcinol arylate chain members are prepared using an interfacial method comprising the steps of: interfacial method for preparing polymers comprising resorcinol arylate polyester chain members substantially free of anhydride linkages linking at least two mers of the polymer chain, comprising the steps of: (a) preparing an aqueous solution comprising at least one resorcinol moiety, said solution having a pH less than or equal to about 5; (b) after step (a), preparing a mixture comprising the resorcinol moiety, at least one catalyst and at least one organic solvent substantially immiscible with water; and (c) adding to the mixture from (b) at least one dicarboxylic acid dichloride while maintaining the pH between 3 and 8.5 through the presence of an acid acceptor, wherein the total molar amount of acid chloride groups is stoichiometrically deficient relative to the total molar amount of phenolic groups.

Abstract:
Source: US2003159500A A throttle–opening sensor has a detect shaft rotatable about an axis in conjunction with

a throttle grip, a pair of rotation terminals respectively disposed on different positions in the same circle with the rotation axis, the pair of rotation terminals being rotatable together with the detect shaft, contact pieces disposed on each of the rotation terminals at predetermined intervals in a rotation−radius direction of the rotation terminal, a printed circuit including conducting pattern portions printed along sliding loci of the contact pieces and, a resistance portion printed in a sliding range of the contact piece of the conducting pattern portion, and generating a resistance against a current flowing in the conducting pattern portion, wherein at least two detection signals variable in mutually opposite directions according to the rotation angles of the throttle grip are generated due to that the contact pieces respectively allow the conducting pattern portions to conduct therebetween.

Abstract:
Source: US4591177A An oleodynamic steering control device for vehicles having a straight traveling stabilizer, the device comprising a cylindrical member containing a reciprocatable or rotatable element connected to the main steering system and operative to generate a fluid pressure which is transmitted to a steering actuator on an axle to be steered. The device provides a fluid bypass to a reservoir for a certain range relative to the position corresponding to the straight traveling condition of the vehicle. This relieves the pressures generated by small deviations from straight traveling, which occur at relatively high speed, and thus they are not transmitted and multiplied on the steered axle which is thus stabilized, affording greater traveling safety.

Abstract:
Explore interesting inventions inside, conceived by our genius idea generator. Discover history's most effective method in conceiving novel uses for existing electronic technology. License huge domains of intellectual property from the invention directory our system helped develop. The searcher can find one of our interesting inventions in this patent application via our LicenseItToday.com, etc. Call our California Headquarters 1−707−428−5000. View invention ideas, plus 100+ variations adapted for end user target markets. LicenseItToday.com fills out exclusive international license agreements valid up to December 2026. It saves time and money creative LP. over any other documented creative thinking process. Licensees seek outputted patents using our or their pat attorneys. Royalties can start when profits begin. Or you can buy the affordable I.P. rights. Proof is in tryingit out. Discover amazing inventions inside today.

Abstract:
The motor vehicle transmission has an engine (2) with a transmission assembly (4) having a first actuator and a

gearbox (6) having a second actuator. The gearbox has multiple gears sets each with a gear fixed to a shaft and a second sliding gear. The actuators control the gear engagements and have a control circuit for disengagement of the previous gears, selection of the new ratio and engagement of the new ratio gears.

Eäi båt enligt anspråk 1, kännetecknad därigenom att den omfattar ett flertal af skrof, mellan hvilka den uppsamlande skopan är medelst tappar hvarvid den senare är normalt nedsänkt under vattenytan. 7. En båt enligt anspråk 1, kännetecknad därigenom att den omfattar medel placerade å båten och öfver vattenytan för att vid alla tidpunkter kasta ett solfjäderliknande ljussken fram till vattenytan på en uppskatt.bar distans framom "båten i afsigt att draga fisken uti båtens väg och samti– digt belysa dess väg. g. En båt enligt anspråk 1, kännetecknad därigenom att den omfattar medel för att reglera utsträckningen till hvilken nätet eller skopan skall nedsänkas. 9. En "båt enligt anspråk l, kännetecknad därigenom att skopans väggar äro sammansatta aj ett. flertal af' sektioner af fi3k–t>en nätverk, af hvilka hvarje sektion är försedd med i sidoled och bakut. sig sträckande distanse– rade stänger. lo. En båt enligt anspråk 1, kännetecknad därlgeftom att den omfattar me– del förenade med den främre änden af Skopan för att hindra densamma att grfva sig in i sjöbottnen.när båten är i grundt vatten. 11. Bi båt enligt anspråk 1, kännetecknad därigenom ä$ att den omfattar medel för att automatiskt skära storfisk för att hindra dess hämmande effekt. 12. En båt enligt anspråk 1, kännetecknad därigenojj att den omfattar medel för att framsrlfva båten l riktningen af dess längd och sidoied, hvarvid aagda medel bestå af anpassbara dubbelskofveihjul. 13– En 'båt enligt anspråk 1, kännetecknad därigenom att nätverkets ele– ment i skopan sammanfattar en fördelad stång mellan hvars sektioner ändar– na af ett flertal trådar äro häktade tillsammans, hvarvid de större delarna af 3agda trådar sträcka sig från kanten af stången i parallellt förhållande 4ch i sned riktning i förhållande till stången, äfvensom medel för att för– hindra svängande rörelse af trådarna å stången. 14. Sätt att fiska med en båt enligt anspråk 1–13, kännetecknadt däraf att det består uti att kraftigt belysa ett förutbestämdt ytinnehåll af vattnet från en ljuskälla belägen öfver vattenjtan, hvarmed fisk tiiidrages in 1 den sälunda "belysta zonen, att åstadkomma deA belysta zonen att röra sig iraaåt och samtidigt i rörelsesätta fislcfängstmedel genom vattnet balc– ut från det belyata

området. Iyfceck Ocean Harvester Co, inc. r, – *4 . IOfIBUteslkaierafru and veneiaaä. Tämän keksinnön esineenä on kalastusvene Ja tarkoittaa se parannuksia kalastuksen toimintaan Ja välineisiin nähden. Keksinnön päätarkoitus, vaik– ka ei yksinomaan, voidaan lyhykkäisyydessä esittää seuraavasti: 1. Laatia parannettuja välineitä laivan eteenpälnkayttöä varten sekä eteenpäin– että sivusuunnassa, sekä parannettuja välineitä laivan ohjaamls– ta varten semmoisten toimintojen aikana. 2. Välineet kalan keräämistä varten ISA laivan tielle ja sen siirto kan– nelle, Joihin välineisiin on.edelleen yhdistetty välineitä siirtovälineiden tukkeutumisen estämistä varten. 3. Verkkolaitteen tai välpän parannettu rakenne, josta kaloja keräävät välineet pääasiallisesti laaditaan, mikä verkkolaite tai vaippa on siten rakennettu että se synnyttää pienimmän vastuksen vedenvirtaukseen nähden silmien tai reikien kautta sanotussa verkkolaitteessa tai Z and 5 välpässä; ja k. Välineet kalojakeräävien välineiden upotussyvyyden järjestelyä varten sekä välineet yhdistettyinä kalojakerääviin välineisiin jotta niiden kärki tulisi estetyksi kaivautumasta merenpohjaan kun ne toimivat matalassa vedes«?" Edelleen perustuu eräs piirre keksinnössä parannettuun menettelyyn ka– lastaa yöllä, Joka perustuu kalojen ISMäävetämlseen käyttämällä vahvaa etsijävaloa veneen etupuoliseen vyöhykkeesen Ja sen tielle, keräten tun– nottomia kaloja aina sen mukaan kuin vene kulkee eteenpäin, sekä siten ke– rättyjen kalojen nostamiseen veneen sisään. Keksinnössä edelleen esiintyvät piirteet, muut kuin tässä luetellut, kuin inyöskin sen edut selviävät tässä alempana olevasta selityksestä, tehty oheenliitettyjen piirustuksien yhteydessä. Oheenliitetyissä piirustuksissa kuvataan erilaisia käytännöllisiä tote– uttamismuotoja keksinnöstä, mutta niissä osoitetut rakenteet ovat pidettä– vät ainoastaan keksintöä kuvaavina eikä sen rajaplirfcjä määräävinä. Kuva 1 on sivuõievatsioni kalastajaveneestä Joka toteuttaa keksinnön. Kuva 2 on huipputaso siitä. Kuva 3 on pohjataso veneestä, esitettynä kuvassa 1. Kuva 4 takapäästä otettu elevatsioni veneestä. Kuva 5 on edestä otettu elevatsioni, mikä osoittaa kalojakeräävät vä– lineet, rungon ja osan ylemmästä laitoksesta. Kuva 6 on poikkileikkaus laivan läpi, otettuna pystysuoralstasossa viivaa 6–6 pitkin kuvassa 1. Kuvat 7 ja 7a ovat keskisiä leikkauksia kalojakeräävien välineiden pa– ft r/ ß rempana pidettävästä muodosta,kuvan 7a esittäessä sanottujen välineiden etu osan, samalla Kun kuv. 7 esittää taaemman osan siltä,Jolloin sanottu kuv. JfiS 7 on suurennetussa mittakaavassa suuremman selvyyden aikaansaamiseksi. On ymmärrettävä että kuv. 7a on Jatko kuvassa 7 osoitettuun rakenteesen. Kuva 8 on suurennettu erikoisosa leikkauksessa viivaa lo–lo pitkin kuvas– sa 7a. Kuva 9 on samantapainen erikoisleikkaus viivaa 9–9 pitkin kuvassa a. Kuva lo on erikoisosa tasossa eräästä verkon tai kalanluu–välpän elemen– tin muodosta, Jota pidän edullisempana käyttää, Ja tekee pienimmän vastuk– sen sen kulkuun nähden veden läpi. Kuva 11 on kuvan lo näköinen kuvaus, osoittaen jonkun verran muunnetun muodon kalanluurakenteesta. Kuva 12 on elevatsioni kuvassa 11 osoitetusta rakenteesta. Kuva 13 on katkonainen leikkaus laivasta osoitettu kuvissa 1–6, jolloin sanottu leikkaus on otettu viivaa 13–13 pitkin kuvassa 1. Kuva 14 on pltuusleikkaua eräästä rungoista, otettuna viivaa 1H–14 pit– kin kuvassa 13. Kuva 15 on leikkaus viivaa 16–16 pitkin kuvassa 3, osoittaen muutamia silpipyöriä edestä otetussa elevatslonissa. Kuva 16 on leikkaus viivaa 16–16 JIXI pitkin kuvassa 15. Kuva 17 on tasokuvaus yhden palkeista ulkoisesta päästä, Jolta käytetään kannattamaan kalojakeräavät välineet. Kuva IS on erikoisosainen leikkaus ynden siipipyärän kautta, kuteo viivaa 19–19 pitkin kuvassa 15. Kuva 19 on tasokuvaus alhaaltapäin yhdestä ainoasta venerungosta, esit– täen uusia piirteitä esilläolevasta keksinnöstä» Kuva 2o on pääasiallisesti keskinen, pystysuora leikkaus kuvassa 19 osoitetun veneen kautta. Kuva 21 on edestä otettu elevatsioni kuvissa 19 ja ‘2o osoitetusta ve– neestä. Kuva 22 on leikkaus viivaa 2g–23 pitkin kuvassa 2o. Kuva 23 on poikkileikkaus viivaa 23–23 pitkin kuvassa 2o, ja Kuva 24 on kuvassa 23 osoitetun leikkauksen näköinen, mutta osoittaen muunnetun muodon rakenteesta, yhdistäen laivansiivet. Viittaamalla piirustuksiin osoittaa A useampia laivanrunkoja, asetettui– na yhdensuuntaissuhteesen toisiinsa nähden,sivu sivussahtelsen kannen B alla, mikä kansi johtuu kaikkien runkojen yli ja ulkonee paraiten Jonkun vèrran sivuillepäin, I8Ä niiden keula Ja peräpuolelta, kuten selvästi osoitetaan kuvissa 3 Ja 6. Kaikki rungot ovat rakennetut yhtäläisiksi ja ovat yleistä rakennetta, kuten osoitetaan kuvissa 19–23. Kukin runko on pääasiallisesti varustettu suorilla, pystysuorilla sivuilla, mutta on sillä yleensä pienen veneen muoto Keskisessä, pituusläpileikkauksössa. Rungon si– vut joutuvat skkljyrkä3tl ales ja päättyvät pääasiallisesti vaakasuoriin emäpuihin a, joutuen käytännön kannalta otettuna kautta rungon koko pituu– den. Sisäinen leikkaus semmoisista, muodosteluista muodostaa rungon, jonka alempi 3ivu on pituussuunnassa kourulla varustettu, siinä kun on verrattain syvä uurre keulassa ja perässä, kuten paralten osoitetaan kuvissa 2o, 21 Ja 22, ja verrattain matala uurre keskilaivalla, kuten osoitetaan kuvassa 23. jQhtuon taaksepäin veneen kustakin nnja–ta neljästä ke3klemäpuusta kaytstääw päväcHbttts, jotai kannattaa sen alemmasta päästä tavallinen euutøiiaula cx, peräsinpylvään Johtuessa ylöspäin ja on laakeroittu eteenpäin ja takaisin kääntöä varten kannessa..On välttämätöntä että nämät kaksi peräsintä kal– listuvat joko toiseen tai toiseen suuntaan K and X and iS and ä samassa kulmassa, ss on toimivat yhdensuuntaisessa suhteessa kaikkina hetkinä,, Ja jotta tämä kä– visi varmaksi ovat ne paralten yhdistetyt toisiinsa niiden päiden välistä jäykän nivelSïT avulla. Jos useampia runkoja A on asetettu toistensa vie– reen kuten osoitetaan kuvassa 3 on niveTV* tehty johtumaan poikki kaikkien peräsinten, niin että, kun yksi peräsin on toiminnassa, joutuvat kaikki muut jäieilä olevat samaan aikaan liikkeesen niin että ne pysyvät yhden– suuntaisessa suhteessa toisiinsa nähden kaikkina hetkinä. Löytyy eri tapoja joilla peräsimet voidaan saattaa toimintaan, mutta mi– nä pidän edullisempana käyttää sitä yleistä sovittelua, mikä osoitetaan kuvassa 3, jossa peräsimiä liikkeesen saattavia köysiä tai ketjuja g2 käy– tetään kiinnitettyinä ni/eleesen c1 Ja johtuvat veneen aisaan saatettavik– si toimintaan sopivien ohjaavien välineiden avulla. Parannettua kourulla varustettua runkoa tässä keksinnössä voidaan käyt– tää yksrunkoisessa tai useampirunkoisessa veneessä ja kaikissa tapauksissa voidaan sanotut rungot kukin erikseen saattaa liikkeesen yhden tai useampi– en potkurislipien c5 avulla, käytettyinä sopivien yhdisteiden avulla, kuten osoitetaan kuvassa 2o. Kun kourulla varustetun rungon rakennetta käytetään ykäirunkoisessa veneessä aijottu käytettäväksi hyvin aaltoilevas– sa meressä, voidaan runkoa varustaa laivasiivillä a1, kuten osoitetaan kuvassa 24, vaikka nämät voidaan jättää pois, jos niin halutaan. Kun useita runkoja selitettyä mallia on sovitettu yhteiden kannen alle, kuten osoitetaan kuvassa 3 ja 6, voidaan sanotut rungot saattaa liikkeesen kukin erikseen tai riippumattomasti potkurien avulla kuten on selitetty, tai voidaan lisäkäyttövälineitä käyttää. Minusta on tämän keksinnön mukai– nen vene käytettävä hyvällä nopeudella ja sentakia käytetään lisäkäyttävä– lineitä, niin että haluttu nopeus voidaan aikaansaada. Tämä väline osoite– taan useampien siipipyörien E muodossa, Joista y*3l sarja on sovitettu ri– viin rajamain olevien runkojen väliin, tuten osoitetaan Kuvassa 3. Kutakin lukumäärää näitä siipipyöriä voidaan täyttää, mutta, esitykseen nähden,ogoi tetaan kaksi panosta johtuen pääasiallisesti keulasta

perään, kahden runko– parin välissä, samalla kun muut osoitetaan sovitettuina parittain jälelläo– levien nautoparien väliin. Kun käytetään useita siipipyöriä, toinen toisen– sa takana, niin että koko sarja Joutuu keulasta perään, ÿl and SIXX olisi toi– sensa Jälkeen seuraavat siipipyörät katsottuina keulasta perään pidettävä liikkeessä yhä lisääntyvillä nopeuksilla. Se on, Jos ensimäiaen slipipyörän tulee tehdä loo tulee toisen pyörän tehdä suuremman lukumäärän kier– toja, esim. Ilo tal 12o Ja kolmannen slipipyörän pitäisi tehdä 13o;stä l4o:een J.n.e. tfämät kuviot ovat luonnollisesti ainoastaan selittävät, mutta käytetään niitä tekemään toiminta selväisi, koskapa, Jos kaikki siipipyörät vaikuttaisivat samalla nopeudella, syntyisi niin no– pea veden syöksy runkojen välissä, varustettuina ensimälsellä viidellä pyö– rällä, että Jälellä olevilla pyörillä ei tulisi olemaan mitään Erikoisosat parempana pidettävästä siipipyörien muodosta osoitetaan kuvissa 15,16 Ja IS. Kukin siipipyörä D on varustettu ontolla navalla d, laadittu onton, ilmatiiviin sylinterin muodossa Jonka kautta Johtuu käy– tettävä akseli dA, Jäykästi kiinnikiilattuna navan päihin. Navan vastakkai– set päät ovat varustetut laipoilla d2, Ja Johtuen säteensuuntaisesti navan ulkoisesta kehäpiiristä käytetään siipilehtiä d5, kuten paralten osoitetaan kuvassa IS, jolloin lehtien vastakkaiset päät ovat paralten jäykästi yhdis– tetyt laippoihin d2. Käytettävä X akseli d1 on sovitettu käantöliikettä varten kahteen varteen e, joiden toisten päiden kautta Johtuu käyttäakseli E (kat3Q kuv. 15 ja 16). Kayttöakaeli E Käytetään sopivasta koneistosta sovitettuna toiseen tai molempiin rajakkain oleviin runkoihin, ja pyörivä liike siirretään käyttöakseiista E käytettävään akseliin d1 hammaspyörän 1 2 e ätyailä ja yhdessä toimivan hammasketjun e avulla. Tätä rakennetta käy– tettäessä huomataan että koska slipipyörän napa d on ilmatiivis, se tulee kellumaan ja estämään siipipyörää painumasta kokonansa veden alle. Käytän– nössä johtuu pääasiallisesti ainoastaan puolet pyörästä vedenpinnan alle, ja sovittamalla pyörä kääntyviin varsiin e, saattaa sanottu pyörä kaikkina hetkinä mukautua itse puolestaan vedenpintaan nähden, mikä selvästikin vaihtuu veneen sormituksen mukaan. Saattaa olla toitottavaa voida toisi– naan kohottaa siipipyörä D erille vedenpinnasta, ja tätä tarkoitusta var– ii ten kiinnitetään kohottava nivel d alemmalla päällään käytettävään akse– liin d* mikä Johtuu ylöspäin veneen kannen B kautta. Käyttämällä pulttia d y/v/ it .. Ó mitä toimii nivelen d yhteydessä Ja on yhdistetty johteesen d, voidaan siipipyörä, slttenkun sitä on Kohotettu tarpeen mukaan,estää joutumasta ennen määrätyn S Kohdan alapuolelle. Jotta siipipyörä ei vahingoittuisi hylkytavarolsta, jään j.n.e taKia kul– j ohon kee Käyttävä aKseli E paralten putkenmuotoisen muhvin ï kautta, puts on jäykästi sovitettu useita suojaavia rimoja f, mitkä johtuvat lyhyen matkan yhdensuuntalssuhteessa Kääntyviin varsiin e nähden ja, jäleiläoievaan osaan nähden niiden ulottuvaisuutta, mukautuvat slipipyörän fUXfiiäSSft ulkoisen kehäpiirin mukaan, Kuten osoitetaan Kuvassa 16. TanKo r1 johtuu kaikKien näiden suojaavien rimojen Kautta Ja ankkuroidaan päistään Kääntyviin var– siin niin että se pysyttää rimat asianmukaisessa suojaavassa asennossa slipipyörän etupuolella. îïiinmuodoin olkoompa siipipyörä milloin tahansa toimivassa asennossa käytetään'sanottuja rimoja aina varjeluspölkkyinä suo– jaamaan siipilehdet C? vahingoittumasta. On useasti tarpeellista voida käyttää siipipyöriä Jo selitettyä lajia parittaln, Ja menettely hyvin säästel and västi aikaansaada tämä osoitetaan Ku– vassa 15, Jossa kaksi sllpipyörää D on sovitettu toistensa viereen yhtei– seen käytettävään akseliin d1 mikä saatetaan liiKkeesen yhteiäen käyttöak– selin S avulla, jolloin yksinkertaista ripustusjäsentä käytetään pysyt– tämään molemmat pyörät ylösnostettuina, kaniin halutaan. Molemmat siipi– pyörät sovitettuina kuten osoitetaan kuvassa 15 tulevat vaikuttamaan yksi– lön tapaan ja pääasiallisesti samalla tavalla kuin yksinäinen pyörä, paitsi että enemmän eteenpäin käyttävää voimaa tulee syntymään, siipipyörien käyt– tö voidaan toimittaa millä halutulla tavalla tahansa sopivan akselijohdon tai välittömien yhdisteiden avulla useampiin moottoreihin tai koneisiin, mutta ei ole tarpeellista osoittaa näitä yksityisiä osia, koskapa Koneisto siipipyörien Käyttöä varten on hyvin tunnettu eikä muodosta mitään osaa esilläolevasta keksinnöstä. Venettä telakkaan pantaessa varustettuna useammilla jo selitetyn laj1311– la rungoilla voivat kaikki ne osat mitkä tässä alempana luetellaan Kalastus toiminnan toteuttamista varten tehdä veneen jonkun verran sas vaikeasti kä– siteltäväksi, ja pidetään sentakia edullisempana Käyttää välineitä veneen Käsittelyn heipoittamista varten ahtaissa paikoissa. Tässä tarKoituKsessa Käytän useita £ä sivupotKureita G keulassa ja perässä, Joiden sijoitus osoi– tetaan Kuvassa 3i »inka ohessa yfcsityiaosat esitetään Kuvissa 13 ja 14. Sivusiipipyörät G saatetaan paraiten toimintaan Kahdenkertaisina sen kautta että ne sovitetaan yhteiseen Käytettävään akseliin g,mikä kannatetaan kään– toliikettä varten kääntyvässä varressa g1 tappiyhdisteen avulla Kiinnitet– tynä käyttävään akseliin g2, mikä johtuu keulat and á Ja peräsSa ja jota Käyte– tään rungossa olevasta sopivasta Koneistosta. Liite siirretään täyttävästä akselista g2 täytettävään atseliin g Hammastetaun g avulla, ja siipipyörä k voidaan tonottaa tai lastea tarpeen mutaan nivelyhdisteiden g avulla, vas– taten eteenpäin täyttävien siipipyörien D niveiyhdlsteitä d. Sivusiipipyö– rät 0 eroavat tuitentin ratenteeltaaü siipipyöristä D siitä että tutin edel lisistä paralten valmistetaan ainoastaan neljästä lehdestä, tuten osoitetaa tuvassa 13, niin että, Kun näiden siipipyörien vaitutusta ei haluta, ne voidaan nostaa ylös, jolloin yt3i lehdistä tussatin siipipyörässä johtuu tannes3a olevan auton Kautta, samalla tun molemmat vieressä olevat leh– det pysytetään tiinni tannen alasivussa. Tällä tavalla voidaan siipipyörät G nostaa ylös vedestä, niin että ne eivät estä veneen eteenpäin tultua sen säännöllisessä toiminnassa. Kultentin tun tahdotaan panna vene telatalle voidaan siipipyörät G lastea alas toimivaan asentoon vedessä ja saattaa liitteesen tarpeen rautaan veneen tääntämistä varten sivusuunnassa telatal– le. Väline veneen täyttöä varten sivusuunnassa toimittaa inyöstin erään toi– sen tärteän tehtävän veneen täytännöllisessä toiminnassa. Jos vene tultee eteenpäin ja talaparvi on näkyvissä verrattain lähellä venettä, mutta sivu– suunnassa veneen tultusuuntaan nähden, on tärteätä että SSa vene voidaan panna nopeasti 2 liitteesen sivusuunnassa,siinä tartoitutsessa että se vä– littömästi tai suinpäin Kohtaisi talaparven. Tämän mutaisesti tetee tämä väline Jolla vene voidaan panna liitteesen sivusuunnassa mahdolllsetsl saa– vuttaa tämä tulos, on siten selvää että semmoinen väline vaituttaa muiden täysi ilãíSX elementtien yhteydessä, niin että saadaan täyttötelpoisuus yhdistel– mään nähden totonaisuudessaan. Kuten paralten osoitetaan tuvissa 1–4 täytetään veneen etupuoleen ja sen alle sovitettuna Kousajäsentä 1, jolla pääasiallisesti on suorataiteen– muotoisen suppilon muoto, jonta suurempi avonainen pää sijaitsee veneen etu – puolella. Kousalla l on tuten osoitetaan piirustutsissa luurangon muoto, mitä on sovitettu seneesen pittien nivelten J avulla jäytääti yhdistettyinä Hondasta tehytseen("j"mikä johtuu taatsepäin veneen alle Ja tääntyy tääntönaatassa molempien uitoisten runtojen sivustaan päin, tuten Kohdasta j1 vallan tea– tiiaivan peräpuolen tohdalta, tuten paraiten osoitetaan tuvissa l ja 3, niin että kousa voidaan saattaa veden alle tai upottaa pienempään tai suu– rempaan syvyyteen Kääntämällä sanottu tousa nivelissä J, Jotta vaituttavat nastan J1 ympäri. Kousa on säännöllisesti ripustettu, asianomaiseen syvyy– teen, useampiin nostaviirPltöygitn I, mittä ovat sovitetut

töysipyörien>5 Kannattavat KaKsi puomia K, Kuten paraiten osoitetaan Kuvissa 2 ja 5. Puomit pysytetään asianomaisessa, etälsyyssuhteeasa ultopäistään jäytän etäisyyden päässä pitävän yhdisteen t avulla, Ja täähtyvät niiden slseiumlss päissä olevissa nastoissa, tuten t1 tohdi3ta, veneen päätanteen. Sanotut* «–V ygiYggf puomit tuetaan myëstin sivusuunnassa Kääntyvään liitteesen.nähden sivutufcien t2 avulla, tlinnitettyinä etumaisista päistään puomien etumai– siin päihin Ja myostin tääntyen nastassa veneen päätanteen päin, tuten toh– dasta t, jolloin táitti nastat t1 Ja t ovat suorass viivassa, niin että puomi siihen tuuluvine osineen on vapaa tääntymään yhteisen at3elin ympäri (katso tuv* 1 ja 2). ¥lësno3tavat töydet i tultevat tëysipyäristä i1 yles– päin peräänpäin toimen onton maston L huippuun, asetettuina pääasiallisesti testilaivan tohdalie, Ja sanotut nostavat köydet ovat yhtäläisesti jaoitet– sisään tuma mastoihin, tuten osoitetaan tuvassa 2. Onttojen mastojen 3XS£3ä2XXI£X on Yjfy pysysuoria johdeteitä tasapainossa pysyttäviä painoja l varten sovitet– tu, Joihin ytsitylsten töysien päät ovat tiinnltetyt. Tämän osien tasapainon sovitutsen tatla tarvitaan hyvin vähän voimaa tou– san nostamista varten täysillä viivoilla tuvassa 1 osoitetusta asennosta jossa ae on upotettu veteen, piltutetuilla viivoilla osoitettuun asentoon, / jossa tousa on nostettu ylös vedestä* Tämä voidaan aitaanaaada monella ta– valla, mutta, tuvaamlstartoitutsessa, osoitetaan päätannen etusivustassa tatsi pystysuoraa pylvästä m asianmukaisesti vahvistettuina,tuten tohdas– sa m1, ja tannattaen huipuistaan poittipalttia m2, Jolloin sanottua laitet– ta, itse asiassa, täytetään Jäytän nostoranan tapaan jonta avulla tousa voidaan nostaa tai lastea täysien m välitytseliä tuten osoitetaan tuvassa 5. Jäämät töydet v? voidaan panna rän avulla, tai saattavat tultea sopivaan nostorumpuun* Kummassatln tapautsessa voidaan tousa nostaa tai lastea mielen mutaan täyttämällä verrattain –flygla vallan voimaa» Kuten tätä ennen on sanottu, on tousa luurangontapaisesti ripustettu Ja avonaiset osat vahvitteiden, pylväiden Ja bhk muiden ratenneosien välissä ovat suljetut verttolaitotsien tai silmien avulla, mitta päästävät veden tultemaan Kouaan seinämien kautta, mutta estävät siihen terääntyneiden ta– lojen polspääsemisen« Olen havainnut pittäaitalsten toteiden avulla, että hyvin tunnettu ristiin tai poltittain tulteva silmä Jota tavallisesti täy– tetään taiavertoissa synnyttää suuren vastutsen veden lävitsetultuun nähden esiintyen tämä siitä tosiseikasta että semmoista verttoa ainoastaan voidaan vetää vedessä täyttämällä meltoista voimaa* Jos tämän laatuista verttoa täytettäisiin K$jjcÏMX32ÜL selitetyssä tousassa, aiheuttaisi se semmoisen vastutsen että oii–v si mahdotonta täyttää venettä vedessä SXI2 and sillä verrattain suurella nope– udella, mitä on edutsi toiminnalle, ja minä olen tämän mukaisesti pitkäai– kaisten kokeilujen jälteen tetsinyt parannetun verttolaltteen, mitä muodos– taa osan keksinnöstä, tuten osoitetaan piirustuksissa. Tämä verttolaite on tavallisen talanluun nätölnen, tuten näkyy erikois– osista osoitetut tuvissa lo,ll ja 12* Verttolaite N, tuten osoitetaan liitteesen täsin tai jietaanisest.i vätipyö– hautta ja johtaa veneessä T H Kuvassa lo, muodostetaan Kiinnittämällä lankojen n päät kahden yhdensuun– taisen Kaistaleen n1 väliin Ja yhdistämällä tai kiinnittämällä sanotut kaistaleet yhteen pulttien tai niittien n2 avulla lankojen päiden pysyttä– mistä varten tiivisti kiinni kaistaleiden välissä. Kaistaleiden ylemmät reu~ nat ovat varustetut vinoilla uurteilla n, ja nämät lankojen– osat, mitkä Johtuvat sanottujen reunojen ulkolaitojen ulkopuolelle taivutetaan ales ja si3ään sanottuihin uurteisiin, niin että kun rakenne on täydellinen, sano– jat tulla rakenteella on määrätty yhtäläisyys kalan selkärankaan nähden. Vinot uurteet kaistaleissa n1 kulkevat risteyttäen toisiaan, niin että lan– gat jotka johtuvat kaistaleen uurteiden kautta tulevat kulkemaan vastakoh– taiset lankoihin nähden Jotka Johtuvat toiaen kaistaleen uurteiden kautta ja tekevät siten mahûolliEüai kaistaleiden sovituksen niin lähelle toisi– aan kuin mahdollista, katsoen siihen että kaistaleen langat eivät mitenkään yhdy toisen lankoihin. Sivu, huippu ja pohjarakenneelementit kousassa l laaditaan,kuten osoi– tetaan kuvassa 1, kukin johtavista langoista n siten sovitettuina että ne johtuvat vonosti taaksepäin kuten osoitetaan kuvassa 7a. Tässä kuviossa ovat osat varustetut osoitusmerkinnällä S laaditut kuvassa lo esitettyjen erikoisosien mukaisesti. Käy kuitenkin selville, että semmoista rakennetta ei voitaisi käyttää edullisesti kulmissa ja sentakia osoitetaan kuvissa 11 já 12 kulmarakenteita, Joissa verkkolaite o on laadittu langoista o 3ido– S tut kahden kaistaleen o1 väliin niitatut tai yhdistetyt toisiinsa kuten ennen, mutta kukin lamta o johtuu sekä sivusuunnassa että alaspäin sen kaistaleen reunojen ulkopuolelle jonka yhteydessä se toimii Ja taivutetaan pääasiallisesti suoriin kulmiin. Muuten on se sovitettu yhdessä toimivassa kaistaleessa o2 olevaan uurteesen o; langat ovat lujasti kiinnitetyt sa– nottujen kaistaleiden väliin ja kousan kulmarakenteesta. Kuvassa 7a on osilla jotka ovat tällä tavalla laaditut osoitusmerkintä 0. Pienempiä muun– noksia SBfigâüiXgXXXãSXSgX lankojen sovituksessa kaistaleiden väliin käyte– tään kousan eri osissa keksintöä toteutettaessa vaihteievissa olosuhteissa, koskapa on toisinaan välttämätöntä antaa lankojen johtua ainoastaan yhteen suuntaan, kuten kousan etumaisessa reunassa kuvassa 7a, jossa löytyy aino– astaan muutamia lankoja osoitettuina sovitetuiksi etumaiseen pylvääsen, jolloin nämät langat J and Hÿ Johtuvat ainoastaan yhteen suuntaan» Kun uaeäffipTätficälänluuvälppäelementtej ä •seitrtgfrfcy and r* oataai puutta on yhdis– tetty kuten osoitetaan kuvassa 7a, kaikki langat johtuen vinosti taaksepäi ja lankojen vapaat päät elementissä vapaina lankojen vieressä olevien päi– den yhtymyksestä rajäkkain olevassa elementissä, ei meriruoho tai muu sen– tapainen aine tule takertumaan kiinni lankoihin, vaan tulee se kousan nope– an kulun johdosta veden läpi kulkemaan lankoja pitkin niiden päihin Ja mf JS niiata kellumaan pois. Kousan sivu–, ylä– Ja alapinnat ovat laaditut kuten on selitetty niin että mitä pienin vastus muodostuu kousan kulussa veden läpi, Ja kuitenkin ovat sanotun kousan seinämät siten laaditut että kalat Jotka kulkevat sen etumaisen avonaisen pään kautta, eivät saata pääs– tä pola siitä kousan seinämien kautta, vaan ovat pakoitetut kulkemaan sen taaemman avonaisen pään kautta. Yhteistoiminnassa kousan taaemman avonaisen pään kanssa käytetään siir– tovyötä P, Jonia alempi pää kulkee Johtavan pyöräkkeen p ympäri sovitettu– na kousaan, ja jonka ylempi pää kulkee samantapaisen pyöräkkeen p1 ympäri sovitettuna paraiten veneen peräpuoleen. Tämä siirtäjä johdetaan pyöräkkei– l p den p p ÏIIIIKS välissä etäisyyden päässä pitävien välitelojen pc avulla sovitettuina sivujohteislin p jotka ovat sijoitetut kujein omalle puolel– leen siirtäjästä. Siirtäjävyö on, sen parempana pidettävässä muodossa, laadittu kahdesta üaâöfrfcomasta hammasketjusta p, mitkä kulkevan hampailla varustettujen ketjujen ylipyöräkkeiden p p1 vastakkaisissa päisaa, Jolloin mainitut c ffiammastetut ketjut ovat yhdistetyt toisiinsa tankojen p7 avulla muodostaen etumaisen pinnan* Pyöräkö p1 saatetaan liikkeesen Ja,yhdistetyn hampailla saattaa varustetun ketjun avulla, 3XXSX and liikkeen siirtäjään. Salat jotka Çydyst.e tyt kousaan ja kulkevat sen avonaisen taaemman pään kautta saatetaan siir– täjän avulla ylöspäin ja sen ylemmän pään yli ja putoavat toiseen siirtä– jään Q,, laadittu samalla tavalla kuin siirtäjä P Ja pidettynä liilckeessä samalla tavalla, siirtäjä percent Jättää kalat pääkannelle B Jonkun verran perä– puolelle ja asentoon jonsa KSZXÄliäääXialXiliaxiÄX veneen miehistö saattaa SS lajitella tai muulla tavalla käsitellä.ne. Jotta kalat niiden

kulussa ylöspäin siirtäjällä eivät voisi pää9tä pois tämän sivuista, ovat sanotun siirtäjän sivut varustetut verkkolaite– rakenteella, mikä on kousan yhteydessä selitetyn verkkolaitteen näköinen, koska Kuitenkin on,SMSX1SJS.M. k.ousa on laadittu kohotettavaksi ja alaslasketta– vaisi,verkkolaite siirtäjän sivuissa paraiten laadittu pystysuorasti ales– laskettavaksl semmoiseen määrään, että se tekee tämän, kousan liikkeen mahdolliseksi. SivukisXot tai johteet –g? ovat jäykästi kiinnitetyt etumaisista alemmis– ta päistään kousan runkokehykseen, ja ovat taaemmista ulkoisista päistään na3tayhdigteessä akselin kanssa joka kannattaa pyöräkettä p1. Tämän mukai– sesti Johtaa kousan kääntyvä liike nastan ympäri sanottujen slvukiskojen * Ja niihin yhdistetyn siirtäjän , p*5 samanaikaiseen samallaiseen liikkeesen. Kunkin sivukiskon $£X££ p–5 päi– den välissä on nastayhdisteessä toisen verkiolaite3ivun ylempi kisko R. Kiskot H johtuvat kousan taaempaan päähän, kuten osoitetaan kuvassa 7, ja tehdään paraiten Joko aineesta joia kelluu veden pinnalla, kuten puusta, XI?w tai ovat sopivasti varustetut ponttooneilla, niin että ne säännöllisesti tulevat nousemaan vedenpinnalle. sivuki and koihin R, Ja kunkin päiden välissä, on nastojen avulla kääntyvästi yhdistetty alemmat Jcisfcot R1 Jotka ovat yh– distetyt lähellä niiden vapaita päitä ylempiin kiskoihin R niveltävän pai– jinyhdisteen avulla johon kuuluvat RlïSiaï Jäsenet r.r1 Ja rt (katso kuv. 1 ja 7a)* Vinosti johtuvia lankoja, vastaten lankoja n Ja o, kannattavat kiskot R R1 ja jäsenet r,r* ja r2, kuten osoitetaan kuvissa 1 ja 7a, siir– täjän sivujen sulkemista varten,pääasiallisesti sen alempaan puoliskoon nähden, verkkolaitteella Joka on sennäkoinen mikä on selitetty kousan –sivu– jen yhteydessä. Siirtäjän ylempi puolisko or* suljettu sivuista lankojen avulla johdetut jäsenen S kautta, liikkuva nastassa sen ylemmässä päässä veneen rungossa, kuten kohdasta s, Ja sen alemmassa päässä yläkiskonn R nähden, kuten kosdassa s1* Tästä rakenteesta käy selville että, koska yläklsko on vedessä kelluva, langan silmä mikä ripustetaan siihen nivelten ja kiskojen avulla, kuten on selitetty, tulee säännöllisesti olemaan levitettynä kun kousa on aiespaine– ty/ssa ta upotetussa asennossa kuten osoitetaan kuvassa 1« kuitenkin on ylemmän kiskonvéohotua rajoitettu pidättävien jäsenten s2 avulla (katso kuv* 1), niin että sivuvälpan seinämien alemmat reunat eivät tule noste– tuiksi tarpeeksi tullakseen vedetyiksi pois Johteista ja päästääkseen kalat pois siinä Ä and saäXXaasSiÄXÄ muodostuneen välikön kautta* Kun kousa on nostettu pilkutetun viivan asentoon kuvassa 1, tulevat sivuvälpänseinämät siirtäjän avulla toisiinsa alespäin, Koska siirtäjä on ylösnostettuna, ta– valla mikä selitetään alempana lähemmin. työskenneltäessä matalassa vedessä, on mahdollista että kousan etumai– nen alempi reuna saattaa joutua merenpohjan kosketukseen, ja, jos ei väli– neitä käytettäisi estämään kousan etumaisen reunan sisäänkaiiva\itumi and t and, tulisi siitä epäilemättä olemaan seurauksena että se menisi rikki. Tästä syystä on kousan sanottu reuna varustettu eteenpäin johtuvilla varsilla t, joihin on sovitettu suuret pyörät tai rullat i laaditut kulkemaan merenpoh– jaa pitkin ja pitämään kousan etumaisen pään vapaana sen yhteydestä, öitä– paitsi –kousan etumainen alempi reuna varustettu eteenpäin johtuvilla nas– toissa liikkuvilla sormilla t* (katso kuv. 1,5 ja 7a), Joiden vapaat'päät ovat ylöspäin käännetyt alustan muodostamista varten merenpohjakohonnuksen ylitaemenon helpottamiseksi. Kukin sormi on varustettu pyörällä t2 sanotun sormen kulun helpoittamisekei, ja sivusuunnassa Ja taaksepäin Johtuvalla kalanluuverkkolaitteelia, jonka toimena on estää kalojen Joutumista kousan alemman reunan alle Ja Jotta niiden Johtuminen kousaan kävisi varmemmaksi. Kousan runkokeüys on varustettu useilla sisäänpäin johtuvilla veitsillä U, joiden terät ovat tehdyt Hyvin teräviksi. Käytettäessä näitä veitsiä tulevat kalat, Jouduttuaan kousaankirjaimeilisesti leikatuiksi kappaleik– si ja SS siten paloitetussa tilassa siirretyiksi laivan kannelle siirtäjän avulla. Pitkäaikainen kalastuskokemus ja kalan tapojen tutkimus ovat Johtaneet parannetun tavan keksimiseen kalastaa yöllä, minkä minä toteutan sen– kautta että sovitan veneesen yhden tai useampia vahvoja etsijavaloja V {katso kuv* 1 ja 2), mitkä ovat siten sovitetut, että niiden säteet leikki– vät vedenpinnalla veneen etupuolella Ja sen tiellä« KUn valonsäteet heite– tään eteenpäin, leviävät ne siten, että säde käy leveämmäksi aina sen mu– kaan kuin se johtuu kauvemmas veneen fi etupuolelle. Pimeänä yönnä saattaa tämä säde melkoisen kirkkaasti johtua useita penikulmia eteenpäin, valais– ten vedenpinnan tällä etäisyydellä r akeeflgfi*€>tse4?ia–iti.41–lola, jonka kär– jessä vene sijaitsee* On äyrin tunnettua että kala tulee valoon päin yöllä ja sentakia tulee houkutelluksi valon vaikutteesta vetäytymään rakeenmuo– toisesti valaistuun piiriin. Koska vene liikkuu eteenpäin tulee kartion leveys kustakin kohdasta veneen etupuolella SXSfiSSS kapeammaksi, niin että kalat tältä kohdalta, niiden pysyteiiessä valaistussa piirissä,tulevat lä– hemmäksi toisiaan ja, sinä hetkenä Jolioinka vene pääasiallisesti on niiden päällä, tulevat ne vedetyiksi kousan avonaisen SXSÿ etusivun rajojen sisä– puolelle. Lamput JS V pvat paraiten siten asetetut, että kousa ei ole va– laistu säteiden sattuessa veteen kousan etumaisen pään seutuvilta. Sinä het– kenä joliolnka kss vene on tullut kyliaksi lähelle kaloja jotka ovat välit– /ft2' töffesti sen etupuolella niin että valo Joutuu sanottujen kalojen ulkopuo– lelle, tulee kousa välittömästi ympäröimään ne ja nliâen pftlspääseminen käy mahdottomaksi. Tällä tavalla vetäytyvät kalat suurelta alalta yhteen lähenevän valon vaikutuksesta ja kerääntyvät välittömästi kausan tielle, lamput V voidaan sovittaa eri kulmiin tai voidaan ne'siten sovittaa että niiden säteet ris– teyttävät toisensa jotta säteelle saataisiin aita suurin hajaantuminen Ja leveys– Tämä tapa suunnata kalat veneen toiminnan piiriin muodostaa paran– netun menettelyn kalastaa öiseen aikaan. Patenttivaatimus. 1. KaJastusvene, tunnettu siltä että se on varustettu aleslaskettavalla kaloja keräävällä kousalla muodostettu suljetulla pohjalla ja on läpeensä ¦jäykkä, sekä välineillä pyydystettyjen kalojen siirtämistä varten kohtaan laivan sisäpuolella. 2. Patenttivaatimuksen 1 mukainen vene, tunnettu siltä että kaloja ke– räävä kousa on pohjasta suljettu ja varustettu lävistetyillä seinillä, //// läheten toisiaan taaksepäin menevään suuntaan. 3« Patenttivaatimuksen 1 mukainen vene» tunnettu siltä että siihen kuu– luu »laakin yksi aluslaite Joka Joutuu kousan etumaisen pään ulkopuolelle ja kuljetettuna eteenpäin kousan avulla Jotta kousa tulisi estetyksi va– hingoittumasta Joutuessaan uponneiden esineiden tai epätasaisen merenpoh– jan kosketukseen. if. patenttivaatimuksen 3 mukainen vene, tunnettu siitä, että siihen kuu– luu pyöräke yhdistettynä aluslaitteesen. 5. Patenttivaatimuksen l mukainen vene, tunnettu siitä että siihen kuu– luu välineitä nastoissa liikkuvan kousan vastaviiputusta varten Joina käy– tetään painoa Joka on toimivasti yhdistetty kouaaaa Ja sovitettu lui– sumaan ontossa mastossa varustettuna sisäisellä kulkutiellä avonaisena alapäästä mereen päin, Jotta senkautta, Jos paino sattumalta irtaantuisi, tämä paino voisi pudota mereen vahingoittamatta venettä» 6« Patenttivaatimuksen 1 mukainen vene, tunnettu siltä että siihen kuu– luu useita venerunkoja, Joiden väliin keräävä kouaa on nastayhdlateen avul– la kiinnitetty, Jolloin tämä Jälkimäinen on säännöllisesti upotettuna vedenpinnan alle. 7» Patenttivaatimuksen l mukainen vene, tunnettu siitä että siihen kuulu välineitä sovitettuna veneesen Ja vedenpinnan yläpuolelle Jotta kaikkina hetkinä voitaisiin heittää viuhkantaeainen valo eteenpäin vedenpintaan määrätyn etäisyyden päähäß veneen etupuolelle tarkoituksessa

saada kalat vetäytymään veneen tielle Ja samalla valaista sen kulkutietä. 8. Patenttivaatimuksen 1 mukainen vene, tunnettu siitä että siihen kuu– luu välineitä sen laajuuden rajoittamista varten Johon verkko tai kousa on upotettava. 9. Patenttivaatimuksen l mukainen vene, tunnettu siitä että kousan sei– nämät ovat yhdistetyt useista osastoista tehdyt kalanluurangontapaisesta verkkolaitteesta, Joista kukin osasto on varustettu sivusuunnassa ja taak– sepäin Johtuvilla etäisyystangoilla. 10. patenttivaatimuksen 1 mukainen vene, tunnettu siitä että siihen kuu– luu välineitä yhdistettyinä kousan etumaiseen päähän Jotta se estettäisiin kaivautumasta merenpohjaan kun vene on matalassa vedessä. 11. Patenttivaatimuksen 1 mukainen vene, tunnettu siltä että siihen kuu– suurten luu välineitä kalojen automaattisesti tapahtuvaa leikkaamista varten nii– den pidättävän tehon estämiseksi. 12. Patenttivaatimuksen 1 mukainen vene, tunnettu siitä että siihen kuu– luu välineitä veneen kuietusta varten sen pituus Ja sivusuunnassa, Jolloin sanottuina välineinä käytetään Järjesteltäviä kaksoissilplpyöriä. 13– Patenttivaatimuksen X nuhainen vene, tunnettu siitä että verkko– laitteen elementtiin kousussa Kuuluu jaettu tanko jonka osastojen väliin useampien lankojen päät ovat yhdistetyt, jolloin sanottujen lankojen suu– remmat osat Johtuvat tangon reunasta yhdensuuntaissuhteessa Ja vinossa suun nassa tankoon nähden, kuin myöskin välineet lankojen kääntyvän liikkeen estämistä varten tangossa. 1. Tapa kalastaa patenttivaatimuksien I–13 mukaisella veneellä, tunnet– tu siitä että voimakkaasti valaistaan määrätty pinta–ala vedessä valoläh– teestä joka sijaitsee vedenpinnan yläpuolella, minkä kautta kalat vetäyty– vät siten valaistuun, vyöhykkeesen, että saatetaan valaistu vyöhyke liikku– maan eteenpäin ja samaan aikaan saatetaan toimintaan kalankiin– niottovälineet vedessä valaistun alueen takana. Iyfceck Ocean Harvester Co., inc. r, – * 4. IOfIBUteslkaierafru and veneiaaae. an object of the present invention is a fishing boat and it means improvements in fishing activities and instruments. The main purpose of the present invention, although not exclusively, lyhykkaeisyydessae can be

summarized as follows: 1 To develop improved devices of the ship eteenpaelnkayttoeae for both the forward and lateral direction, of the ship as well as improved devices ohjaamls for these things, the operations. 2 means the fish collection of the ISA ship's path and its transmission on the deck on which the instruments on.edelleen connected to the means of transmission for the prevention of clogging. 3 power supply or the screen bar an improved structure, which means the fish collected mainly drawn up, which the AC adapter or the casing is constructed in such a way that it generates the least resistance to water flow in relation to the eyes or holes in said network device or Z and 5 vaelpaessae; and k means the fish collection of tools immersion depth of the regime, and tools combined with kalojakeraeaeviin instruments so that their tip should be prevented from digging into the bottom of the sea when operating in shallow in water '? "Furthermore, based on a feature of the invention, the improved procedure ka–loading at night, which is based on fish ISMAEaevetaemlseen using a strong seeker of light in the boat as a front vyoehykkeesen And in its path, collecting hours fish always possible to build in accordance with what the boat is traveling forward, and thus collected in the raising of fish in the boat. present invention further features, other than those listed in the inyoeskin its advantages will become apparent from the description here below, made in connection with the accompanying drawings. in the accompanying drawings, describes a variety of practical tote uttamismuotoja the invention, but their structures are assigned to Held–for–only illustrative of the invention and its rajaplirfcjae determinant. Figure 1 is a fishing boat who sivuoeievatsioni the invention. Figure 2 is a high level of it. Figure 3 is a bottom plan boat, shown in Figure 1 Figure 4 taken from the rear end of the boat elevatsioni. Figure 5 is a front elevatsioni, which shows the fish collecting means for hull and the upper part of the plant. Figure 6 is a cross–section through the vessel, pystysuoralstasossa, taken along the line 6–6 in Figure 1 Figures 7 and 7a are concentric cuts in the fish collection of instruments pa–ft r / observed as increased beta–held form in Figure 7a presentation of the front portion of said means, at the same time when ill. 7 shows a portion of the rear seems, said in Fig. JfiS 7 is an enlarged scale, a greater clarity to achieve. is to be understood that FIG. 7a is shown in Figure 7 Extension indicated structure. Figure 8 is an enlarged special part of the section line along the lo–lo in Figure 7a. Figure 9 is a similar special section line 9–9 of Figure a Figure lo is a special plane from a network or a fish bone motion of the screen element form, which I preferred to use, and makes the smallest resistor in the path of the water through. Figure 11 is a view of the lo–looking description, indicating a somewhat modified form of kalanluurakenteesta. 12 is shown in Figure 11 elevatsioni addressed to the structure. Figure 13 is a fragmentary sectional addressed in Figures 1–6 the ship, said section being taken along the line 13–13 in Figure 1 Figure 14 is a pltuusleikkaua of an stems, taken along line 1 H 14 along Figure 13 Figure 15 is a section along the line 16–16 in Figure 3, showing some of the received silpipyoeriae front elevatslonissa. Figure 16 is a section along the line 16–16 in Figure 15 Jixi Figure 17 is a plan view of one of the bars to get an external,'s who are used to support the kalojakeraeavaet tools. Figure IS is a special segment cutting through ynden siipipyaeraen, kuteo along the line 19–19 in Figure 15 Figure 19 is a bottom plan view of a single boat hull, discloses using novel features of the present invention "Figure 2o is essentially concentric, vertical section indicated in Figure 19, the boat through. Figure 21 is a front elevatsioni in Figures 19 and '2 No addressed to the water medium. Figure 22 is a section on the line 2G–23 finishes in Figure 2o. Figure 23 is a cross–sectional view along the line 23–23 in Figure k2, and Figure 24 is a section indicated in Figure 23 looking, but showing a modified form of the structure, connecting the ship's wings. reference to the drawings showing a number of ship hulls, asetettui as yhdensuuntaissuhteesen to each other, the side sivussahtelsen cover B through which the cover is because all frames over and extends paraiten somewhat sideways, I8ae the bow and stern side, as is clearly shown in Figures 3 and 6 All the frames are built equally and have the general structure, as shown in Figures 19–23. Each frame is provided with a substantially straight, vertical sides, but it is usually a small boat shape concentric, pituuslaepileikkauksoessa. Frame side numbers are skkljyrkae3tl ales and end emaepuihin essentially a horizontal, being under practical point of view, taken through the entire body length. The internal cutting such ones formulation thus forming a body having a lower 3ivu a longitudinal direction of the gutter equipped as in the relatively shallow groove at the bow and stern, such as paralten shown in Figures 2o, 21 and 22, and a relatively low groove midships, as shown in Figure 23 jQhtuon back of the boat nnja each of the four–ke3klemaepuusta kaytstaeaew pavaecHbttts, jotai supports the lower end of the standard euutoeiiaula cx, peraesinpylvaeaen Due to the upward and forward, and is mounted for swiveling the back cover.. It is essential that these two calcium–buting to the rudder either one or the other direction and X and H iS days and at the same angle ss is operating in parallel relationship at all moments, and so that the EV–visi paralten confident they are connected to each other between their ends by means of a rigid nivelSIT. If several frames A is set to each adjacent as shown in Figure 3 is niveTV * of dissipated across all of the rudders so that when one rudder is in operation, are all jaeieilae the same time, my revolution so that they remain in parallel relation to each other at all times. Available in different ways with the rudders can be activated, but mi as I prefer to use it as a general reconciliation, which is shown in figure 3, where the rudders to your shop available on ropes or chains g2 is used to attached my / eleesen c1 And due to the boat's stick saatettavik– si activities suitable guiding means. an improved trough body equipped with the present invention can be used to yksrunkoisessa or useampirunkoisessa the boat, and in all cases the blades can be called individually placed in circu one or more of the potkurislipien I–c5 using suitable compounds used, such as is shown in figure 2o. When the trough body equipped with ykaeirunkoisessa the boat structure is used in the designed for use in well–aaltoilevas in the ocean, the body may be a ship equipped with wings a1, as shown in Figure 24, though these may be omitted, if desired. When the number of frames described model of nozzles is arranged under the lid, as shown in Figure 3 and 6 can be called to your shop blades may individually or independently by means of propellers as described, or can be used to further drive means. I think this is according to the invention used with good boat speed and are, therefore, used using additional tools, so that the desired speed can be achieved. This instrument is shown with the number of impellers E form, which one y * 3l series has been adapted for a row with the limit advertising in between the hulls, Tuten shown in Figure 3 for each number of these impellers can be fulfilled, but, the presentation in relation to ogoi used two rounds of ammunition, mainly due to bow to stern, the two housing between the pair while the other is adapted to address pairs of seaweeds jaelellaeo between nautoparien. The use of multiple impellers, each other in the back, so that the whole series He has to bow to stern, YL and SlXX would be after another the following impellers viewed from bow to stern kept moving the

ever−increasing speeds. That is, if ensimaeiaen slipipyoeraen to do loo will be the second wheel to make a greater number of thread−tion, for example, Joy tal 12o And the third slipipyoeraen should do 13o, to l4o: Een Etc. tfaemaet patterns are, of course, merely explain, but used them to make the action selvaeisi, seeing, If all the impellers affected at the same rate, would such a rapid water to pour into between frames, fitted with ensimaelsellae five rotating blades in the perceive;, on wheels should not be any Special Parts prefer to be held in the form of impellers shown in Figures 15.16 and IS. Each impeller D is equipped with a hollow hub d, prepared in a hollow, air−tight cylindrical form By whom Due for use in dA shaft, stiff kiinnikiilattuna ends of the hub. The hub opposite ends are provided with flanges d2, and due to the radially external perimeter of the hub circuit is used d5 leaf blade, as shown in Figure paralten S, wherein the opposed ends of the leaves are paralten rigidly assembled to the flanges d2. Used for the X axis d1 is arranged for pivoting movement of the two arms E, through which the second ends Due to kaeyttaeakseli E (kat3Q in FIG. Of 15 and 16). E Kayttoeakaeli adapted to be used suitable machinery of one or both of the abutting frame, and the rotary motion is transmitted to the driven shaft kaeyttoeakseiista E d1, the gear 1 2 e aetyailae and a co−operating tooth chain by means of e. This structure when using noticed that since slipipyoeraen hub d is air−tight, it's going to float, and to prevent the impeller from sinking utterly under the water. In practice, is mainly due to only half of the wheel under the water surface, and fitting the wheel, rotating shafts e, may be called at all times to adapt to the bike itself, turn the water surface, which clearly changes the boat, the fingerings. It may be on full alert can sometimes increase the impeller D batches surface of the water, and for this purpose as paid ii d, lifting the lower hinge wearing used for the shaft d * due to the upward through the deck of your boat B. Using a bolt dy / v / it.. O what works in connection with the joint d and d is connected to its guide, to the impeller, slttenkun it has been elevated as necessary, to prevent from getting into before the stipulated S item below. In order not to damage the impeller hylkytavarolsta, ice, etc. because of angle j ohon relates the input shaft E paralten tubular sleeve i via puts is rigidly fitted to a number of protective ribs f, which result from a short distance yhdensuuntalssuhteessa swivel arms with respect to e and, in relation to the part of the jaeleilaeoievaan ulottuvaisuutta, adaptive slipipyoeraen fUXfiiaeSSft the external periphery of the circuit, as shown in Figure 16 is due to the rod r1, all of these protective Through the bars and is anchored at its ends pivotally to the arms so as to maintain the slats in proper protective position in front of slipipyoeraen. Iiiinmuodoin olkoompa impeller at any operating position kaeytetaeaen'sanottuja ribs varjeluspoelkkyinae always protect a wing of the leaves in C? from damage. It is often necessary to be able to use the paddle wheels are already the kind described parittaln, and conduct a mince and considerably time to get this address is indicated in Figure 15, in which two sllpipyoeraeae D is arranged beside each other in a common driven shaft d1, which may be my revolution yhteiaeen drive shaft S, in which case a simple suspension members used to stay, understood, both wheels in the raised position, the rabbit is desired. Both blade wheels adapted as shown in Figure 15 will have an impact on individual manner and substantially in the same way as any single wheel, except that the more forward using the force will be generated impellers used Adjustment can be transmitted by the desired manner of any suitable axis line or the immediate compounds by means of several motors or machines, but it is not necessary to show these private parts, seeing Equipment for the operation of the impellers is well known and form no part of the present invention. boat dock with In implementing more of the already discussed laj1311−la trunks to all the parts of which are listed below in fishing activities for the implementation of the boat to make sas somewhat difficult to be handled, and is considered to be remarkable, allowing use of a less costly means of boat handling heipoittamista for tight spaces. For this purpose, I use a number of £ s sivupotKureita G fore and aft, With the rank is indicated as in Figure 3i »inka by yfcsityiaosat are shown in Figures 13 and 14 Page impellers G may be paraiten operation of the two; through it that they are within a common driven shaft g, which is supported either pushing movement of the pivotable arm g1 pin with the compound attached to the to the drive shaft G2, due to the bows and A and aft, and which Used for frame the appropriate machinery. Note transferred meets the axis G2 inflatable atseliin g of Hammastetaun g is used, and the impeller is standing or k may be necessary to lastea g of mud compounds of the joint by means of signals corresponding to full forward of the impellers D niveiyhdlsteitae d. Sivusiipipyoe volumes 0 differ tuitentin ratenteeltaaue impellers D in that the teat previous supplements paralten is produced only four newspaper Tuten shown to changing 13 so that, when the blade wheels vaitutusta not desired, they may be increased up to yt3i the leaves of faults impeller due to the tannes3a of the car Through, at the same hour, both next to the leaves that maintained tiinni Tannen underside. In this way, impellers G can be lifted out of the water, so that they do not prevent the entry of the boat ahead of its regular operations. Kultentin known not want to be put on a boat to telatalle impellers G lastea down to a working position in water and may need to iron boat in Appendix taeaentaemistae for lateral telatal−le. An instrument for filling the boat sideways inyoestin transmit a second task of the boat taerteaen taeytaennoellisessae operation. If the boat tultee ahead and talaparvi appears relatively close to the boat, but in the lateral direction of the boat arrived at the direction of, is that taerteaetae in the boat can be quickly sideways in Appendix 2, the tartoitutsessa that it immediately or headlong upon talaparven. As a muddy tetee boat With this instrument can be mahdolllsetsl lateral annexes to be achieved this result, it is thus clear that the instrument semmoinen full ilaISX velocities of the other elements, so that it can be taeyttoetelpoisuus with respect to the combination of totonaisuudessaan. paralten As indicated by the breeding 1−4 make up the front of the boat and arranged to less than 1 kousa Members having essentially the art of straight−shaped funnel shape, larger open end of the ply is located on the front − side. Kousalla l is Tuten shown piirustutsissa skeletal shape which is adapted to seneesen pittien the joints J of jaeytaeaeti combination Hondasta tehytseen ("j" which is caused taatsepaein under the boat and taeaentyy taeaentoenaatassa both uitoisten runtojen flank of the feet, Tuten From j1 power tea−tiia yeast rear side tohdalta, Tuten paraiten indicated by the breeding l, 3, so that kousa may be submerged or immersed in a smaller or to a larger depth of turning said tousa joints J order vaituttavat pin J1 round. kousa is regularly hung, the appropriate depth of at several nostaviirPltoeygitn I, the measurement of made toeysipyoerien> 5 strains Dual boom K, as paraiten shown in Figures 2 and 5 Bars maintained concerned, etaelsyyssuhteeasa ultopaeistaeaen also undermined the distance from the hold of compound T through, and taeaehtyvaet the slseiumlss at the ends of pins, Tuten t1 tohdi3ta, boat paeaetanteen. Said * '− A support beam ygiYggf myestin lateral folding liitteesen.naehden sivutufcien t2 through the ends of booms tlinnitettyinae from the front ends of the foremost and myostin taeaentyen pin paeaetanteen

the feet of the boat, Tuten TOH–s dasta, wherein taitti pins T1 and T are in direct in the line, so that the boom tuuluvine components will be free taeaentymaeaen common at3elin around (see tuv * 1 and 2). ¥ lesno3tavat toeydet i tultevat teysipyaeristae i1 yles–up after the action of a hollow mast L–peak, placed primarily a test of the ship tohdalie, and called lift ropes are equally jaoitet–in to the nucleus of the masts, Tuten address the changing 2 hollow masts 3XS £ 3AE2XXI £ X is Yjfy stay straight derived from I remain in balance weights for adapted for, Upon which ytsitylsten toeysien heads are tiinnltetyt. parts of the balance sovitutsen tatla requires very little power in May–san for lifting the full lines changing one assigned to the position where e is immersed in water, piltutetuilla lines indicated the position / tousa which is raised from the water * This can be in many aitaanaaada manner, but, tuvaamlstartoitutsessa, addressed to the ends of anne's etusivustassa signature style vertical column m properly fixed, Tuten tohdas–in m1, and tannattaen peaks poittipalttia m2, said a device is, in fact, make up also undermined nostoranan like ply using tousa can be raised or lastea full m vaelitytseliae Tuten address the changing residues toeydet 5 years? amount may be using, or is likely to tultea suitable hoisting drum * Kummassatln tapautsessa tousa can be raised or lastea mind the mud filling the relatively flygla power–the power of "As this has been said before, it is tousa luurangontapaisesti hung and wide–open parts of the vahvitteiden, columns and other ratenneosien bhk in between are closed verttolaitotsien or eye–lets, let the measure of water tultemaan Kouaan through the walls, but to prevent the teraeaentyneiden–LIGHTS polspaeaesemisen «I have found pittaeaitalsten toteiden using the well–known cross or did you smoke tulteva eye which is usually filled with a taiavertoissa delivers high vastutsen water laevitsetultuun, appearing in relation to this the fact that the kind of stuff verttoa only to be pulled in the water by filling a soft–by power * If the quality verttoa meet the K $ jjcIMX32UEL described tousassa, cause it is such a one vastutsen that ol–v si impossible to meet the boat in the water SXI2 and for relatively a high speed, which is edutsi operation, and I am accordingly of long–term experiments jaelteen tetsinyt improved verttolaltteen which forms a part of the invention, Tuten shown on the drawings. verttolaite This is a normal tween low bone naetoelnen, Tuten shows the special parts of the huts addressed lo, ll and 12 * Verttolaite N, Tuten shown in Appendix TASIN or jietaanisest.i vaetipyoe–hautta and leading figure in the boat TH lo, formed by attaching the wires to the ends of the two one–way strip, between n1 and joining or attaching the strips together called bolts or rivets n2 using the ends of the wires on be for the purpose of fully fitted between the strips. Strips upper edge ~ of sodium are provided with inclined grooves of, and these wires portions, which Deriving the said edges of the outer sides outside the bending of ales and si3aean the said splines so that when the structure is complete, the message continues to be a structure is provided for an equal fish to the backbone other. The inclined grooves strips n1 risteyttaeen pass through each other, so that the yarns which due to the strip will pass through the grooves as opposed–specific yarns resulting from the toiaen the strip through the grooves, and hence making mahuolliEueai strips Atonement as close together as possible, looking at the that strip the threads do not in any way agree with the other threads. page, top and bottom structural elements kousassa I developed, such as is indicated as in Figure 1, each of the conductive yarns adapted in such a way that they are caused vonosti back as shown in Figure 7a. In this figure, the parts marked with an indication of the S drawn in Figure lo accordance with the special parts. It is, however, found out that the kind of stuff the structure can not be used advantageously in the corners and are, therefore indicated in the figures 11 and 12, the angle structures in which the AC adapter o have been prepared yarns No 3ido–S research two strips o1 between the riveted or combined with each other as before, but each lamta o is due to the lateral and downward to the edges of the strip in connection with which it works and is bent at right angles, mainly. Otherwise, it is provided together with the operating strip the o2 uurteesen o; the yarns are firmly attached to the same nottujen between the strips and the angle kousan structure. Figure 7a elements which are in this way drawn indication marking 0 Minor modifications of SBfigaueiXgXXXASXSgX yarns matching the strips between is used to kousan different parts of the practice of the invention vaihteievissa conditions Seeing it is sometimes necessary to allow the wires due to only one direction, such as kousan the foremost edge of Figure 7a, wherein found in only a few of the yarns at the indicated reconciled to the front onto a column, wherein these wires J and Hy Conducted in only one direction "When uaeaeffipTaetficaelaenluuvaelppaeelementtej s • seitrtgfrfcy and r * oataai puutta are connected as shown in Figure 7a, all of the threads due to the oblique taaksepaei and yarn–free ends of the element free from the wires adjacent to the ends of the yhtymyksestae abut the element, no sea grass or other it–like substance will cling to the wires, but will it kousan fast an the flow of water through the pass through wires at their ends and MF JS curtsy to float away. Kousan side, top and bottom surfaces are prepared as above, so that the minimum resistance to flow is formed kousan through the water, and without kousan, however, the walls are drawn up in such a way that the fish which pass through the front open end of the via may not end to the polarization of the kousan through walls, but are Guest access pass to an open rear end. kousan In collaboration with the rear open end is used to transfer tovyoetae P at him passes through the lower end of the leader around the p Loader arranged as kousaan, and whose upper end passes through a similar Loader p1 paraiten arranged around the stern side. This led the transferor pyoeraekkei–lp pp IIIIIKS the distance between the intermediate rolls maintain your pc using the adapted sivujohteislin p kujein that are placed on your side of Lee's transporter. Siirtaejaevyoe, the better to be held in the form of prepared two ueaaoefrfcomasta tooth chain p, which passes teeth with chains ylipyoeraekkeiden p p1 opposite paeisaa, said C ffiammastetut chains are connected by rods p7 using the form on the front surface of the * Pyoeraekoe p1 may showroom and, combined with teeth may be equipped with a chain, and the movement 3XXSX shifter. Cydyst.e the secrets that kousaan fill in and pass it through the open rear end user may be moved upwardly and over the upper end of the second transfer and fall to the ice–Q, prepared in the same manner as the transporter P liilckeessae and held in the same way, transferring the fish percent Leaves B A bit on the main deck aft side, and the position of the boat crew Jonsa KSZXaeliaeaeaeXialXiliaxiaeX SS may sort or another way kaesitellae.ne. In order to fish up the flow of the assignor could not paeae9tae from this site, are called the transferor pages with the network device structure, which is kousan described with reference to the network device looking, because However, SMSX1SJS.M. k.ousa has been prepared raised and lowered, is anticipated to see, the AC adapter to the sides transferor paraiten prepared in accordance with vertically–ales laskettavaksl into such an extent that it does this, kousan movement possible. or guides SivukisXot g? are rigidly secured to the front at lower ends of the kousan body frame, and are taaemmista na3tayhdigteessae external ends of the axis of which is worth Loader p1. Accordingly, the Lead

kousan pivoting movement around the pin–called slvukiskojen * And they combined the transferor, p * 5 simultaneous samallaiseen to my store. Each side rail $ £ £ £ X 5 wt ends of the nastayhdisteessae between the second upper rail verkiolaite3ivun R. rails due to the H kousan the rear end as shown in Figure 7, and are either paraiten joia material floating on the water surface, such as wood, XI,? w or are suitably equipped with the pontoon, so that they will regularly increase the water surface. and R sivuki koihin, and the ends of each slot is by means of the pins pivotally connected to the lower Jcisfcot Which R 1 are combined together near their free ends to the upper articulating rail R by means of the pressure jinyhdisteen the group consisting of RliSiai Members And r.r1 rt (see FIG. 1 and 7a) * arising from the diagonal threads corresponding to the threads and o, supported by the rails R, R 1 and members r, r *, and r 2 as shown in Figures 1 and 7a transferred to the user's pages for closing the substantially lower half of the relative, AC adapter sennaekoinen That is what is explained in the kousan–side indirect RTD action. Assignor upper half of the folded sides or * by threads derived from a member of the S through a mobile pin to the upper end of the hull, such as line s, and its lower end R of the ylaekiskonn, such as kosdassa s1 * This structure is apparent that, since ylaeklsko floating in the water, wire mesh which is hung on the joints and rails, such as has been described, will regularly be applied to the kousa is aiespaine / as in the embedded position as shown in Figure 1 «, however, the upper kiskonveohotua limited restraining members S2 (see Fig * 1) so that the lower edges of the walls sivuvaelpan will not be raised enough to aid in order to be pulled out of the guide rails and to let the fish out of the ae and saaeXXaasSiaeXAE formed via the menu * When the kousa is brought dashed line position shown in Figure 1, the transferor will sivuvaelpaenseinaemaet alespaein help each other, because the transferor has raised, in a manner which will be described in more detail below. when working in shallow water, it is possible that the kousan the foremost lower edge may have contact with the seabed, and if you do not instru–ments used to prevent kousan the front edge of the sisaeaenkaiiva \ itumi and t and, should it be in no doubt as a result of it would go broke. For this reason, it is kousan with a forward edge of said arms attributable to T, which is adapted to large wheels or rollers drawn in to pass on along the sea bed and to keep the free end of the front kousan the connection, number of nights–except–kousan the front lower edge provided with studs attributable to the forward moving currencies s * with fingers (see Fig. 1.5 and 7a) With vapaat'paeaet are upturned to form a suspension for merenpohjakohonnuksen ylitaemenon easier. Each finger is equipped with a bicycle t2–called finger flow helpoittamisekei, and side to side and back kalanluuverkkolaitteelia resulting from the activity of which is to prevent the fish kousan Avoid contact with the lower edge under and order their Conduction kousaan it might be more confident. Kousan runkokeueys with a plurality of inwardly arising from the U knives with blades made very sharp. When using these knives come to fish, kousaankirjaimeilisesti After being cut from kappaleik–si and the SS to paloitetussa state shifted the ship's deck using the assignor. Long–term experience in the fishing and fish–methods of research have led to the discovery of an improved way to fish at night, and I will do it, and to tailor your boat through one or more strong etsijavaloja V * {see Figs 1 and 2), which are arranged in such a way that the rays of the play – tion on the surface of the water and the boat in front of it on the road 'where the rays of light thrown forward, spread them in a way that the beam is wider than the always accord–ing as it is due to kauvemmas en front of the boat. Dark Yonna this beam may be due to a number of fairly bright a mile ahead, the lighting as the water level at a distance r from akeeflgfi * €> tse4? Iti.41–ia–lola, the tip of the boat is located oere * It is well known that the fish comes into the light at night and are, therefore will attract the light affects the retreat rakeenmuo a rule–lit subject. As the boat moves forward will be the width of the cone from each point on the front of the boat SXSfiSSS narrower, so that the fish in this position, the pysyteiiessae lit circle, come closer to each other and, at the moment Jolioinka boat is mainly on their site, they shall be dragged into the open kousan sxsy within the boundaries of the home page – side. A JS lamps pvat paraiten set in such a way that there is no kousa illuminates the rays in the event of a front end of the water kousan seutuvilta. That het–Kena joliolnka see page boat has kyliaksi close to the fish that are mediated / ft 2 'toeffesti its front side so that the light Will face of said fish outside, will immediately kousa to surround them and nliaen pftlspaeaeseminen impossible. In this way, the fish retreating to a large one in the converging influence of light and will collect immediately kausan the road, V lamps can be adjusted to different angles or ne'siten can be adapted to the rays of the risk teyttaevaet radius of each other in order to fence the largest dispersion and width–to–head this way fish in the boat in subjects to form an enhanced procedure to fish at night. Claim. KaJastusvene 1, characterized in that it is provided aleslaskettavalla fish kousalla collector formed by a closed bottom and is thoroughly | rigid, and with means for the transfer of captured fish to the inside of the vessel. 2 as claimed in claim 1, wherein boat, characterized in that fish are de–predominant kousa is closed at the bottom and equipped with punched walls; / / / / to converge in a direction backward. 3 «according to claim 1, wherein the boat" well–known in that it comprises "Laak, a ship that comes into the device kousan the front outside of the head, and shipping on kousan To ensure that the kousa should be prevented va–hingoittumasta When faced with sunk objects or the uneven seabed contact. If. Patent boat according to claim 3, characterized in that it comprises in combination aluslaitteesen Loader. according to claim 5 l of the boat, characterized in that it comprises means of rolling pins for kousan vastaviiputusta by weight is used for each operatively connected to kouaaaa and adapted lui–up of several cars in a hollow mast equipped with an internal passageway open at the lower end of the sea, To senkautta, If the weight is accidentally detached from, this weight could fall into the sea without harming the boat »6« as claimed in claim 1, wherein boat, characterized in that it comprises a number of boat hulls, between which a collecting kouaa is nastayhdlateen by means of the attached which case this latter is periodically submerged under the water surface. 7 »Claim l of the boat, characterized in that it include means adapted to your boat and the water level above the order at all times to throw viuhkantaeainen light on the water surface a predetermined distance into your head the boat on the front end to get the fish retreat to the boat's path and at the same time shed light on the route. 8 according to claim 1 boat, characterized in that it comprises means for limiting the extent to which the network or kousa is immersed. claim 9 l of the boat, characterized in that the walls of kousan are connected to a number of departments made the fish skeleton resembling a network device, each department is provided with a lateral and backward resulting from the distance between the rods. 10 claim 1, wherein boat, characterized in that it comprises means combined with the front end of the kousan order to prevent it digging into the bottom of the sea when the boat is in shallow water. 11 as claimed in claim 1, wherein boat, characterized in that the hot–sized fish bone tools for the cutting of the automatic and their retaining power protection. 12 as

claimed in claim 1, wherein boat, characterized in that it comprises means for kuietusta boat to its length and lateral direction, said tools used kaksoissilplpyoeriae be organized. 13 – as claimed in claim X runny boat, characterized in that the network device element kousussa part divided rod which compartments to more ends of the wires are connected to said wires greater than stated parts Resulting from the rod side of yhdensuuntaissuhteessa And the oblique direction direction the rod in relation to the also means for pivotal movement of the wires for the prevention of the rod. one of claims 1 to fish Type I–13 in accordance with the boat, characterized in that the highly illustrated by the specific surface area of the water from the light source which is situated above the water, through which the fish are withdrawn from under the illuminated thereby, vyoehykkeesen that may be illuminated zone of movement – forward and at the same time activating the Kalanke niottovaelineet in the water behind the illuminated area.

Abstract:
A safety motor vehicle with a front vehicle part (260) mounted so as to pivot off about a horizontal transverse axis (263) on a rear part of the vehicle (261) and which in the event of a sharp braking process converts the kinetic energy of the vehicle into a raising of the centre of gravity of the vehicle and thus causes the front axial load on the carriageway to be increased.

Abstract:
Source: US5033522A An anti−skid device for a vehicle is automatically positioned by securing members 50 which cause the device to pass from an installation position to the operating position in which an anti−skid assembly 70, such as a snow chain arrangement, is arranged on the peripheral surface of the tire 10. The anti−skid device comprises a principal annular section 30 fixed to the anti−skid assembly 70 by arms 40 and arranged in a manner such that the securing member 50 can be fixed to this annular section 30 and can move freely over the circumference thereof.

Abstract:
The invention refers to a method of routing (that is setting–up the vehicle's course towards a predetermined destination), navigation (that is estimating and verifying the vehicle's position, on the road network at any instant and guiding the driver on the course and manoeuvres he has to follow), protection (that is checking the vehicle's condition and driver's physical status, controlling the driving conditions and the proper performance of manoeuvring and warning or interfering in case of emergency) and guidance (that is supplying information of any kind which fall into the driver's interest during driving), which method is characterised by the provision of a number of services to the driver in order to accommodate his/her needs during vehicle's movement (routing, navigation, protection and guidance services) using a limited number of devices and only by processing their indications, which devices are installed: 1) on–board the vehicle (measurement and protection devices); 2) on the driver (information devices); 3) on the surrounding area (guidance devices), and which devices are connected with and controlled by a data processing system which is installed on–board the vehicle, in such a way that the processing system, upon receipt of the devices' indications, based on pre–programmed criteria as well as on data stored in its memory unit, to identify the road network and the prevailing conditions in every spot (traffic signs, locations and buildings on both sides, topography etc.); estimate and verify the vehicle's position on the road network, at any instant; identify the vehicle's condition and driver's physical status; identify driver's immediate and future needs on protection and guidance, and based on these elements, it provides the driver with a number of services concerning the routing, navigation, protection and guidance requirements.

Abstract:
Source: GB412599A 27289/32, 35636/32, and 18703/33. [Classes 17 (i) and 17 (ii).] Heels.–Relates to shoes having heels built up of superposed lifts which heels are shaped to final form around their side and rear surfaces before they are attached to the shoes, and consists in methods of making wherein the heels are first trimmed to a predetermined shape under templet control, then, if desired, scoured under templet control to ensure retention of the shape to which they have been trimmed, and, finally attached. The soles do not extend to the rear end of the heels, and the rear end of the sole and the attaching face of the heel are shaped to complementary form only lengthwise of the shoe, the wings of the rear end of the sole being trimmed flush with the sides of the heel after attachment. To shape the attaching face of the heel, a cutting tool is used which operates simultaneously across the whole width of the heel and forms a ledge adapted to support the heel end of the sole extending across the full width of the heel and located below the general plane of the periphery of the attaching face of the heel. The heel is first built up and compressed, the dies being shaped to form a flattened peripheral rim at the attaching face and a recess at a predetermined position in this face to facilitate positioning in the trimming and scouring machines. The heel is then trimmed in a machine such as that described in Specification 411,448 and scoured in a machine such as that described in Specification 411,143, [Group XXIII]. The attaching face may then be shaped to conform with the bevelled end of a sole in a machine comprising a driven cutter 1035 shaped as a frustum of a cone and positioned adjacent to a work–supporting plate 1037, inclined at some 16 to the perpendicular to the axis of the cutter. The plate is adjustable towards or away from the cutter by an adjusting screw 1045, substantially in the line of the axis of the cutter by a screw 1053, and is clamped in adjusted angular position by a bolt 1057. A pair of fingers 1061, 1063 have hooked ends for engaging the breast edges of a heel and are mounted on stems 1065, 1067, respectively, formed with rack teeth engaging a pinion 1069, so that the fingers move simultaneously inwards towards each other or outwards. To adjust the distance apart of the fingers, the ends of the stem 1065 are screw–threaded and provided with nuts 1071, 1073, the latter backed by a spring. A fibre block 1079 engages the work adjacent the cutter. The fingers are bevelled to grip the heel and ensure it being withdrawn laterally from the cutter when the cut has been made. Alternatively, the heel and the rear end of the sole may have their engaging parts shaped to complementary form. The heel end of the sole is shaped to correspond with the cut made by the knife 1035, but left wider than the heel. The projecting wings are reduced flush with the side surfaces of the heel after attachment, the machine described in Specification 181,099 being suitable. If the uppermost lift of the heel should be of board instead of leather, it is preferable to harden the edge surface, after attachment, by the pressure of a smooth–surfaced roller. In another modification, the uppermost lift of the heel may be skived before the heel is built to agree with a skive of some #–inch width at the rear end of the sole. Specifications 181,099, [Class 17 (i)], 278,976, 305,276, [both in Class 17 (ii)], 306,192, 310,822, 331,934, 339,935, [all in Class 17 (i)], 398,845, and 408,210 also are referred to.

Abstract:
Source: DE3103961A1 The invention has the purpose of constructing a vehicle which, in addition to its economical production and without additional equipment, is capable of travelling on almost impassable and also wet terrain and on areas of sand. The invention can be used for research purposes and also for emergency and police operations etc. With some simplifications it is possible to use it as a passenger car for normal road traffic. The two–wheeled car comprises two large wheels which are attached laterally to a cabin. The insertion and the displaceability of the driving weight underneath the wheel axle make it possible for the car, in this case, to operate or move forward; the car maintains its horizontal position constantly during driving, when braking or even when stationary. The blades installed within the wheel spokes, in conjunction with special tyre parts, likewise make it possible for the car to move over snow–covered terrain, water and areas of sand.

Abstract:
Source: US2016271905A Methods for fastening or coupling dissimilar materials to each other may include providing a first component with a first through hole and a second component with a second through hole that is at least partly aligned with the first through hole. A mixture including a first material and a second material may be injected into the aligned through holes of the first component and the second component. The mixture of the first material and the second material may expand in the through holes, e.g., due to a chemical reaction, thereby connecting the first component and the second component together.

Abstract:
Source: US5033213A An item of wearing apparel, such as a ski shoe or boot, provided with an energy source and an energy consuming device, such as a heater, and a mechanism for automatically terminating the energy supply as soon as the wearer removes the item of apparel. More specifically, the ski shoe or boot includes a shell base on which is journalled at least one movable upper element, such as a rear spoiler or a front cuff, to permit insertion and removal of the boot, wherein the boot includes a device controlling the energy supply of the consuming device. The boot further includes a linkage device between the movable upper element and the device controlling the energy supply so as to allow the energy supply of the consuming device only when the movable element of the boot is closed and to automatically cause the fuel supply to be shut off as soon as the movable element of the boot is moved toward the open position.

URT, agningen (23), –.. The present keksintoiarkoittaa A specified type snhkoe meter or in connection with automaattimekanismiat held in a predetermined position the money can be regulated "value, so that it myuentaeae saehkoeaittarin constructed through Tua rjaeaeraeae paid to the corresponding saehkopaljouden, and then jonls mechanism Au toma and cuts off the power ttisesti the flow through the meter. Kyseees the si whose support can occur one or more times after the other, all the way up to a specified maksiJikertalukuun, so that the money can be paid to a private one, or AMPI in the UAE, as soon as one's right sensu I was wed. he sisaeaenpunon means moves the body that provides a stream of closing and disconnection, predetermined distance from the position where the "body causes the power concealment, and when the meter is working, affinity associated group said body suitably in the opposite direction to that rather, jp to which it before transferred. The time after the power given to invested money to vastaana amount is thus directly verranaollioen the mobile kapituateen that said body can move money after placing. The automatic mechanism is in a known manner arranged so that the transfer can be adjusted spacy range, e o # the electric machine on a can be adjusted by influencing minute electricity price similarly ss One application form has been shown in the accompanying silicon, ** virus Tuksi for "2uva 1 shows the case the mechanism altomaat time e ss detetae seen, parts, in those positions for which they are forced when the power can not pass through the electricity meter ',' Figure 3 shows 3 € p $ eWstedest and seen the makanigm, L after each movement of the mechanism that caused ra!. Figure 2 shows a side view of the same. ? –I «?,. n–Kee flows through the meter. Money, with an opening on top of the tile and the tile matched control are deleted. Automaattlmekanlsmlin a tile L, Figure 1, money–panoaukon 2 onesaa this on the inner side of the SAE and tal plate 3 and connected to the bolt and coupler wheel 4, Which is provided with a plurality saeteettaelsiae money grooves 5, Which ylet–MENT each wheel circumference up to. These parts are known and therefore need not explain. It is only mentioned that the money spent on track switches control the slab 3 "Who is the pin 6, rely on, passing a key plate 1 through And carrying of this outside of the knob 7, the bolt and coupler wheel 4, and that after acting on vaeaefctimeen 7, can be rotated plate 3 and the wheel 4 of the arrow 1 to indicate direction in Figure 1 the same circuit fail of falling money down the drawing out of the filed of money in a container having After adjusting toelaatta 3 »as soon as the handle 7 is released, turns back to its normal

spring force, while the wheel 4 takaisinkiertyminen telklhaan preventing means 8. of a suitable fixed connection body rotatably, but not tyoentyvaestl nut 9 is set to "Figure 2, Which is fixed to one end adapted to bevel gear 10, which is linked to the phenyl kartlohammaspyoeraen with Figure 3, the shaft 12, which in the drawing is moved in a suitable manner not addressed to the e–koemittarikonelston help, when the gauge supplied. The nut 9 through the twisted in respect of its length with a threaded shaft 13, which has a central pin 6, whose alongside the part of the shaft, which mud 2 by the threads on the right side, has a square cross–section and carries the bolt and view–holder wheel 4 through which the shaft projectingly (but are not therefore lioemuotonsa–rotatably) passes. Therefore the shaft to rotate in conjunction with the wheel 4, when determining the manner described, it is rotated a given angle equal to tetun arranged through the mouthpiece, and since the nut 9 arrest or telkli kartlomainen hajumaspyoeraeyhteys 10, 11, at the same time as the. ytwiMantoaai. »« »! mint? ViKini – 3 – 4 rotation of the wheel takes place in the instrument, the mechanism levos ea, so S6u.r and in that the axial length of the shaft 13 protrudes Compatible ise, an amount suhteelinen kisrtoimiman with the wheel 4. protrusion of the shaft 13 is done ss in the right direction in Figure 2. When the meter, in contrast, is in operation, re transfer this movement to the shaft 12 and the gear–carboxylic tiohaunuispyoerae by means of a nut 9 11.10; at the same time as the rotation of the shaft 13 is prevented through the provision of telkihaka 0 reserve wheel 4, which is a result of the axial movement of the shaft 13 may already take place, which, however, in the opposite direction as before, i.e., to the left in Figure 2. These are precisely the axial movements of the exploited this occurring goal for Money Slot 5 business format (automaactikoneisto is off $ ut meter circuit) is skewed settled in, inter shaft 14 outside the head, Figure 1, one is attached to the thread on the obtained axis 15, Figure 2, Nyos which is attached to the second curved arm 16 ss This leaning against the outer end of the pin 17, which is eccentrically attached to the rotatable drum 18 to contact the second end, the edge of which is provided with a kontaktikap–paleel Ia–19 function jointly with the contact spring 20. A drum 18 acts spiral spring 21 which tends to keep the drum to lever figure 1 the position shown, in which case the contact spring 20 is erooSAE contact piece, following which the meter ignition circuit is switched off by one hundred than the pin 17 by acting on var–'I 16 holds the shaft 15 is rotated therefore, the arm 14 e.ttae slant outer end of money on said trajectory. When the money placement through the opening 2 through the thread of the combined dead bolt and the door coupler wheel 4 concerned, money, which is coupled with the wheel rahaurieta 5, arm 14 at an angle that has set the head and to rotate the shaft 16 so that the pushing pin 17 to rotate the contact roll 18 shown in Figure 3 the indicated position, kontaktikap–connection piece 19 with a contact spring 20, and as soon as the drum reaches this position, spring 27 engages under the influence of the bifurcated lever arm 22 the other end of the drum olevassaa the collar 24 into the opening 23, through which the dryer to be used. The relevant consumer can now get flowing through the meter "lever arm 22, one end of the Forms shaft 13 piten in parsing the counter–element 25, which in Figure 2 on the far left side of the axis 13 of the head 2 (> moves away from a certain distance as the rotation, the axis of which the bike 4 with met with, when 9 of this thread to the permitted angle of the number of years: iaentimen 7, and the money invested in the overhang is the impact of working., if after this, a second money, can be ac axis 26 to distance again, just as much as before the counter–support Lee 25, partnered by a contact drum 18 remains an impressive installation – tion, etc ss until finally the shaft 13 can not be pushed further to the right (Fig. 2), when s aelikoemittar etiellaemainitulla way i have been toimikelpoiseen condition of their control the automatic an apartment, taking the view that one or more investment money has made it possible to provide power until used for flow quantity through the meter, passing, is caused by the fact that the meter movement of the nut 9 circumvention through has pushed the shaft 13 so much to the right (Figure 2) that the end of the shaft 26, by pressing the mating part 25 to turn the lever arm 22 from the opening 23 of the connection, which is a drum 18 of the collar 24 in traffic as soon as this happens, the twist spring 21 contacts tirummun 18 position indicated in Figure 1, where the piece is kontaktikap 19 is separated from kontaktijousesta 20 ss Uittarivirtapiiri is then disconnected from the place, and can be re–closed only through the process of setting monetary song device and performing the rotation wheel 4, which through this it becomes possible to. As automatic mechanism involving the mode of action survives edollae, from the description, it needs to present only briefly. Ra he placed in the handle 7 is rotated by means of the wheel 4 of the arrow direction shown in Figure 1, niin.suurella angle DA? as machinery grants. Turning this wheel 4 cause the shaft 1? head 26 moves away from a certain distance only, in Chapter 25 the lever bar 22 at one end, and pass the final hump portion face financial arm 14 through which the shaft 15 and along with it the arm 16 is rotated so that the latter arm to turn kontaktlrunmun 18 impressive position in Figure 3 Mit– story is then toimikykyiseasae mode and contact the drum to hold the lever arm 22 into the slot 23 of infection until the shaft llnpaeae. 26 the axial movement of the reason, the axis 13 may be mittarlmekanismln during operation, disconnect lever vigor the lo–west 23 palnajuealla the mating part 25 Real soon as this occurs, rotates to contact the drum Jousivalkutukeesta influence–trative chitosan position, Figure 1 »It saijkopaljous who can be provided equal value to the money piece, thus provides for Ben through the meter through which electricity is passed, "and any of this cord caused by its activities, it seems the shaft 13 to penetrate, only to give the flow passage until said protrusion has reached a pre–determined magnitude of« This can be a known way adjusted in such a way "that the tiles, may be so changed the position where the coin slot 2 must suurenaan or the smaller the angular distance from the position, the place ck money song gets when the wheel 4, who receive the money, it is twisted into the end position. by the claims. 1 / Electrical machine with a threaded shaft illustrating another member by rotating protrudes a distance that is proportional to the angle that this body can be rotated by hand, the paid–up money body contribution herein, wherein the shaft is pushed in the opposite direction itself mittarikonelston a on page when the power passes through the meter, characterized in that the rotating contact with the drum (18), which spring (29) influenced by endeavor into such a position, that the overlying contact piece (19) is separated from the contact j ous.en (20) and its connection to the six keep the meter power off, but any mechanism (14–16) through which affects that said member (4) of the money of the copies of the body be turned by the second part–of–doors, is rotated to the active position (contact piece 19 concerning ketuksessQ 'a contact spring 20) in which the drum reserved locking member (22), which is again opened without the projecting shaft (13) the impact when this self–mittarikoneis ton of the effect is the same distance protruded lock member (22) in a direction to the body (4) johdosta.tyoen was allowed to pivot in the direction away from the lukkoeliiaestae. 2 / shape in claim 1 Application / vehicle shown carbamate, characterized in that the mechanism (14–16) formed on the rotating shaft

(15) fixed to the arm (14) having a skewed end is set to the outer member (4), the rahakap−paieen exercise orbit and the other on the same shaft fixed to the curved arm (16) having a distal end (end surface) abuts the pin (17) against which is eccentrically secured to the Group taktirummun (18) to the second end surface, so that the arm (16) pivots the drum (18) by pressing this rod when the monetary paragraph of the end (14), while on the contrary the pin (17) of the spring (21) effects and esta press arm (16) such that the shaft (15) rotates and translates the stem (14) ulommai the end of the piece of money physical track, ti lie when the lock member (22) is released kontaktirummusta. 3 / Embodiment claims 1 and / 2 /−shown automatic, characterized in that the locking member (22) forms a two−armed lever, one end of which is j jeste of Ir added on a spring (27) under the influence of gripping the notch (Z'6) Group taktirummulla in the collar ti IUn of the drum pi filtration, at the same time as the lever arm tjmen end of the shaft (13) to the second end (36) exercise on the track, so that this shaft end of the push herein, the axis of which can be obtained, when the electricity meter is in operation, Approaching more and more and eventually presses the lever arm (22) of the corresponding head and thereby to rotate the lever arm rid of the notch (23) of the detention. − Vf

Abstract:
Source: US5722502A A hybrid vehicle having as a control mode at least a continuous−type parallel series hybrid vehicle (PHV) mode and a series hybrid vehicle (SHV) mode, and a control method thereof. A torque distributing mechanism is provided to distribute the output torque of an internal combustion engine (ICE) to a generator and a motor. A braking mechanism and a clutch are provided in this order between the torque distributing mechanism and the motor. The torque distributing mechanism and the motor are connected by the clutch to keep a power transmission efficiency from the ICE to driving wheels at a high value without depending on the vehicle speed in the continuous−type PHV mode. A battery can be recharged even when the vehicle is not running, by releasing the connection between the torque distributing mechanism and the motor by the clutch. When switching to the SHV mode, the motor side output shaft of the torque distributing mechanism is stopped by the braking mechanism to prevent the ICE from overrunning. An SOC sensor is used to detect the state of charge (SOC), of the battery, and when the SOC is lowered, the control mode is forcedly or automatically switched to the SHV mode. The generated power of the generator is controlled to a very small level to substantiate creeping.

Abstract:
Source: US2008271503A A lock comprises a rotary latch (10) with a pre–latch position (12) and a main latch position (11), the latch being retained by a catch (20). A combined, power–driven closing and opening aid ensures an increased comfort when closing or opening the door by means of two drive elements (50, 60) that can be moved simultaneously, namely a closing element (50) and an opening element (60). In order to obtain a compact lock, both drive elements (50, 60) are arranged on a common drive wheel (40) with a mutual axial offset.

Moreover, the closing element (50) is movable relative to the opening element (60) in two rotation planes which are axially offset relative to one another. A carrier (14) is also provided on the rotary latch (10), in the plane of the closing element (50), while the catch (20) has a release finger (23) arranged in the plane of the opening element. The opening element (60) is resiliently received in the drive wheel (40) and can be automatically moved between a retracted position and an extended position.

Abstract:
Source: BRPI0901940A 1 Resumo "Eixo de Roda Veicular e Rodado Veicular Sem Parafusos" refere– se a um "Eixo de Roda Veicular e Rodado Veicular Sem Parafusos" que com sua industrializacao podera ser implantado na fabricacao de veiculos com rodas sem parafusos e na fabricacao de quites para adaptarem nos veiculos que ainda usarem parafusos nas rodas. Assim agilizara a troca segura do pneu, e so usar uma chave tipo de abrir o carro ou casa, retirar o rodado, colocar outro rodado no lugar, travar novamente sem esforco algum e esta trocado o pneu. 1 summary "Vehicle wheel axle and wheels Vehicle No Screws" refers to a "Vehicle wheel axle and wheels Vehicle No screws" which with its industrialization will be able to be deployed in the manufacture of vehicles with wheels without screws and manufacturing quits for adapt the vehicles that still use screws on wheels. Thus expedite the safe tire change, and so use a key to open the type of car or home, take the shot, put another shot in place, lock again without any effort and this changed the tire.

OOOOO–QQ––––– Guldo Al f «mi, irofessori, Ja Leandro Mazza, Insinööri, Milano, Italia. üudestikytkinlaite automaattisia telefonikeskuaasemia Ja senta– paisia varten. Esillä oleva keksintö koskee uutta uudest.ikytkinjärj estelmää sähkövirtoja Ja erittäinkin telefonivirtapiireja varten, esim. semmoisia Jolta käytetään automaattisina telefoniasemilla Ja sentapaisissa lai– toksissa, perustuen sen kummankin osan ifiultlppelikäyttöön. Tämä käyttö aikaansaadaan yleensä Joko antamalla kummankin sanotun osan samaan ai– kaan toimittaa eri toimintoja syystä että niiden sopivasti on siten va– littu, että nultippellÄäyttö kaikkine toimintoineen £.s>äy mahdolliseksi, tai sen kautta että annetaan sanottujen osien vähitellen Jatkuvasti toi– mittaa eri toimintoja kytkemällä ne vähitellen jatkuvasti sähköisesti eri tavoilla. Kuhunkin uudestlkytkijään kuuluu pääasiassa kuten tunnetuissa Järjes– te'imlssä kolme osaa, se on määrätty lukumäärä kiintonaisia koakettimia, Jotka muodostavat n.k. kosKetinryhmän, Jolloin koskettimet yleensä vas– taavat loo tilausjohtoa yhdistettyinä keskusasemaan Ja joskufc useampia tai –vähemmän, yksi tai useampia XSS liikkuvia koskett.imia sovitettuina erityiseen koneistoon ja riippumattomina uudestlkytkijan varsinaisesta vaikutuksesta ja yhdistettyinä huutoaseman johtoon sekä lopuksi mootto– riorgaanit. On huomattava, että muitippelikäytön periaatetta sovellutetaan sa– manaikaisen vaikutuksen lain mukaan kosketinryhmaän, samalla kun sitä sovellutetaan säännöllisesti jatkuvan lain mukaan liikkuvaan kosketinko– nelstoon ja ennenkaikkea niihin moottorioraanelhis, jotxa järjestävät sitä. Tätä tarkoitusta varten on ryhmän koskettimilla semmoinen muoto, et.ta ne samanaikaisesti aikaansaavat kosket iaharjoj en ja yhden Ja saman uudestikytkijän ryhmän välisen yhdistyksen ja niitä käytetään vastaavi– en koskettlmien välistä kertolaskua varten eri uudestlkytkijöiden ryh– missä. Toisaalla järjestellään liikkuvan koneiston kaikki liikkeet vähitellen jatkuvasti vaihtelemalla niitä toimintoja, mitkä eri elemen– tit toimittavat, joista se on laadittu, yhden ainoan moottorin avulla, mikä sopivan koneiston avulla mu liikkuvaan koneistoon aina niiden eri toimintavaiheiden mukaan, joissa uudestlkytkijä saittuujple– \ maan. Esillä olevan keksinnön Hukaan on kilntonalslla koskettimilla lit– teiden tankojen tai sentapaisten muoto, ja kosketinryhmällä on semmoinen V* BteLxs muoto, että eri koskettimet tusaajin sarjassa ovat sovitettuina yhden– suuntaisesti toistensa kanssa samaan tasoon, mikä taso on yhdensuuntai– nen muiden tasojen kanssa, joihin eri koskettimet muissa sarjoissa ovat sovitettuina yhdenmukaisella tavalla, tfämat litteät tangot johtuvat il– man keskeytystä sen rhmaelementin ulkopuolelle, JoSion ne kuuluvat, niin että ne muodostavat sarjan koaketinryhmiä, joista £ä and fi!tfX£XU and XKHUtfjE£ ISZXXKiUI kukin muodostaa täydellinen kokonaisuuden, se on sultippeiikos– ketinryhmän aijot.tu useampia uudestikytkijöitä varten käyttämättä ker– t ojaaapele i ta. Tämä on hyvin tärkeä ominaisuus nyt esillä olevassa uudestlkytkijä– järjestelmässä, josta sen tavaton yksinkertaisuus ja käyttövarmuus ver– rattuna muihin järjestelmiin on riippuva, tfäissä järjestelmissä ovat kosketinryhuàt laaditut metalliBtø and atø4#$a, sovitettuina säteensuuntai– sesti määrättyä lukumäärää ftlfftfXttiíXlíSgfi oleviin tasoihin eristävästä ai– neesta laadittujen

puoliympyränmuotoiaten sektorien välissä. Sektorien Ja koskettiaiien ryhmä yhdistetään pulttien avulla, niin että muodostuu Biohkäie, ja koskettimet johtuvat moiUiäleen sisään varsinaisten kiinto– nalsten k03kettimien muodostamista varten sekä johtuvat ulospäin kerto– jakaapeiien lankojen kiinnittämistä varten, mitkä tässä tapauksessa ovat välttämättömät. Esillä olevan keksinnön mukaan saattaa liikkuva koneisto –mikä jär– jestellään sähkömoottorin avulla ajoittaisella tai asteittaisella liik– keellä (tai yhtäjaksoisella liikkeellä) varustettuna– liikkuvat kosketin– harjat liikkumaan, ja oämät toimittavat halutun yhdistyksen ryhmässä olevien kiintonaisten koskettisiien kanssa, sen kautta että ensimaiset liikkuvat yhteen suuntaan yhden eri sarjojen kiintonaisista koskettlmis– ta valitsemista varten ja senjalkeen toiseen suuntaan määrätyn kosketti– men valitsemista varten sarjassa. tfämät liikkuvat koskettimet ovat siten sovitettuina, että ne saattavat liikkua vahitelle» jatkuvasti kahdessa toisiaan vasten suorakulmaisessa suunnassa. Eräissä yksinkertaisimmiksi tehdyissä rakenteissa ja erittäinkin semmoisissa uudestlkytkijöissä, joissa kiintonaiaten koskettimen lukumäärä on rajoitettu, ovat liikkuvat koskettimet sovitettuina liikkumaan ainoastaan yhteen suuntaan. Vähitellen jatkuva multipp«likäyttö fit aikaansaadaan erityisen säh– kömagneettisen laittaen avulla ja te*ee mahdolliseksi tunnettuun tapaan ei ainoastaan uudestikytjiij an virtapiirien vähitellen jatkuvan muutoksen tämän Järjestelyä varten sen eri toimintavaiheiden aikana, vaan se tekee mahdolliseksi myöskin täydellisesti uudella tavalla eri toiminnat, mitkä ovat kokonansa mekaaniset. Hiihin saattaa esim. kuulua eri elementtien SäIIft*gXflaiUaillä£X välisten mekaanisten yhdistyksien sovittelu, niin että j»*ikkuva koneisto saattaa saada kosketinharjät liidustaan vähitellen Jatkuvasti ranteen suuntaan, vaikka ainoastaan yhtä sähjDmagneett imootto– ria käytetään, tai liikkuvan koneiston irroltuksen aikaansaaminen, niin että se saattaa »ennä takaisin lähtöaseatoon» täi suita yhdeBBiukaiaia toimintoja, kut«** Moottorin ankkurin yhdistäminen akseliin ähkömekaa– nlsen laitteen saattamista varten kiertoliikkeeseen, Ilman että aita varten vaaditaan toista moottoria, niin että se liikkuu asennosta toi– 4.,'yr v seen aina uudestikytkii toimintavaiheen mukaan. Yllä sanottu muodostaa toisen tunnusmerkin, minkä kautta tämä uusi uudestlkytkijäjärjestelmä melkoisesti eroaa tahan saakka tunnetuista uu– X'deatikytkijäiaitteista ja käy suuressa määrässä yksinkertaisemmaksi, suaalia kun käyttövarmuus suurenee multippeliiyh and an yllämainitun erityi– sen Muodon takia. Iässä laitteessa korvaa ynai ainoa sähkömagneetti nel– jää tai viittä ftähköwagneettia, se on sähkömagneettimoottori aikaansaa tässä tapauksessa välittömästi tai välillisesti liikkuvan kosketinkoneis– ton iftolõionat liikkeet Ja sen irroltuksen, ja ae voidaan aiyöakln sovittaa järjestämään MatKifasmig sähkömekaanista laitetta, samalla kun muissa jär– kaksl jest–elmissä tarvitaan liila eri säftkömgneettia liikkuvan koaketinlait– teen liikkeiden aikaansaamista varten, kolmas sähkömagneetti sen irroi– tusta varten, neljäs sen laitteen järjestelyä varten, mikä vastaa yllä– mainittua sähkömagneetista laitetta, seka lopuksi viideB sähkömagneetti sen irtikytkltyksen aikaansaamista varten, aika on tarpeen, kun mainittu laite menee takaisin lepoasentoon. Oheenliitetyissä piirustuksissa osoittaa kuv, 1 perspektiivissä mul– tippeliryhmän kiintonaisia koskettimia varustettuna vastaavilla liikku– villa koskettimilla, ja kuv. 2 poikkileikkauksen pienemmässä mittakaa– vassa Kahdesta muunnoksesta. Kuva 3 osoittaa uudestlkytkijan yhteenso– vitteiun varustettuna kahdenkertaisella liikkeellä. Kuvat h–g osoittavat erityisiä rakenteita ja vastaavia muodostelma.–Jûjva 9 osoittaa uudes– tikytk–ijän joka toimittaa yhden liikkeen, ja kuv. lo osoittaa muunnoksen siitä. Kuva 1 osoittaa ylemmässä osassa osan multippeliryhwästä johon kuu– luu ryhaäpäa oiiealla puolella, keskikohdalla kaksi täydellistä ryhmä– elementtiä kahta uudestlkytkijää varten sekä vasemmalla puolella osa kolmannesta ryhmaeiementista. j * Osoitettu multippeiiryhmä on aijottu kaktfiapaisia johtoja varten (jossa tapauksessa selvästikin uudestikytkijat ovat kaksSaalsia) varus– tettuina eri ryhmillä kutakin napaa varten, se on löytyy kaksi ryhmää, joista kumpikin erikseen saattaa muodostaa yksnapaisen ryhmän'. Knsiaai– nen ryhmä ottaa toimintaan kalkki koskettimet a, mitkä saattavat– olla te. f £! and $£ ulosjontuvat Koskettimet, ja toinen ottaa kaikki koskettimet to, mitkä saattavat muodostaa sisäänpäin menevät koskettimet. Kuhunkin Joh– toon kuuluu niinmuodoin kaksnapaisessa ryhmässä kosketin a Ja kosketin t> ja kutakin Johtoa 1,2 ».»..x vastaavat koskettimet a1, b1, a2, D2... a* bx. Kaikilla näillä koskettimilla on litteiden tankojen muoto ja saattavat olla samaa muotoa muutenkin. Piirustuksen yksinkertaisemmaksi tekemista varten on kosketinryhmä osoitettu laadituksi ainoastaan.25 kaksnapaista Johtoa varten, jaettui– na viiteen sarjaan kussakin viisi johtoa, tai Kaikkiaan viisikymmentä kosketintä litteiden tankojen muodossa. Kaikki nämät tangot ovut yhden– suuntaiset toistensa kanssa ja sovitettuina yhtäläisen etäisyyden päähän toisistaan useampiin eri tasoihin. Tangot johtojen samassa sarjassa ovat sovitetut ahteen naista tasoista, yksi kuhunkin naparyhuaan; tangot a esim. ensimaisessä sarjassa (Johdot l,2,3i ja 5), 3e on tangot a1,a2, a–a ja a–* ovat sovitetut yhtäläisen keskenàisen etäisyyden päähän enBimigessä tasossa kussakin ryhmässä, samalla kun tangot D1)'b2,b,b4', samassa sarjassa ovat sovitettuina saman keskenäisen etäisyyden pää– hän ensimaisessä tasossa toisessa naparyhmässa, ja samalla tavalla ovat muut tangot a ja h muissa neljässä sarjassa sovitettuina. Kaikki viisi tasoa tankoja a varten ryhmässä ovat yhdensuuntaiset toistensa katossa ja yhtä etäällä toisistaan ja sijoitetaan tavallisesti saman etäisyyden päähän toisistaan kuin eri tankojen etäisyys kussakin tasossa, Ja samalla tavalla nuo viisi tasoa tankoja b varten toisessa ryhmässä yhdensuuntaiset toistensa kanssa ja yhtä kauhana toisistaan tankojen ollessa kummassakin tasossa yhtä suuren etäisyyden päässä toi– sistaan. Viimeisen a–tason ja ensimaisen fc–taBon välinen etäisyys saat– taa kuitenkin olla jokin muu, jos niin katsotaan sopivaksi, sitäpaitsi ovat. kaikki tangot a ja b, jotka kuuluvat johtoihin samaa järjestystä kussakin sarjassa, esim. tangot aaa1116,»211,6,11,16,*)21 j.n.e. sovitettuina tasoihin, jotka ovat suorakulmaiset johtosarjojen tasojen kanssa. Jotta klintonaiset, tangonrauotöiset koakettiiaet voitaisiin pysyttää määrätyissä asennoissaan ja tehokkaasti eristää toisistaan, ovat ne kiinnitettyinä kantolaattoinin 26,261,2o11 j.n.e. tehdyt sopivan muotoi– siksi ja sopivasta aineesta, sovitettuina määrätyillä valikoilla sunra– kuimaisesti mainittuja tankokoskettimia vasten. Laatan 2ó etusivu muo– dostaa multippeiiryhrnän pään, Ja kaikki tangot pistävät esiin jtapppaleen matkan sen ulkopuolelle, niin että muodostuu pieniä sorsia joilla on sopiva muoto päällejuotcttuja iiiUltippe li lankoja varten. Laatat 26 ja 26 muodostavat ensimäiaen ryhmäeleaentin rajat, mikä ryhmäelöTaentti raataa ensimäistä uufleatikytkijää» laatat 20* ja 261* muosostavat toisen ryhmä– elementin rajat, ja laatan 2b11 ulkopuolella näkyy kolmas ryhrnäelementti. Ityîuûâeleme and tien lukumäärä, mikä vaaditaan ynden multippeliryhmän muo– dostamista varten, riippuu saatavissa olevasta tilasta kehyslaltoksesssa, johon uudeat–ikytlcijät –orat sovitettuina, seka ennen kaikkea niiden lin– jojen lukumäärästä,.IXXIÏ mitkä ovat aijotut käytettäviksi telefonikea– kuaaseiaulla.. _____>rfK>lempien /.gnsiiHäiaten ryhmaelementtien alapuolella osoitetaan

osa tanden en– simaisen uurleatikytkij an liikkuvista kosketinkonøistosta, se on koske– tinharjat 27 pitäjineen. Kuhunkin harjaan kuuluu kakai yhtäläistä jousta 28, jotka ovat sähköisesti yhdistetyt toisiinsa. Alemmista päistään ovat mainitut Jouset kiinnitetyt pitäjiin 29, jotta ovat kiintinaisesti yh– distettyinä harjavaunuun 3o, i.mikä on osittain osoitettu. Jouset ovat si– joitettuina taaoihin jotka ovat yhdensuuntaiset.kosketinryhmasaa olevien tankojen kansaa ja siten kiinnitettyinä, että ne sattuvat näihin tankoi– hin auorakulmaisesti ja sopivassa kunnassa Ja puristetaan niiden sivuja vasten. Ylemmistä päistä ovat jouset siten muodostettuina, että ne hel– posti laahaavat tankojen sivupintojen yli ja muodostavat hyvän sahkokos– ketukaen näiden kanssa. Sitäpaitsi tulee jousien moleamiila päiilä olla semmoinen muoto, että ne saattavat kulkea tangosta' seuraavaan alkaansaa– matta lyhytsulkeouata tankojen välissä. Jousef ovat peitetyt sopivalla 31/ eristävästä aineestaftehdyllä peitteellä sisä– ja ulkosivusta pitkin ko– ja Jonkun tangon jco pituuttaan paitsi £2$ päistä, niin että j ousienïrvlïïiien kosketus tu– lee estetyksi, joiden tankojen yli kosketinpäat kulkevat. MUltlppeiiryhmän paralleliipedisen muodon takia on selvää, että se liike, mikä on sopiva saattamaan kosketinharjat ensinnä valitsemaan joh– tojen sarjaa ja senjalkeen erityisen johdon sarjassa, on jo mainittu, se on suoraviivainen liike tasossa, joka muodostaa suoran kulman ryhmäs– sä olevien tankojen kanssa. Sitäpaitsi ovat nämat liikkeet, kuten on osoitettu piirustukaeaaa, mikä osoittaa enaimaiaen ja toisen uudestikyt– kljän yhteydessä johdon 3 kanssa ja erillekytettnä, ensinnä suorakul– maiset tankojen tasoa vasten Ja suunnatut oikeaan päin j–a senjalkeen suorakulmaiaet tankoja vasten suuntaan ylöspäin– Kosketinryhma varustettuna yksnapaiallla alaryhmillä, kuten yllä on mainittu harjakoskettiaiien yhteydessä, on yksinkertaisin Ja yleisimmin käytetty muoto, koska alta helposti ilman mitään muutosta voidaan käyt– tää uudestikytkijöitä varten millä napalukumäärällä tahansa varustettui– na. Senkautta että toistensa viereen sovitetaan kaksi, kolme, neljä tai useampia yksinapaisryimia saadaan kakanapalsia, koiminapalaia, nelinä– Missing page/ pages verraten, se on kehykseen laattojen reunaan. Yksinkertaisen ääriviivan asemesta voidaan myöskin käyttää uurretta. sopivanmuotoisia viputankoja 39,40,41 J–n*e. saatetaan sopivien laitteiden avulla toisella päistään luisumaan laatojen ääriviivalla, niin että ne saatetaan liikkee– seen ja saattavat saada kaksi, kolme tai useampia ori asentoja, ja toi– silla päillään järjestellä vetotankoja 42,43,44 j.n.e. joita kannattavat ' ja ohjaavat sopivat tuet 4$, kiinnitettyinä uudestikytkljája kehyslait– tokseen 46. Namät järjestävät liikkeet siirtyvät silloin vetotankojen avulla niihin eri koneistoihin, jotka muodostavat liikkuvat kosketin– laitteen ja oottariorgaanit, ja muuttavat niiden yhdistystä toistensa kanssa. Huutamia näistä koneistoista voidaan järjestää (mainittujen ve– totankojen ja erittäinkin vetotangon 42 avulla) takaislnvientisähkäuag– neetia 47 tai oikeammin sen «inkkurin 43 kautta joka kerta kun on välttä– mätöntä siirtyä liikkuvan kosket irilaitteen liikkeestä yhdistäjän liikkee– seen. Tänä sähkömagneetti muodostaa yhdistäjään sisältyvän osan. Erityisen laitteen kuten mainitun yhdistäjän käyttö mainittujen sään– nöllisesti jatkuvien mekaanisten muutoksien aikaansaamista varten aina eri toimintavaiheiden mukaan, muodostaa täydellisen uutuuden uudestlkyt– kijöissä, mikä on erikoisesti soveltuva automaattisia telefonikeskusase– mia varten ja tekee mahdolliseksi nootlppeliperlaatteen soveliuttamisen kokonaisuudessaan niitä eri orgaaneja varten, jotka muodostavat liikku– van kosketiniaitteen, ja ennenkaikkea moottorieiementtejä varten. ahmittuja puhtaasti mekaanisia toimintoja aikaansaa yhdis– täjä tunnettuun tapaan yhdenmukaisia vähitellen Jatkuvia muutoksia Jot– ka ovat sahköXuonnetta. Kuviosta käy selville, että iyag laattaa 38 vastaava Jousifcosketin 49 puristetaan laatan reunan avulla kolmeen mää– rättyyn asentoon, joko X3S kiintondi3ta kosketinta 491 vasten virtapii– rin aulkamista varten, tai kilntonaista kosketinta 49** vasten toisen virtapiirin sulkemista varten, tai lopuksi väliasentoon koskettlmien vä– liin, niin että »olemmat virtapiirit ovut katkaistut, kuten on osoitettu piirustuksessa. Samantapaiset jouslkoskettlmet, se on päätekoskettimet 5o ja si¥ukoskettimet 51 S voidaan uude<jtikytkeä tunnettuun tapaan liik– kuvan laitteen avulla sen ensiaaisen vastaavasti toisen liikkeen alussa. Yhdistäjän akseli 34 kiertyy suuntaan mikä on päinvastainen osoitta– jien pm kulkuun nähden kellotaulussa nähtynä alemmasta päästä, ja sen– muana kiertyvät laatat porraspyörän 52 avulla, johon vaikuttaa porras. Akseli ja senkautta koko yhdistäjä voidaan ainoastaan saattaa lepoasen– toon määrätyissä asennoissa, mitkä sopivasti ovat määritetyt saman kul– saetäisyyden päähän toisistaan. Xïftfi Kussakin mainituista asennoista aikaansaa yhdistäjä aina 1aat– to j su ääriviivojen sukaan määrätyn lukumäärän mekaanisia yhdistyksiä Ja määrätyn lukumäärän sisaaja– Ja erillekytkityksia sähkövirroissa. Se saat– taa sitäpaitsi toimittaa samantapaisia toimintaa lepoasentojen välissä pysähtymättä. Häiden toimintojen järjestysjakso on selvästikin muuttu– aaton Ja edeltäkäsin määrätty. Yhdistäjän asentojen lukumäärä, laattojen lukumäärä ja niiden ääri– viivat sekä käytettävien viputankojen muoto saattavat vaihdella aina Uiiden sähkömagneettisten yhdistelmien mukaan,mitkä ovat tarpeen kutakin erityistä uudestlkytkijänmallia varten sen erityistä käyttötapaa Ja eri– tyisiä sisempiä virtapiirejä varten. ïiirustuksessa osoitetussa laadin– tamuodossa on yhdistäjällä kuusi mahdollista asentoa. Kuvan 5 ylemmässä osassa näkyy kosket.iniyhmd leikkauksessa tasossa Joka äifi on suorakulmainen tankoja vasten, niin että yksi laatoista 26, joihin tangot ovat kiinnitettyinä, on näkyvissä. Laatat ovat sovitetut sopivalla tavalla kety–slaltokseen 46. Kuvion keskikohdalla näkyy liikkuva laite, johon kuuluu harjavaunu 30 harjoinaan 27 ja varustettuna kahdella akselilla 53 Ja 54., mitkä voi– »utøiw järjestäväksi akseliksi ja jarjestetykl akseliksi. Nämät akselit ovat yhdensuuntaiset toistensa kanssa ja muodostavat suoran kul– man tankojen tasojen kanssa ja ovat tasossa joka on suorassa kulmassa tankoja vasten. Niitä ohjaavat erityiset kehyslaitteessa olevat tuet, niin että ne vapaasti saattavat liikkua vasempaan päin akselin suunnassa ja palata takaisin lähtöasentoon, jolloin liikettä tiaisin rajoittavat laiaat tai sentapaiset 55 Ja 56. Akselit eivät kuitenkaan ole kiertyvät. Harjavaunun ja senkanssa harjakoskettlmlexi kahdenkertainen sivulii– ke aikaansaadaan Järjestävän akselin yhden ainoan liikkeen avulla kah– /SplSl/;y des3a vaiheessa. Ensimaisessä vaiheessa tulee järjestelty akseli luki– tuksi kiinni Järjestävään, ja molemmat liikkuvat yhdessä. Toisessa val– heessa tulee järjesteltyä akseli lukituksi kiinni kehykseen, ja aino– astaan Järjestelevä akseli liikkuu, sovitus on semmoinen, että järjes– teltävä akseli aina on kiinnilukittuna toiseen tai toiseen eikä milloin– kaan riippumattomana. Zanä aikaansaadaajjyiidi atä jan avulla, joka järjestää sopivia laitteita tätä varten. Järjestävä akseli on lähellä toista päätä (MiöjiHl vasemmalla puo– lella kuviossa) varustettuna uurteella 57 Ja useammilla telkihampailla 58, jotka ovat saman etäisyyden päässä toisistaan kuin kosketintankojen tasojen välinen etäisyys ja on niitä luvultaan yhtä monta kuin johto– sarjojen lukumäärä lisättynä sarjassa olevien johtojen lukumäärällä, se on osoitetussa tapauksessa löytyy kymmenen hammasta. Järjesteltävä akseli on läheltä, päätä {vasemmalla puolella) varustettu uurteilla 59, I jotka myöskin ovat sovitettuina etäisyyden päähän

toisistaan mikä va3– jt taa hampaiden 5S valista etäisyyttä, sutta on vähemmän luvulleen j<* itse asiassa yhtä sonta kuin johtosarjojen lukumäärä, esillä olevassa ta– pauksessa viisi. Järjesteltävä akseli kannattaa sitäpaitsi tästä päästä koteloa 6ft, Joka on kiertyvä akselin ympäri vaan ei siirtyvä sitä pitkin. Koteloon on suorassa kulmassa akselia vasten sovitettu kaksi vartta (vertaa kuvaa 4), joista toinen 61 on lehdenrauotöinen ja saattaa johtua järjestävässä akselissa olevaan uurteeseen 57» niin että tämä akseli tu– lee kiirmilukituksi järjestettävään akseliin, samalla, kun toinen varsi S$S 62 on kahvelinauotoinen. Tämä kahveli yhtyy tankoon 63, joka on kiinnitetty yhdensuuntaisesti järjesteltäväin akselia kanssa vetotangon 44 sivu–uikonemukseen 64. Tällä tangolla on semmoinen pituus, että se jää kahvelin yhteyteen, myöskin kun järjesteltävä akseli liikkuu aina uikoasentoonsa saakka. Vetotanko 44 johtuu päällä 65 uurteisiin 59 järjesteltävin akselin kiinnilukitsemista varten kehykseen, kun viputanko 4l tapin 66 avulla vaikuttaa vetotankoon 44. Kun tämä vaikutus lakkaa, palaa vetotanko säännölliseen asentoonsa ja irroittaa järjestellyn äkseiin, mikä vedetään takaisin sopivan vastavoiman avulla. On selvää, että tangon 63 ja kah– velin 62 välisten suhteiden takia tänä takaisinmenfcvaT liike ainoastaan saattaa tapahtua, kun lehti 61 on uurteen 57 vastapäätä ja vapaasti ajat– taa yhtyä tähän. Järjesteltävä akseli on'niinmuodoin aina kiinnilukittu– na Joko järjestelevässä akselissa tai uudestikytkijän kehyslaitteessa. Sitä paitsi on huomattava että järjestelevään akseliin kohdistuva yhdistys ainoastaan ï saattaa tapahtua, kun moienuaat akselit ovat määrätyssä asennossa toisiinsa verraten, samana kun toinen yhdis– tys saattaa tapahtua niin monessa asennossa, kuin on uurteita 59. Harjavaunu 30 on sovitettu järjesteltävään akseliin ja sitä ohjaa ohjauskehys 67, jota kannattaa järjesteltävä akseli tai mikä kannatetaan muulla sopivalla, tavalla, niin että harjavaunu järjesteltävästä akselis– ta riippumatta vapaasti saattaa liikkua yhteen ainoaan suuntaan suora– kulmaisesti molempia akseleita vasten ja samaan aikaan suorakulmaiaesti kosketintankoja vasten* iäma harjavaunun riippumaton liike aikaansaadaan järjestelevän akse– lin avulla sea toisen llikevaineensa aikana, se on sen liikkeen kautta järjesteltävään akseliin verraten, mikä tämän toisen valheen aikana el liiku. Se on, kuten yllä on sanottu, suorakulmainen harjavaunun ja mo– lempien akselien liikettä vasten ensloiaiaen vaiheen aikana ja voidaan aikaansaada eri tavalla, kuten esitetään seuraavassa. Hammaspyörä 69 ou akselilleen laakeroittu kohdasta 69 kehykseen 67 yh– densuuntaisesti kosketintankojen kanssa,.Hammaspyörä yhtyy kanteen ham– mastankooa 7o ja 71, jotka ovat suorakulmaiset toisiaan vasten ja yhden– suuntaiset harjavaunujen molempien liikesuuntien kanssa. Maniat hammastan– got ovat kiinnitettyinä järjestelevään akseliin vastaavasti harjavaunuun. On nyt selvää, että kun Järjestelevä akseli vie mukanaan JÉÍJesteltävän akselin vasempaan, harjavaunu seuraa mukana toimittamatta muuta liikettä ja vie harjat siihen kohtaan, jossa haluttu johtosarja on valittava, samalla kun, kun järjestelevä akseli liikkuu vasempaan ja Järjesteltävä akseli on paikoillaan, hammaatanko 70 kiertää hammaspyörää, niin että tämä puolestaan nostaa ylö3 hammastangon 71 harjavaunun yhteydessä, jolloin harjat muon03tavat kfiâ3Ütxaziä» määrättyyn johtoon kohdistuvan kosketuksen valitussa sarjassa. Kuvion 3 alempi osa osoittaa moottorilaitetta, se on magneettisahkö– moottorin 72 ankkurlnaen 73 Ja tämän vaikutuksen alaisina olevat eri ko– neistot. Qn huomattava, että yhden ainoan sähkömagneetin vähitellen jatkuva käyttö liikkuvan koskètinlaitteen ja £KX yhdistäjän tarpeel– listen liikkeiden aikaansaamista varten saattaa tapahtua kahdella taval– « __ la yhdistäjän avulla: joko sen kautta että eri koneistot.niihin yhdis– tetyt erityiset orgaanit maatetaan vähitellen jatkuvasti moottoriankku– rin yhteyteen, tai myöskin senkautta että mainittu ankkuri tai pikemmin siihen yhdistetty, liikkuva orgaani saatetaan vähitellen jatkuvasti mai– nittujen koneistojen yhteyteen. Enslmälnen tapa täyttää erinomaisesti vaatimukset, koska se tekee mahdolliseksi käyttää yhtä ainoata ankkuria, senkautta että liike Kunakin hetkenä rajoitetaan välttämättömiin yksi– tyisiin osiin, se on ankkuria ilman liikkuvia yhdistyksiä tai muita tar– peita, ja se on niinmuodoin määrättyä vahvuutta olevan sahkomagneetin yhteydessä paremmin soveltuva hopeita herätteitä varten. Snaiksimainitun tavan sukaan on ankkurin 731 pää sopivasti muodos– tettu ja siirtää liikkeensä välittömästi tankoihin 74 ja 75, mitkä ft*** vuorostaan saatetaan sen yhteyteen vetotangon 42 avulla tappien 76 ja 77 välityksellä. Molemmat tangot 74 ja 75 ovat kiertyvästi laakeroidut kohdista 78 ja 79 tukiin äo Ja 81, jotka ovat kiertyvät tappia 82 ja 83 ympäri. Ne siirtävät moottoriankkurln aiheuttaman liikkeen porraspyöraän 52 ja senkautta yhdistäjän akseliin, telkihampaieiin 58 ja niinmuodoin järjestelevään akseliin portaiden 84' ja 85 avulla.Vetotanko Six 42 aja– tetaan siten vaikutuksen alaiseksi, että tanko 74 joutuu työasentoon yhdistäjän liikettä varten, joko viputangon 39.Sï£ avulla (kuten on osoi– tettu piirustuksessa) tai takaisinasetteluaahkömagneetin avulla. Toi– saalla saatetaan tanko 44 vaikutuksen alaiseksi, niin että tanko 75 joutuu työasentoon järjestelevän akselin liikettä varten, Jonkun sopivan# vastavoiman avulla, mikä voidaan saattaa vaikuttaman,silloin Mi il kun ei viputanko 39 eikä ankkuri 48 vaikuta. Telkihaka 86 laakeroittuna kohtaan 07 yhtyy telkihampaisiln 58 Järjestelevän akselin pysyttämistä varten vähitellen jatkuvasti esiln– työnnetyssä asennossa. Tämä telkihaka irroitetaan vetotangon 43 avulla ja saatetaan yhtymään hampaisiin sopivan vastavoiman avulla. Toisen tavan mukaan liikkeen siirtämistä varten (kuv. 5) järjestää rnoottoriankkuri tangot 74 Ja 75 £ sormen 68 avulla, Joka on laakeroittu kohdasta 89 ankkuriin ja joka vuorostaan järjestää sen noista moleramis– ta tangoista, jonka vastapaäta se on viety vetotangon 42 avulla tappien 76 ja 77 välityksellä. Vetotanko 42 vaikuttaa tässä tapauksessa sormeen @3 tankojen 7* ja 75 asemesta. On helppo seurata uudestlkytkijan vaikutusta yksinkertaisessa esi– merkissä eräässä niistä tapauksista) joiioinka sitä useimmin köytetään, se on johtojen yhdistämistä varten automaattisessa telefonikeskuaasemalla mm uudestlkytkij * aikaa. vaikuttamaan, johtuu moottoriin virtafcerä– te ja vetää ankkurin puoleensa, mikä tangon 74 ja vastaavan portaan avulla työntää yndistäjän asennosta I asentoon II. Tässä asennossa ir– roittavat viputangot 39 ja 4o vastaavat vetotangot. Tanko 75 saatetaan ankkurin yhteyteen ja telkihaka 86 yhtyy hampaisiin 58. Silloin Johtuvat vlrtaherätteet huutoasemalta välittömästi tai siirrettyinä releiden kautta sähköaiagneett moot tori in, joka vetää puoleensa atokkurinsa yhtä useasti kuin se ot–taa vastaan naita herätteitä, ja kun ankkuri vaikuttaa tangoon 7$ ja sen portaaseen, siirtyy järjestelevä akseli Ja t.aman akse– lin mukana liikkuva kosketinlaite vasempaan vastaavan lukumäärän aske– lelta. Jos huutoaaeoan otaksutaan lähettäneen ainoastaan yhden herätteen liikkuu järjestelevä akseli yhden ainoan askeleen ja pysytetään tässä asennossa tekihaan S6 avulla, jolloin kosketinharjat on viety asentoon \jiaa_ / tankojen vastapäätä ensimalsessä sarjassa. Välittömästi senjalkeen ta– kaisinasettelumgneetti 47 virtaa paakoakettimien'yhdistetyn vaikutuk– sen kautta liikkuvan kosketlnlaitteen enslmaisen liikkeen takia, he– rätteiden lakkaamisen kautta huutoasema eaxa eri releiden kautta, Joita ei osoiteta piirustuksessa,j *. joiden toiminnat lankeavat keksinnön piirin ulkopuolelle, jolloin sanottu

sähkömagneetti vetää puolelleen ankkurinsa, niin että sähkömagnettimoottori jälleen tulee asetetuk– si kuntoon yhdistäjän vaikutuksen alaiseksi saattamista varten, mikä tapahtuu välittömästi niinpian kun uusi vlrtaheräte sattuu mainittuun sähkömagneettimoottoriin. =l£äS maistajan asennossa III yhtyy viputangon 41 vaikutuksen alaisena oleva vetotanko 44 päällään 65 sen vastapäätä, olevaan uurteeseen 58 (tässä tapauksessa ensimaiseen uurteeseen)« ja samaan aikaan jättää leh– ti 61 uurtegn 57. Kun järjesteltävä akseli siten on kiinnilukitt'ina ke– tiyslaitteeseen, ja ainoastaan järjestelevä varsi saattaa liikkua, ai– kaansaavat seuraavat virtaherätteet huutoasemalta edelleen tapahtuvan liikkeen järjestelevään akseliin vasempaan päin ja niinmuodoin liikkeen harjavaunuun ja harjoihin ylöspäin. Jos eslci. kolme utta herätettä saa– puu huutoasemalta, liikkuu järjestelevä varsi edelleen kolme «kelta ja pysähtyy kaikkiaan neljän askeleen liikkeen Jälkeen. Harjat ovat silloin siirtyneet siten, että ne ovat johdon 3 kosketuksessa (kuv. 1), se on tankojen 9? ja t? kanssa. ïübko liikkuva kosketinlaite pysytetään silloin tässä asennossa telkihaan 86 avulla. Välittömästi senjälkeen ja yllä mainitun yhdistetyn vaikutuksen kautta, jonka lisäksi tässä tapauksessa sivukoekettiiiiien 51 uudestikytkitys harjavaunun ensimuieen riippumatto– maa liikkeen takia» uusiintuvat mainitut toiminnat, ja yhdistäjä siirtyy silloin asentoon IV, jossa viputanko 39 jälleen saattaa vetotangon *2 kuviossa osoitettuun asentoon. Äskenmainittua kosketinasentoa ja aeuraavia asentoja IV,V ja VI voi– daan käyttää multa välttämättömiä toimintoja varten, eslR. huutoase– man tutkimista varten, merkin "ylösotettu" siirtämistä varten huutoase– malle, joa huudettu aseica on ylösotettu, huutomerkin siirtämistä varten huudettuun asemaan, jos tämä on vapaa sekä keskustelua varten. Kaikki nämät XäISUI8ä£2XSJU6X toimitukset toimitetaan riippumatta uudestikytki– i* jän oikeasta liikkeestä eri releiden ja sänköyhdistyksien yhdistetyn vaikutuksen kautta, aikaansaadut yhdistäjän avulla ja riippuvina erityi– sistä slseitfidstä virtapiireistä ÄSX uudestikytkijässä ja telefonlkeskus– aseman erityisestä tyypistä mutta jotka eivät kuulu esilläolevaan kek– sintöön. kun puhelu on päättynyt, mikä voidaan otaksua tapahtuvan, kun yhdls– tûjii on tullut asentoon VI, vie sähköBagneettlmoottorin kautta kulkeva vlrtaheräte yhdistäjän lähtoasentoon, se on asentoon I, Jossa vetotanko 4–3 saattaa telkinään 36 erille hampaiden 58 yhtyisykøesta. Siten liikkuu l– järjesteievä akseli sopivan vastavoiman vaikutuksen alaisena takaisin, *– siksi kunnes sen laippa 55 sattuu lehteen 61, ja samaan aikaan laskeutuu tin– harjavaunu järjesteltyyn akseliin. Ainoastaan talla hetkellä, koska yh– 'a diatäjän asennossa I viputangon 41 vaikutus vetotankoon 44 lakkaa, saat– OiU– taa lehti 61 johtua uurteeseen 57i minkä vastapäätä se sijaitsee, ja vä– järjestelevän akselin liike takaisinpäin saattaa Jatkua, talloin ottaen mukanaan Järjestellyn akselin, siksi kunnes molemmat, saavat lähtöasennon «4.p= . – v" se 011 kunnes laippa 55 sattuu kehykseen. HarJavaunun toinen liike, se on kun se liikkuu järjesteltävästä ak– selista riippumatta, voidaan aikaansaada monella muulla tavalla kuin se– litetyllä. Voidaan esim. hammaspyörän 68 asemesta, mikä samaan aikaan £ yhtyy molempiin haamastankoihin 70 ja 71, käyttää kahta hammaspyörää tai ha–tfpnassektorla, kiinnitettyinä samaan akseliin 69 ja kumpikin yhtyen yh– 'teen hammastangoista. On huomattava, että Job hammaspyörillä tai hammas– sektoreilla on eri suuret halkaisijat, järjestelevän akselin toimittamat liikkeet tulevat olemaan toiset kuin harjavaunun liikkeet. työrien ja sektorien asemesta voidaan käyttää suoraan kulmaan taivu– tettua viputankoa, laakeroituina akseliin 69« Molempien hammastankojen 70 ja 71 asemesta käytetään silloin kahta tappia, sovitettuina siten että kun ainoastaan järjestelevä akseli liikkuu, ensimälnen tappi, mikä on kiinnitetty mainittuun akseliin, vaikuttaa viputangon toiseen varteen saalia kun toinen tappi, joka on kiinnitetty harjavaunuun, on viputan– gon toisen –laikutuksen alaisena, niin että harjavaunu siirtyy pystysuo– rasti. Gb huomattava, että jos viputanko ei ole tasavartinen tulevat järjestelevä» akselin ja harjavaÄnub liikkeet olemaan erilaiset. On myöskin mahdollista taivutetun viputangon asemesta käyttää epä– keskoja tai kaltevaa tasoa, sovitettuina järjestelevään akseliin tai harjavaunuuft, tai käyttää sopivia yhdistelmiä mainituista orgaaneista tai jotain muuta sopivaa orgaania. Lopuksi on myöskin mahdollista so– vittaa molemmat akselit, sekä järjestelevä että jär– jesteltävä, tasoon mikä on yhdensuuntainen kosketintanicojen kanssa näi– tä vasten suorakulmaisen tason asemesta, tai ayöskls johonkin muuhun ta– soon tai tehdä toinen akseleista ontoksi ja sovittaa toinen tämän sisään* Liikkuvan kosketinla.itt.een ja sen muunnoksien selitetyssä raken– teessa liikkuvat aina kosketinharjat kahdessa eri suunnassa. Tämä liike ob ipyöskin sopivin kosketinryhmän annetussa, tunnusomaisessa muodossa. On kuitenkin huomattava, että erittäinkin ÆüSKil harjojen toinen liike erityisen Johdon valitsemista varten sarjassa saattaa olla kiertoliike pysyttämällä tähän tarpeelliset orgaanit tarpeeksi yksinkertaisina. Täs– sä tapauksessa saa ko*o liikkuva kosketiniaite samaa muodon kuin on muilla jo tunnetuilla uudestikytkinjärjestelmillä. Kuva 6 osoittaa poikkileikkauksessa kosketinryhmän kautta uudesti– kytkijsn yhdistelmän jossa käytetään kahta liikettä varustettuna liik– kuvalla kosketinlaitteella kiertyvine harjoineen. Yhdistäjä ja kosketin– ryhmä osoitetaan ylhäällä vasemmalla ja oikealla puolella Ja liikkuva ko»».etinlaite kuvion keskikohdalla. Liikkuvaan kosketinlaitteeaeen kuu– luu aivan yksinkertaisesti akaej.! 90, johon kosK–tinharjat 27 ovat vä– littömästi kiinnitettyinä puristimien 29 avulla. Äkseli on sovitettu suorakulmaisesti kosketintanicojen tasoa vasten Ja pysytetään asemillaan Ja ohjataan erityisten tukien avulla sovitettuina kehyslaitokseen 46, niin että se helposti saattaa liikkua XZ vasempaan akselin suunnassa Ja palata takaisin lähtöasentoon, Jolloin liikettä takaisin rajoittaa lain– pa 91» Akseli saattaa myöskin kiertyä molempiin suuntiin. Kosketinharjoina näytetään Jousia 2S, jotka muotoon ja sovitukseen nähden ovat jo selitettyjen näköiset paitsi siinä, että ne tassa tapa– uksessa sattuvat enBiffiäiäii» kosketintankoihin pienemmässä kulmassa. Tä– mä käy selville kuvasta 7, joka osoittaa oaan uudestlkytkijastä pituus– leikkauksessa. Karjavaunun kahdenkertaiseen liikkeeseen kuuluu tässä ensinnä akse– lin siirto vasempaan ja senjalkeen sen kierto vastaaurinkoa, nähtynä sen vasemmasta päästä. Easimäiaessa liikkeessä saatetaan harjat asentoon halutun johtosarjan valitsemista varten, ja toisessa liikkeessä saate– taan ne erityisen johdon kosketukseen valitussa sarjassa. Näiden molempien liikkeiden saamilta varten shköniagneettiBioottoris– t» kannattaa akseli vasemmassa päässä kuviossa kahta ryhmää hampaita 92 Ja 93* Ett****!*** Ensiksimainittu muodostaa renkaanmuotoiaia telkiham– paita etäisyyden päässä toisistaan mikä on yhtä kuin kosket, lntakoj en ta– sojen välinen etäisyys ja luvultaan yhtä kuin johtosarjojen lukumäärä (t..saa tapauksessa viisi), samalla kun toinen tyhmä muodostaa pitkittäin lukumäärä kussakin sarjassa (esillä olevassa tapauksessa viisi). Pit– kittäin kulkevien hampaiden välinen etäisyys suurenee asteittain suh– teellisesti siihen kulmaan» minkä harjojen tulee kiertyä saavuttaakseen tangot. Jos otaksutaan, että tangot ovat saman etäisyyden päässä toi– sistaan» suurenee akselin kiertoliike harjojen liikkeen mzXKät aikana tangosta seuraavaan. Jos. eri tankojen välinen etäisyys valittaisiin niin että ne pienenisivät, voitaisiin

akselin kulmaliike pitää pysyvänä» Kuvion alaosassa osoitetaan uudestlkytkijän moottorielement.it, mitkä ovat täydellisesti yhdenmukaiset jo selitettyjen kanssa. lankojen 74 ja 75 välissä on tässä kuitenkin kolmas tanko 94, mikä kontaan 96 laakeroi– 2££K dun kulmaviputangon 95 ja portaan 97 avulla siirtää Kiertoliikkeen akseliin. Löytyy myöskin toinen telklh–ku 98 laakeroituina kontaan 99 ja järjesteltävissä enslmäisessä telklhaassa frlevan sormen 86* ja sen– kautta ££?)£ vetotangon 43 avulla, mikä siten pysyttää akselin toisiaan 3eura.itvissa asennoissa, mitkä se kiertyessään saa. On kuitenkin sejaä että järjestelytanko 42 tässä tapauksessa saattaa vaikuttaa moottoriank– kulkevia telkihampalta luvultaan yhtäkuin johtojen kurissa olevaan varteen leuten kuvassa 5 sen sijaan että se vaikuttaa tankoihin 7*75 ja 9*. Uudestlkytkijä varustettuna kiertyvillä harjoilla vaikuttaa pääasi– assa samalla tavalla kuin yllä on selitetty. Kim vetotanko 42 yhdista– |ïttt jän asennossa III jpitää tangon 94 ankkurin vastapäätä, aikaansaa– daan akselin kierto, kun toinen virtaheräte saapuu huutoaäenulta. iCun keskustelu on päättynyt ja yhdistäjä palaa takaisin asentoon I, irroit– taa vetotanko 43 telklhaat 86 ja 98 yhtyaiyksestään telkih and xr.paiden kans– sa ja akseli kiertyy ensinnä takaisin sopivan vastavoiman avulla, siksi kunnes harjat ovat vapautuneet kosketintangoista, ja senjalkeen saatetaan akseli lähtöasentoonsa. Mahdollisuus voida yhdistää liikkuvan kosketinlaitteen päärakenne yl– läselitettyyn kiertyvään harjakoneistoon on suuresta merkityksestä, On tu irtyöskin jrahdollista antaa kosketinharjoiiie päärakenteessa mainitsi kah– denkert*i$Bn IISKIifcf liike käyttäjällä akselia mikä osaksi siirtyy ja osaksi kiertyy. Kuva S osoittaa esimerkin tästä yhdistetystä rakenteesta, jolloin akseliin 90 kosketinharjojen asemesta on kiinnitetty kaksi ul– konevaa vartta loo, joiden väliin on sovitettu hammaspyörä loi, joka harjavaunuasa 30 olevaan hammastankoon lo2. Mainittuja varsia käytetään siirtämään harjavaunu akselia I03 pitkin, aika on kiinnitetty kehyslai– toicseen 46. Tämän akselin tehtävänä on ainoastaan olla johteena harja– vaunua varten, kun se akselin 90 kiertyessä pakoitetaan liikkumaan ylös– päin. Johde voidaan useasti sovittaa välittömästi harjavaunun Ja Js.ehys– laitoksen väliin tai suulla sopivalla taialla. Samalla tuvalla kuin yllä on selitetty, on inyöskin tässä mahdollista mainittujen erikoislaitteiden asemesta käyttää muita orgaaneja, mitkä sopivasti yhdistettyinä toimit– tavat samoja toimituksia. Kuva 9 osoittaa yksinkertaisemmaksi tehdyn uudestikytkijän jolla on ainoastaan yksi liikesuunta. Ylhäälläpäin näkyy kosketinryh»ä, johon esimerkiksi kuuluu yxsi ainoa, sarja viisi kaksnapalsta johtoa, ge on sillä on ainoastaan kymmenen kosketinta litteiden tankojen muodossa. Alaosassa osoitetaan liikkuva laite, johon kuuluu akseli lo4 j«, harja– vaunu 30. Akseli saa llikeherätteensä hampaiden lo5 kautta ja siirtää sen hairor.ast and u and ftn yo avulla hammaspyörään, joka vuorostaan siirtää liikkeen hammastankoon 71» niin että harjavaunu liikkuu ylöspäin. Ak– seli I06 on kiinnitetty kehykseen 46 ja sitä käytetään ainoastaan kan– nattamaan johdekehystää 67. Myöskin tässä yksinkertaisemmassa laadinta– muodossa on mahdollista käyttää laitetta varustettuna kiertyvillä har– joilla (ollen kuvassa 6 osoitetun näköinen) tai yhdistettyä laitetta (kuten kuvassa 8), ja on sitäpaitsi mahdollista käyttää hammaspyörän asemesta jotakuta muuta sen ennen mainituista yhdenarvoisista pyöristä. Voidaan myöskin vielä edelleen tehdä yksinkertaisemmaksi laite {ku– ten on osoitettu kuvassa lo) yhdistämällä akseli lo4 ja harjavaunu 3o yhdeksi' ainoaksi orgaaniksi. Tässä tapauksessa supistuu liikkuva laite yksistään harjavaunuun, mikä,sopivasti ohjattuna kehyksen ö7 avulla, välittömästi kannattaa hampaita I07, joiden avulla se saa liikkeensä s ahkoæagneett moottorista. Patenttivaatimus. 1. Uudestlkytkijälaite automaattisia teltífonixesiusadéraia ja senta– paisia varten, jossa kuilunkin uudestikytkijaan kuuluu häärätty lukumäärä kiintonaisia koskettiraia, yksi tai useampia liikkuvia koskettlmla seka moott.oriorgaanit, tunnettu siitä, että namit osat ov«*t sovitettuina muitippelikåyttöä varten Joko senkautta että niitä käytetään samanai– kaisesti eri toimituksien toimittamista varten riippuen siitä, että niiden muoto on sopivasti valittu kiintonaisiin koskettimiin verraten, tai senkautta että niitä käytetään mainittujen toimituksien toimitta– mista varten vähitellen jatkuvasti niiden sähkömekaanisen kyt.kityksen vaihtelun kautta liikkuviin koskettimiin Ja moottorioraaneihin verraten. 2. Patenttivaatimuksen 1 mukainen uudestikytkijälaite, tunnettu siitä että hiintonaiset koskettimet, mitkä muodostavat kosketinryhman,samaan aikaan ovat multlppelikäytön esineenä ja niillä on semmoinen muoto, että niitä samanaikaisesti käytetään liikkuvien koskettinuen ja yhden ja sa– man uudestikytkijäryhaän välisenä yhdistyksenä 3ejta vastaavien kilnto– ria.i3t.en koskettimien ja lyimien valista kertolaskua varten. 3. Patenttivaatimuksen 2 mukainen uudestikytkijälaite, jossa ryhmän kiintonaisia kosjtet.tiraia samaan aikaan käytetään yhdistystä varten liik– kuvien koskettlmien kanssa yhdessä ja samassa uudestikytkijässä sekä eri uudestikytkijöiden välistä kertolaskua varten, tunnettu silta, että kiintonaisilla koskettimilla on litteiden tankojen tai sentapaisten muo– to, jotka ovat yhdensuuntaiset toistensa kanssa ja kiinnitettyinä eris– tävästä aineesta laadittuihin kannatuslaattoihin, mitkä ovat sovitetut, suorakulmaisesti tankoja vasten yleanaä yhtäsuuren etäisyyden päähän toi3istaaa, ja joiden kautta tangot pistävät esiin, ilman että niiden päitä muutetaan Ja keskeymattä, sen ryhmän ulkopuolelle, joihin ne kuu– luvat, niin että ne muodostavat sarjan ryhmiä, eroitettuina toisistaan mainittujen eristävien laattojen avulla. h–. íatenttlv*atimuk3ôn 3 mukainen uudestikytkijälaite, tunnettu alita että tangot ovat sovitetut yhtäläisen etäisyyden päähän toisistaan mää– rättyyn lukumäärään yhtäläisen etäisyyden päässä toisistaan oleviin tasoihin, jolloin ne XZftX tangot, jotxa kuuluvat johtosarjaan, ovat íáfcíÂàâí yhdessä tasossa, Jos johdot ovat yksnapa–lsla, tai useammissa ta– soissa vastaten napoja, jos johdot ovat mooinapaisia, ja tangot saavat asantojtasossa ‘tai tasoissa, mitkä tantalleen taataavat aiita asentoja mitkä tangot saavat Kaikissa suissa tasoissa. 5. Patenttivaatimuksen * mukainen uudestikytkijälaite, tunnettu siitä että, kun yksi ainoa sarja johtoja on olemassa,tangot ainoastaan ovat siihen/ sovitettuina XälgBX tai niihin tasoihin, mitkä vastaavat johtojen napoja. o. Patenttivaatimuksen 1 mukainen uudestikytkijälaite, jossa liikku– vat koskettimet (joita kannattavat harjavaunu sekä muut siihen yhdiste– tyt orgaanit) ja ennen kaikkea moottoriorgaanit ovat aijotut. vähitellen että jatkuvaa multippelikäyttöa varten, tunnettu siitäTmainittu Mlilï aul– tippelikayttö aikaansaadaan vähitellen Jatkuvasti vaihtelemalla niiden orgaanien toimituksia, mitkä muodostavat liikkuvan laitteen ja järjestä– mällä ne yhden ainoan moottorin avulla, joka saattaa vaikuttaa eri ta~ valla samaan liikkuvaan laitteeseen kalkki niiden erilaisten toiminta– vaiheiden mukaan, joissa uudestlkytkijä on. 7. Patenttivaatimuksen 6 mukainen uudestikytkijälaite, minkä tunnus– merkkinä on sähkömekaaninen yhdistäjä, mik* tekee multippeiikäytön mah– dolliseksi uudella tavalla uudestikytkijän eri toimintavaiheiden aikana vaihtelemalla mekaaniset yhdisteet ja samaan aikaan tunnettuun tapaan vaihtelemalla uudestikytkijän sisemmät sähköyhdisteet. 8. Patenttivaatimuksen 7 mukainen uudestikytkijä, tunnettu siltä että sähkömagneettiseen yhdistäjään kuuluu useita iaurtttttK laattoja, joilla on eri äariviiva radiaaiisessa suunnassa, kiinnitettyinä yhtei– söön kiertyvään

akseliin, aekä joukko viputankoja, mitkä nojaavat mai– nittuja ääriviivoja vaaten toisella päällä Ja toisella päällä toimitta– vat tarvittavat muutokset yhdisteissä. 9. Patenttivaatimuksen 3 mukainen uudestlkytkijälaite, minkä tunnus– merkkinäftakaisinvieva «ähkömagneetti, sovitettuna käytettäväksi yndis– jän apuna, kun tumä on saatettu liikkeeseen moottorin avulla liikkuvan kosketmialtteen edelläkäyvän liikkeen jälkeen. 10. Patenttivaatimuksien S Ja 9 mukainen uude3t.lkytkljälaite, tunnettu siitä, että laatat 3>n sijaan että ne ovat profiloidut säteen suunnassa ovat profiloidut akselin suunnassa t*.i varustetut uurteilla. 11. Patenttivaatimuksien S–lo mukainen uudestikytkijälaite, tunnettu ainoastaan siitä, että yhdistäjä on sovitettu pysähtymäänedeltäkäsin määrättyihin asentoihin muuttumattomassa, edeltäkäsin määrätyssä Järjestyksessä,Jota edeltäkäsin määrätyt sähkömekaaniset yhdisteet vastaavat, jolloin muita £ and £££ and $ yhdisteitä myöskin voidaan aikaansaada hetkellisesti lauttojen »19*– ’ 1/. Patenttivaatimuksien 15 Ja 16 mukainen uudestlkytkijälaite, tunnettu siitä, että hammaspyörä on vaihdettu kanteen hammaspyörään tai hammassektoriin yhtäsuurilia tai erisuuriila halkaisijoilla varustettui– na, tai taivutettuun viputankoon, Jonka toiseen varteen vaikuttaa tappi, mikä korvaa ensimäistä haramastankoa, samalla kun toinen varsi vaikuttaa tappiin, mikä korvaa toista hammastankoa, tai epäke3koihin tai mainittujen orgaanien sopiviin yhdisteisiin tai muihin laitteisiin. lö. Patenttivaatimuksien 15 ja 16 mukainen uudestlkytkijälaite, tun– nettu silta että järjestelevä akseli on kiertyvä siirron jälkeen, ja etta harjakoskettimet ovat sovitetut välittömästi siihen,sopivaan asen– toon, niin että ne sattuvat kllntonaisiin kosketintankoihin sopivan Vä– liajan aikana, jolloin järjesteltävä akseli Jää pois. 19– Patenttivaatimuksien 15–17 mukainen uudestikytkijalait–e, tunnettu siitä, että harjojen riippumaton liike, kun järjestelevä akseli on kier– tyvä, aikaansaadaan jo and o hammaspyöran avulla, joka on sovitettu sanot– tuun akseliin ja yhtyy harjavaunuun sovitettuun hammaotaakoon patentti– vaatimuksen lo mukaisesti tai patenttivaatimuksessa 17 mainitun laitteen avulla. Ho. Patenttivaatimuksien 5 Ja 13–19 mukainen uudestikytkij älaite, tunnettu siitä, että, kun ainoastaan on kysymyksessä yksi ainoa sarja Johtoja, liike sarjan valintaa vartøm jätetään pois ja että harjakosket– timien toinen liike aikaansaadaan jonkun edellä olevissa patenttivaati– muksissa mainitun laitteen äl£ avullaryhdistämällä järjestelevä akseli ja narjavaunu yhdeksi ainoaksi orgaaniksi senkautta että akselin ham– paat sovitetaan välittömästi harjavaunuun. 21. Patenttivaatimuksen 6 mukainen uudestikytkijalaite, jolioina moottoriorgaanit ovat aijotut multippelikäyttöa varten aikajärjestyksessä tunnettu siitä, että moottorinherate siirtyy liikkuvaan kosketimlaltt.ee– sean sen liikkeiden aikana kahdenkertaisen valinnan toimittamista varten ja myöskin yhdistäjään saattamalla ne Í8Í11ÂX3EX koneistot, joiden teh– tävänä on vähitellen jatkuvasti ottaa vastaan liike, varsinaisen aahkö– magneettlrnoottorin ankkurin yhteyteen, Jolloin mainitut mekaaniset toi– mtuuat aikaansaadaan itse yhdistäjän ïi$t avulla. 22. Patenttivaatimuksen 21 mukainen uudestikytkijälaite, tunnettu siitä, että sen sijaan että saatetaan eri koneistot, joiden tulee ottaa vastaan liike, vähitellen jatkuvasti moottorin ankkurin yhteyteen sanot– tu an/vkuri tai siihen yhdistetty liikkuva sormi vähitellen Jatkuvasti saatetaan mainittujen koneistojen yhteyteen. ääriviivojen avulla välillä olevissa asennoissa, joiden kautta yhdistäjä Kulkee pysähtymättä. 12. Patenttivaatimuksien 7–11 mukainen uudestikytkijälaite, tunnettu siitä, laattojen lukumäärä, kunkin näiden ääriviiva, viputankojen muoto Ja, Ifixsäälxa pysähdyspaikkojen lukumäärä ovat valitut uude3tikyt– kljän kunkin erityisen mallin mukaan, jonka kanssa yhdistäjän tulee toi– mia ja sen sisemmän virtapiirin mukaan. 13. Patenttivaatimuksen 6 mukainen uudestikytkijälaite, joesa liikkuva kosketinlaite on aljottu multippelikäyttöä varten erään ajanjakson aika– na tunnettu siitä, että harjakoskettimet tai niitä kannattava vaunu on sovitettu toimittamaan kahta liikettä, nimittäin ensinnä Johtosarjan va– lintaa varten ja senjalkeen erityisen johdon valintaa varten sarjassa järjestelevän akselin avulla, joka on liikkuva yhteen ainoaan suuntaan hammastangon tai sentapaisen avulla, ja toisen järjesteltävän akselin avulla, johon sopivasti harjavaunu on sovitettu, mitkä kaksi akselia ovat yhdensuuntaiset toistensa kanssa, suorakulmaiset koaketintankojen tasoja vasten ja sovitettuina yhteen Ja samaan tasoon mikä an suorakul– mainen kosketint and nkoja vasten* 14. Patenttivaatimuksen 13 mukainen uudestitytkijälaite, tunnettu siitä, että akselit sen sijaan ovat sovitetut tasoon joka on yhdensuun– tainen kosketintfeikojen kanssa tai johonkin muuhun sopivaan tasoon, tai myöskin siten että toinen akseli on ontto ja toinen sovitettuna siihen. 15. Patenttivaatimuksen 13 mukainen uudestikytkijalaite, tunnettu silta, että liike kosketlntankojen valintaa varten toimitetaan kahdessa vaiheessa, jolloin ensimäisen aikana liike siirtyy välittömästi järjes– teltävään akseliin ja harjavaunuua kosketlatakosarJan valintaa varten, samalla kun toisen vaiheen aikana järjesteltävä akseli jää liikkumatto– maan tilaan ja Järjestelevää akselin liike siirtyy harjavaunun riippu– mättämässä liikkeessä, mikä aiheuttaa sen, että harjat toimittavat toisen valinnan, se on erityisten kosketlntankojen valinnan, jolloin harjojen molemmat liikkeet toimitetaan tasossa joka on suorakulmainen tanko;ja vasten siten, että easiaainen liike on yhdensuun– tainen akselien kanssa Ja toinen suorakulmainen tankoja vastan. 16. Patenttivaatimuksen 15 mukainen uudestikytkijälaite, tunnettu siitä, että harjavaunun riippumaton liike aikaansaadaan harjavaunuun so– vitetun hammastangon avulla, mikä yhtyy järjestelevään akseliin laake– roittuun hajnmaspyörään, mikä samaan aikaan yhtyy toiseen hammastankoon sovitettuna Järjestelevään akseliin ja niineuodoin kiertyy viimeksimai– nitun avulla. –15 – 1 Van lean iven still another ytterligare Forenklet device (As is ritat i Iflg. OOOOO–QQ ––––– Guldo Al f «mi, irofessori, and Leandro Mazza, Engineering, Milan, Italy. ueudestikytkinlaite automatic telefonikeskuaasemia And Senta–paisia for. The present invention relates to a novel uudest.ikytkinjaerj SYSTEM electrical currents and especially from telefonivirtapiireja, e.g. such ones used for automatic's who telefoniasemilla and the like at plants, based on each part of the ifiultlppelikaeyttoeoen. This usage is generally accomplished by either providing each said part at the same time, the supply various functions for the reason that they suitably being so selected that the nultippellaeaeyttoe all its functions £.'s> Ay possible, or through the administration of said parts gradually continuously supplies the various by connecting them to progressively continuously electronically in various ways. Each uudestlkytkijaeaen is primarily known as te'imlssae arranged in three parts, it has been determined number of kiintonaisia koakettimia, forming a so called contact array, With the contacts tend to correspond to the loo subscription cord in combination with a central station and joskufc more or less, one or more of XSS moving koskett.imia adapted to the specific machinery and independence, uudestlkytkijan the actual impact and combined with exclamation position of leadership, and finally the engine riorgaanit. It should be noted that the principle apply the same law muitippelikaeytoen the simultaneous effect of the law of the contact array, whilst continuing to apply the same law periodically under the law of the movable contact nelstoon and above all, moottorioraanelhis, jotxa organize it. For this purpose, a group of contacts semmoinen shape, et.ta at the same time they provide a touch iaharjoj and I for one and the same group of uudestikytkijaen between the association and are used for the respective I–koskettlmien between multiply uudestlkytkijoeiden different groups. On the other hand organized the moving machinery all the movements gradually continuously varying the activities to which categories of the elements supply, of which it is drawn, a single motor, which is suitable for machinery but according to the moving machinery at the various stages, with uudestlkytkijae saittuujple–\ the country. of the present invention is Hukaan kilntonalslla contacts lit roads form of bars or the like, and is such a contact assembly * BteLxs V shape, that the different tusaajin contacts are disposed in parallel with each other in the same plane, which plane is parallel to the other levels with which the various contacts in other sets are housed in a uniform manner tfaemat flat bars due to without interruption in its rhmaelementin outside JoSion they belong, so that they form a series of koaketinryhmiae which £ s and fi! TFX £ XU and XKHUtfjE £ ISZXXKiUI each forms a complete unit, it is sultippeiikos–ketinryhmaen aijot.tu uudestikytkijoeitae for the use of multiple layers in the ojaaapele s. This is a very important feature of the present uudestlkytkijae system, where it is unheard–of simplicity and reliability compared to other systems is dependent, tfaeissae systems are kosketinryhuat prepared metalliBtoe and atoe4 # $ a, adapted to the radial–down in the number of ftlftfXttiiXliSgfi to the levels insulating mat–ter prepared puoliympyraenmuotoiaten between the sectors. And koskettiaiien group of sectors are combined by means of bolts so as to form Biohkaeie, and the contacts due to moiUiaeleen in the actual open–nalsten k03kettimien for the formation and resulting from the multiplication jakaapeiien outwardly for attachment to the wires, which are necessary in this case. of the present invention, there may be a moving mechanism, which is arranged, jestellaeaen of the electric motor by means of intermittent or by gradual movement is necessary (or in one continuous motion) with–moving contact brushes to move, and oaemaet provide the desired association in the kiintonaisten koskettisiien with it through the On the first move in one direction, one of the different series kiintonaisista koskettlmis–to for selecting and subsequently in the other direction a given contact against the selection for the series. tfaemaet moving contacts are adapted in such a way that they may move vahitelle »constantly against each other in two directions at right angles. In some of the simplest structures, and particularly of studies Had there uudestlkytkijoeissae with kiintonaiaten contact number is limited, the moving contacts are adapted to move only in one direction. Gradually, the constant multip «driving itself fit is achieved by a special electromagnetic, putting, and you * ee possible manner known not only uudestikytjiij an electrical circuits gradually constant change in the arrangement of the various phases, but it makes it possible to also completely new way of different activities, What are the utterly mechanical. Hiihin for example, may include various elements of the SAEIIft gXflaiUailIAE * £ X's Association between the mechanical mediation, so that j »* ikkuva machinery might get kosketinharjaet liidustaan gradually continuously in the direction of the wrist, even though only one saehjDmagneett imootto paper is used, or moving machinery irroltuksen achievement, so that it may be "a record back laehtoeaseatoon" or mouths yhdeBBiukaiaia functions, called «** Engine Combining anchor shaft aehkoemekaa–nlsen device for placing the rotational motion, without the fence is required for the second motor, so that it moves the position of the second 4, 'v yr to Always uudestikytkii action stage. formed above said second characteristic through which this new uudestlkytkijaejaerjestelmae Until now, quite a bit different from the known and the new X'deatikytkijaeiaitteista is a large number of simplicity, reliability is increased when suaalia and an multippeliiyh the above–mentioned embodiment in particular, because of its. At the age of the device replaces the ynai only the electromagnetic four–ice or five ftaehkoewagneettia, it is the electromagnetic motor provides in this case directly or indirectly to the movable kosketinkoneis–ton iftoloeionat movements and the irroltuksen, and e may be aiyoeakln adapted to provide MatKifasmig electro–mechanical device, while the other sys–kaksl jest– significant extent needed purple different saeftkoemgneettia rolling koaketinlait Coffee

movements for the purpose of receiving, the third electromagnetic its detached as tion, the fourth for the device arrangement of which corresponds to the above−mentioned electromagnet device, mixed, finally viideB the electromagnetic irtikytkltyksen at the time of obtaining the time is needed, when said the device goes back to the rest position. in the accompanying drawings shows the Figure 1, a perspective view of mul−tippeliryhmaen kiintonaisia contacts with the corresponding movement of these contacts, and Fig. 2 is a cross−section on a smaller scale, in two transform. Figure 3 shows the uudestlkytkijan vitteiun compatible with the two−fold motion. Photos hg identify special structures and the like muodostelma.−Jujva 9 shows the reused−tikytk, which supplies ceased to be a movement, and Fig. lo show the transition from it. Figure 1 shows the upper part of the multippeliryhwaestae which belongs ryhaaepaea oiiealla side of the middle of a group of two complete two−element uudestlkytkijaeae for both the left side portion of the third ryhmaeiementista. Designated multippeiiryhmae j * is the designed kaktfiapaisia conduits (in which case uudestikytkijat are clearly kaksSaalsia) progressed to different groups for each pole, it is found in two groups, each of which individually may form a group yksnapaisen '. Knsiaai−tion group having operations in a limestone contacts, which may−be you. f £! and $ £ ulosjontuvat contacts, and the other to take all of the contacts, which may form inside the contacts go. The manage−ment to each of a group, then kaksnapaisessa contact and a contact s> and each cord is 1.2. "".. x corresponding contacts a1, b1, a2, D2... a * bx. All of these contacts having the shape of flat bars, and may be of the same shape in general. the drawing for the simplest things to do is contact array shown to code prepared ainoastaan.25 two pin cord for to shared during five series in each of five wires, or a total of fifty contacts in the form of flat bars. All these ovut rods parallel to each other and adapted equal distance from each other in several different levels. Wire rods in the same series are made Ahtee of these levels, one for each of the naparyhuaan; bars in the first, for example, a (l cords, 2,3 and 5 i), 3e rods a1, a2, aa * and a are arranged in mutual equal distance from the plane of enBimigessae in each group at the same time as the rods D1), 'b2, b, b4 ', in the same series have been adapted to the same mutual consent at a distance from the plane of the first, second naparyhmaessa, and in the same way as to other bars a and h in the other four series have been adapted. All five a level of rods in the group are parallel to each other on the ceiling and equidistant from each other and positioned generally the same distance from one another different than the distance between the rods at each level, and at the same time as the five level bars of the second group b parallel to each other and one bucket from each other the rods of both planes equidistant from each other. A last−in first−level fc and the distance between the Tabon might be the other one, if so is considered suitable, moreover, are. All the bars a and b, which belong to the same order of lines in each set, e.g., rods aaa1116, "211,6,11,16 *) 21, etc. adapted to planes that are orthogonal wire harness levels. In order to klintonaiset, tangonrauotoeiset koakettiiaet to maintain certain positions to effectively isolated from one another and are attached to the kantolaattoinin 26,261,2 O11, etc. made of suitable shaped and of a suitable material, in certain menus adapted to sunra−kuimaisesti against said tankokoskettimia. Home Plate 2 O multippeiiryhrnaen formed in the head, and all the rods protrude beyond the jtapppaleen distance, so that a small ducks having a suitable shape paaellejuotcttuja iiiUltippe additional wires. Plates 26 and 26 form a ensimaeiaen ryhmaeeleaentin the boundaries of what ryhmaeeloeTaentti slave ensimaeistae uufleatikytkijaeae »tiles 20 * and 261 * muosostavat for another element boundaries, and is displayed outside of the slab 2b11 third ryhrnaeelementti. Ityiuuaeleme and the road number, which is required ynden multippeliryhmaen for forming, depends on the space available kehyslaltoksesssa which uudeat−ikytlcijaet−Orat adapted to, above all, the mixed−signal of the number of lines;. IXXII which are used in the designed Telefonika−kuaaseiaulla.. _____> RFK> of both. / gnsiiHaeiaten ryhmaelementtien below shows part of the tanden I−simaisen uurleatikytkij an kosketinkonoeistosta moving, it is in contact with tinharjat pitaejineen 27. Each Kakai is equal to the brush springs 28, which are electrically connected to each other. Lower ends of said springs attached to the keepers 29 in order to kiintinaisesti are connected to the trolley brush k3, i.mikae is partially addressed. The springs are positioned taaoihin that are yhdensuuntaiset.kosketinryhmasaa of the bars attached to the people, and that they happen to these auorakulmaisesti price of the bars, and the appropriate municipality and pressed them against the sides. From the upper ends of the springs are formed so that they are readily lagging the rods over the side surfaces and form a good sahkokos−ketukaen with these. Besides, the springs will be moleamiila paeiilae semmoinen shape, that they may walk in bar 'next alkaansaa without lyhytsulkeouata between the rods. Jousef are suitably covered with 31 / aineestaftehdyllae insulating covering of the inner and outer side along the co−and any one shift j? Its length, except at the ends of £ $ 2, so that the contact ousienirvIIiiien j becomes blocked, which bars pass over the contact pressure. MUltlppeiiryhmaen paralleliipedisen embodiment, it is clear that the motion, which is suitable to bring the kosketinharjat first of all to select the wires sets and thereafter particularly consistent in the series, has already been mentioned, it is a linear movement in a plane which forms a right angle with the categories had the bars with. Moreover, are these movements, as shown in piirustukaeaaa, which shows enaimaiaen and second uudestikyt−kljaen connection line 3, and erillekytettnae, first of all, rectangular bars against the plane and directed at right feet, and subsequently suorakulmaiaet rods against the upward direction, the contact array with yksnapaiallla sub−groups, such as harjakoskettiaiien the above−mentioned connection is the simplest and most commonly used form as easily over without any change can be used for uudestikytkijoeitae which napalukumaearaellae as any normally equipped. Senkautta that arranged beside each other in two, three, four or more yksinapaisryimia obtained kakanapalsia, koiminapalaia, nelinae−Missing page / pages rather, it is the edge of the tile frame. A simple outline of the may also be used instead of grooves. 39,40,41 viputankoja suitable shape of the J−e * may use suitable equipment to the other ends to slide laatojen outline, so that they are put into circulation and can get two, three or more positions of the stallion, and the other public paeillaeaen sort the tie rods 42,43,44 etc which are supported by the "fit and guide the aid $ 4, uudestikytkljaja attached to the apparatus frame 46 completed arrange these movements are transferred by means of drawbars, when the various equipment that make up the moving contact device and oottariorgaanit, and alter their association with each other. Shouted by the machinery of these can be arranged (referred to water totankojen, and particularly of the draw bar 42 by means of) takaislnvientisaehkaeuag−neetia 47 or more to the point it «inkkurin through 43 each time it is necessary to move the movable contact irilaitteen movement of combiner circulation. This electromagnetic form of part of a combiner. Particularly device, such as the

combiner of use of said regular continuous mechanical changes the time for obtaining at various stages, to form a complete novelty uudestlkyt–kijoeissae, which is particularly suitable for automatic telefonikeskusase atoms, and makes it possible to nootlppeliperlaatteen soveliuttamisen entirety of the various organs in for which form the movable kosketiniaitteen and, above all, for moottorieiementtejae. After devouring a purely mechanical functions provides a combination of the user in a known manner consistent with a gradual, sustained changes in the Jot–ka are sahkoeXuonnetta. Figure it is apparent that iyag plate 38 corresponding Jousifcosketin 49 is pressed plate edge through the three state with a specific position, either X3S kiintondi3ta contact 491 against a electric circuit to the aulkamista; or kilntonaista contacts 49 ** against a second circuit for sealing, or the end to the intermediate position koskettlmien at – molecule, so that "olemmat circuits ovut cut off, as shown in the drawing. Similar jouslkoskettlmet, it is a terminal contacts 5o and si ¥ ukoskettimet 51 S can be uude <jtikytkeae in a known manner of a mobile device by means of its ensiaaisen at the beginning of the second movement. combiner shaft 34 rotates in the direction opposite to what is shown Jie pm path of the table as seen at the lower end, and the pivot plates muana–stage pulley 52 by means of which depends step. shaft and senkautta throughout the integrator can only be resting position in certain positions, which are suitably defined in the same angle saetaeisyyden apart. Xiftfi In each of these positions provides a connector always 1aat–to j contour of the Sun sukaan the specified number of mechanical associations and the specified number of sisaaja And erillekytkityksia flows of electricity. Doing so may it not only delivers similar activity to its rest position without stopping in between. Wedding order of operations section is clearly a variable's Eve and predetermined. combiner number of positions, number of tiles and their contours, as well as for viputankojen shape may vary at Uiiden electromagnetic combinations that are required in each specific uudestlkytkijaenmallia for the special use of specific components and the inner power circuits. Iiirustuksessa addressed to the drawing up of a combiner is tamuodossa six possible positions. 5 shows the upper part of the section plane kosket.iniyhmd any AiFi has a rectangular bars, such that the one plate 26, which rods are fixed, is displayed. The tiles are arranged in a suitable way kety–slaltokseen 46 shown in Figure middle of the moving device which includes a brush carriage 30 harjoinaan 27 and provided with two axles 53 and 54, which may »utoeiw is organized by the axis and the axis jarjestetykl. These axes are parallel to one another and form a right angle with the planes of the bars and lie in a plane which is perpendicular to the rods against. They are driven by specific subsidies in the frame unit so that they can move freely in the axial direction of the left and return to the starting position, which movement is limited by tiaisin laiaat or the like Shafts 55 and 56 are not rotated. Brush Wagon and ladle harjakoskettlmlexi two–fold sivulii–Wed provided by the organizing axis of a single movement of the two / SplSl /, y des3a stage. On the first stage will be organized in the shaft locked in the catch of the organizing, and the two move in together. In the second stage of preparation will arranged the shaft locked to the frame, and only arrange the axis moves, arrangement is such that the system under consideration is always the axis kiinnilukittuna one or the other, or at least independent. Zana aikaansaadaajjyiidi mg to trolled with that organizes devices suitable for this purpose. Organisation axis is near the second end (MioejiHl the left side of the figure) with uurteella 57 and more telkihampailla 58, which are the same distance apart as the distance between the contact bars levels and there are as many in number as the lead–in plus the number of sets of the number of lines, it is addressed can be found in the case of ten teeth. –Arrangements axis is near the head {left side) with the grooves 59, I which are also adapted at a distance from each other which VA3, Jt the teeth 5S distance between the wolf is less luvulleen J <* in fact one of the muck like a cord count of sets, in the present – case five. –Arrangements on the shaft supports not only at this end of the housing 6ft, which has a pivotal axis but not movable along it. housing is perpendicular to the axis of the arranged two arms (compare figure 4), one of which 61 is lehdenrauotoeinen, and may be due to the shaft being held in a groove 57 "so that this axis becomes kiirmilukituksi held in the shaft, while the second arm of S $ S 62 is kahvelinauotoinen. This agrees with the fork rod 63, which is secured organized in parallel with the axis of the drive shaft 44 side uikonemukseen This rod 64 is such a length that it remains in contact with gaff, even when the shaft moves always organized in uikoasentoonsa up. tension rod 44 is due on the 65 of the grooves 59 of the shaft kiinnilukitsemista be organized in the frame, the handle bars 4l pin 66 to allow affected by the draw bar 44 When this wears off, go back to the regular draw bar position and remove the arrangements aekseiin, which is pulled back into a suitable counter–force. It is clear that the rod 63 and the two relations between the server 62 takaisinmenfcvaT due to this movement may only occur when the magazine 61 has a groove 57 opposite the free–time–share this. Organized in the shaft on'niinmuodoin always adhere locked to either arrange the shaft or frame uudestikytkijaen device. It should also be noted that organize axle, the association only i may occur when the moienuaat axes are in a defined position relatively to each other, the same as the second combined–ment may occur in as many position as tumblers 59 brush trolley 30 is adapted to be organized axis and is controlled by a control frame 67, which supports the arrangements on the shaft or which is supported by other suitable way, so that the brush wagon–arrangements axis, regardless freely can move in a single direction in a Cartesian both shafts against and at the same time, suorakulmaiaesti contact bar * IAMA brush against the vehicle independent of the business is achieved by arranging the shaft by means of sea llikevaineensa the second period, it is the movement through a relatively organized in the shaft, which is the second el lie during the move. That is, as above said, the rectangular brush and the carriage of both shafts against movement ensloiaiaen phase and can be obtained in different ways, as shown below. ou gear 69 on shaft 69 journalled in the frame section 67 in parallel with the contact bars;. agrees with the gear teeth action mastankooa 7o and 71, which are orthogonal against each other and parallel to the brush carriages with both directions of movement. MANIATE got the tooth is attached to the shaft accordingly arrange the brush wagon. It is now clear that when arranging the shaft carries with JEIJesteltaevaen axis to the left, brush on the wagon with the other to supply the movement and take the brushes to the point where the desired wiring harness must be selected at the same time as the organizing axis moves to the left and organized in the shaft is in place, the hammaatanko 70 to rotate the gear wheel, such that this in turn raises gear rack 71 yloe3 brush wagon, in which case the brushes muon03tavat kfia3uetxaziae »provided for contact with the lead against the selected series. Figure 3 shows the lower part of the engine unit, it is magneettisahkoe ankkurlnaen motor 72 and 73 under the influence of the different data sets question. Qn should be noted that a single electromagnet gradually continued use of the contact member and the movable £ combiner KX–tional movements necessary for obtaining the time

may take place in two ways «__ la combiner means, either through the various koneistot.niihin the combined organic maatetaan gradually specific constant moottoriankku – ed in connection with, or senkautta also said the anchor, or rather the combined organic may be gradually moving continuously between said at machinery. Enslmaelnen way outstandingly fulfills the requirements, since it makes it possible to use a single anchor, senkautta that the motion at each instant is limited to the necessary one–tyisiin parts, it is the anchor without moving associations, or other needs of, and is then provided for the strength of the electromagnets in connection with a more appropriate impulses for the silver. Snaiksimainitun sukaan is the end of the armature 731 suitably formed to transfer the movement and immediately rods 74 and 75, which in turn may be ft. *** in connection with it the pull rod 42 by means of pins 76 and 77. Both rods 74 and 75 are rotatably journalled lines 78 and 79 and IQ supports 81 which are pivotal pins 82 and 83 around. Moottoriankkurln they transfer the movement caused by porraspyoeraaen senkautta combiner 52 and the shaft 58 telkihampaieiin and then arrange the stages shaft 84 'avulla.Vetotanko 85 and 42 and six are deleted thus the action of the rod 74 will combiner for movement to the working position, either the shift lever £ 39.SI means (as has been shown in the drawing) or by means of takaisinasetteluaahkoemagneetin. On the other with large quantities placed under the influence of rod 44, the rod 75 has to arrange the working movement of the shaft, any one of # a suitable counter force, which may be a difference, where Mi is not expressed when the lever rod 39 and the anchor 48 affected. Telkihaka 86 with bearings 07 to 58 agrees with the telkihampaisiln arrange for the maintenance of the shaft gradually constantly esiln–retracted position. This telkihaka disconnected from the pull rod 43 and is subjected to align the teeth until a suitable force. the second mode of motion for transfer (Fig. 5) arranged rnoottoriankkuri rods 74 and 75 £ 68 by means of a finger, which is mounted on the anchor section 89, which in turn arrange that those moleramis–bars to which it is exported to the opposite end of the draw bar 42 by means of the pins 76 and 77. The tie rod 42 seems in this case, the finger @ 3 bars of 7 * and 75 instead. It's easy to keep track of uudestlkytkijan effect of a simple example, the one of the cases) joiioinka the most frequently lashed, it is a wire to connect to the automatic telefonikeskuaasemalla mm * uudestlkytkij time. contribute, due to the engine–virtafcerae you attract the armature and pull, and thus the corresponding rod 74 pushed by means of yndistaejaen step from position I to position II. In this position, ir dissuasive lever bars 39 and 4o responsible for tie rods. The rod 75 may be in connection with the anchor and telkihaka 86 agrees with the teeth 58 Then Conducted vlrtaheraetteet call the station directly or seconded to the relays through saehkoeaiagneett engine market in which atokkurinsa attracted to the same extent as it setting any of the triggering events against giving in marriage, and when the anchor seems to tango and its $ 7 to level, moves to the organizing axis of the shaft and t.aman Ii moves with the electrical contact to the left corresponding to the number one incre–side. If the transmission is assumed to huutoaaeoan only one excitation shaft moves in the organizing a single step and is maintained in this position tekihaan S6, wherein kosketinharjat position has been \ jiaa_ / ensimalsessae opposite to the bars in series. Immediately thereafter by the 47–kaisinasettelumgneetti paakoakettimien'yhdistetyn power through the influence of the mobile kosketlnlaitteen enslmaisen movement because they raetteiden–cessation through the auction status EAXA different relays through which are not indicated in the drawing, j *. whose activities fall outside the scope of the invention, when said electromagnet to pull over with their anchors, so that saehkoemagnettimoottori once again become the asetetuk–si shape under the influence of a combiner for the placing, which takes place immediately as soon as a new vlrtaheraete happens to said electromagnetic motor. = l £ AS taster position III agrees with the lever rod 41 under the influence of the pull rod 44 wearing 65 of its opposite, a groove 58 (in this case from the first to the minor groove) "and at the same time leave the Journal Tue 61 uurtegn 57 When organized in the shaft in such a way is kiinnilukitt 'ina de–tiyslaitteeseen, and only for the organizing arm may move, the time, the auction will receive the following virtaheraetteet station to continue to organize the axis of movement on the left and then at the brush carrier, and brushes up. If eslci. three INFOR M ATIO N excitation enters the call from the station, the organizing arm moves further three «yellow and stops in all, four–step movement. The brushes are then moved in such a way that they are in contact with the line 3 (Fig. 1), it is the rods 9? and t? with. iuebko the movable contact member is maintained in this position when telkihaan 86. Immediately after this and the above mentioned combined effect, by whom, in this case, sivukoekettiiiiien 51 uudestikytkitys brush wagon ensimuieen independent country due to movement »by recurrent activities mentioned, and the unifier will then take position IV, in which the lever rod 39 again may draw bar * 2 in Figure position indicated. Freshly Said kosketinasentoa and aeuraavia positions IV, V and VI may be used to mold the functions necessary for the ESLR. huutoase–man for examination of the mark "put up" for the transfer of huutoase station, joa Auctioned aseica has been taken up, with an exclamation point for the transfer Auctioned drive if this is free, as well as for discussion. All these XAEISUI8AE £ 2XSJU6X supply provided independent of the regeneration switch i ? voltage correct movement of the various relays and saenkoeyhdistyksien the combined effect through the time from the combiner, and dependent, in particular Sista slseitfidstae circuits Asx uudestikytkijaessae and telefonlkeskus position of the particular type but which are not part of the present invention. When the call is ended, which can be expected to occur when the yhdls–tujii position has become VI takes saehkoeBagneettlmoottorin passing through the combiner vlrtaheraete starting position, it is the position I, Wherein 4–3 pull rod 36 may telkinaeaen lots of teeth 58 yhtyisykoeesta. Thus, moving the shaft L–jaerjesteievae a suitable counter–force under the influence of the back, * – there until its flange 61 of the magazine 55 occurs, and at the same time, the brush descends tin–axis carriage jaerjesteltyyn. Only this time, because one 'a diataejaen position I handle bar 41, the impact to the drawbar 44 stops, get–oiu–the Journal of 61 due to the minor groove 57i which is opposite to it is located, and at the organizing axis of motion back may continue, with pads, taking with him the arrangements axis, until such time as both of them, get the start position «= 4.ed.. – V "is 011 until the flange 55 happens to the frame. Brush second trolley motion, that is when it moves arrangements on the axis of whatever can be obtained in many other ways as herein described. May, for example, instead of a gear wheel 68, which at the same time agrees with both haamastankoihin £ 70 and 71, the use of two gear wheels or acid tfpnassektorla, attached to the same shaft 69 and each coinciding with one "tea tooth rods. It should be noted that Job sprocket or gear sectors have different sized diameters, arrange the axis provided by the stores are going to be different from those of the brush wagon movements. tyoerien and

sectors may be used instead at right angles to the bending tettua viputankoa, journalled shaft 69 'of both toothed racks 70 and 71 is used instead when two pins, adapted such that when only the organizing shaft moves, ensimaelnen pin, which is fixed to said shaft, affecting the lever rod to the second arm sorry for the second pin, which is attached to the brush wagon, viputan–gon is the second–laikutuksen under, so that the brush carrier moves to the vertical tick. Gb noted that if the handle bar is not tasavartinen enter the organizing »axis and the movements of harjavaaenub be different. It is also possible to the bent lever rod used in place of non–keskoja or inclined plane, adapted to arrange the shaft or harjavaunuuft, or the use of said combinations of suitable organic or some other suitable organ. Finally, it is also possible to be adapted to both axles, and the organizing the sys–jesteltaevae, the level of which is parallel to the kosketintanicojen with these value against a rectangular plane instead of or ayoeskls to one another in a plane or making one shaft is hollow and adapted to another aspect of this in * Rolling kosketinla.itt.een and its variants described structure, the kosketinharjat always move in two different directions. This movement ob ipyoeskin contact assembly on the most appropriate, in the characteristic form. It should be noted that, especially from AEUESKil brushes another business management for selecting a particular series may have a circular motion, keeping the necessary organic enough that simple. In this case, available from the Commission * No moving kosketiniaite the same shape as the other already well–known–again coupling systems. Figure 6 shows a cross–section through the contact array kytkijsn Again, the combination of using two motion with a moving electric contact device rotatably with brushes. Connector and the contact group address in the top left and on the right side and moving co »». Etinlaite pattern at the center. The moving kosketinlaitteeaeen belongs to, quite simply, akaej.! 90, which cont–tinharjat 27 are immediately attached to the clamps 29. The shaft is arranged at right angles to kosketintanicojen against the plane and maintained at the stations and controlled by specific subsidies adapted to frame the facility 46, so that it easily can move the XZ left in the axial direction and return to the starting position, In which case the movement of the back limit at–shi 91 »The shaft may also rotate in both directions. Kosketinharjoina of springs 2S are displayed to the shape and fit of the already described with respect to not only look in that they are in this case occurring enBiffiaeiaeii "contact bar at a smaller angle. Of the group is clear from Figure 7, which shows oaan uudestlkytkijastae longitudinal section. Cattle wagon to double in this issue include first of all the axis move to the left and subsequently the rotation until the sun, as seen from the left end. Easimaeiaessa motion brushes may be desired position harness for selection, and the second movement is brought to them in a particularly consistent contact in the selected category. Both of these movements saamilta for shkoeniagneettiBioottoris t »shaft supports the left end in Fig two groups of teeth and the other 93 * 92 **** Ett! *** renkaanmuotoiaia to form said first telkiham–shirt at a distance from one another which is equal to the touch, do not lntakoj of peoples, and the distance between the wire in number equal to the number of sets (t,. be the case five), while the second longitudinally to form a dumb number in each series (in this case five). Longitudinally traveling the distance between the teeth gradually increases proportionally to the angle "which should rotate the brushes in order to achieve rods. If it is assumed that the rods are the same distance from one another »increased rotation of the shaft mzXKaet during the movement of the brush bar to the next. If you. The distance between the bars of the various elected so that they would fall, to keep the axis of the angular momentum as a permanent "pattern shown at the bottom of uudestlkytkijaen moottorielement.it, which are fully consistent with the already explained. the wires 74 and 75, however, between this third rod 94, which is journalled kontaan 96 £ 2 £ D dun angle shift lever 95 and the stage 97 by means of transfer at the axis of rotation. Telklh also found in second–ku, 98 and 99 journalled kontaan organized in enslmaeisessae telklhaassa frlevan finger 86 * and through–£ £?) £ pull rod 43, thereby to maintain axial positions of the 3eura.itvissa each other, the rotation of which it receives. However, the arrangement sejaae rod 42 in this case may be affected by run–moottoriank telkihampalta lines in number equal to the buffer arm leuten in Figure 5 instead of being actuated by a rod to 7 and 9 * 75 *. Uudestlkytkijae equipped with a descending helical brushes affects mainly the same manner as described above. Kim tow–bar 42 Combine | ittt voltage jpitaeae position III rod 94 opposite the anchor, there is provided a rotation axis of the second virtaheraete huutoaaeenulta arrives. iCun the debate is over and the integrator will return back to position I, to disassemble the draw bar 43 telklhaat 86 and 98 yhtyaiyksestaeaen telkih and xr.paiden–operation with and the shaft is rotated back to the first of all the appropriate counter–force, until such time as the brushes are released from the contact bars, and subsequently placed on the axis of its initial. The possibility can not be combined with rolling contact member main structure of UP–laeselitettyyn twisting harjakoneistoon is of paramount importance, is tu irtyoeskin jrahdollista give kosketinharjoiiie the main structure mentioned two denkert * i $ Bn IISKlifcf business user into a shaft which moves and rotates into. Of S shows an example of this structure connected to the shaft 90 is attached to the kosketinharjojen instead of two protruding arms loo which is arranged between the gear wheel made of harjavaunuasa the toothed rack 30 lo2. Said arms are used to move the brush along the carriage axis I03, time–kehyslai is attached to this shaft 46 toicseen to be only as track for a carriage for the brush as it rotates shaft 90 is forced to move upwards. The guide can be adapted to many times the vehicle and immediately brush Js.ehys plant, or between the mouth of the appropriate magi. Hut the same as described above, it is possible to inyoeskin mentioned in this specialized equipment used in place of other organs in which a suitable combination supplied by the same supply. Figure 9 shows the uudestikytkijaen simpler with only one direction of movement. Ylhaeaellaepaein shown kosketinryh »s, which is yxsi example only, a series of five kaksnapalsta lead, to ge is only the top ten has a contact in the form of flat bars. At the bottom address of a traveling device comprising a shaft lo4 j ', the brush–axis carriage 30 may be llikeheraetteensae lo5 teeth and move it through the hairor.ast and u FTN and stud by means of a gear wheel, which in turn transmits the motion to the toothed rack 71 "so that the brush carriage moving upwards. The shaft is secured to the frame I06 46 and is only used to support a 67 johdekehystaeae Also in this drawing, in a simpler form it is possible to use the device with descending helical–gray to (being indicated in Figure 6 looking), or a hybrid device (as shown in Figure 8), and not only is it possible to use the gear in place of someone else mentioned it before monovalent wheels. can also still continue to be made simpler device {such as is shown in Figure lo), combining the shaft lo4 and brush carriage as one of the 3o 'as the only organic. In this case, the mobile device alone reduced the brush wagon, which, appropriately supervised framework oe7 help, you should immediately I07 teeth, allowing it to obtain movement's ahkoaeagneett engine. Claim. 1

Uudestlkytkijaelaite itself to the left and automatic teltifonixesiusaderaia–paisia for a particular gap again switches from a number of haeaeraetty kiintonaisia koskettiraia, one or more mobile koskettlmla mixed moott.oriorgaanit, characterized in that the parts treats Cu «* t muitippelikayttoeae adapted for senkautta that they are either is used simultaneously for the transmission of different depending of supplies that their shape is suitably selected Kiintonen relatively contacts, or they are used in senkautta said deliveries for delivery to gradually towards their electro–mechanical kyt.kityksen through variation of the moving contacts and a relatively moottorioraaneihin. 2 as claimed in claim 1, wherein uudestikytkijaelaite, characterized in that the hiintonaiset contacts which form the contact assembly, at the same time are the object of multlppelikaeytoen and they have such a shape that the simultaneous use of mobile and koskettinuen and one of the same uudestikytkijaeryhaaen association between the respective kilnto–3ejta ria.i3t.en lyimien about creating contacts and multiply. as claimed in claim 3 uudestikytkijaelaite claim 2, wherein the Group kiintonaisia kosjtet.tiraia at the same time, the association is used for the movable koskettlmien with one and the same uudestikytkijaessae uudestikytkijoeiden between the various multiplications, characterized bridge the contacts of kiintonaisilla flat bars or the like to form thu, which are parallel to each other and attached to the insulating material drawn up kannatuslaattoihin which are arranged, at right angles to the rods against the yleanaae an equal distance from the toi3istaaa, and through which the bars protrude, without their ends modified and keskeymattae, the outside of the group to which they include, so that they form a series of groups of said separated from one another by means of insulating plates. h–. Iatenttlv * atimuk3on 3, wherein uudestikytkijaelaite, characterized drops below the rods are arranged in equal distance from each state with a specific number of equal distance from each other in the underlying layers, wherein the XZftX rods jotxa include a wiring harness, are iafciAAai a single plane, if the wires are yksnapa–lsla, or in more s–boxes corresponding to the poles where wires are mooinapaisia, and the rods are asantojtasossa ', or even what tantalleen taataavat aiita positions for which the bars are all gases from planes. as claimed in claim 5 wherein * uudestikytkijaelaite, characterized in that, when only one set of wires exists, the rods are only to / or be adapted to XaelgBX levels, which correspond to wiring terminals. No. As claimed in claim 1, wherein uudestikytkijaelaite, which move in contacts (which are carried by the brush to the other car and the combined organic) and above all have the designed moottoriorgaanit. a gradual and ongoing multippelikaeyttoea, characterized siitaeTmainittu Mlili aul–tippelikayttoe is achieved by gradually constantly varying their organs and supplies, which form a movable device and arranging them a single motor, which may be affected in different ways ~ a the same mobile device lime to the different operating phases According which is uudestlkytkijae. 7 claimed in claim 6, wherein uudestikytkijaelaite, which is recognized as an indication of an electromechanical device, pre micro * will multippeiikaeytoen it possible in a new way uudestikytkijaen various stages of varying the mechanical compounds and at the same time in a known manner by varying the uudestikytkijaen inner electrically compounds. 8 claimed in claim 7, wherein uudestikytkijae, characterized in that the electromagnetic combiner includes a plurality of iaurttttK plates, which have different contour radiaaiisessa depth, moored to the Community to the rotary shaft aekae set of viputankoja which rely on advertising–mentioned outline of vaaten one end and the other end supplied by changes to the required compounds. 9 as claimed in claim 3, wherein uudestlkytkijaelaite, the sign–merkkinaeftakaisinvieva «aehkoemagneetti, adapted for use in yndis–voltage reference when the nucleus has been issued kosketmialtteen motor for rolling the above–fair movement. to claims 10 and 9 wherein the S uude3t.lkytkljaelaite, characterized in that the plates 3> instead that they are profiled in the radial direction are profiled in the axial direction T *. fitted in the grooves. 11 claims S–lo with uudestikytkijaelaite, known only to the fact that a connector is adapted to pysaehtymaeaenedeltaekaesin to specific positions unchanged, at a predetermined order, which previously limited electro–mechanical, correspond to an additional £ and £ £ £ and $ compounds also can be achieved by temporarily ferries »19 * –" 1 /. To claims 15 and 16 wherein uudestlkytkijaelaite, characterized in that the gear is changed to the action toothed wheel or toothed sector yhtaesuurilia or erisuuriila diameters normally equipped as, or a bent lever rod By the second arm influence the pin, thereby replacing ensimaeistae haramastankoa, while the other arm acts on a pin, which replaces the a second toothed rack, or said organic or epaeke3koihin suitable compounds or other devices. Lo. To claims 15 and 16 wherein uudestlkytkijaelaite, characterized bridge that the organizing shaft is rotatable after the transfer, and that the brush contacts are made directly to the appropriate position, so that they happen to kllntonaisiin contact bar suitable intermediate liajan time when organized in the shaft remains off. 19 – according to claims 15 to 17 uudestikytkijalait–e, characterized in that the ridges independent from the rotation axis of the organizing–occurring, is obtained already by means of a gear degrees and which is adapted to said brush axis and the carriage shares the patent arranged hammaotaakoon – in accordance with claim lo or claim 17 of said device. Ho. Claims 5 and 13 to 19 wherein uudestikytkij aelaite, characterized in that when only concerns one set of cables, operating a series of selection vartoem is omitted, and that the brush the contacts second movement is achieved by one of the preceding claims said apparatus al £ avullaryhdistaemaellae the organizing narjavaunu shaft and a single organic senkautta that the teeth of the shaft arranged immediately brush carrier. 21 as claimed in claim 6, wherein uudestikytkijalaite, jolioina moottoriorgaanit of the designed order of the time for multippelikaeyttoea characterized in that moves the movable moottorinherate kosketimlaltt.ee–sean during the movement of the double selection for the transmission of ice and also joined by bringing them I8I11AX3EX apparatus which task is gradually continue to receive the business, the actual aahkoe–magneettlrnoottorin anchor connection, said second mechanical mtuuat provided by the combiner itself II $ t help. 22 as claimed in claim 21, wherein uudestikytkijaelaite, characterized in that, instead of reacting the various movements, which should be taken against movement, the motor constant gradually to say in connection with the anchor–base an / or vkuri connected to the continuously moving a finger slowly at machinery may be mentioned. using the contours of the range in the positions through which a connector Passing through without stopping. 12 uudestikytkijaelaite according to claims 7–11, characterized in that the number of tiles, each of the contour shape viputankojen And, the number of staging Ifixsaeaelxa are selected from uude3tikyt–kljaen each specific model, the combiner will act as an inner and an electrical circuit According to. 13 as claimed in claim 6, wherein uudestikytkijaelaite, joesa the movable contact member is aljottu multippelikaeyttoeae for a period of time during characterized in that the brush contacts or the carriage supporting them is adapted to deliver two movements,

namely firstly from the cable set va–selection and thereafter particularly consistent preference for in arranging the axis by means of a moving in a single direction toothed rod or the like means, and second arrangements on the shaft by means of which suitably brush carriage is arranged, which two axes are parallel with each other, the rectangular koaketintankojen levels against and adapted to one and the same plane which an rectangular –like contacts and nkoja against * 14 as claimed in claim 13, wherein uudestitytkijaelaite, characterized in that the axles on the other hand are arranged plane which is parallel to the kosketintfeikojen, or any other suitable plane, or also in such a way that the second shaft is hollow and the second fitted to it. 15 as claimed in claim 13, wherein uudestikytkijalaite, characterized bridge, the motion kosketlntankojen selection is supplied in two stages, wherein during work of the first operating system immediately switches to an adjustable shaft and harjavaunuua kosketlatakosarJan for selection purposes, while the second stage of the shaft is organized in a stationary state and arranging axis motion is transmitted to the brush trolley independent maettaemaessae motion, which results in that the brushes provide a second selection, it is a specific kosketlntankojen selection whereby the ridges, both movements transmitted in a plane is a rectangular bar, and against a way that easiaainen movement is parallel to the axes And the one with rectangular bars at large. 16 as claimed in claim 15, wherein uudestikytkijaelaite, characterized in that the brush trolley independent movement is achieved brush trolley–tor fitted toothed rack, which agrees with arranging the axis of the bearing roittuun hajnmaspyoeraeaen, which at the same time agrees with the second toothed rod adapted to arrange the shaft and niineuodoin rotates viimeksimai of said means.

Abstract:
Source: GB776361A 776,361. Cutting machines. BRITISH UNITED SHOE MACHINERY CO., Ltd. (United Shoe Machinery Corporation). June 23, 1955 [June 25, 1954], No. 18625/54. Class 31 (1). [Also in Groups XVI and XXIV] A machine for marking shoe soles has a pressure head carried by a parallel linkage and arranged to carry a marking tool and movable downwards to press the sole towards a second tool for marking the lower side of the sole, the machine including a toggle for actuating the pressure head, and means for adjusting the lowest position to which the head is moved when actuated by the toggle means. As shown, a worktable 30, Figs. 5 and 7, has gauge rolls 36 and 38 for positioning an insole S, Fig. 10, laterally of the worktable for a marking and/or impressing operation. A movable head 50, Figs. 1, 5 and 12, carries presser members 52, 54 and 56 which press the insole S into engagement with dies 42, 44 and 46 respectively. A toothed indenting tool 58 carried by the head 50 co–operates with a die 48 to form indentations in the insole S to mark the breast–line, while presser members 60 and 62 co–operate with the dies 44 and 46 when positioned rearwardly of the table 30. Knives 64 and 66 are also carried by the head 50 for making incising cuts in the surface of the insole S. The head 50 has arms 68 and 70, Figs. 1 and 5, pivotally connected by a pin 72 to an arm 74 supported by a pin 76. The lower end of the arm 68 is pivotally connected by a pin 82 to an arm 84 pivotally supported by a pin 86, while the arm 70 is connected by a pin 88, coaxial with the pin 82, to an arm 90. Thus, the head 50 is held vertical during movement, since the axes of the pins 72, 76, 86 and 82 define a parallelogram. An eccentric 92 on a driving shaft 94 is coupled, by a connecting rod 96, to a toggle pin 98 which connects a link 102 and an arm 106 and a link 104 and an arm 108 respectively, the arms 106 and 108 being formed on a yoke 100 mounted on a pin 110 secured in arms 84, 90. The links 102 and 104 are pivotally mounted on a pin 112 having a notched central portion 114 to clear the arm 74. The ends of the pin 112 are secured in arms 118, 120 mounted on trunnions 122, 124, coaxial with the pin 98 when the rod 96 is in its most rearward position, i.e. with the head 50 raised. The stroke of the head 50 is adjustable by angular adjustment of arms 118, 120 about the trunnions 122, 124 by a bracket 126 pivotally connected to a sleeve 134 engaged by an adjustable screw 136 rotatable by a hand wheel 142 to move axially through a nut 138 to vary the height of the pin 112 in accordance with the thickness of the workpiece to be impressed and/or marked, the setting being indicated by a pointer 152 co–operating with scale markings on a plate 150. The presser member 52, Fig. 12, is secured by a screw 154 to a bracket 156 secured to the head 50, the member 52 being adjustable vertically by means of a slot 160 and adjusting screw 162. The presser members 54, 56, 60 and 62 are threaded into the head 50, and retained by locking plates, not shown. The indenting tool 58 is clamped to a rod 176 adjustable vertically in the head 50. The knives 64 and 66 are similarly mounted on the head 50. The knife 66 is clamped to a block 188 by a screw 190 extending through a horizontal slot 192 to permit transverse adjustment. A leaf–spring 196 is disposed behind the knife 66 and acts as a stripper to force a workpiece off the knife after a cutting operation. The block 188 is adjustably clamped by a screw 198 to a block 202 to permit forward and rearward adjustment by screws 206, 208, the block 202 being secured to the head 50 by a tongue and groove engagement which permits vertical adjustment of the block 202. The knife 66, Fig. 30, is secured on the block 188, slidably adjustable on the block 202, while the knife 64, Fig. 31 (not shown), is mounted on a block 1188 slidable on a block 1202 vertically adjustable on the head 50. The knives 66 and 64 are moved forwardly and rearwardly by a pivoted lever 772, Fig. 30, connected to a link 776 pivotally connected to the block 188. A similar link 784, Fig. 31 (not shown), pivotally connects the lever 772 and block 1188. When the lever 772, Fig. 30, is rocked, by manually sliding a rod 792, the knife 66 is moved in the opposite direction to the knife 64. The pivot of lever 772 is secured in a lateral extension 804 of an L–shaped slide 806. A U–shaped slide,

comprising parts 818 and 820, and a part 816, Fig. 31 (not shown), is secured on the head 50, Fig. 30. Screws 834 and 832, Fig. 31 (not shown), threaded through the part 820, engage the rearward ends of links 784 and 786, Fig. 30, to determine the rearward positions of the knives. The die 42, Fig. 5, is mounted upon an electrically−heated block 216 supported on springs 222 to permit yielding and tilting under the pressure of the presser member 52. Each die 44 has a stem which fits into one of a plurality of holes formed in a slide 224 movable transversely of the machine to bring a selected die into an operating position beneath the appropriate presser member 54 or 60. The slide 224 can replace a blank slide 246 when it is required to position the dies 44 beneath the member 60. Size marking dies are carried by a wheel 228 secured to a shaft 234 rotatable to bring a required die into operative position by a hand wheel 236. The hand wheel is integral with a dial 238 carrying numbers corresponding to the size marking dies which register with a stationary pin 245, the hand wheel normally being held locked by a coil spring 242. The die 48 is fixedly mounted in a recess in the table 30. Positioning workpieces.−A heel end gauge 40, Figs. 7 and 10, is secured to a member 250 forming part of an H−shaped slide 252 also having members 254 and 256. The slide 252 is slidable along a lower slide 260. A block 274 has a pin 276, Fig. 5, carrying a rotatable block 278 engaging a worm 280 on the shaft 234, rotation of the shaft 234 by the hand wheel 236 causing sliding of the block 274. To permit adjustment of the heel end gauge 40 independently of the hand wheel 236, a key 288, Fig. 7, engages a slot 290 in the member 254 and is clamped at required positions along the slot by a screw 302, a pointer 298 on the slide 252 co−operating with a scale 300 to indicate such positions. Alternatively, a rack 600 and pinion 602, Fig. 17 (not shown), is provided for adjusting the slide 252, Fig. 7. Edgegauges 36 and 38 are mounted on arms 306 and 308 pivoted on pins 310 and 312 secured to the table 30, Fig. 10. The arms 306 and 308, urged together by a spring 324, have extensions 314 and 316, the extension 314 having a slot 322. A block 318 mounted on a pin 320 secured upon the extension 316 engages the slot 322 to co−ordinate movements of the arms 306 and 308. When use of the gauge roll 38 is not required its supporting bracket 340 is turned through 90 degrees about a screw 344; similarly the roll 36 may be turned to inoperative position. A latch 364 normally retains the roll 38 in operative position. Driving arrangements.−A driven pulley 372, Fig. 1, drives the shaft 94 through a clutch, not shown, controlled by mechanism 374, Fig. 21, tripped by a treadle on a rod 376 or, automatically by insertion of an insole in a gauging mechanism, not shown. A pin 472, parallel to the axis of the shaft 94, is rotatably mounted in a disc 474 keyed to the shaft 94. The pin 472 has a half−round extension which can enter any one of a plurality of half−round recesses in an inner cylindrical wall of a ring, not shown, carried by the pulley 372, Fig. 1, to couple the shaft 94 to the pulley. A spring− pressed plunger 478, Fig. 21, in the disc 474 engages a head 480 on the pin to rotate the pin 472 into engaging position, while a lever 482 normally holds the pin in disengaged position. A pawl 484 holds the disc against retrograde rotation. The lever 482 is pivoted on a pin 486 and urged into stopping position by spring 488. The clutch is engaged by withdrawing the lever 482 from the pin 472 by rocking a lever 498 carrying a latch 492 engaging the lever 482 and connected to a rod 502 pivotally connected to an armature 504 of a solenoid 506. The solenoid 506 is energized by an electric circuit closed by engagement of the heel end of an insole S, Fig. 20, with a finger 448 positioned in a notch 444 of a heel gauge 440. An arm 450 pivoted on a stud 452 on a bracket 454 is held in engagement with the finger 448 by a spring 462. A lug 460 on the arm 450 engages a button 466 of an electric switch in a casing 468. After engagement of the clutch, an arcuate cam 510, Fig. 21, on the disc 474 depresses the latch 492 to release the lever 482, thus disengaging the clutch by rotating the pin 472. A guard 380, Fig. 3, not shown, protects the operator's fingers and facilitates the introduction of workpieces, while a sector 390, Fig. 21, engages a latch 392 forming part of the clutch mechanism 374 to prevent operation while the guard is raised. Adjustment for varying thickness of work. pieces.−A crank−arm 700, Figs. 22 and 24, is secured on a trunnion 122^1 also carrying a yoke 116. A tension spring 702 is secured to the arm 700 and to an extension 704 of a pin 821. As the head 50 descends the spring 702 turns the arm 700 to swing the yoke 116 forward and downward about the trunnions 122^1 and 124. A spacing link 706 is pivoted to the arm 700 and has a slot 710 engaging the pin 821 which controls the position of the yoke 116 in relation to the head 50 during its downward movement. Thus, the head descends idly until the presser members engage the workpiece which upon continued downward movement of the head causes the pin 112 to rise. This raising movement is opposed by a locking mechanism which permits only forward and downward swinging movement of the togglesupporting yoke 116 which holds the pin 112 against upward movement when the presser members engage the workpiece. As the connecting rod 96 comple

Abstract:
Source: US2004093817A A foundation framework for structures in a reinforced setting material includes a foundation raft with a form having a plurality of modular panels and angular reinforcements for joining at least two faces of at least one right−angle dihedral formed by faces of the modular panels. A layout and positioning template is disposed on top of the form of the foundation raft for correctly dimensioning, positioning, and fitting walls, installations and reinforcements in the foundation raft. Adjustment legs for centering the layout and positioning template are provided, as well as self−centering clamps and a stabilizer having security pins and an anchorage mechanism for securing the form to a support surface.

Abstract:
Source: US1884510A 1 "Having described my –invention what ‘I claim as new and desire to secure by–Letters Patent is 1– ‘ ‘ ¢ ' = ~1.'In' a muiiled–retort o1'e–oxidizing furnace, the combination of supporting walls with a plurality of retorts mounted thereon and provided with a plurality ofnonlconductive floor members, heat conveying flues, electric current circuit wires extending into said furnace to the said non–conductive iioor members, a heat conducting casing embedded in said non–conductive floor' lnexnbersj and an electrode Within said casing arranged to heat said casing. ' ~ i V 2.']fn an orepxidizing muffled–retort furnace, the combination with side and ‘ end foundation wall members of sz, pluralityoi vm retorts each comprising opposite side members, a floor member and a roof member, said 'side members each comprising a straight rec~ tangularly shaped piece of metal provided with a right angle foot member extending outwardly therefrom and resting 'upon said side foundation Wall members and _an inwardly projecting shelf member, and having its upper edge releasably engaged by an edge of said roof member, said iioor member being dishshaped transversely of its length and consisting of a Hat wide horizontal portion and opposite short upwardly projecting side edge portions, and outwardly extending lug members projecting from said side cdgeportions over and resting uponshelf portions of said opposite side foundation Walls. 3. Inj a muiiiled–retort ore–oxidizing fun nace the combination of supporting Walls with a plurality of superposed retorts there» in each comprising side members, an`o1e–0xidizing Hoor member releasably supported by said side members and arranged to be removed therefrom, without tearing 'down said supporting walls, and a roof incinber fitting on said side members ; said ore–oxidizing floor member having upwardly projecting side edges With Hat track members extending therefrom to the inside surfaces of the adj acent side members; and an ore moving' and stirring endless chain conveying mechanism within said retorts comprising a pair of end, less link chains mounted along the opposite sides of said retorts and connected to ayariable speed poiver operated mechanism ar~ ranged to move said chains in different predetermined periods of time through said retorts; metal rods connected at their opposite ends to the links of said side endless chains and extending transversely across the orc oxidizing fioors of said retorts; and ore shovels mounted loosely' enough on said rods to have a short adjusting movement thereon, said ore shovels having shoveling edges bearing against said iioors; and means including .re~ silient members for takingup the wear of said endless chains and–holding them taut. _ ‘ degrees ‘ _ ` 4, A mu.1iied_lt;retort ore–oxidiiing furnace comprising a. plurality of superposed 'retorts S5 ice 'iso pus 14 _i»,BB4,51f)t each composed of separatelside, floor and roof meinbcrs, the said ore oxidizing Hoof member of each retort being releasably attached to its side members and having upwardly projecting side edges carrying' track nielnbors so arrangedthat each floor member is dish–shaped, an ore moving and stirring endless chain COIlVEyl1'1g~~1ll€Cl12IILISIl1, the chains of which are mounted on said track 'members and the stirring members of which are arranged to moveunder the ore to raise it u and cause some of it to drop down on the ilioor behind them while pushing some of the ore ahead ofthem as they are moved with a eontinuously forward movement through said retorts, meansfor feeding ore into the uppermost retort, means 'fOF`WltllCl1`H.Willg~ oxidized ore from the lowerinost retort, means for heatin the retorts, a variable speed power operated rrrechanisin arranged to move said Qre moving_ and stirring endless ~ chain conveying rneclianisin at different predetermined pcriods of time through said re–torts, metal rods coruiected at their opposite ends to the links of said side endless chain and extending transversely across the ore oxidizing floors of said retorts, shovels mounted loosely enough on said rods to have at short adjusting movenienttheren, saidshovel members consisting of a huh member and thin spokes that stand at right angles to the hub members and extend in opposite directions therefrom and thin shovel blades that stand at right angles to the spokes and bear with their ore slioveling edges against the floors of said retorts by gravity; the said shovel blades being positioned on the opposite ends of said spokes so that one of the shoveling blades willbear on the iioor of one retort and the other shoveling blade –will bear on the iloor of the next lower retort, means for adjusting the shoveling blades to 'any

predetermined angle of ore shovclilig inclination to the doors, ‘and means including springs for’ holding said endless link chains tant on said tracks and sprocket wheels as its joints Wear. 5. In an ore–oxidizing niuihed–retort furnace the combination of supporting walls with a plurality of superposed retorts therein having hoods at their ends, said retorts each comprising side nieinbers, a roof meniber on top of said side nicnihers and an oreoxidizing Hoon member having upwardly projecting opposite side edges With truck ,members thereon extending from them to the inside surfaces of the adjacent side incinbers _of .the retoirtpneans for releasably securing said ore oxidizing fioor members in operative relation to said side members, sprocket wheels journaled in said hoods, an ore moving and stirring endless roller chain conveying mechanism the rollers of which _are mountedon said tracks and the side chains of which passovei' said sprocket wheels means including spring controlled lever mechanism –for holding said endless chains under it resilient tension on said tracks; and sprocket Wheels, ,a variable speed power operated mechanism arranged to inovesaid chains in diliercnt predetermined , periods of time tlirozigh sa–id rctorts, metal rods connected at their opposite ends to the links of said side endless chains and extending transversely across the ore–oxidizing(floors of sa–id retorts, ore shovels mounted loosely enough on said rods to have a short adjusting _mo–veinent thereon; said shovelmembers consisting of a hub inemberand tliinyspokes that stand at right angles to the hub menibefrs and extend in; opposite directions therefrom, and thin shovel blades that stand at right angles to the spokes and bearwith their ore shoveling edges against the iloors of said retorts by gravity; the said –shovel blades _being positioned on the opposite ends ofvsaid spokes so that one of the sliovoling blades will boar on the floor of one retort and the other slioveling bla–do will bear on the floor of the next lower retort, and means for adjusting the shoveling blades to any predcterinined angle of, ore shovcling inclination to the floors(' , p _ 6. In a muffled–retort ore–oxidizing furnace the combination of supporting walls with retorts supportedthereby, Hues in said walls and between and above said retor1:s,orc moving and stirring mechanism in said retorts, hoods, on said retorts, doors" on said hoods hiugedatitheir top edges and extending to and releasably fastened to 'their lower edgesr tire clay floors in said retortssupported by skeleton metallic floorniembers, track members carried on said Hoorinem–~ bers, and asbestos side boards and root members in said retorts. ‘ , `7. In aiinuiiied–retort orc–oxidizing furnace ,105 the Coznbination With snpporting Walls of a pluraliiyot superposed retorts each havinga hood at its oppositcelicls, a pair of sprocket wheels rotatably rnountcd in each of said hoods, means for slidably moving one pair of said sprocliet Wheels, means for rotating the other pair of sprocket' wheels,–' a shaft "secured to the sliding pair of ,sprocket Wheels, a lever secured to the one end of said shaft, a bolt rod secured at one of its ends to the adjacent Wall and having its 'Free endrextending through the free end of said lever; springs mounted on said rod on the opposite sides of said lever, nuts threaded on the ends of said rod _and lC)€9\1'l.llg against thcends ot the adj acent springs, endless chains, ore moving members mounted on said chains, andnieans including slideways in the opposite sides of said hood for supporting slidably said shaft whereby said endless chains are 'automatically held taut in said retorts and hoods. » S. A, mullled–retort ore–oiidizing furnace comprising' supporting Wall members, retorts supported by said 'wall Ineinbers and; provided with non–conductive ore oxidizing floor no vll5 rzo 1,sa4,s rot 1 members,_gt;he21t~receiving fines arranged to convey heat to said rotorts, means including electric current conveying Wires extending through said Wall members to said non–con~ ductive floor members, electric current heated eosingsf embedded in said non–conductive iioor members, and _electrodes in said cusings connected tosaid current' conveying wires and arranged.to heat said csisings. 9. A 1l1LlH'i€(_i~l`9i`r(JICt ore–oxidizing furnace comprising supporting wall rnenibers pretorts supported by said wall members and pro~ vided with it plurality of non~eonduetive ore» oxidizingiioor niembelsrheat receiving Sues below and between find above said retorts, and electrical current heating means disposed in recesses formed at the contacting edges of the Hoor members of the retorts. ` 1O.' In at I!1l.`lHl€d_gt;1`€t0ll`» ore–oxidizing furnace tho combination with supporting walls of retorts Within said walls and fiuos for heating said Walls and said retorts, said retorts being provided with opposite side members, and an ore~oXidizi11g floor member comprising ai flat Wide central iioor portion and upwardly projecting opposite side members carrying horizontally disposed terminal members extending to the opposite side members of said retorts, und means including the horizontally disposed tormin al members for supporting said floor member in operative relation to said retorts and its opposite side members. i ’ 11. In sr muiiied–retort ore–oxidizing furnace the combination with supporting Walls oi’ retorts within said walls and fines for heating said walls and said retorts, said re~ torts being provided with opposite side members and an ore–oxidizing floor member coniprisinga, Hat Wide central floor portion and vertically projecting opposite side men1~ bers carrying horiiontally disposed terminal members extending to the opposite side mombers of Sf|.i(lVY_tU1`tS, and menus for supporting said floor member in operative relation to, said retorts and its opposite side members, the 'said flat floor portion 'of said floorfmeinber being provided with large openings bounded by transverse ribs and longitudinal members. 12. In £1 mutl1ed~retort_ oreoxidizing furnace the fconibinntion with the supporting Walls of retorts Within said walls and Ilues for booting said Walls and said retorts, said retorts being provided with opposite side inemliers and an ore–oxidizing floor member, said. floor member comprising a Hot Wide central floor portion and vertically projecting opposite side members carrying horizontally disposed terminal members extending to the opposite side members of said retorts, moons for supporting said floor member in operative relation to said retorts and its opposite side members, the 'said flat Hoot portion of said Hoor member being provided with large openings, bounded by transverse ribs and _longitudinal members, and 11 re~ trnotory floor member laid on top of said fiat floor portion of said floor member and against its opposite vertical side members. In testimony whereof I affix my signature

Abstract:
Source: CN2851346Y The utility model relates to a self–thawing type hoisting negative–pressure automatic snow removing truck with a multi–head crushing disk, which is used for removing the snow cover on roads. The utility model is composed of a truck chassis assembly, an electrical generator, a snow storage, a snow remover, a snow picking–up device and a negative–pressure residual snow collector, wherein the snow storage is arranged on a chassis arranged at the back of a truck cab, a portable generator is arranged between the snow storage and the truck cab, the snow remover is horizontally hung under the chassis arranged at the back of truck back wheels, the top end of the crushing blade of the crushing disk of the snow remover has the same height as the bottom surface of the truck back wheels, the snow picking–up device is composed of a conveyor belt and a snow picking–up spade and is annularly arranged in an isolation storage arranged at the tail part of the snow storage, the upper end of the negative–pressure residual snow collector is provided with a high–pressure draught fan, the whole negative–pressure residual snow collector is arranged at the tail part of the snow storage, a collecting port of the lower end of the has the same width as the snow remover, the height of the bottom edge of the collecting port is equal to that of the top end of the crushing blade of the snow remover and the top end of the back part of the snow storage is provided with a residual snow inlet. The utility model is rebuilt on the basis of a truck chassis and is an ideal special truck for snow removing.

Abstract:
Source: US2757526A I claim: 1. In a circular independent needle knitting machine having a needle cylinder provided with vertically movable needles and also having a set of stitch cams and also having means for alternatively imparting rotary ai–id reciprocatory motion to the needle cylinder aiid –also having means for respectively, lowering and elevating the needles to and from a position to pass through the stitch cams means for at times lowering four needles and clev,itin_ two lowered needles to permit the number of needles passing through the stitch cams to be increased by two upon each of certain movements of the needle cylinder in either direction during reciprocation thereof, means for varying the capacity of the elevating means so the elevating means will elevate a single ne–,dle upon each of certain other movements of the needle cylinder in either direction, said elevating means including a pair of elevating picks, said means for varying the capacity of the elevating means coiiiprising _a pick rcstrictor mounted for movement on each of said elevating picks, spriiig means normally holding the pick restrictor out of operati–,,c position on each of the elevating picks, pattern controlled means for moving the pick restrictor into operative position on each of the elevating picks for decreasin.– the capacity thereof, latch means for holding the pick restrictor in an operative position for predetermined intervals and said pattern controlled means being operable to release said latch means to again permit the spring means to move the pick restrictor to inoperative position. 2. In a circular knitting machine, the combination of a needle bed, needles, pattern controlled means for feeding a plurality of yarns to the needles at a single feeding station, means for reciprocating the needle bed, a first pattern controlled means for shogging the needle cylinder and pattern mechanism functioning on the needles so as to knit separate triangularly shaped areas in the same courses but upon separate reciprocations of the needle bed and interknitting the terminal loops of the courses in adjacent triangular areas to form a stiture therebetween, said pattern mechanism functioning on the needles including stitch cams and radially movable cams, said needles having radially extending butts thereo–_i of three different lengths namely short, medium and long butts, said needles being divided into successive grotips of short, long and medium butt needles, a second pattern controlled means for moving at least one of the movable cams inwardly as a short butt group passes thereby so as to ,cause the cam to operate upon the succeeding, long, medium and short butt needles, the long and medium butts serving to extend the interval during which the last–named cam may move into the plane of the succeeding short biitts. 3. In a circular knitting machine having a needle cylinder and also having stitch cams and also having a pair of relatively movable narrowing picks and also having means for imparting reciprocatory and rotary motion to the needle cylinder, each of said narrowing picks being pivotally mounted intermediate their ends on the knitting machine, a composite link pivotally connecting the ou.ter ends of the narrowing picks relative to the needle cylinder to each other, means for varying the capacity of the narrowing picks so as to vary the number of needles rendered inactive thereby upon certain movements of the needle cylinder in either direction during reciprocation thereof, and means for varying the effective length of the composite link so the movernent of one pick relative to the other may be varied according to the capacity thqreof. 4. In a circular knitting machine having a needle cyli.,Uder and also having stitch cams and also having a pair, of relatively movable narrowing picks associated with the stitch cams and also

having means for imparting reciprocatory and rotary motion to the needle cylinder, each of said narrowing picks being pivotally inounted ilitermediate its ends on the knitting machine, a composite liiik pivotally connected at opposed ends thereof to the outer portions of the narrowing picks, pattern controlled means for varying the capacity of the narrowing picks so as to vary the number of needles iendered inactive th,–reby upon certain movements of the iieedle cylinder in either direction during reciprocation thereof, and other pattern controlled means for varying the effective length of the coraposite link so as to vary the movement of the narrowing picks relative to each other in accordance with the variations in capacity of the narrowing picks. 5. An improvement in a circular knitting machine having a needle cylinder with vertically movable needles carried thereby, said machine also having a knittiiig station and means for feeding a first yarn to the needles, said improvement comprising means for shogging the needle cylinder so as to cause the centers of successive groul)s of the needles carried by the needle cylinder to move equidistant past the knitting station during reciprocatory knitting, means for momentarily stopping movement of the needle cylinder in the course of the shogging opera– tion, means for clamping, cutting and withdrawing the first yarn from the needles and for selectively independently feeding other yarns to the needles, said means for withdrawing and selectively feeding the yarns to the needles comprising an improved latch ring having a circumferentially extending yarn feed opening therein which is closed at its upper end and partially closed at its lower end, said latch ring also having a yarn passageway at the lower edge thereof communicating with said opening, a plurality of yarn feedin– fingers mounted for swin.– '3 5 ing movement on a vertical a'xis adjacent said latch rin–., means independently swingin– each of the fingers pist said latch ring, pattern contr'olled means for selectively pogitioning the fingers so that the particular finger swung will pass beneath and beyond said passageway, said clamp– ing means being automatically operable in coacting relation to said means for swinging the yarn fingers so as to aline the yarn extending therefrom to the corresponding yarn feed finger with the passageway as the finger is moved past the same, means for clevatijiz. the last–named yarn feed fi]3gCr to move the yarn thrOtigi–I said passageway into the opening and simultaneously into the hooks of a few adjacent needles and means for aga:tn swinging said last–named finger to caiise the yarn fed thereby to pass through said slot to the needles but 5o out of registry witli said passageway. 6. In a cixcular knitting machine having a needle cylinder with vertically movable needles carried thereby, a knitting station and means for imparting reciprocatory and rotary movement to the needle cylinder, means for shogging the needle cylinder so as to cause the centers of successive groups of the needles carried by the needle cylinder to move equi–distant past the knitting station during rciprocatory knitting, means for stopping the needle cylinder momentarily in the course of a shogging opera– tion, improved means for introducing yarn to the necdles comprising a latch ring having an annular depending flange thereon surrounding the upper ends of the needles, said annular flanges being provided with a circumferentially disposed yarn feed opening therein and also C)5 having a slot in the lower edge thereof communicating with said yarn feed opening, said slot extending substaiitially tangent to the path of travel of the needles past the yarn feed opening in one direction, yarn claniping means disposed in substantial alinement with the slot, 7o a pliirality of horizontally swin,–able yarn feed fiiiger3 mounted adjacent said latch ring, spring means normally holding each of the yam feed fingers in an inoperative position, a first pattern controlled means for presentiig, any particular one of the yarn feed fingers at a predeter– mined elevation in a horizontal plane siibstaritially ad– lacent the lower edge of the annular flange of the latch ring, a second pattem controlled means for swinging the corresponding one of the yarn feed fingers w th the yarn extending from the yarn feed fingers to the clamping means and to where a yarn will be disposed in alinement with said tangentially extending slot in the latch ring, a third pattern controlled means for elevating the yarn feed fingers to cause the yarn carried by the said particular yarn feed finger to enter the yarn feed opening through said tangentially extending slot, said second pattern controlled means also being operable to again swiiig the said particular yarn feed finger slightly in the opposite direction from which it had originally swung to prevent the yarn from passing through said tangentially extending slot as it is fed to the needles tipon ftirther movement of the needle cylinder. 7. In a structure according to claim 6, said second pattern controlled means also being operable to move said particular yarn feed finger slightly in its original direction of movement following the knittin.– of a predetermined number of courses to again aline the yarn carried thereby with the tangentially extending slot and said third pattern controlled means also being operable to again lower the yarn feed fingers slightly to cause the yarn carried by said particular yam feed finger to pass throu.–h said tangentially extending slot and the said second patterncontrolled means again being operable to release the said particular yarn feed finger to permit the spring ineans associated therewith to move the same to inoperative position. 8. In a circular knitting machine having a needle cylinder with vertically movable latch needles carried thereby, a kriitting station and means for imparting reciprocatory and rotary movement to the needle cylinder, a first pattern controlled means for shogging the needle cylinder so as to cause the centers of successive groups of the neeidles carried thereby to inove equi–distant past the knitting station during reciprocatory knitting, a plurality of horizontally swingable yarn feed fingers disposed adjacent the needle cylinder, a second pattern controlled means for positioning any onof the yarn feed fingers at a predetermined elevation so as to be disposed in substantially the horizontal plane of the latches of the needles, individual yarn clamding means associated with each of the yarii feed fingers, means for momentarily stopping movement oi' the needle cylinder in the course of a shog.–ing operatioi,i, mearis for moving the corresponding yarn clamping means into a position closely adjacent the needle cylinder so as to cause the yarn clamped thereby to extend therefrom to the corresponding yarn feed fniger, and between the latches and hooks of the adjacent needles in the needle cylinder as reciprocatory inovenient is agaiii iric_parted to the needle cylinder and means for withdrawing the corresponding yarn clamping riaeans from closely acljacent the needle cylinder upon the occurrence of a subsequent shogging operation of the needle cylinder. 9. In a circular knitting machine having a needle cylir.der with vertically movable needles carried therebl_ a kiiitting station a–,id means for impartin.– reciprocatory alid rotary movement to the i, .eedle cylinder, means fox shoggiiig be i7cedl,– cylinder so as to cause the centers of succe3sive gi–oup_; ci' the needl–s carried by the needle cylinder to move equi–distant past the knitting station during reciprocatrry knitting, an annular latch ring surrounding the upper ends of the needles and having a yarn feed opening therein and also haviiig a slot therein extending substantially tangentially relative to the path of travel of the needles, a pltirality of horizontally swingable yarn feed fin._ers disposed adjacent the latch ring, a first pattern controlled means for swinging selected yarn feed fin,_ers into a position adjacent said tangentially

extending slot, a pltirality of horizontally movable yarn clamping means also disposed adjacent the latch ring, a second pattern controlled means for positioning any one of the yarn clariip;n,_ m__–ans at a predetermined elevation in a horizon– tal plane immediately below the annular latch ri ng, a thir d d' pattern controlled means for moving the selected yarn clamping means into operative position so the yarn extend–'_ng therefrom to the cor onding yarn feed ger will be disposed in alinement w th the tangentially extendirig slot in the latch riiig, means for stopping the needle cylinder momentarily in the course of a shogging operation as the selected yarn feed finger and the yarn clamping means are moved into operative position, a fourth pat– tern controlled means for moving the last–named yarn feci finger tipwardly to cause the yarn carried thereby to pass through said tangentially extending slot in to the yarn feed opening, aiid a fifth pattern controlled means to cause the last–named yarn clamping m,Dans to release the yarn upon movement again being imparted to the needle cylinder. 10. In a structure according to claim 9, said third patterii controlled means also being operable to again cause the last–named clamping means to clamp the yarn follow– in.– the knitting of a predetermined number of courses, coactidg yam cutting means cooperating with the yarn clamping means for clamping the yarn fed by said yarn feed finger and said first and third pattern controlled nieans bein_. operable substantially simLiltaDeously for 21i causing the corresponding yarn feed finger:and the clamping mcaiis to again withdraw from operating position as the needle cylinder is again momentarily stopped during the course of a shogging operation so the yarn will extend froiii the yarn clainping means to the coinciding yam feed finger. 11. in a circular knitting machine, the combination of a needle cylinder having needles and havin.– means for feeding yarns to said needles, and having means for reciprocating said needle cylinder and needles, meaiis for wid– ening and narrowing so as to knit reciprocatory courses of varyiiig length, ineans for shogging the needle cylinder so as to knit other reciprocatory courses of varying length in the planes of the first–named reciprocatory cotirses, means for raising terminal needles in knitting each of certain courses to retain the loops thereon so that terniinal loops of all reciprocatory cotirses in the same plane may be lilterlcnitted to form a suture between respective areas formed by each set of reciprocatory courses, said iliean.s for widening and narrowing including means for in– 4,_D creasing and decreasing the number of needles knitting each of a plurality of successive courses by more than one needle and means for increasing and decreasing the number of needles in knitting each of anothe_r plurality of successive courses by a single needle. . 12. In a circular knitting machine havng a needle cylinder and needles, means for feeding yarns to said needles' mcaiis for reciprocating the needle cylinder and elevatin_ sol–iie of the needles so that a fractional part of a course may be knitted by the noii–elevated needles upon each of a plurality of reciprocatory strokes of the needle cylinder and _neans for sho.–ging the needle cylinder so as to knit an additional fractional part of a cours:e in the plane of each of the previously knitted fractional parts of courses, means for elevatiilg the terniiiial needles knitting (;o certaiii fractional pa–rts of courses to retain their loops so that terrr_iiial loops of each of the latter fractional parts of i–eriprc_,atory cotirses ii–iay be interknitted with terminal loops of other fractional parts of courses to form a sliture therebetween, other means for rotating said needle cylinder and moving the needles so as to knit rotary work at other times, means for varying the number of elevated needles by more than one needle in knitting certain frac' ional parts of courses and means for varying the number of elevated needles by only a sin,gle needle in TO knitting certain other fractional parts of courses in the kiiitting of a single article. 13. In a circular knitting machine having a needle cylinder provided with independent vertically slidable needles and also having means for transmitting rotary and i–eciprocatory motion to the needle cylinder, means for _hogging the needle cylinder a predetermined aniount so as to cause the center of a group of the needles in the iieedle cylinder to move equidistant past the knitting station during reciprocatory motion of the needle cylinder and then to catise the vertical center of a succeeding group of the needles to move equidistant past the knitting station, means for varying the number of needles which knit in a p'.Urality of courses by at least two needles, means for varying the number of needles which knit in another plurality of courses by only a single needle and means for elevating terminal iieedies in knitting each of certaiii courses to catise their loops to be retained thereon. 14. An improvement in a circular knitting machine having a needle cylinder and needles, and also having means for feeding yarns to said needles and also having means for reciprocating the needle cylinder and elevating some of the needles so that a first partial course may be knitted by the non–elevated needles upon each of a plurality of reciprocatory strokes of the needle cylinder, said improvement comprising means for shogging the needle cylinder so as to knit an additional or second partial course in the plane 6f each of the first knitted partial courses, means for elevating the terminal needles in each first partial course to retain their loops so that terminal loops of each first partial reciprocatory course may be interknitted with terminal loops of a corresponding second partial course to form a suture therebetween, pattern controlled means for varying the number of needles employed in knitting certain of a plurality of said first partial courses by at least two needles from course to course, ,other pattern controlled means for varying the number of needles employed in knitting certain others of a plurality of said first partial courses by oiily a single needle from course to course, and means for varying the number of needles empl6yed in knitting a plurality of said second partial courses so that terminal loops of the latter partial coi,irses may be interknitted with terminal loops of said certain and said certain others of said first partial courses in the knitting of a single article. 15. In a circular knitting machine, the combination of a needle cylinder having vertically movable necdles. a single feeding station having a plurality of means for feeding yarns to the needles, means for shogging tt–e needle cylinder, means for reciprocating the needlc cylinder and needles so as to knit a portion of a tubular fabric having a plurality of independently knitted yarns in a single course, means for varying the number of needles knitting by a single needle upon each of a plurality of successive movements of the needle cylinder in eitlier direction, and means for varying the number of iieedles knitting by more than one needle upon each of another plurality of movements of the needle cylinder in either direction in the knitting of a single article. 16. In a, circular knitting machine havin,– a needle cylinder provided with vertically movable latch needles aiid also baving means for imparting reciprocatory and rotary movement in the needle cylinder, a first patterncontrolled means for shogging the needle cylinder so as to cause the centers of successive groups of the iieedles carried thereby to move equi–distant past the knitting station during reciprocatory knitting, a plurality of horizontally swingable yarn feed fingers disposed adjacent the needle cylinder and each having a strand of yarn extending therethrough, a plurality of individual yarn clamping members associated with the yarn feed fingers, a vertically movable carriage for said yarn clamping members' said yarn clamping members being

mounted for horizortal movement on said vertically movable carriage, a second pattern controlled means for individually positionilig selected yarn feed fingers at a predetermined elevation in substantially the horizontal plane of the latches of the needles, a third pattern controlled means for elevating the carriage for the yarn clamping members to position a selected yarn :clamping member at a predetermined elevation in substantially the horizontal plane of the latches of the needles, a toothed member fixed on the carriage. for the yarn clamping members, a pivoted toothed member disposed adjacent the carriage, a fourth pattern controlled means for moving the pivoted toothed member into engagement with the toothed member fixed on the carriage, said third pattern coiitrolled means being adapted to release the carriage iipon elevating the same to a predetermined position and said pivoted toothed member being adapted to engage the fixed toothed mem– 1.0 ber on the carriage so as to accurately position the carria.e at a desired elevation for presenting the selected yarn clamping member at the desired elevation. 17. In a circular knitting machine having a needle cylinder provided with vertically movable latch needles and also having means for imparting reciprocatory and rol_ary movement to the needle cylinder, a first pattern controlled means for shogging the needle cylinder so as to cause the celiters of successive groups of the needles carried thereby to move equi–distant past the knitting station during reciprocatory knitting, a plurality o,_' horizontally swi–ngable yarn feed fingers disposed adjacent the needle cylinder and each having a strand of yarn extending theretliroligh, a plurality of individual yarn clamping members associated witli the yarn feed fingers, a ver– tically movable carriage for said yarn cl_ampin.– members, said yam clamping members being mounted for horizontal movement on said vertically movable carriage, a second pattern controlled means for individually positioning selected yarn feed fingers at a predetermined ele– vation in substantialiy the horizontal plane of the latches of the needles, a third pattern controlled means for elevating the carriage for the yarn clamping members to position a selected yarn clamping member at a predetermined elevation in substantially the horizontal plane of the latches of the needles, a toothed member fixed on the carriage for the yarn clamping members, a pivoted toothed member disposed adjacent the carriage, a fourtb pattern controlled means for moving the pivoted toot'iied member into engagement with the tootlled n–iember fixed on the carriage, said third pattern controlled means being adapted to release the carriage tipon elevating the same to a predetermined position, said pivoted toothed member being adapted to engage the fixed toothedmember on the carriage so as to accurately position the car– 4.5 riage at a desired elevation for presenting the selected yarn clamping member at the desired elevation, a fiftli pattern controlled means for moving the selected yarn clamping member into a position closely adjacent the needle cylinder, a sixth pattern controlled means for mov– ing the selected yarn feed finger into a positiod closely adjacent the needle cylinder so as to cause the yarn to extend therefroni to the corresponding yarn clamping member and between the lalches and hooks of the adjacnt needles in the needle circle and a seventli pattern controlled means for releasing the yaril from the yarn clamping means so as to permit the last–named needles to take the yarn therefrom as it is directed thereto from the last–named yarn feed finger. 18. An improvement in a circular knitting machine having a needle cylinder with vertically movable indepei–ident needles carried thereby and also having means for imparting reciprocatory and rotary movement to the needle cylinder and also having a pattern chaip and also having pattern ;controlled means for imparting move– ment to the patt.–rn controlled means for imparting movement to the pattern chain and also having a plurality of yarn feedi–tig, cuttiiig and clamping elements thereon for control ng the feeding of different yarns to the needles and also havilig a patterii drum for controlling the op– eration of said yarii feeding, cutting and clamping elements and also having a shaft thereon, said improvement comprisino pattern controlled means for imparting rotation to the said pattern drum at varying intervals in a step–by–step maiiner including a cam wheel carried by said shaft and having a plurality of irregular cams there– oli, iiinrs to inip_irt totation to said cam wheel a ratchet wheel fixed oii tli._, pattern drum, a ratchet pawl disposed adjaceiit said ratchet –__iheel, a series of pivotally ;r,terco,iiicct–.d pivoted members, one of the endrnost of said i)ivoted rnembers being pivotally connected to said ratchet pawl, a cam follewer connected to the pivoted iiienib(–_r it the opposite eid of the series of interconnected pivoteci iii2mbers, spring itieaiis iormally urging the cam iiito cii.–agcn–ient with the cams on said cam ,vhccl ' r i.–aportiii_ moiement to the ratchet pawl, a notch i__–i ciie oi the i);voted members of said series of iiitercon;–tf,–cted pivo_ted me,–nbers, a latch normally urged into said in _he pivoted member and noriiially holding fhe c–,rr fo'Ac,,wer oi–i_ of engagement with said cams on the ca_n wheel, and means controlled by said pattern chai,–i for rtioving said latch meiriber out of eii–gagement ivith the corresponding notch in one of the members to thiis release the series of interconnected pivoted members at predeter,,iiiiied intervals so as to cause rotation to be inivar',ed to said pattern drum at varying iiitervals accord_r,g to a desired pattern. in a circular knitting macliine having means for th_– top of a stocking thereon and wherein coiiti_–itic,us rotatioii of a needIG cylinder having vertically iiiovable iieedies is involved ' in combination, means for i,,itrodliciiig i first yarn to ,II of th, needles during the l__aitt;n,– of tlao iol), pattern controlled means for activ,i"ing sel–,–ted groups of needles for taking and knitting ,,he fii–st yar_i, nieans controlled by said pattern controlled iiie,ins for decreasing the numb.–r of needles in action, at tir_ies, by a sin,–le needle in each course and, at other tirnes, by P. plurality of needles in each course in said –elected . –rolips for successively knitting a triangle, having one pointed end facing away from the top of the stocking, with each of said selected groups of needles, pattern controlled means for shogging the needle cylinder to cause each of said groups of needles to lcnit the yarn into the shape of said triangles successively and independently of each other, said pattern controlled means for shogging the reedle cyli_–ider also being effective a number of times i.n the knitting of a stockin.– to cause the needle cylinder shog varying d;stances so that the remote halves of a jacent groups of needles may be rendered inactive while the proximate halves of adjacent groups of needles may be rendered active in a widening operation to knit a third trian,–le and having one pointed end of the third triangle facing iD the opposite direction from the said pointed encis of the first–named triangles between the previotisly kpitted triangles, means for elevating terminal needles to ret,–in their loops while decreasing the number e–f– iieedles in action during reciprocatory knitting, so terminal loops of said third triangle will subsequently be 'mterknit'Led with terminal loops of said first–named triangles and said nicaus controlled by said pattern controlled meaiis includiiig means for increasing the number of active iieedles at tin–ics by a single needle in knittin.– each of a plurality of courses and at other times by more than oi,ic iieedle in l_Tiittiii– another plurality 6f courses. 20. In a circular knitting machine having a needle cylinder willi vertically movable independent needles carried thereby and also having stitch cams defining a knittiiig station Lnd having a first pattern controlled means for offecti_ig

rotpry and reciprocatory movement of the iieedle cylinder and also having means for shogging the iaeedle cylindcr so as to cause the centers of selected .–rolips of the n–,edies carried by the needle cylinder to mc,ve eqlii–distaiit past the knitting station during reciprocatory knittiiig, a second patter–n controued means for effectin.– the '_owering of at least two additional needles to p.–ss t',arough the stiteli cams durineach of a Plurality of su–,cessive rotary niovements of the needle cyliiider in either e_irection to effect a widening operation and a third patteri controlled means for effecting the lowering o'L a single additional needle to pass through the stitch cams tipon e,,ich _f another pliirality of successive rotary movements of ene ileedle cylinder –in eithet direction in the knitting of a single article. 21. In a circular knittin.– machine having a needle cylinder with vertically movable independent needles carried thereby and also havin– a kiiitting station including stitch cams and said machine having a first pattern controlled nieatis for effecting rotary and reciprocatory movement of the needle cylinder and also haiiing means for shogging the needle cylinder so as to cause the centers of lo selected groups of the needles carried by the needle cylinder to mo–ve equi–distant past the knitting station duriiig reciprocatory knitting, a second pattern controlled means for effecting the lowering of at least two additional needles to pass through the stitch cams during each of a plurality of successive rotary inovements of the needle cylinder in citlier direction to eff6ct a wideiaing operation, a third patterii controlled rneans for eitecting the loweriii– of a siiigle qdCti'Lional needle to pass through the stitch carns tipon each of another plurality of successive rotary move– ments of the needle cylinder in either direction in the knitting of a siiigle article, said second pattem controlled means being operable for effecting the elevating of at least two additional needles to pass above the stitch cams durin.– each of a pltirality of successive rotary movements of the needle cyliiider in either direction t,o effect a narrov_iiig operation and said third pattern controlled means bein.– operable for effecting the elevating of a single, additional needle to pass above the stitch cams upon each of a plurality of successive rotary movements of the needle cylinder ii–i e4her direction. 22. In a circular knitting machine having a needle cylinder with vertically movable needles carried thereby aiid also having a knitting station including stitch cams and said machine having a first pattern controlled mealis for effecting rotary and reciprocatgry moven–ient of the needle cylinder and also having means L'Gr shogging the needle cylinder so as to cause the centers of selected groups of the needles carried by the needle cylinder to move equidistant past the knitting station during reciprocatory knit– tiug, a second pattern controlled means for effecting the e evating at cast two a tiona needles to pass a ove the stitch cams during each of a plurality of successive rotary movements of the needle cylinder in either direction to effect a narrowing operation, and a. third pattem controlled means for effecting the elevating of a single additional needle upon each of another pltirality of sticcessive rotary movements of the needle cylinder in either direction in the knitting of a single article. 23. An improvement in a circular knitting machirte 5(having a needle cylinder provided with vertically movable needles and also having a set of stitch cains aiid also having a first pattern controlled meai–is for alternately effecting reciprocatory and rotary movement of the needle cylinder, said improvement comprising see– ond pattern coiitrolled means for causing a widening operation upon a first series of successive rotary movements of the needle, cylinder in either direction in which the number of needles which pass thxough the stitch carns upon each of said rotary movements are increased by a predetermined number of needles, said second patterncontrolled means also being operable to cause the number of needles which pass through the stitch cams upon a second series of successive rotary moveinents of the needle cylinder in either direction to be increased by a lesser uumber of needles than said predetermined number of needles during the knitting of a single article, said means for increasing the number of needles which pass through the stitch cams upon said first seriles ofsuccessive rotary movements of the needle cylinder in either direction comprising a first pair of coacting widenin._ picks, each having a capacity for lowering two needles and one of said fi–rst pair of widening picks being operable to lower two needles upon a rotary movement of the needle cylinder in one direction and the other of the first pair widen ng picks having a capacity for lower– ing two needles upon a rotary movement of the needle cylinder in the opposite direction, a second pair of widening picks disposed astraddle the first pair of widening picks and each also hOVing a capacity for lowering two needles upon alternate rotary movements of the needle cylinder, whereby four needles are loivered upon each rotary movement of the needle cylinder in opposite directiolis, a pair of narrowing picks disposed astraddle the stitch cams and each having a capacity for elevating two needles to inoperative position upon alternate rotary movements of the needle cylinder whereby, upon four needles being lowered by the widening picks, the leadiig two needles which may be in a lowered position will be elevated to inoperative position by the corresponding narrowing pick to perinit two additional needles to pass through the stitch cams upon each successive rotary movement of the needle cylinder in either direction. 24. In a structure according to claim 23, third pattern controlled means for rendering one of the pairs of widening picks inoperable during said second series of successive rotary movements of the, needle cylinder in either direction and fourth pattern controlled means for decreasin_ the capacity of the narrowing picks to where the narrowing picks will elevate only a single needle upon each rotary movement of the needle cylinder in either direction and whereby the widening picks which have remained operative will lower only two needles upoti each rotary movement of the needle cylinder in either direction and the narrowing picks will permit a single additional needle to pass through the stitch cams upon each rotary movement of the needle cylinder in either direction. 25. In a circular knitting machine, the combination of a needle bed, needles, pattern controlled means for feeding a plurality of yarns to the needles from a single station, mcaiis for reciprocating the needle bed, pattern controlled means for shogging the needle bed and pattern mechanisms functioning on the needles so as to knit separate areas in the same courses but upon separate movements of the needle bed in either direction and to interknit terminal loops of the courses in adjacent triangular areas t6 form a suture therebetween, said pattern mechanisms including means for widening to, at times, include at least two additional needles in the knitting wave upon each of certain successive movements of the needle bed in either direction and, at other times, to include a single additional needle in the knitting wave upon each of certain other successive tnovements of the needle bed in either direction, said pattern me anisms also inciuding means for narrowing to, at times, include at least two less needles in the knitting wave upon each of certain successive movements of the needle bed in either direction and, at other times, to include only one less needle in the knitting wave upon each of c_rtain other successive movements of the needle bed in either direction. 26. In a circular knitting machine having a needle cylinder with vertically movable independent needles carried thereby and also having stitch cams and having a first pattern

controlled means for effecting rotary andreciprocatory movement of the needle cylinder and also having means for shogging the needle cylinder so as to cause the centers of successive groups of the needles carried by the needle cylinder to move equi−distant past the knitting stEitiOn during reciprocatory knitting, a second pattern controlled means for effecting the lo,,vering of at least two additional needles to pass through the stitch catns dtiring each of a plurality ofsuccessive movernents of the needle cylinder in either direction to effect a widening operation, and a third pattern controlled means for effecting the lowering of an additional needle upon each of another plurality of successive movements of the needle cylinder in either direction in the knitting of a single article. 27. In a circular kiiitting niachine having a needle cylinder with vertically movable independent needles car− ried thereby and also having stitch cams and having a first pattern controlled means for effecting rotary and reciprocatory movement of the needle cylinder and also having means for shogging the needle cylinder so as to cause the centers of successive groups of the needles carried by the needle cylinder to move coui−distant past the knitting station during reciprocatory knittin,−, a second pattern controlled means for effecting the lowerinof at least two additional needles to pass through the stitch cams during each of a plurality of successive movements of the needle cylinder in either direction to effect a wideiiing operation, and a third pattern controlled means for effecting the lowering of only one needle to pass through the stitch cams upon each of another plu− rality of successive movements of the iieedle cylinder in either direction in the knitting of a single article. 28. In a circular knitting machine havi−.ig a iieedle cylinder xith verticall.y movable indep−.ndent needles carried thereby and also having stitch cams and having a first patt−,rii controlled means for effecting rotary and reciprocatory movement of the needle cylinder and also haking means for shogging the needle cylinder so as to cause the centers of successive groups of the needles carried by the needle cylinder to move equi−distant past the knitting sta− tion during reciprocatory knitting, a second patterncontrolled means for effecting the lowering of at least two additional needles to pass thr gh stitch cams each of a plurality of successive movements of the needle cylinder in either direction to effect a widening operation, a third pattem controlled means for effecting the lowering of a single additional needle to pass through the stitch cams upon each of another plurality of successive movemelits of the needle cylinder in either directioii it'i the knitting of a single article, said second pattern controlled means being operable for effecting the elevating of at least two additional needles to pass above the stitch cams during each of a plurality of successive movements of the needle cylinder in either direction to effect a narrowing operation, and said third pattern controlled means being oper− able for effecting the elevating of only one additional needle to pass above the stitch cams upon each of a plurality of successive movements of the needle cylinder in either direction. 29. In a circular knitting machirie, the combination of a needle bed, needles, pattern controlled means for feeding a plurality of yarns to the needles at a sin.−Je feediilg station, means for reciprocating the needle bed, pattern controlled means for shogging the needle cylinder and pattem mechanisms fiinctioning on the needles so as to 5o knit separate triangularly−shaped areas in the same courses but upon separate movements of the needle bed in either direction and interknitting the terminal loops of tl−te coi−irses in adjacei−it triangular areas to form a suture therebetween, said pattern mechanisms including meaiis for widening and liarrowing by increasing the number of active needles by at least two upon each movement of a first series of successive movements of the needle bed in each direction and by decreasing the number of active needles by at least two upon each movenielit in a second 6o series of successive movements of the needle bed in each direction, and said pattern mechanisms also including means for widening and narrowing by increasing the number of active needles by a single needle upon each movement in a third series of successive movements of the needle bed in each direction and by decreasidg the number of active needles by a single needle upoii each movernent of a fourth series of successive movements of the ,icedle bed in each direction in knitting a single article. 30. In a circular knitting machine having a needle cyl− inder provided with needles, means for feeding yarns to said needles and ineans for reciprocating said needle cylinder and needles4l the combination of means for widening and narrowing so as to knit reciprocatory courses of varying length, means for shogging the needle cyliiider so as to knit other reciprocatory courses of varying length in the planes of the first−named reciprocatory courses, means for raising terminal needles in knitting each of certain courses to retain the loc._,7.)s thereon so that terminal loops of all reciprocatory courses in the same plane may be i−,iterknitted to form a suture between respective areas forriied by each set of reciprocatory courses, said nieans for widening aiid narrowing including means for increasin,,, atid decreasi_ig the number of needles knitting each ol' a plurality of success__Vo cotirses by a given nt−Lmber of needles, and means for increasing aiid decreasing the number of needles kiiitting each of another plurality of successive courses by a number of needles varying with respect to said _.liven IILimber. 31. li−i P. circuiar indepeiident needle kiiitting machine having a needle cylinder provided with vertically movable needles, a set o.L' stitch cams, means for alteriiately ;mparting rotary and reciprocatory movemeiit to the needle cylinder and means for respectively lo_vering and elevatin_ needles to and from a position to pass througli the stitch caw_s; the combination of means for at times lowering four needles and elevating two lowered needles to permit two additional needles to pass through the stitch earns upon each of certain movements of the needle cylinder in e;ther direction during reciprocation thereof, means to vary the capacity of said elevating means so the latter will elevate a single needle upon each of certain other movements of the needle cylinder in e−.ther direction, said elevating rneans including a pair of elevatin_., picks, said means for vaFy−ID.− the capacity of 'Lhe eievating means comprising a pick restrictor mounted for ii−iovement o−,i each of said elevatil−ig picks, means normaily holding the pi,.k restrictor out of oi)erative pos,tion ol, each ol the elevating picks, selectiv_Ly cc,−iitrolled meaiis for moviiig the i)iclc restrictor into operat'Lve position o.;i eacti of the elevatiii,., picks for decreasiiig the capacity thereof, means cooperaling with the last−iiai−ned m−,g,ns c)r holdin−. the pic,__ restrictor in oi)erative positiod foLpredelfrniiiied i.,itervals, said selectively controlled ri2cans being operable to release said latch means, and said holdin−, meaiis being operable to r_iove the pick restr;ctor to inoperative position.

Abstract:
Device incorporated permanently into a motor vehicle for automatic mounting of non–slip accessories, which comprises a module arranged under the bodywork of the motor vehicle, which contains the elements for equipping the drive wheels of said motor vehicle when the latter is to travel on snow–covered or icy roads. The device is formed by a module (1) driven by electromechanical means, in the form of a workable box that contains a band (2) rolled up on a rotary shaft or drum, the end of which incorporates a "U"–shaped pull (3) with hooks at the ends. In addition, there are two horizontal–shaft rollers (4) with freedom to rotate, and a transversely moving blade (5) driven by an electric motor that drives a shaft (6). Supplementarily, on the drive–wheel rims (8) there are studs (9).

Abstract:
Source: SE466317B Foereliggande uppfinning avser en anordning foer infaestning och manoevrering av en foer snoeroejning avsedd plogvinge (1) pa sidan av ett fordon, i synnerhet en lastbil, som inbegriper fraemre och bakre hjul eller hjulboggin (4), varvid plogvingen aer med hjaelp av ett kraftutvecklingsdon (5) svaengbart roerlig mellan ett insvaengt transportlaege naera intill fordonet och ett fran fordonet utsvaengt snoeroejningslaege da plogvingens bakre aende aer fjaermad fran fordonet. Haervid aer savael kraftutvecklingsdonet som en framfoer detta befintlig utliggare eller tva i par anordnade svaengarmar (6, 7), relativt vilka vingen aer svaengbart roerlig, foerbundna med fordonet mellan de fraemre och bakre hjulen. The invention relates to an arrangement for fastening and manoeuvring a side plough 1 at the side of a vehicle of the type which includes front and rear wheels. The side plough 1 is connected in an articulated manner to the vehicle and is, via an extendable arm 5, pivotably movable between different positions relative to the vehicle, both the articulation between the side plough and the vehicle and said extendable arm 5 being located in the area between the front and rear wheels of the vehicle. The extendable arm consists of a hydraulic cylinder 5 which carries out pivoting of the side plough between a pivoted–in transport position close to the vehicle and a snow–clearing position, in which it is pivoted out from the vehicle, in addition to which the articulation between the side plough and the vehicle consists of two pivot arms 6, 7 which serve as outriggers and are individually connected in an articulated manner to both the vehicle and the side plough.

Abstract:
Source: US3613311A ABSTRACT OF THE DISCLOSURE In a device for opening and closing sliding roof sections of containers, such as two−section roofs of freight cars, each roof section is connected by two cables to a respective drum rotatably mounted on a cross connection of a freight car. Each of the two cables is connected to the roof section adjacent a respective end of the latter, and the two cables are wound in opposed directions on the associated drum. Manually operable crank means rotate the drums through transmission means interconnecting the crank means and the drums. Respective clutches are interposed between each drum and the transmission means, and clutch operating means connect the crank means to the clutch means and are operable, responsive to operation of the crank means in a direction to open one roof section, to engage the clutch means connecting the associated drum to the transmission means and to disengage, and maintain disengaged the clutch means interposed between the other drum and the transmission means. When one roof section has been moved to the open position, the other roof section cannot be moved to the open position until the one roof section has been returned to the fully closed position. Continued movement of the crank means in the closing direction for one roof section will, after the two roof sections are in the closed position, initiate opening movement of the other roof section. B

Abstract:
A constant mesh change speed gear train (10) has input and output shaft gears (16) and (20) in direct constant meshing engagement with corresponding gears on primary layshafts (22) and (24). Clutches (34) and (36) on the primary layshafts control the transmission ratios. In addition, a range layshaft (48) is provided to provide two transmission ratios for each ratio provided by the primary layshafts (22) and (24). Range layshaft has input and output gears (50) and (52) which mesh directly with output shaft gear (20) and a final output gear (54) respectively. Clutches (58) and (60) enable selection of the torque output path. A further clutch (38) enables the input and output gears to be directly coupled to provide two further ratios, making a total of six. A hydraulic coupling device (5) with a grounded reactor provides drive input with modest torque multiplication for drive take–up and full coupling efficiency at normal road speed.

Abstract:
Source: JP2000199443A PROBLEM TO BE SOLVED: To prevent a battery from running down even when

headlamps are kept ON while a vehicle remains stationary. SOLUTION: In a 'stop/start mode,' in which an engine is brought to a stop in response to predetermined stopping conditions while a vehicle is running and the engine is started in response to a predetermined sequence of starting operations once the vehicle is stopped, idling while the vehicle remains stationary is prohibited normally (in a first operation pattern). If, however, the period of time during which the vehicle remains stationary with its headlamps kept ON exceeds a predetermined value [condition (3) is met], the vehicle enters a second operation pattern, canceling prohibition of idling. When a driver then attempts to start the engine, therefore, the engine is started and it can be run at idle speed.

Abstract:
Source: US2010125383A A method of programming and setting parameters for a computer unit that regulates the interface between the operator of a marine vessel and the vessel's electric generation and propulsion systems. The invention describes the regulation of energy producing devices, energy storage devices and drive motors and propellers in both propulsion and regeneration modes. This invention simplifies and automates most of the operation of marine electric, hybrid electric, or diesel electric propulsion because the only controls requiring operator intervention are three generator modes: OFF, AUTO and ON, an alarm, an override switch and one or more throttle(s). This helm control can be duplicated in different areas of the vessel. All automatic modes required to regulate forward movement, reverse, emergency power, zero drag, propeller freeze and regeneration are all controlled by a logic using a combination of generator mode, the position of the throttles, the speed and the stored parameters of the vessel.

Abstract:
Source: US2006245891A A releasably detachable forklift assembly is coupled to a snowplow mount on a light truck to utilize the mechanical actuating features of the snowplow assembly to actuate the forklift assembly for lifting the forklift and angling it. The use of the light truck provides for forklift transport, adequate clearance for uneven terrain, and with the height of the seat of the light truck affording excellent visibility above the load carried by the tines of the forklift assembly.

Abstract:
The invention relates to a driven liquid–cleaning device for the railtrack grooves of tram rails, comprising a cleaning unit (1). A pressure–generating device (2) is located upstream and a separating unit (3) for the dirt mixture from the groove is situated downstream of said cleaning unit. A driven dirt–storage unit (4) and a dirt–discharge unit (5) for the dirt from the groove which has been separated, are arranged downstream of the separating unit. The cleaning unit (1) consists of a high–pressure jet device (9), a guide chute (11) and a bag conveyer (12) and is guided by two front and two rear flange wheels (14, 15) along a rail (17) which runs parallel to the railtrack (7). The height of the cleaning unit can be adjusted. The pressure–generating device (2), mounted upstream of the separating unit (3), a fine–filtration or decantation device (21) and a cleaning–fluid storage unit

(22) are mounted on the carriage chassis (18).

Abstract:
Source: US5806899A A flexible connection tube for an automotive exhaust system comprises a flexible metal bellows adapted to be connected between a run of exhaust piping for absorbing expansion or contraction of the exhaust piping, and an outer knitted metal−wire braid covering the outer periphery of the bellows for protecting the bellows from damage and for preventing the bellows from stretching to its full length. The outer knitted metal−wire braid is formed into a substantially cylindrical shape by knitting plural metal−wire bundles (each bundle being produced by a plurality of parallelly bonded metal wires) alternately with each other in spiral directions with respect to the axial direction of the bellows. Apertures are defined by many groups of four adjacent metal−wire bundles knitted alternately with each other. A total opening area of all of the apertures is set within a range of 20 percent to 50 percent with respect to an over−all area of a curved surface of the outer knitted metal wire braid, for providing a substantially cylindrical low−density knitted outer metal wire braid.

Abstract:
Source: GB471069A [Class 31 (ii)] [Also in Group XVI] In a machine for punching and printing on record–cards, of the kind that comprises typebars and associated code–punches and is operable alternatively by a keyboard or under control of a master–card fed past a holedetecting device, means is provided for rendering the hole–detecting device operative during only a predetermined part of the feed of the master–card so that part only of the matter is reproduced on the record–card, the remaining parts being reproduced by means of the keyboard, or skipped. In the mechanism shown in Fig. 2, each type–lever 234 engages a sublever 250 abutting on a bell–crank 259 in connection with a slide 257 which is provided with a pivoted, spring–urged hook 272 for engaging a toothed driving–shaft 74. A lug 272a on the hook normally abuts on the arm 271 of a keylever 230 and prevents the hook from engaging the driving–shaft. An arm 271a for preventing repeat operation of the type–lever if the keylever is held down or sticks is pivoted on the arm 271 and is held in contact therewith by a spring 274. The arm 271a is slightly longer than the arm 271, and both arms are cut away to provide a recess which is slightly narrower than the lug 272a. On depression of the keylever, the arm 271 releases the lug, the hook 272 rises into the path of a tooth on the drivingshaft, the slide 257 is drawn forwards, and the arm 271a is rocked. During movement of the slide, the type–lever is operated, and when it has travelled about 45, a lug 272b on the hook engages a tooth of the driving–shaft, the hook is released, and the stroke of the type–lever is completed by momentum. On release of the key–lever, the type–lever and slide are returned by springs 253, 266, the arm 271a re–engages the arm 271, the lug 272a rides under the arm 271a, and is thereby prevented from re–engaging the driving–shaft, and then rises slightly and re–engages the arm 271. To ensure full engagement of the hook 272 with the teeth of the driving–shaft, the hook is provided on the inner face with a spring–urged, pivoted dog. If the hook, when released from the arm 271, moves towards the tip of a tooth, the dog is caught by the cooth, and prevents the hook from engaging that tooth. Under these conditions, the hook enters into full engagement with the succeeding tooth and the dog yields. For automatic operation, each key–lever 230 is connected by linkage 505, 503 to the armature 504 of a magnet KSS. Punches 280, for code–perforating the card simultaneously with the typing of letters or numerals, are connected by bellcranks 288, links 290, and bell–cranks 291 to slides 292, each having a lug 292a co–operating with one of a set of bails 295 engaged by lugs 257c on the slides 257. On operation of any type–lever, one or two punches are operated to make the corresponding code–perforations for a numeral or letter respectively. For positively withdrawing the punches, a universal bail 213 in the path of the bell–cranks 291 is connected by a slide to a bell–crank 259b which co–operates with a star–wheel 74a on the driving–shaft. The card is supported by rails 120, 121 and is fed step–by–step by means similar to those described in Specification 375,884 and comprising a card–carriage associated with escapement mechanism, and

mechanism for ejecting a finished card and initiating return of the cardcarriage. Column−stops 302, Fig. 5, mounted on a rack 300 on the card−carriage co−operate with a pivoted stop−finger 303 which rests on a link 313 connected to the armature 310 of a magnet TS. The link is connected to a pivoted frame 315 provided with a revoluble brake 319 in connection with a pinion 321 for raising a rack 194 to release the card−carriage. The tabulating−key closes contacts TKC1, TKC2, Fig. 11b, for energizing the magnet TS. A magnet TKS is provided for automatically operating the tabulating−key. When the magnet TS is energized, a spring 318 raises the stop−finger, and the card−carriage is released and runs until arrested by engagement of a column−stop and the stop−finger. On engagement, the stop−finger moves a short distance laterally and closes contacts SC, TEC in circuit with the magnet TS and the escapement magnet EM respectively. For automatic control, there are employed, in addition to the ordinary column−stops, referred to as No. 6, five kinds of column−stops, referred to as No. 1... No. 5, each having a contactoperating lug 302b which is arranged in a different position from the other lugs, and co−operates with a lever 387, Fig. 8, abutting on a contact−operating pin 386. Column−stops No. 1... No. 4 close contacts ATC, PEC, SCC, DSC1 respectively, and column−stop No. 5 opens contacts DSC2. As described below, the contacts ATC, PEC initiate tabulating, and an eject−cycle respectively, the contacts SCC cause the escapement−magnet EM to operate once for the purpose of skipping a column, and contacts DSC1, DSC2 cause automatic operation to stop and start at a predetermined column respectively. An ejectkey 233 closes contacts EKC for energizing the magnet TS, and rocks a lever 377 for obstructing the stop−finger 303 to prevent engagement thereof with the column−stops during the run of the card−carriage. A magnet EKS is provided for automatically operating the eject−key. When the card−carriage has run to the final position it closes and opens contacts LCC1, LCC2, a magnet ECS is energized, a clutch is thrown in, the motor coupled to the ejecting mechanism, the finished card is discharged, the card−carriage is returned, and a new card is fed thereto in the manner described in the above−mentioned Specification. A master−card for automatically controlling the machine is placed on a table 420, Fig. 9, at the top of the machine, and is fed in unison with the cardcarriage by means of blocks 463 secured to arms 460,461 on the card−carriage. A contactroller CR is mounted in a housing 429 which is pivoted at 425 and is provided with an arm 431 for engaging a latch 432. Brushes BO... B12 in circuit with the key−lever magnets KSS are mounted in a support 438 which is rocked, to move the brushes into and out of contact with the master−card, by means of a magnet BM. The support 438 also carries another brush for connecting the contact−roller to the automaticcontrol circuits. Each brush BO... B12 is in circuit with one of a set of relays, of which only the relays R11, R12 are shown in Fig. 11b. The relays R1... R9 are each arranged to close contacts in circuit with more than one of the magnets KSS, and the relays RO, R12 close contacts in circuit with one magnet KSS, and open contacts C in circuit with other magnets. The relays close also contacts A for establishing holding−circuits through the brushes. When a single hole, for instance the 1 hole, is read, the relay R1 is energized and the circuit of the associated magnet KSS is established, the other magnets in circuit therewith remaining unenergized. When two holes, for instance the holes 9, 11 designating the letter R, are read, the relays R9, R11 are energized and circuits are established through the two associated magnets KSS. Before a master−card is inserted, a switch ESS is opened and the eject−key 233 is depressed, thereby establishing through contacts CS4, EKC and relays R16, R17, R18 a circuit through a wire W2. The relay R18 opens contacts A and thereby disconnects a wire W4 in the automatic−control circuits. The relay R17 closes and opens contacts A, C to connect the magnet TS to the wire W1, and the relay R16 closes contacts B to complete the circuit of the magnet, the card−carriage thereafter moving to final position, and the contacts LCC1 being automatically closed. The master−card is now inserted and, assuming that automatic duplication of columns 40 to 65 is required, No. 5 and No. 4 column−stops are placed opposite columns 40 and 66 respectively. A No. 4 column−stop is placed also opposite column 1. The arm 431 is then depressed, closing contacts CLC, DC, and the switch ESS is closed to initiate the eject−cycle, during which the card−carriage is returned to initial position. The first No. 4 column−stop closes the contacts DSC1, and a relay opens contacts to disconnect the relays RO... R12, solenoid KSS, and brushes from the wire W4. The machine is now operated manually until column 40 is reached, when the No. 5 columnstop opens the contacts DSC2 to initiate automatic−control. When the card−carriage reaches column 66, the second No. 4 columnstop disconnects the automatic control−circuits, and manual operation can be restuned. For automatically causing the card−carriage to jump when a column without holes occurs in the master−card, there are employed a slowacting relay R20 in circuit with contacts which are closed by the escapement mechanism, and a quick−acting relay R21 in series with the relays RO... R12. If a column without holes is presented, the relay R20 only is energized, its contacts are closed, and the magnet EM is energized to operate the escapement. If holes are presented, the relay R21 opens the contacts before the contacts of the relay R20 can close, and the magnet EM is prevented from operating. If full automatic−control is required, a switch AES is raised, and a switch SS is closed to place the magnet EM in series with the contacts TSC which are closed during tabulating. If for instance, it is required to skip columns 1 to 10 and 66 to 72, to duplicate columns 11 to 30, 32 to 65, and 73 to 76, to skip column 31 containing a hole, and to initiate an eject−cycle at column 77, No. 1, No. 6, No. 3 and No. 2 column stops are placed opposite columns 1 and 66, columns 10 and 72, column 31, and column 77 respectively. At the end of the eject−cycle No. 1 column−stop closes contacts ATC, the magnets TS, TKS are energized, and the card

Abstract:
Source: US4244412A The invention relates to an anti−skid device for vehicle wheels, formed by a plurality of U−shaped elements adapted to radially fit on the wheel tire and rim, said elements being connected with one another by spacers allowing the device to be put flat on the ground and to be automatically mounted on the wheel by simply advancing said wheel on the device.

Abstract:
Source: KR20050095802A The present invention car remote–mount snow chains attached to the wheel, and the right size apparently cover, there is no difference in normal alloy wheel and lightweight and the structure is simple, by giving a minimal load wheel horsepower performance and appearance of the vehicle, one button without affecting during traveling or stops, and general remote mounting / release without even otherwise adapted for the vehicle may also be equipped with an existing there are those features. "After the vehicle when he met at 40~42 proof / attached to the product in the unhaengjung driver seat of the vehicle relative to one–button if at 1 second car accident is mounted on/off suddenly appeared at most unhaengjung //car, the fact that the winter off a large effect on the prevention of accidents. What is expected. However, if the structure for mounting the excessive weight of the weight of the wheel so that the first vehicle maneuverability excessively to cause a serious adverse effect on, there is no practical use, secondly, because there are many parts that are projected to the outside wheel and damage, there is a serious problem that collision, third, is not good in appearance, there is a disadvantage that is mounted. In addition, most of the conventional automatic–mount design is a driver of a flat tire replacement, there is a problem that it is impossible to. The following features to solve the invention devised to meet. 1. Driver's, one button for 1 to 2 seconds will be long / desorption. 2. Production of the present invention to any differences in conventional vehicles or it can be attached without modification. 3. The minimum weight of, but attached to the wheel itself horsepower that minimal impact on the wheel. 4. Usually there will be no difference in general wheel and the appearance. 5. During regular equipped for sufficient power as snow chains would be wound on the tire. 6. Minimizes the protruding part will suppress the damage risk and impact. 7. Even when the flat tire and tire replacement can be represented. 8. Structure of flock to simply to be produced. To this end the present invention provides a vehicle seat portion to install a small remote control or remote control attached to the lower portion in the engine room of the vehicle, it actuates the small hydraulic pump. The hydraulic pressure is mounted on the inner surface of the pipe to a vehicle wheel, the cylindrical part cylindrical part opposite to the back portion of the piston acts on the gear. And then rotated by a gear cover is open when rotating the central axes of the other two plates using a distance difference occurring in the tire is equipped with a special spike. Is in the reverse order. This product is mounted on the wheel wheel so to have a structure, automatic snow chains, but can also be seen as a special wheel mounting type is preferable to satisfy the above functions because the title of the invention of the car object remote was snow chains in the long / removal and lightweight. Bythe brake drum/caliper, wheel base, flat center, greater the rim flange, beads, hydraulic pump

Abstract:
Source: GB546590A [Class 106 (i)] [Also in Group VIII] A machine of the kind comprising means for sensing perforation patterns in master and detail cards, means for making a set–up of the master and pattern, separate pockets for receiving master and detail cards separate means for conveying master and detail cards to their receiving pockets, deflecting means for each conveying means arranged when operated to prevent the passing of cards to their respective pockets includes the combination with means for making a direct comparison between a perforation pattern sensed from a detail card and the contemporaneous setup made from a master card of means under the control of the comparing means to operate both said deflecting means when the result of the comparison is disagreement. The card feeding and comparing mechanism may be similar to that described in Specification 510,910, [Group VIII], and the driving and c. mechanism similar to that described in U.S.A. Specification 2,044,119. Master cards are fed singly from a box 290, Fig. 25, by a picker 292 into a sensing space between perforated plates 330, 331 against a stop 335 and whilst therein their perforations are sensed by a reciprocating pin box 360, of which certain pins located opposite to perforations in the card are locked in downwardly displaced position by slides 362 so that corresponding pins 395 in the reading retaining pin–box are also downwardly displaced and locked by slides 397, the displaced pins 395 in turn displacing pins 435 in the master card comparing pin assembly 425. Detail cards are fed singly from a box 170, Fig. 26, by a picker 172 into a sensing space between plates 220, 221 against a stop 265 and sensed by a reciprocating pin assembly 226, of which the displaced pins displace other pins 250, translator pins 260 and finally pins 455 in the detail card comparing pin assembly 445. The displaced comparing pins 435 and 455 interact through comparing levers 460 having forked ends engaging projections 464, 466 of smaller diameter than the forks so that a displacement of a pin 435 will transmit through a lever 460 only a partial displacement of a pin 455, and. vice versa; other projections 472, 474 coact with cam points 471, 473 in slots on comparison slides 470 and unless the perforation columns in the compared cards correspond one or more of the projections 472, 474 will remain located on a cam point or points 471, 473 causing comparison slide 470 to be held displaced to the front of the machine with the result that the wide part of an interponent bar 476 in its raised effective position will prevent the free rearward swing of a bail bar 640. The cams controlling the feeding, punching, sorting and stopping of the machine are mounted on a sleeve 600, Fig. 60, to which are keyed two ratchets 605, 615 each with four teeth and four dwells arranged staggered and adapted to be engaged by pawls 608, 618 mounted on levers 610, 620 so disposed that normally pawl 608 engages a dwell on ratchet 605 and pawl 618 is held out of engagement with ratchet 615 by a pin 623 on pawl 608. When as the result of a disagreement between compared master and detail cards bail 640 is unable to complete its rearward swing as shown in Fig. 60 the bell crank lever 639 prevents downward movement of lever 610 on the next downward movement of push rod 625 and lever 620 moves down alone causing pawl 618 to become free of pin 623 and later to engage a tooth on ratchet 615 and then on the next rise of push rod 625 to rotate the control cam sleeve 600 through one step. Master card picker operating link 294 is operated as shown in Fig. 32 by a bell crank 299 and slide 301 moved forwardly by a cam 190 and rearwardly by a spring 303 detail card picker operating link 174 is operated by an arm 177 and slide 179 moved forwardly by cam 190 and rearwardly by spring 303; slide 301 can be held out of action by engaging a pin 304 thereon with a latch 305 on a

rock shaft 195 and slide 179 by engaging a pin thereon with a second latch 194 on rock shaft 195. For this purpose shaft 195 is rocked by a crank and vertical link 647 adapted to be operated through levers and links by one or more of the cams on the control cam sleeve 600, link 647 in its high position locking feed slide 179 allowing master card feeding only and in its low position locking feed slide 301 allowing detail card feeding only and in its intermediate position locking neither feed slide and allowing simultaneous feeding of both master and record card. The various control cams on sleeve 600 are referred to later. Punching mechanism.–In many types of operation the entire perforation pattern in the master card is punched in the detail card by mechanism including a removable punch translator 485, Fig. 50, the pins 490 of which transfer the displacements of the master card comparing pins 435 to a reciprocal set pin box 495 with which reciprocates a plate 516 carrying punch pins 517 so that the detail card which has been passed to a punch space between two plates 520, 523 is perforated to agree with the master card. If certain columns of data are not to be transferred the requisite keys 385, Fig. 25, are set in their locking positions. Perforation may take place in the event of agreement of designation data in corresponding columns of master and c. record cards for which the requisite interponent 476 has been set in elevated position and prevented when there is disagreement. The punch translator 485 is placed in position only when detail cards are to be punched. Feed control mechanism.–Five feed control cams are mounted on the control sleeve 600 which as set out above is rotated through 45 degrees when a disagreement is sensed by the comparison mechanism each of which cams may be rendered operative by lever mechanism operated by projecting lugs on an equal number of discs on a parallel sleeve 702, Fig. 32, settable by an operation selector dial at the front of the machine. One of these control cams is in the form of a plain disc 710, Fig. 32, engaged by a roller 711 on a lever 712 carried by another lever 714 and connected by a link 715 to an arm of a shaft 650 having another arm 648 connected to the link 647 controlling the locking of the feed slides. This feed control cam or ring 710 is of such diameter as to effect locking of neither feed slide and permits master and record cards to be fed simultaneously both on agreement and disagreement since although roller 711 is held in contact with cam 710 by the projection 717 on operation selector disc 718 rotation of the concentric cam 710 will have no influence on link 647. Other cams on sleeve 600 may be operative during this type of feeding to effect an agreement or disagreement card sorting, card punching, or stopping of the machine to insert extra cards. In addition to feed cam 710 four other feed control cams mounted on sleeve 600 may be caused to operate the link 647 and are rendered operative by the selector dial. All five feed cams are shawn in Fig. 69. The second cam 720 has four high dwells of a height permitting simultaneous master and detail card feeding on agreement and four lower dwells causing detail card feeding only on disagreement or vice versa since as shown in Fig. 69 this cam has a second key way for setting it displaced through 45 degrees on sleeve 600. Also on a low part of cam 720 becoming operative a rearward arm 655, Fig. 70, releases a shoulder 417 on a catch 416 from the arm 418 allowing the latter to be lifted by push rod 422 without raising arm 415 and rotating shaft 412 whereby operation of the retract bar 405, Fig. 25, by the link 410 is prevented and the set–up of the last fed master card reading retaining pins 395 is retained until an agreeing detail card is sensed whereupon sleeve 600 is rotated to bring a high dwell of cam 720 into operation. The third feed control cam 730 is a concentric ring of smaller radius causing detail card feeding only both on agreement and disagreement, the set–up by the master card reading retaining pins being maintained. The fourth feed control cam 740 has four low dwells of the radius of disc 710 causing simultaneous master and detail card feeding on agreement and four high dwells which on disagreement lift link 647 to its highest position causing master card feeding only. Since the last sensed detail card has to be retained in the sensing space until a corresponding master card is again sensed the card stop 265, Fig. 42, is held in its lower closed position all the time a high dwell on cam 740 is effective by a hook 660 on an arm 649 on shaft 650 engaging lever arm 281. The fifth feed control cam 750 has low dwells of same radius as the highs of cam 740 causing detail radius a cam disc 730 and high dwells of same card feeding only on agreement and master card feeding only on disagreement, the low dwells also causing retention of the set–up of the master card reading retaining pins and the high dwells also causing detail card stop 265 to be held closed. Cams 740 and 750 have second key ways at 45 degrees for adjustment in sleeve 600 to effect above operations on agreement and disagreement or vice versa. Sorting control mechanism.–Referring to Fig. 25 the master cards may be sorted into a rear box 25 or into an eject box 26 by operating a deflector 680 and the detail cards into a rear box 27, 27a, or into an eject box 28 by operating a deflector 690. These deflectors may be operated to eject master cards and detail cards for which there are no detail cards or master cards with corresponding designation punchings and are controlled by a cam 780, Fig. 71, with four low dwells and four high dwells such that when sleeve 600 is rotated bringing a high dwell into contact with roller 781 on bell crank 782 deflector 680 is raised by link 683 and deflects a d

Abstract:
The vehicle has a battery for electric drive, a vertically adjustable springy rider seat (13), suspension elements, front wheel (10), rear wheel (3), and right and left base plates (1). The base plates include main wheels which include axles (2–3) and wheel hubs (2–4) and/or disc brakes. A steering wheel is provided for steering the wheels at different rotational speeds while moving the front wheel in predetermined direction. The load carrier/load container and rider seat are maintained in equal height. The velocity delimiters are provided for each wheel.

Abstract:
Source: FR1379425A [Source: Claim 1] **ATTENTION** debut du champ CLMS peut contenir fin de DESC **. 172 soi1t solidaires aux moyens de supports 229 aux deux poutres 201 du pont roulant 200. Le second transporteur 172 comporte le tambour moteur 222, entraine par un dispositif moteur tel que moteur electrique, le tambour de renvoi 224 comportant le dispositif de tension 225 compose des vis, des coussinets et des glissieres et d'une pluralite de rouleaux 226, ces rouleaux soutenant aussi bien le brin porteur 227 que le brin retour 228. Le second transporteur 172 deverse les produits repris dans une goulotte 287 qui en etant solidaire aux poutres a treillis 21 par des supports 230 se deplace en meme temps que le pont roulant. La partie inferieure 231 de cette goulotte d'alimentation 229 se trouve au–dessus de la courroie 232 d'un troisieme transporteur 233 identique a tout point de vue au premier transporteur 1 et les produits deverses sur cette courroie 232 sont amenes par le troisieme transporteur 233 a l'atelier d'utilisation des produits. Ces differents appareils presentent de nombreux avantages et notamment L'ensemble des elements, servant a apporter les differents produits, est allege au maximum ce qui permet d'eviter les depenses supplementaires et onereuses pour la realisation de fondations importantes sur lesquelles sont scelles les rails servant de chemin de roulement. En outre l'ensemble des elements de reprise 101 et 117 est plus facilement malleable, d'ou une eco– nomie certaine de la force motrice et cette economie permet une reduction des prix de revient des produits finis. Le palpeur 92 dispose a la tete 58 de la fleche 54 du tripper 45 permet de doser tres exactement l'epaisseur de chaque couche des differents produits stockes meme si l'epaisseur de cette couche est tres minime. Le transporteur a raclettes 101 par le deplacement des couteaux racleurs 102 assure d'une part le glissement vers le has des produits stockes et d'autre part le melange des differents produits. L'utilisation de la couronne a billes 179 placee entre la partie superieure 145 et la partie inferieure 180 du chariot, mobile transversalement, permet de pivoter l'ensemble des elements de reprise compose par le transporteur a raclettes 101 et la roue–pelle 117. Ainsi on peut proceder au deplacement dans les deux sens de l'ensemble et il n'est plus necessaire de ramener celui–ci a son point de depart. On peut faire fonctionner continuellement les elements de reprise, malgre l'inversement du sens de la marche du pont roulant 200. Par le fonctionnement continu des elements de reprise 101 et 117 on augmente considerablement le rendement de l'installation. On evite egalement les frais supplementaires necessaires soit a l'installation d'un second ensemble des elements de reprise, soit d'un transbordeur. La cabine 167, abritant la personne chargee de surveiller le fonctionnement des appareils de reprise 101 et 117 est placee sur le chariot mobile 180 et se deplace en meme temps que l'ensemble forme par le transporteur a raclettes 101 et la roue–pelle 117 et la personne chargee de la surveillance voit tres facilement si les deux elements travaillent a plein rendement. L'articulation centrale 219 du pont roulant 200 absorbe les denivellations du terrain et meme si les trois rails 2071, 2072 et 2073 ne sont pas de niveau, le poids de l'ensemble des elements de reprise 101, 117 est reparti uniformement sur les trois rails 207l, 2072 et 2073 et les galets 210 des boggies 206 sont en contact permanent avec le dessus des rails 2071, 2072 et 2073. Bien entendu l'invention n'est pas limitee aux exemples de reaLisation ci–dessus decrits et representes et a partir desquels on pourra prevoir d'autres modes et d'autres formes de realisation sans pour cela sortir du cadre de l'invention. RESUME L'invention s'etend aux caracteristiques ci–apres et a leurs diverses combinaisons possibles 1D Installation de manutention notamment pour le stockage et la reprise de materiaux, installation caracterisee parce qu'elle comporte, en combinaison des moyens de mise en stock automatique des materiaux en provenance du lieu de dechargement et des moyens de reprise de ces memes

produits, pour acheminer ceux−ci vers un atelier d'utilisation, permettant de placer les aires de stockage dans le prolongement l'une de l'autre, ce qui permet d'une part, de reduire considerablement la surface de stockage, et d'autre part, d'eviter une perte de temps due au daplacement des differents elements composant l'installation de manutention; 20 Les moyens de reprises sont constitues par un ensemble d'elements formant un bloc dont la partie superieure pivote horizontalement par rapport a la partie inferieure, ce qui permet de continuer, en sens oppose du precedent et sans perte de temps, la reprise des produits stockes et de prendre alternativement des produits des differents amoncellements sur les aires de stockage disposees de part et d'autre de cet ensemble; 30 Le transporteur a raclettes comportant des couteaux raleurs fixes par un moyen quelconque sur une chaine attaque de front les differentes couches superposees triangulairement des produits stockes. Les couteaux raleurs provoquent le glissement vers le has des produits et par ce glissement on realise le melange des differents produits; 4 La roue−pelle, ayant sur son pourtour une pluralite de godets, ramasse les produits glisses a la base de l'amoncellement et elle les deverse sur un transporteur a courroie continue; 5 Le transporteur a courroie continue fonctionne a l'interieur de l'ossature metallique servant de support a la roue−pelle, et son brin porteur achemine les produits deverses par la roue−pelle vers une tremie; 60 Des rouleaux amortisseurs, situes sous le brin porteur de la courroie continue du transporteur a l'emplacement ou tombent les produits deverses par la roue−pelle absorbent au maximum l'effet de choc provoque par la chute des produits et reduisent considerablement l'usure de la courroie contínte; 7" Le bras de levier, permettant de lever ou de rabaisser le transporteur a raclettes solidaire de la roue−pelle, assure le contact permanent des couteaux racleurs avec le plan du coin des produits stockes et, en soulevant au maximum les deux appareils, il permet de pivoter l'ensemble et d'attaquer une aire de stockage situee de l'autre cote de l'axe longitudinal du transporteur transversal; s" Le treuil scelle sur le caisson contenant les contrepoids, permet, a l'aide d'un cable, de relever ou de rabaisser le bras de levier; 90 Le transporteur a courroie continue a axe transversal, sur lequel ont ete deverses les produits par la tremie, modifie perpendiculairement le par. cours du transport des produits et les achemine vers le transporteur longeant les aires de stockage; 10 Des boggies solidaires du bati de l'element mobile, assurent le deplacement transversal de l'ensemble des elements de reprise c'est−a−dire le transporteur a raclettes et la roue−pelle; 11" Des rails, reposant sur des poutres a treillis du pont roulant servent de chemin de roulement transversal a l'element mobile transversalement; 12" Le pont roulant se deplace longitudinalement sur trois rails paralleles aux aires de stockage et la combinaison du deplacement transversal avec le deplacement longitudinal permet de balayer toute la surface des aires de stockage; 130 L'articulation centrale du pont roulant absorbe les denivellations existantes entre les trois rails et assure la repartition du poids de l'ensemble sur ces trois rails en permettant aux deux tron cons du pont roulant de former une ligne brisee; i 40 Le transporteur a courroie continue longeant les aires de stockage, amene les produits deverses par le transporteur transversal a l'atelier duti− lisation; 15 Le transporteur a courroie continue para. lele aux aires de stockage apporte depuis le lieu de dechargement les produits destines a etre emmagasines a l'emplacement de stockage prevu; 160 Le chariot elevateur souleve le brin porteur du transporteur a courroie continue et permet d'elever les produits a la hauteur necessaire a leur deversement sur un autre transporteur; 17 Le transporteur a courroie continue perpendiculaire au transporteur precedent et place a l'interieur de l'ossature metallique de la fleche du tripper deverse les produits apportes sur le terrain destine au stockage; 18" Le piston a double effet, alimente par une pompe a huile, releve ou rabaisse la fleche du tripper et permet de doser tres exactement l'epaisseur de la couche des differents produits; 19 Le dispositif palpeur en liaison avec un indicateur de position, est situe a la tete de la fleche du tripper et actionne le relevement automatique de ladite fleche; 200 Le dispositif de controle, des formation de l'epaisseur voulue de la couche d'un certain produit, provoque l'arret de l'alimentation et un signal avertisseur quelconque transmet a un poste de commande central l'arret d'arrivee de ce produit et declenche le branchement de manutention deun autre produit; 21 Le tripper repose sur trois pieds realises en charpente metallique, et se deplace longitudinalement sur un chemin de roulement par l'interme− diaire d'une pluralite de boggies moteurs; 220 Les galets des boggies sont mis en mouvement par une transmission solidaire au reducteur accouple au moteur electrique et ils se deplacent sur les rails formant le chemin de roulement; 230 Les articulations solidarisent le tripper et le chariot elevateur et tout deplacement longitudinal du tripper entraine automatiquement le deplacement du chariot elevateur. [Source: Claim 1] ** WARNING ** start of CLMS field may contain late 172 soi1t solidarity to support means 229 to the two beams 201 crane. 200. the second carrier 172 includes the drum motor 222, driven by a motor device such as electric motor, the return drum 224 with the tensioning device 225 consists of screws, bearings and glissieres and a plurality of rollers 226, these rollers supporting both the carrier strand that strand 227 228. the second carrier 172 products listed pours into a chute 287 which being integral to beams a mesh 21 by supports 230 moves concurrently with the crane. the lower part 231 of the feed chute 229 is located above the belt 232 of a third carrier 233 identical in every respect to the first conveyor 1 and the dumped products on the belt 232 are brought by the third carrier 233 has the product use workshop. These different devices many PRESENT benefits including all of the elements serving to make the different products is maximum allege thereby avoid the additional expenses and onerous for the realization of important foundations on which are sealed track for road rolling. Also all resumption of Elements 101 and 117 is more easily malleable, hence a certain eco− nomy of the driving force and the economy allows a reduction in costs finished products. the probe 92 has a head 58 of the arrow 54 of 45 for the determination tripper very precisely the thickness of each layer of different products stored even if the thickness of this layer is very minimal. the carrier squeegees 101 by the displacement of the scraper blades 102 ensures both the slide into the hAS of stored products and also the mixture of different products. the use of the krona ball 179 placed between the upper part 145 and the lower portion 180 of the carriage transversely movable, allows you to rotate all recovery Elements made by the carrier 101 and squeegees bucket wheel 117. So you can proceed to the displacement in both directions of the whole and it is not necessary to bring it to its starting point. it can be continuously operate the resumption of elements, despite the reversal of the direction of travel of the crane 200. for the continuous operation of recovery elements 101 and 117 is increased considerably the efficiency of the plant. It also avoids the additional costs necessary either to install a second set of recovery Elements or a ferry. The cab 167, housing the person charged to monitor the operation of the devices resume 101 and 117 is placed on the carriage 180 and moves at the same time that the entire form by the carrier 101 scrapers and bucket wheel 117 and the person

charged surveillance seen very easily if both work Elements has full capacity. the central joint 219 crane 200 absorbs ground drop−offs, and even if the three rails 2071, 2072 and 2073 are not level, the weight of all recovery Elements 101, 117 and left evenly over the three rails 207L, 2072 and 2073 and the rollers 210 bogies 206 are in permanent contact with the top of the rails 2071, 2072 and 2073. course the invention is not limited to the embodiments described above and represented and from which we can predict other modes and other forms of realization without departing from the scope of the invention. SUMMARY The invention extends to the characteristics listed after and their various combinations 1D Installation handling including storage and recovery materials, the installation being characterized because it comprises, in combination means for automatically placing in storage of materials from the place of unloading and means of recovery of these same products, to transport them to a user workshop for placing the storage areas in the extension of one another, which allows on one hand to significantly reduce the storage surface, and secondly, to avoid a waste of time due to daplacement of different elements component handling facility; 20 means of times are constituted by a set of elements forming a block whose upper part rotates horizontally relative to the lower part, allowing to continue in opposite direction of precedent and without loss of time, recovery of stored products and alternately take products of various piles on ARRANGED storage areas on either side of this whole; 30 the carrier with squeegees moaners knives fixed by any means on a chain frontal attack the different layers superimposed triangularly of stored products. The knives moaners cause the slide to the HAS products and this shift is realized the mixture of different products; 4 wheel excavator, having on its periphery a plurality of buckets, picks snowsports products based the accumulation and pours them on a continuous carrier belt; 5 the carrier continuous belt works in the interior of the metal frame for supporting a bucket wheel, and carrying strand carries products spilled from the bucket wheel to a hopper; 60 rolls dampers, situated under the carrier strand continuous conveyor belt at the location or the fall spills by bucket wheel absorb maximum effect shock caused by falling goods and considerably reduce the wear of the belt contínte; 7 "The lever arm to lift or lower the carrier squeegees secured to the bucket wheel, ensures permanent contact with the scraper blades with the plane of the corner of stored products, raising the maximum both devices, it can rotate together and attack a storage area situated on the other side of the longitudinal axis of the cross conveyor; S "the winch seals on the box containing the counterweights, allows, with the aid of a cable, to raise or lower the lever arm; 90 the carrier has a continuous belt transverse axis, on which the products were dumped by the hopper, change the angles by. during the transport of goods and routes them to the carrier along the storage areas; 10 Supportive bati bogies of the mobile element, ensure the transverse displacement of all recovery Elements that is, −dire the carrier scrapers and bucket wheel; 11 "rails, beams resting on a lattice crane serve transverse runway to the mobile element transversely; 12" the crane moves longitudinally parallel rails on three storage areas and the combination of the transverse displacement with the longitudinal displacement allows to scan the entire surface of storage areas; the central joint 130 crane absorbs existing drop−offs between the three rails and ensures the weight distribution of all these three rails allowing two sections cons crane form a brisee line; 40 i the carrier continuous belt along the storage areas, brings products dumped by the transverse carrier is duti− workshop lisation; 15 the carrier continuous belt para.Lele storage areas brings from the place of unloading the goods intended to be stored in the planned storage location; 160 The carriage elevator raises the carrier side of the conveyor belt and allows a continuous of raising Products to the necessary height to their spill on another carrier; 17 the carrier continuous belt perpendicular to the previous spot and carrier inside the metal frame of the arrow of the tripper pours bringest products intended field storage; 18 "the double acting piston, powered by an oil pump, notes or demeans the arrow of the tripper and allows to dose very precisely the thickness of the layer of different products; 19 the probe device in connection with a position indicator is located at the head of the arrow of the tripper and operates the automatic increase of that arrow; 200 the control device, training the desired thickness of the layer a certain product causes the food and stop any alarm signal transmitted to a central control station for the arrival of this and stop triggers the connection ofone another product handling; 21 the tripper rests on three legs realized in metal structural, and moves longitudinally on a track through the intermediary of a plurality of bogies engines; 220 bogies rollers are set in motion by a transmission solidarity in reducer coupled to electric motor and they move on the rails forming the runway; 230 joints clamp the tripper and the lift truck and any longitudinal displacement of tripper automatically causes the displacement of the lift truck.

Abstract:
Source: AU2002301175A What had been created are various new processes with the corresponding newly created devices that support or to handle the new processes in order to attained the desired outcome of the new processes. One desired outcome is to produce a low technology cooling system that can be easily made by the ordinary man for himself and this is answered by the creation of a misting tube having a plurality of water misting nozzles and a blower blows wind thru the water mist towards a place or into a house or into an office. An alternative of this is a blower that blows wind thru the water mist created by an atomizer and into a house, a building, a work shop, a play area, or into a green house or plantation. An improvement of this is misting tube being place infront of a blower by attaching the misting tube to the frame/shell of the blower so that the misting tube goes freely with the left and right oscillation of the blower. A further improvement of this water–mist–blower system is where the water is mist sprayed inside a vacuumed air duct to speed up water evaporation wherein air is passed thru a multi–tube radiator inside the vacuumed air duct and the cold air from the air duct is passed thru a hybrid Centrifugal Cyclone separator to remove surplus water mist. Further created are desalination devices.

Abstract:
Source: US2005245845A A supply of lancets for a multi−use lancing device are carried by a tape and sequentially brought from a storage position to an activating position by advancing the tape around a bend. The lancets are non−circular in cross−section along their longitudinal lengths, and in their activating position they extend from the tape such that their sharp tips are available for lancing tissue. The carrying tape can be arranged in reel−to−reel format in a housing having a lancing opening. The lancets can be integral with the tape and activated to move the lancet through the lancing opening by moving the tape along its tape path or by translating a dedicated service loop of the tape. The lancets can also be independent from the tape and activated through the lancing opening by a separate lancing actuator. A test media can be included on the carrying tape and the housing can contain a sensor to yield an integrated lancing and testing device.

Abstract:
Source: US2003146331A A device is provided on a spinning preparation machine for receiving a sliver from a discharge device of the spinning preparation machine and transporting the sliver to a downstream machine, the spinning preparation machine having a depositing region. The device has a support for receiving the sliver deposited from the discharge device in the depositing region, and a moving device for moving the deposited sliver relative to the discharge device in the depositing region for forming a free standing sliver bundle, and for moving the free standing sliver bundle out of the depositing region for transport to a downstream machine.

Abstract:
Source: US2008203735A A system for increasing the efficiency of the movement of a railroad car over a length of rail, including a fluid reservoir for containing a quantity of efficiency enhancing fluid, a fluid dispensing member, a fluid pump connected in fluidic communication between the reservoir and the fluid dispensing member for dispensing a predetermined quantity of fluid through the fluid dispensing member, a microprocessor operationally connected to the fluid pump, and a first sensor for generating a first sensor signal in response to a railroad car crossing a predetermined section of track and operationally connected to the microprocessor. The fluid dispensing member is positioned along a railroad portion substantially equal in length to the circumference of a railroad car wheel to provide a substantially continuous flow of efficiency enhancing fluid substantially equal in length to the circumference of a railroad car wheel onto the rail portion when the predetermined quantity of fluid is dispensed.

Abstract:
The invention relates to a gearing (G) for a motor vehicle, comprising an input shaft (GW1), an output shaft (GW2), a first planetary gear set (P1) which is designed as a stepped planetary gear set and the planet gears (PL1) of which have two different effective diameters, and a second planetary gear set (P2), said first and second planetary gear sets (P1, P2) being designed as minus gear sets, a first sun gear (E111) of the first planetary gear set (P1) engaging with the larger effective diameter of the planet gears (PL1), a second sun gear (E112) of the first planetary gear set (P1) engaging with the smaller effective diameter of the planet gears (PL1), the second sun gear (E112) of the first planetary gear set (P1) being permanently connected to a sun gear (E12) of the second planetary gear set (P2), a planet carrier (E21) of the first planetary gear set (P1) being permanently connected to a ring gear (E32) of the second planetary gear set (P2), the input shaft (GW1) being able to be connected, by means of a first switching element (18), to the planet carrier (E22) of the second planetary gear set (P2) and, by means of a second switching element (14), to the second sun gear (E112) of the first planetary gear set (P1), the output shaft (GW2) being attached to the ring gear (E32) of the second planetary gear set (P2), and said gearing (G) comprising a first electric machine (EM1) with a non−rotatable stator (S1) and a rotatable rotor (R1), the input shaft (GW1) being connectible, by means of a third switching element (13), to the rotor (R1) of said first electric machine (EM1), the first sun gear (E111) of the first planetary gear set (P1) being connected to the rotor (R1) of the first electric machine (EM1) either switchably by means of an additional switching element (K), or permanently, and a ring gear (E31) of the first planetary gear set (P1) being securable, in a rotationally−fixed manner, by means of a fourth switching element (06).

Abstract:
Source: US5211258A PCT No. PCT/SE90/00103 Sec. 371 Date Aug. 13, 1991 Sec. 102(e) Date Aug. 13, 1991 PCT Filed Feb. 15, 1990 PCT Pub. No. WO90/09293 PCT Pub. Date Aug. 23, 1990.An auxiliary vehicle control device for maneuvering a vehicle (1) from a position other than the driver's position is disclosed which includes an operations unit (3) composed of an operating panel, a drive unit (40) and a control unit (23). The control unit (23) is mounted beneath the steering wheel (20) of the vehicle and coacts with the steering wheel (20) through a multi−disc clutch. The drive unit (40) is disposed in the region of the universal joint of the vehicle and coacts with a flange or collar on the output shaft of the gearbox, through a slip coupling arrangement. The front of the vehicle is equipped with a collision guard (50) which, when activated, is operative to activate devices, via operating devices, which apply one of the standard brake systems of the vehicle. The auxiliary vehicle control device can be fitted advantageously to many different types of vehicles.

Abstract:
Source: US5241875A A robot system with robot specific effects. Reconstructable for other fields of activities with few manipulations by the users themselfs. This objective is achieved in accordance with the present invention by standard robot−block parts of nearly the similar design for the installation of multiblock−robots with self operating walk, drive and manipulation faculties, with horizontally and vertically fitting, rotation flange plug connections, with turntables and driving motors and with current and communication channels which are leading through the center of the rotation plug connections and which provide current and communication supply lines and current and communication control lines. These lines are leaded to inside and outside slip−ring and induction units and to equipment components, composed of accumulators, sensors and electronic boards inside the block chamber. The multiblock−robots achieve only by rotary power and in accordance with the individual plug connection installations, variable manipulations, locomotions and walk−movements, with multi−axis free−motion efficiency, for the most different user applications and objectives.

N. WEING ART BY United States Pateilt Offic(t MACB]NES FOR PRINTINTG AND ISSUING TICKE, TS AND BUSINESS FO–RIMS Richard 1. N. We_ngart, Broo_kvifle, N.Y., assi,–nor to Burroughs Corporation, Detroit, Mich., a corporation of AUchigan ri !led Dec. 17, 1954, Ser. No. 475,940 10 22 CWms. (Cl. This invention relates to machines and methods for issuin– business forms and to forms or tickets issued by the machine and in accordance with said methods. The general objects of the present invention relate to the issuance of business forins and particularly transportation tickets in such fashion as to avoidthe necessity f(yr carrying on hand stocks of preprinted tickets which, by virtue of their nature, represent documents of value, to provide accounting records of the tickets issued from which all essential data may be secured, to insure against falsification of records, and to facilitate the issuance of tickets. In accordance with the invention, a mechanism for issuing tickets and maintaining records is provided which is relatively simple and inexpensive and, hence, is particiilarly adapted for use at stations, airports, – relatively small ticket –agencies, etc., where the number of sales of tickets made would not warrant the cost of more elaborate machines. However, as will become apparent hereafter, machines of the type herein disclosed are by no means so limited in their capabilities that they would be inapplicable even to stations, or the like, where large volume sales are involved. Furthermore, the machines are adapted to other than transportation use, though for consistency of description they will be hereafter referred to as for that use. In brief, the machines of the present invention are ar– ran,–ed to print tickets from sheet stock, which may be in part preprinted, through the use of removable slugs corresponding to particular tickets to be issued. These slugs not only print suitable matters on the ticket strip toi form the tickets to be issued, but additionally provide complete printed records of the transactions involved' Furthermore, the machine is arranged to issue, and record the issuance of, tickets of "write–in" type in which certain information must be written in the ticket by the ticketissuin.–a.–ent. Such tickets may be involved, for exam– ple, when it does not pay to provide at the station of issuance slugs involving the issuance of tickets to small stations or destinations to which the traffic from the issuing station may be quantitatively very low. Write–in operation may also be involved in the case of issuance of puuman or coach reservation tickets, in which instances the ticket issuing agent may be required to ascertain space available and identffy on the ticket the particular space sold. The general objects of the invention outlined above, as well as other objects relating particularly to det0s of the machine, its operation, procedure in issuing tickets, and the tickets themselves, will become apparent from tne following description read in conjunction with the

accompanying drawings, in which: r Patented Sept. 6, −1960 cated at 2−2 in Figure 1, the, view being taken in the direction of the arrows; Figure 3 is a vertical section taken on the plane indicated at 3−3 in Figure 1; Figure 4 is a vertical section taken on the plane indicated at 4−4 in Figure 1; Figure 5 is a vertical section taken on the plate indicated at 5−5 in Figure 1; Figure 6 is a ver−tical section taken on the plane indicated at 6−6 in Figure 1; Figure 7 is a vertical section taken on the plane indicated at 7−7 in Figure 1; Figure 8 is an elevation viewed from the plane indicated at 3−8 in Figure 1 in the direction of the arrows; Figure 9 is an elevation, with part of the casing broken anvay, of a printing box located above the main top plate of the machine and containing various printing elements and devices associated therewith; Figure 10 is an inverted plan view of the printing box shown in Figure 9; Figure I 1 is a vertical section taken on the plane indicated at 11 in Figure 9; Figure 12 is a vertical section taken on the plane indi_cated at 12 in Figure 9; Figure 13 is a vertical section taken on the plane indicated at in Figure 9; Figure 14 is a vertical section taken on the plane indicated at in Figure 9; Fi,_ure 15 is in part a section and in part an elevation taken on the broken surface indicated at 15−15 in Figure 9; Figure 16 is a plan view of the machine with the top plate removed and various other parts broken away to show details; Figure 17 is a plan view of the top of the machine but with portions of the printing box broken away to show elements therebeneath; FigLire 18 is a vertical section through the machine particularly showing the storage provisions for the ticket strip and record members and illustrating the paths thereof through the operating mechanism; Figtire 19 is a perspective view of the upper. portion of the machine particularly showing the printing box in opened position for write−in purposes; Figure 20 is a perspective view of the machine showing the printing box in its normal partially tilted position in which it is ready to, receive a slug; Figure 21 is a plan view showing a typical preprinted ticket stook− Figur.e 2_ is a top plan view of a typical slug provided for use in the machine; FigLire 23 is a front elevation of the slug; Figure 24 is a bottom plan view of the slug; Figure 25 is a plan view showing the matter printed by a slug on one type of ticket; Figure 26 is a plan view showing the matter printed on −a ticket by a slug which is arranged for the issuance of a round−trip interline ticket; Figure 27 is a plan view showing matter typically printed on a ticket by a slug designed for the issuance of pullman or similar reservations; Figure 28 is a plan view of a tick−et which is typical of tickets issued for one−way transportation; Figure 29 is a plan view of a ticket typical of tickets ,),5 issued for round−tiip transportation on a single line; Figure I is a general Plan view of the operating mecha− Figures 30 and 31 are plan views showing coupon elements which are associated with the ticket strip for the nism of a preferred type of machine, showing, in particuproductio n of a round−trip interline ticket,, lar, the mechanism located below a top plate of the ma− Figure 32 is a plan view showing an asserhbly of coupon chitie, with various parts broken away to show details 7o elements associated to provide a round−trip interline of construction; ticket; Figure 2 is a partial elevation taken on the plane indi− Figure 33 is a fragmentary plan view showin,− a plor− tion of a ticket journal strip as printed in the machine, there being indicated in this figure certain legends indicative of types of sale; Figure 34 is a plan. view with portions broken away irustra_ve of a three−ply ptillman reservation ticket stock of preprinted type; I Figure 35 is a plan view showing associated pullman reservation coupons as provided by the machine and with certain data written therein; I _ Figure 3 6 is −a, fragmentary plan_ view, of a ptillmanreservation ticket journal as printed in the machine, and . Figure 37 is a plan view of a commutation ticket Nvhich may be issued by the machine. The preferred form of machine provided in accofdance with the invention will be first described, this descripti6n being followed by a description 6f the machine operation and by a description of the types of tickets and the various alternative ticket issuinmethods which may be employed in accordance with the invention. The machine comprises a housing vvhich incorporates various supporting frame elements the arrangement of which will become clear as the descripti6n proceeds withoiit the necessity for detailed description of these elements_ − Power for operation is provided by a motor 2 the sliaft of which through its pinion 4 drives gear 6 which, in turn, is conneeted to rotate with a pirlion S. A clutch arrangement is provided by a gear 10 arranged to mesh with p.inion 8 but having a portion of its circumference cut away to be completed by the teeth on a lever 12 pivoted at 14 to the gear 110 and urged in a counterclocknvise direction, as viewed in Figure 3, by a spring 16. The gear 10 is carried by a shaft 11 which furnishes drive to certain parts of the machine as will hereafter appear. 'ne lever 12 is provided with a pin 18 with which is engageable the hook end 20 of a lever 22 pivoted at 24 and normally urged in a clockwise direction, as viewed in Figure 3, by a spring 26. The lever 22 is held in engagement with the pin 18 by means of a lever 28 to which further reference will hereafter be made. The gear 10 meshes with a gear 30 which is secured to a shaft −32 from which various operations of the mechanism are derived. A pin 34 carried by lever 22 is arranged to engage a movable switch member 36 to produce circuit closure through the motor 2 by engagement of contacts 38− The shaft 11 is provided with a cam 40 arranged to act upon the roller 42 carried by the pivoted lever 44 which is ur.−ed by spring 46 to produce contact between roller 42 and cam 40. The lower end of the lever 44 is also a ranged to engage the switch member 36 to close the contacts. The switch member is normally ur−,ed into circuit opening position by a spring 45. Secured to the shaft 32 is a gear segment. 48 subtending 180' and arranged to drive through haff of a cycle of operation a pinion 50 secured to a shaft to which there is also secured a sproclet wheel 52 over which a _.ain 54 is trained to drive a second sprocket wheel 56 secured to a transverse shaft 58. A disk 51 secured to pinion 50 is provided with a notch to receive a detent roller 53 carried by a lever 55 urged by a spring 57 to provide a yielding detent action. The shaft 58 is provid6d with a pair of pin−,vheels 60 each carrying pins 62 for the driva of a ticket strip T. Edge stripping member_ 64 embrace portions of the circumferences of the pinwheels 60 to remove and deliver dowiawardly the perforat_d edge portions T' of the ticket strip T. A plate 66 is arr_nged to divert the central main portion of the ticket strip T outwardly of the machine. The shaft 58 carlies the Geneva drive member 68 which cooperates with a driven member 70 to which is secured a pinion 72 meshing with a gear 74 secured to a second transverse shaft 76. The shaft 76 is longitudinally slidable and is urged toward the left, as viewed in Figure 1, by means of a spring 78 to engage a pin 80 carried by shaft 76 wifliin a notch in the,end of a sleeve 82. It will be noted that the pinion 72 is provided with a wide face so that the lengthwise movements of shaft 76 will not disenga−,e the pinion 72 and gear 74. For the purpose of imparting movements to the shaft 76 toward the right, as viewed in Figure 1, to disengage pin 80 from sleeve 32,there is guided in Llie frame a pin 77 engageable with a head 75 formed on the end of shaft 76. This arrangement permits manual axial movement of the shaft while preventing the projection through the housing of the ro− tating shaft. The arrangement thus prevents m−,Lnual interference Nvith the shaft

rotation. The sleeve 82 is provided with a pair of pinwheels 84 provided with pins 86 for the feed of a pair of record strips R and R' Nvhich areperforated at their edges. A member 88 serves to hold these strips in engagement with the pins and forms together with a plate 90 an outlet opening for the delivery at –the rear of the machine of the record strip R. The tick–et strip T is provided from a bin 92 in the housing, as shown in Figure 19. The severed edges T' of this strip are received in a bin 94. A bin 96 supplies the record strips R and R' Nvhich are fan–folded in parahel in the bin. The record strip R' is ultimately delivered to a receiving bin 98 Nvherein it is automatically refolded. 2,5 To prevent interference of the several strips with each other, they are fed past spacing rollers 100 and 102 and over plate 103. The edge portions T' are guided to the bin 94 through guide members 104, while a plate 106 serves to control and guide the movement of the record strip R' to the bin 98. Secured to the shaft 32 are a pair of eccentrics 16,3 the straps 110 of which are pivoted at 112 to a carriage 114 which is mounted for horizontal sliding movements in the machine frame. A shaft 116 moun'Led in this cqrr,.age is provided with a pinion 118 which meshes with another pinion 120 carried by the carriage and which, in turn, ineshes with a fixed rack 122 mounled on a machine frame' The shaft 116 carries a seniicircular platen 124 of yielding rubber niaterial which, as will appear, serves to Press the several strips against type to effect printin,_. The carriage 114 is provided with a plate 126 which provides a backing for the writing of information on tickets. A housing 128, which will be referred to hereafter as printing box, is provided with ears 130 which serve to mount it pivotally on the ends of shaft 58, this being merely a convenient mounting. The bottom of the printing box 128 is open and mounted therein is a plate 132 provided Nvith lips 134 for the guidance of an introduced pair of magnets 136 are fixed above the plate 132 and are arranged to attract and hold upwardly a slug S inserted below the plate 132 which is of non–magnetic material. To the rear of the plate 132 and in position to be engaged by an inserted slug is a slide 133 which is slotted for guidance by pins 140, the slide being urged in r fo ,,5 a rward direction by springs 143. The slide 138 is provided at one end with a projection 142 which is arranged to cooperate with a shoulder 154 formed on an arcuate link 144 which is slotted at 146 for the passage of a screw 148 to secure it shdably to the printing box 128. _The depending portion of the Enk 144 is provided– witli an arcuate slot 150 embracing a pin 152 fixed to the m_,chine frame. A pair of rollers 156 and _158 serve to inount the reeled ends of an inked ribbon C. Knobs 160 ;_nd 162 serve for 66 control of movement of the ribbon C. N"ite its movement could be made automatic in obvious fashio–.i, this is unnecessary, the ribbon being idvanced manually through manipulation of the knobs as required. The ribbon is guided about rollers 164 and,166 and –also about guide strips 168 and 170 provided with slidable giiide pins which are urged downwardly by leaf springs 169 and il7l carried by the printing box. The members 168 and 170 also serve for the guidance of a slug S by cooperation with guide slots 172 and _174. In normal conditions prior tp ac_ual printing, the s ace between the plate 132 and the ribbon C is g_–eater than required for the reception of the slug and the slug is kept from engaging the ribbon C by means of the ma,–nets 132. However, as platen pressure is applied the members 168 and 170 are forced upwardly and serve to hold the slug in positive fashion and in defmite position by reason of the gliides 1,72 and 174 which receive projections on the slug as hereafter described. It may be remarked that the member li7O additionally normally holds the ribbon C away from other type surfaces involved in the printing box. Projecting through the top of the printing box are wheels 176 which carry date designations and are respectively coupled by means of gear trains _178 to correspond– , ing type wheels 180 which are located in the printing plane of the type surfaces of a slug. When particular date designations are uppermost on wheels 176, corresponding type elements are in lowermost printing positions. A printing numbering head is indicated at 182 and is ofconventional type provided with an arm 184 normally urged upwardly by a spring 186 and being arraiged vvhen depressed to advance the numbering head by one unit. For this purpose, a pin carried by the arm 184 is engaged by the forked end of a lever 188 pivoted in the box and provided with a pin !190 which is arranged to be engaged by the upper end of a slide 192 guided for vertical slidin–. movement in the machine frame by studs 194 and normally urged downwardly by a spring 196. The lever I 88 is connected by a link 198 to an arm depending from a shaft 200 journalled in the printing box and provided with dependiiag fingers 202 for the purpose of ejection of slugs. 'Ihese fingers are arranged to engage the slide 140 to move it forwardly. An operator's key 204 is arran.–Od to be inserted in the printing box and is provided with a code or other designation indicative of a particular operator of the machine, printing being effected through the medium of a type surface indicated at 206. The key 204 also serves to control operability of the machine and for this purpose is provided with a notch 208 engageable by the tapered nose of a slide 210 which is guided for horizontal sliding movement in the printin–, box an is normally urged toward the right, as viewed in Figure 9, by means of a spring 212. The end of the slide '210 is arranged to engage a shoulder 214 formed on _ vertical slide member 216 which is slotted at 218 for its vertical guidance. An opening 220 in the lower poftion of this slide which projects below the printing plane of the printing box is provided for purposes hereafter described. A projecting ear 222 is supplied at the opposite end of the printing box and is provided with a similar openin.– 224. For the purpose of providing coding of tickets to indicate types of sales involved, there projects through the upper surface of the printing box a –,vheel 226 carrying suitabl,– designations and geared as indicated at 228 to a printing type wheel 230 carrying type elements correspondin.– to the designations on wheel 226, corresponding designations and type elements being respectively uppermost and lowermost simultaneously. The printing box also contains fixed, but replaceable printing slu–,s for the printing of special data. For example, a slug 225 may be provided to print a member of code identifying the machine, and a slug .23]L may be provided to print the validating signature of some alithorized officer or agent of the transportation company. It will be evident that various other relatively unchangeable matters may be printed by suitably arranged slugs. A slide 232 is slotted to embrace pins 234 and 236 secured in the frame to mount it for vertical movements. A spring 238 normally urges this slide upwardly. The upper end of this slide is arranged to be engaged by the member 216 previously mentioned when the printing box is lowered. The slide 232 has a pin and slot connection :240 with lever 28 and when the slide is depressed by the member 216 operation of the machine is initiate(f by the removal of lever 28 from the lower end of lever 22. At 242 the slide 232 has a pin and slot connection with one arm of a bell crank 244. the other arm of which is pivoted to a link 246 which is in turn pivoted to a lever 248 pivoted to the frame at 24 and arranged to be engaged by a rofler 250 carried by the gear On the opposite side of the machine a slide 232' is mounted similarly to 232 and is similarly actuated through bell crank 244' and link 246' from a lever 248' which is acted upon by a

stud 250' carried by a disc 10' carried by shaft lil. _The shaft 32 carries a cam 254 and is arranged to act over an extent of approximately 180' upon a follower roller 256 carried by a link 258 which is slotted at 260 to embrace the shaft 32 for guidance. The link 260 is connected at its forward end at 262 with the operating arm 264 of a counter 266 which registers the number of operations of the mechanism. At its other end, the link 258 is pivoted at 268 to an arm 270 which is secured to a shaft 272 which carries a second arm 274 similar to 270. The respective arms have hooks at their upper ends arranged to cngage within the respective openings 220 and 222 of the members associated with the printing box.. A spring 276 normahy urges both of these arms to disengaging positions. A lever '278 is provided with a handle 280 projecting out,_vardly of the machine and is pivoted at 282 to the machine frame. A link 294 connects this lever with a second 1–ver 286 pivoted at 283 to the frame and tirged counterclockwise, as viewed in Figure 7, by a spring 287. At its lower end lever 286 is connected by link 292 to a lever 294 pivoted to the frame at its lower end at 296. This lever 294 is pivoted at 298, where a follower roller is provided, to a slide 300 which is slotted and mourited in the frame by pins 302 and 304, being urged toward t'_le left, as viewed in Figure 2, by a spring 306. At its upper end, the lever 236 is provided with a roller 308 arranged to enter a depression in a disc 310 carried by the shaft 58. Sectired to the ear 130 of the printing box is a cam 312 which is arranged to act upon the roller 298 at the upp–,r end of lever 294. The cam 312 is also provided with depressions 318 and 320 arranged to cooperate with a roller 316 mouiated in the forward end of a lever 322 which is pivoted to the frame at 324 and urged countercloc se as viewed in Figure 2 by a spring 326. A notch 327 in the lever 322 is arranged to cooperate with a lug 329 carried by the lever 286. A pin 328 on lever 286 is arranged to engage the depending arm of a bell crank 330 which is urged in a clockwise direction, as viewed in Figure 7, by a spring 331. This bell crank is carried by a shaft 333 which supports the plate 66, previously mentioned, and serves to provide swin,–ing of the free edge of plate 66 towards and from the portion of the cover plate 335 adjacent to the opening 337 thus clamping or releasing the ticket strip. A lever 332 pivoted to the frame at 334 has its rear end pivoted to the slide 192 previously referred to, and at its other end is provided with a roller 336 arranged to be acted upon by a cam 338 secured to the sbaft 11. As shown in Figure 20, the top of the machine housitig is provided in front of the print.ing box with a led.–e 340 the purpose of which is to prevent the removal of a pr;nting slug S when the box is in its lowermost position. it has a bevelled forward surface which is of assistance in guiding a slug int(_gt; position in the box. An inked ribbon D passes between the two record strips R and R' transversely across the machine, bein– supplied from a reel 342 and tak(,n up by the reel 344 which may be manually rolled by means of a knurled roller 346 projecting upwardly throu.–h the top plate of the housing. By means of this libbon the impressions to be recorded are impressed on both record strips R and R'. To attain this end, the ribbon D is of a type to apply ink from both of its faces and the upper record strip R is made of thin paper so that matter imprinted on its under side is visible from its top side. The strip R' may be of relatively heavier paper. Before describing the operation of the machine, reference may be made to the construction of a typical slug S as particularly illustrated in Figures 22, 23 and 24. This slug comprises a body 350 of steel having its side edges folded at 352 and shaped to provide ridges 354 presenti_l–g angular edges arranged to seat in the bottoms of the gu;Litgrooves 172 and 174. As a result of this construction, when the strips 168 and 170 are raised and upward pressure is applied to the sILig it is precisely and fixedly positioned in the printing box. The lower edge of the body, as viewed in Figur– 24, is inturned and cooperates with punched out tabs 359 to hold the printing matrix 360 which is held at its sides by lugs366and368pLmehedoutwardlyfromthebody. The matrlx, –%vhich is of the inexpensive type commonly used in addressing machines, has type elements thereon of t,,Vo groups, the first, 362, arranged to print matters on tickets only, and the latter, 364, arranged to print matters on both tickets and record or joumal strips. The latter, it will be noted, occupy only narrow strips on the matric,–s, i–n printing being aligned with the active type on the nl,–mbering b–ead, the type faces on the operator's key and slug 225, and the active type on the type wheel 230. The upper edge 370 of the body is inturned and cooperates with plinched out tabs 372 and 374 and with punched out lucs 376 and 378 to hold a slug identifying card 330 on wnich may be printed data corresp6nding to the matrix, i–iicluding, for ready reference by the tick–et agent, the price to be charged for the ticket issued through use of the slug. A large number of these sliigs may be stored in a rack in overlapping arrangement with their identifying cards 380 exposed to view. X's as indicated in Figure 24 may be provided to fill spaces on a ticket which should not receive insertions. They serve the further purpose of _providing even pressure to maintain the slug in proper printing position when the useful matter to be printed is asymmetrically locatd on the slu– as in the particular sltia illustrated. The structure of the machine havin_ been described there may now be considered the operations involved in printing a ticket throu.–h the use of a slug which contains all the m,,itters required to identify the ticket, i.e., reqtiiring no write–in. When the machine is in rest position, the printing box occupies a slightly tilted position as iuustrated, for example, in Figures 2, 3, 6 and 20. It is retained in this position by the 3,ielding engagement of roller 316 in the notch 318 of cam 312. The discs 176 will have been aditisted for the printing of a proper date by the printing of a proper date by the pri–iting type wheels 180. The operator's key 204 will be in position serving to locate the end of slide 210 over the shoulder 214 of the slide 216. The operator will adjust the disc 226 to secure printing by the Nvheel 230 of the designation on the ticket to correspond with the type of sale involved. The sILig corresponding to the tici_et desired is now iiitroduced, matrix down and held by the ed.–c containing the card 380, into the printing head, being guided thereinto over the member 340 and under the ears 134, and beiilg pushed into the opening between the plate 132 and the inking,ribbon C. The magnets 136 will attract the slug in its inward movement, raising it upwardly so as to avoid engagement of its advancing edge with the ribbon C. Prior to the insertion of the slug, the portion 142 of slide 138 will be resting on the shol–ilder 154 of the link 144 which will be prevented from do–,vnward movement by the fixed pin 152 in engagement with the upper end of the slot 150. As the slug reaches its innermost position, the slide 138 will be forced rearwardly so as to clear the portion 142 from the shoulder 154, thus freeing the print– ing box for downward inovement. To effect initiation of the operation the printing box is now pressed downwardly, the roller 316 yieldin–, to perniit such movement. It may be noted that if the slug was entered upside down, the ribs 354 would prevent guides 168 and 170 from moving upwardly relatively to the printin.– box so that by engagement with plate 126 they would prevent sufficient donvnward movement of the printing box to start the machine. The downward movement of the printing box produces downward movement of slide 232 against the action of spring

238 through the slide 216 which is backed up by the slide 210 because of the presence of the operator's key, tne slide 216 then being, in effect, ri.–id with tlle 1,5 printing box. The downward movement of the slide 232 rocks the lever 28 to release the lever 22 for movemeit under the action of spring 26. The gear segment 12 is thus released into mesh Nvith the pinion 3. SimLItaneously, the pin 34 acts upon the switch member 36 to caiis–, enaagement of con'Lacts 33 and thus close the eircui'c for operation of motor

Abstract:
Source: IN00726CH2013A 'Smart Active Tyre Pressure Optimising System [TPOS] 102 is a highly time sensitive design and technique that instantaneously sense and controls the tire pressure particularly in imminent and inevitable critical driving situations to reduce emergency and high speed breaking distance, mitigate – loss of traction, hydroplaning, roll over or loss of stability, over and under steering, break failure, loss of control due to puncture by smartly sensing, perform context aware computing and directing the Tyre Pressure Control Units [TPCU] 104 to instantaneously control the tyre pressure in right time with right pressure on right tyres thereby actively controlling the footprint and sidewall deformation rate to enhance traction and stability simultaneously sustaining drivability or steerability ultimately to avoid or reduce the impact of collusion and overcome or mitigate critical situations for protecting the vehicles, occupants, pedestrians and other objects around or on the way; also according to design, configurations and scenarios the system instantaneously optimises the tyre pressure on all tyres for further safe driving till next restoration else restores the pressure to optimum preset value utilising inbuilt reservoir or other external restoration systems immediately after the vehicle overcomes the critical situation to continue with safe and comfortable driving. In critical situations TPOS performs sensing, pre computing, current computing for controlling the tire pressure during critical situation, post computing to optimise tire pressure after overcoming accordingly. TPOS 102 utilise smart and adaptive closed loop processing algorithm with predetermined and tested lookup table to instantaneously check and compare the effects between predetermined and tested real world scenarios to the actual real world scenarios for actively sensing, computing and controlling the tire pressure accordingly to mitigate the critical situations. The controlling of tyre pressure is computed mainly based on parameters comprising of sensor system, vehicle safety and stability systems, nature of breaking and break force distribution, tires upper and lower cut–off pressure values, sensing reservoirs and tires internal and external pressure, temperature, moisture, humidity, wheel and tire specifications, vehicle and wheel speed, acceleration and deceleration, vehicle orientation and axial rotation, transverse motion and lateral acceleration, tires position or angle of attack, load and torque distribution, tire traction, steering position, cornering effects, change in Centre of gravity, over and under steering, hydroplaning, sensing road conditions, etc and to further enhance the efficiency, the system interoperates with vehicles existing safety and stability systems like ABS, EBD, ESC, TCS, Rollover mitigation systems, ECU, BA, Precrash systems, suspension and vertical dynamics, radar assisted auto breaking, cruise control system, aerodynamics and airbrakes etc. Other aspects of present invention are controlling the tire temperature according to environmental temperature, moisture and humidity thereby to enhance traction and vary tire pressure according to change in centre of gravity and load, driving modes – comfort, standard and sports modes. Abstract:
Source: US5778796A An electromagnetic switching system for use in a Personal Rapid Transit (PRT) system having a personal rapid transit vehicle with an attached chassis operating over a network of interconnected guideways. The electromagnetic switching system comprises an electromagnetic switching unit mounted on each side of the chassis for directing the transit vehicle into a predetermined path at a switch section of the guideway. The electromagnetic switching unit has an electromagnet for exerting magnetic force on a continuous reaction rail which is attached to an internal sidewall of the guideway.

Abstract:
Source: GB341017A 27021. [Classes 106 (i) and 106 (iv).] Recording–mechanism is set by liquid–delivery apparatus, actuation being completed and the mechanism returned to zero position by a single member. As shown in Figs. 3, 4, 5 a cam rotated by the pump crank closes a mercury switch once for each half gallon delivered. A solenoid 88 is thus energized ; a pin 84 on the armature 86 draws forward the arm 80 of a bell–crank lever and engages a pawl 76 with a ratchet wheel 72 inside the type–wheel 10. When the solenoid is de–energized, a spring 82 causes the pawl 76 to advance the wheel 10 by one–tooth space. A pin 108 then ceases to obstruct a three–armed lever 110 which rocks under the influence of a spring blade 112 and lifts the depending arm of the lever from engagement with a notch in a lever 18. The type–wheel is mounted in a pivoted frame 12 and may now be raised by depressing the lever 18 thus making contact with a paper strip 22 and ink–ribbon 28. A second pivoted frame 30 is formed with a bar 34 which bears on the frame 12 and carries on an extension 38 a spring–restrained pivoted hook 40. When the lever 18 is actuated, the hook 40 swings clear of a pin 42 and engages a pin 44 on which is a catch 46 engaging a notch in the edge of the cash drawer 36. As the hook 40 falls with the return of the lever 18, the catch 46 is withdrawn, and the drawer opens automatically due to the engagement with a part thereon of a spring–impelled bar 54. A pawl 58 on the bar 54 at the same time rotates a ratchet wheel 62 on the spindle of the paper reel which is thus advanced. A cam 66 rotated by an external knob serves for lifting the pawls 68, 58 to allow a completed reel to be withdrawn. The lifting of the wheel 10 permits the spring 82, after advancing the wheel by means of the pawl 76, to lift the latter from engagement with the ratchet teeth leaving it supported by the upper end of the projection 106 carried by the armature 86. A tail–piece 59 lifts the retaining pawl 74 and allows the wheel 10 to swing back to zero under the influence of a coil spring 70. The zero position is determined by the engagement of the pin 108 with lever 110, which also relocks the lever 18. The blade–spring 112 also 'acts as a switch contact for a lamp 116 illuminated during the recording operation only. Any number of type–wheels may be included in one casing, each wheel carrying corresponding type for indicating the amount and price of liquid delivered, together with the pump number. Duplicate records, one of which is to be torn off, may be provided by adding a reel 122, Fig. 11, carrying a strip which passes beneath a roller 124, through a curved guide 126, beneath the platen 24 and out through a slot 128. The roller 124 is geared to the spindle of the first paperreel so that the second strip moves about six times as fast as the first. The ink–ribbon is led between the type and the second strip and back between this strip and that to be retained in the apparatus. In a modified construction, electric control is replaced by a Bowden wire, and the lever 18 by a hollow lock–barrel actuated by any one of a series of keys, the record made indicating which key–user is responsible. The insertion of a key 140 into the pivoted hollow lever 158 first pushes aside a catch 162. The lever 164 is thus released and falls forward until its end snaps into a recess in the underside of the key and prevents withdrawal. The spindle 170 of arm 164 carries an arm to which is connected a pivoted hook held by a spring in the path of the pump plunger which is thus released for operation by the movement of the arm 164. A lever 182 pivoted to and passing into the hollow lever 158 has its upper end in the path of the key, while a pin 186 abuts against a second lever 188 also pivoted to the hollow lever 158. The movement of the key against lever 182 allows lever 188 to swing until a pin 192 on lever 164 is just above a notch 190. The pump–delivery mechanism sets the type–wheel through a lever 204 and slide 156 which acts on the lever 80 controlling the ratchet advancing pawl 76. The key is then depressed, lifting the type–wheel into printing position, and allowing pin 192 to enter notch 190. During the return downward movement the bar 188 swings down the arm 164 sufficiently to release the key 140. At the same time, the pawls 74, 76 are released by a weighted detent 208 formed as a bell–crank lever rocked by a cam on the slide 156, and the type–wheel returns to zero under the influence of its enclosed coil spring. The. paper reel is advanced by pawl 196 mounted on a slide 194, having a pin and slot connection with the end of the hollow lever

158. In order that the keys may print distinctively, type−levers 212 corresponding in number and outline to the keys are pivoted at 214. Printing and the return to zero position may be effected automatically by the return to initial position of an operating member of the delivering apparatus. Electromagnetic means may be so employed, or the hanging up of the delivery nozzle may be the actuating medium. The Provisional Specification describes a construction in which operation is effected by a sliding bar having a V−notch engaged by a link depending from the platen mechanism. As the bar is withdrawn, the end of the link is lifted, trails along a serrated portion and drops into a semicircular notch. A small pivoted dog is drawn along by the link, and prevents reversal except at the extreme positions by jamming in the serrated part of the bar. Rack teeth are also formed on the bar and mesh with a pinion for turning the paper feed rollers. A ramp formed on the bar disengages the pawl holding the typewheel, and permits the latter to return to zero. A small projection advances the ink−ribbon. The paper strips are wider than the type−wheel permitting signature by the attendant, and the use of different price−scales, and affording a blank zone for use where liquid is to be withdrawn for a purpose other than sale.

Abstract:
Source: US2001016626A Block copolyestercarbonates may be prepared by first conducting a reaction between at least one of resorcinol or an alkyl– or haloresorcinol and at least one aromatic dicarboxylic acid dichloride, preferably isophthaloyl dichloride, terephthaloyl dichloride or a mixture thereof, to produce a hydroxy–terminated polyester intermediate, and then conducting a reaction of the intermediate with a carbonate precursor, preferably in the presence of a dihydroxy compound such as bisphenol A. The products have excellent physical properties, including a high degree of weatherability. They may be blended with other polymers such as polycarbonates, poly(alkylene dicarboxylates), polyarylates, polyetherimides, and addition polymers to improve the weatherability thereof.

Abstract:
Source: BRPI1005974A DISPOSITIVO PARA O CORTE DE ROCHAS, CONCRETO E/OUTROS MATERIAIS, PROCESSO PARA CORTE, MANDRIL APERFEICOADO. A presente invencao proporciona um dispositivo e um processo para o corte de rochas, concretos e/outros materiais, e um mandril aperfeicoado. O dispositivo da invencao e particularmente util para o corte de granitos, marmores, ardosias, outras rochas, pedras, concretos e materiais diversos, e compreende: um sistema automatizado do avanco da mesa e aprofundamento do corte; sistema de corte capaz de abrigar multiplos discos de corte; e sistema de controle de rotacao dos discos. O mandril aperfeicoado da invencao e capaz de abrigar um ou mais discos de corte com diametro igual ou variavel, proporcionando vantagens nos processos de corte de rochas e afins.

Machine translation: DEVICE FOR CUTTING OF ROCKS, CONCRETE AND / OTHER MATERIALS, PROCESS FOR CUTTING, CHUCK improved. The present invention provides a device and process for cutting rock, concrete and / other material, and a mandrel perfected. The device of the invention is particularly useful for cutting granite, marble, slate, other rocks, stones, concrete, and miscellaneous materials, and comprises: an automated system of advancement and deepening of the table cut, cutting system capable of holding multiple discs cutting, and control system of rotation disks. Chuck perfected the invention and capable of housing one or more cutting discs with diameter equal or variable, providing advantages in the processes of rocks and the like.

Abstract:
Source: IN04542CH2011A Smart Active Tyre Pressure Optimising System [TPOS] 102 is a highly time sensitive design and technique that sense and instantaneously controls the tire pressure particularly in imminent and inevitable critical driving situations to reduce emergency and high speed breaking distance, mitigate –loss of traction, hydroplaning, roll over or loss of stability, over and under steering, loss of control due to puncture by smartly sensing, performing context aware computing and directing the Tyre Pressure Control Units [TPCU] 104 to instantaneously control the tyre pressure in right time with right pressure on right tyres thereby actively controlling the footprint and sidewall deformation rate to enhance traction and stability ultimately to avoid or reduce the impact of collusion and overcome or mitigate critical situations for protecting the vehicles, occupants, pedestrians and other objects around or on the way; also according to design, configurations and scenarios the system instantaneously optimises the tyre pressure on all tyres for further safe driving till next restoration else restores the pressure to optimum preset value utilising inbuilt reservoir or other external restoration systems immediately after the vehicle overcomes the critical situation to continue with safe and comfortable driving. In critical situations TPOS performs sensing, pre computing, current computing for controlling the tire pressure during critical situation, post computing to optimise tire pressure after overcoming accordingly. TPOS 102 utilise smart and adaptive closed loop processing algorithm with predetermined and tested lookup table to instantaneously check and compare the effects between predetermined and tested real world scenarios and parameters to the actual real world scenarios for actively sensing, computing and controlling the tire pressure accordingly to mitigate the critical situations. The controlling of tyre pressure is computed mainly based on parameters comprising of sensor system, vehicle safety and stability systems, nature of breaking and break force, tires upper and lower cut–off [threshold] pressure values, sensing reservoirs and tires internal and external pressure, temperature, moisture, humidity, wheel and tire specifications, vehicle and wheel speed, acceleration and deceleration, vehicle orientation and axial rotation, transverse motion and lateral acceleration, tires position or angle of attack, load and torque distribution, tire traction, steering position, cornering effects, change in Centre of gravity, over and under steering, hydroplaning, sensing road conditions, etc and to further enhance the efficiency, the system interoperates with vehicles existing systems like ABS, EBD, ESC, TCS, Rollover mitigations systems, ECU, BA, Precrash systems, Suspension and vertical dynamics, radar assisted auto breaking, cruise control system, aerodynamics and airbrakes etc. Other aspects of present invention are controlling the tire temperature according to weather or environmental temperature, moisture and humidity thereby to enhance traction and vary tire pressure according to change in centre of gravity and load, driving modes – comfort, standard and sports modes.

Abstract:
Source: US2111119A een staggered. tacts associated with the even number are placed at the upper level and their links 41 have only the upper nose SI. tacts associated with the odd number are placed at the lower level and their ljnks 41 have only the lower nose 51. The contype bars operating The comtype _baxs operating ' Briefly then, the energization of the printing magnet 31 will interrupt the type bar 20 with a printing element in position. Immediately following the interruption of the type bar movement, the resultant relative movement between interposer 46 and camming element I5 Wil] cause momentary closure of the associated pair of crmtacts 52. These contacts are utilized to conwol the entry into the accumulator of the value set up on the type bar in the manner to be pres–= ently explained. ~ ' Accumulating mechanism The adding mechanism is entirely similar to that shown and described in the application rcferred to and the description thereof will accordingly be limited to a brief explanation of its manner of operation. The accumulator _dive shaft 53 (Fig. S) is geared directly 1.0 the pulley shaft 5 of Fig. 1 so that it is in operation as long as the driving motor of the machine functicns and the driving ratio is such that shaft 53 makes one revolution for each card feeding cycle of the malchine. Shaft 53 has slidably mounted thereon but keyed for rotation therewith a clutch element 54, one for each dE!1OIT1i1'1BtiGI1_1 order 'of the accumulator. The element 513 is provided with s. groove in which Hts the short mm of zz lever 55 which is pivoted as shown and provided with a block 56 normally held as in Fig, 6 by armaturc latch 51 of adding magnet SE. A leaf spring 59 bears against the extremity of the longer arm of lever 55 and moves the same in a counterclockwise direction upon release of block 56 by armature 51. This movement will bring clutching member 54 intp engagement with cooperating teeth GB integral with z» gear 65 loosely mounted on shaft 53. Gear EH, when thus cou~ pled to shaft 53, will rotate ca. gear which meshes therewith and will displace the accumulator index wheel 63. ' The rearward extremity of member 55 is adapt– 'ed to be engaged by a linger EQ toward the end of the cycle for the purpose of disengagmg the clutch element 54 from teeth GK! and re–latching izlock'56 on armatuse 51. Briehy summarizing the adding uyeration, the magnet 58 may be energized at various points in the cycle of the machine, depending upon the location of a perforation in the column of a record card analyzed by the 'lower brushes LB. This energization may take place in response to 9. perforation in –any of the index point positions from 9 to 1, inclusive. A perforation in the “9” index point position will trip the clutch element El" nine steps before finger 54 is operated to declutch it and 2. perforation in the “E” index point position will trip the clutch element 513 one step before it is declutched by the finger GBE, Each step of clutching engagement corresponds to a. tenth of a revolution in the 'accumulator index wheel 63 so that a “9” hole will move it £5 cf a, revolution and the “1” hole will move it 1% si a revolution. _ ` ThE' energization of magnet SS is controlled by the closure of the contacts 52 associated with the printing méchanism. The manner in which the circuits are completed will be set forth in connection with the explanation of the circuit diagram. Read–out meciumism Also driven by gear GI! (Fig. 6) is a. gear 65. Since the ratio of gears 65 and 62 is 211, the former will turn through a. halirevolution for each revolution' of the latter. Carried by and insulated from geir 65 is sc pair of electrically connected brushes 66, one of which cooperates successively mth ten conducting segments 61 while the other cooperates with an arcuate con~» ducting strip 813. ' The relationship of the parts is such that when the index wheel S3 is inlits zero position, one of the brushes 68 is in contact with the zero seZ~ ment ET and the other brush is in contact with the strip 68, thus forming an electrical con;1ec»~ iiion between the two. If the wheel 53 is displaced; to indicate, –say "S", then one of the brushes EEE will be in contact with the “S” segment S7 and the other brush will be in contact with the arcuairs– strip "fine positioning of the brushes 66 provides zz convenient electrical read–out mechanism lox' controlling total transferring and total priming operations and the electrical circuits involved in these functions will be more fully explained connection with the circuit diagram. Accumilator reseiting mechanism The shsit (Elia.

6_gt;.upon' which the index wheels G3 of an accumulator are loosely mcuntafl is slotted for coo;_gt;era,ticn with spring–pnessecl pawls (mot shown) pivotecl upon ami carried by the individual index wheels in such manner cowntercluclwdse rotation of shaft 69 will engage and :Hive the index wheels G3 forwardly to zera posliicm during; a. single revolution of shaft Referzing to Fig. 2, shaft G9 carries 2. gear W at its extremity which is in engagement with gear WS mmmted upon reset shaft 72. Gear `H,' of which there is one for each accumulator, ;:m:1 be selectively coupled to the resetting shaft Fil in 'blue well known manner more fullylexplained in the application above referred to. At the cr;– tremity M shaft 72 is a. gear U3 (see also 5) which is adapted to be driven by an intermediate gear irli– which is secured to shaft 35. Also to shaft H is an arm TIG which carries spIr§\;fgpresses clutch dag W normally held in the ;:scsition shcvm 131 2 by a latching mm 'EB su§9= ported by armsymre shaft ‘MB of magnet amass ture U®. ` Energlzzmtinn oi magnet 8| Will release dog 171' for enga–gemeiit with clutch driving elemeniy SZ, Element 32 is integral with a gear 33 which meshes with 9. gear (XC secured upon constantly running shaiiz GQ. ‘With tltls a,rrsLll3e311en'h;_c11'ive element is in constant `\;_ta,tion and Whenever it is desifecl to effect resetting of the accumudatovs, magnet SU is energized to provide a co'nnection 'between the slement B2 and the ycsettlng shaft 72; Resetting is usually an accompsmiraemt of total taking and by virtue of the mtelmittexaiz gear connection occurs during the latter pmt of Q total taking cycle. ` ` C'ércui1§ controlling devices) ‘ln ‘E‘ig'. Q is shown a, so–called emitter wlcich cooperates with the read–out devices of the ELCCQmulator for ideal printing; or total transferring operatimns. /Garried by 9. stud S5 coaxially with the T5 is az, pair of electrically connected ga so as so ss: “O G5 4 V' V – A 1,111,119 I brushes lil, one of which contacts with conducting segments I1 while the other wipes over a common arcuate conducting strip IB. The brushes Ili are carried by a gear I! driven through an idler 90 from a gear 9| carried by constantly running shaft |9. The emitter used for controlling total Printing operations is' timed so that a brush 85 successively contacts with each of the segments I1 as the corresponding type elements 33 of Fig. 3 approach printing position opposite platen Sl. The emitter used for controlling total transferring operations is timed so that one ol' its brushes 15 successively contacts with each of the segments I1 at times appropriate to the entry of corresponding digits into the accumulators. In Fig, 3 are shown a. plurality of cam controlled contacts whose operation is controlled by cams carried by a shaft 92 driven from shaft 15. The contacts are prenxed “P” to indicate that they function only during totalytaklng and resetting operations. Similar cam controlled, contact devices prefixed with the letter "L" are carried by or may be driven' from the shaft £8 and these are in constant operation as long as the driving motor functions. In Fig. 1 is shown a shaft B3 which is driven from the gears of the card feeding mechanism and. rotates only when cards are being advanced. Controlled by suitable cams on shaft 53 are con–V tact devices, each of which is designated by the letter “F" indicating that they are associated with the feeding mechanism and operative only when the feeding mechanism functions. All these cam contact devices are indicated in the timing diagram (Fig. 7) where their relative timing may be observed. General explanation of the circuit diagram 'I'he wiring diagram of the' electric circuits is shown in Figs. B, Ba and 8b wherein the various cam controlled contact devices are diagrammatically shown and suitably labelled F, L or P for identincatlon as lust explained. The exact timing of these contact devices is shown in Fig. 7 to which reference may be made for the actual time in the cycle of operation during which they function. Due to the numerous interlocking relays employed in the present arrangement, it has not been advisable in all instances to show relay magnets and their associated contacts in close proximity to one another. For purposes of clarity in the wiring arrangement, the relay contact points are shown in the circuits which they control and their relay magnets a.re repeated adjacent thereto. Further than this, the contacts are designated with the same reference numeral as their controlling magnet, followed by a lower case letter. General operation.–The general operation of the machine will first be outlined with particular reference to Figs. 9 and,10. The record card R ls provided with data fields labelled as shown, which are to control the printing by type bars 2U and certain of which will control the entry of data into the accumulators 1–5 indicated below the row of type bars. All of the card fields from which printing is to be controlled are connected directly to the appropriately located type bars 20 as by connections indicated Sl. This is with the exception of fields labelled "Demand," “Gross Tax,", “Net Tax" and “Arrears” These fields are connected directly tc the accumulators #3, #4 and #5 as by connections 95. Some of the connections 9| from the direct llstina llelds are branched to effect the same entry into more than one section of the type bars; for example, the consumption field enters its data in two places, In such case, these positions of the type bars are provided with the checking contacts 52 to insure that printing will actually be the same in the related positions. The “gross bill” and “net bill" nelds are connected for entry into three sections of the type bars through a connection indicated at 91 as follows: from the card fields through connection 91, relay contacts R9Ba, 119911, and Rllllla in series. connection IDI, to the appropriate type bars lll, as indicated by 'vertical lines extending upwardly from connection llll.' It the data is correctly prlnted in the several positions on the bill, the same information is entered ln ACC#| through connections 98 which, under control of the type bar contacts 52, transfer the data through connection 96, relay contacts R.IU2a, to ACC#|, The timing of ACC#| is adjusted to take account of the time delay between the analysis of the card lleld and the eventual entry into the accumulator. If a record card contains “tax” or “arrears” perforations, a cycle of operations follows an lnltial entering cycle, during which following cycle the datavstandlng in ACC#| is printed and transferred to ACC#i, and during a succeeding cycle the data in ACC#5 is similarly Printed and transferred. . During the "tax" transfer cycle the contacts R8811 are open and contacts Rl9b are closed and the data is read from the upper or read–out section of ACC#4 through connection HIP., contacts R99b, contacts Rl Ma, connectlon IIII, to the "gross and net bill" sections of the type bars and from there, if the duplicate printing is correct, through the checking contacts 52 and connections 56 to ACC#£. During the “arrears” transfer cycle, contacts Rllllla are open and Rllllllb closed so that the transfer ls similarly effected from the read–out section of ACC#5 through connection llll, contacts Rllllllb, connection I0 I, to the type bars, and from thence to ACC#i. After all the record ‘cards for a particular account or folio number have been analyzed, the machine will enter into a total taking cycle of operations during which contacts R98a, andRID2u. are open so that the total in ACC#–H may be transferred from the read–out section thereof through connection IGS, contacts R98b, now closed, contacts R.99a, Rllllla, connection IDI, to the several sections of the type bars and, again. if the printing ls the same in all positions, through connections 96, contacts Rl02b, to ACC#2. At the completion of this total taking cycle, ACC#l is cleared but the data ls retained ln ACC#2 which will receive all totals and at the completion of all tabulatlng operations will

show what is termed the "route" total which may be compared with a known value, After all the record cards for a particular “route” have been analyzed the machine will stop. Initial reset cycle,–In the lower part of Fig. 8 is shown the usual group control mechanism, generally designated GC, and as is usual in tabulating machines, it is nrst necessary to set up the major and minor holding relays RA2 and RAS before the machine can be started. This is effected by depression of the reset key to close contacts Ill), thereby completing a circuit from right side of line Ill, wire Ill. contacts Ill), relay contacts RBSC. Rllllc, relay coil RSD, to left side of line IIS. Energizatlon of magnet R30 will close its contacts R300 in the upper part of sill! Fig. 8 which will thereupon complete a circuit from right side of line Ill, stop key contacts Ill, contacts R4Ba, wire ||5, contacts `R30a, relay magnet R25, `conta.cts IIB, main drive clutch magnets II1, to line HS. Energization of magnets ||1 will cause coupling of the driving motor to the pulley shaft 6, mentioned above, and will, incidentally, cause opening of contacts M6 whereupon relay RI will be included in the series circuit through magnet II1 andpwill close its contacts Rla to complete the circuit through motor TM. ' I Contacts R25a provide a holding circuit which is traceable from the contacts through cam contacts LI and wire H2 to line Ill. Cam contacts LI open toward the end of each cycle, and at such time, the circuit through magnet R25 is maintained through either contacts‘”UCLa, or contacts LCLa which are in_series with contacts RSQU., Rlla, R49a, andstop key contacts I 54. The manner in which one or more of these contacts in the holding circuit may be opened to interrupt the same will be explained hereinafter. When the machine is set for automatic resetting, following total taking operations, switch is closed to short–circuit contacts R491 The relay magnet RI–ID, energized by depression of the reset key will close a second pair of contact points R305 for completing a circuit from line UM, wire H2, cam contacts L2, contacts Ritllb, reset magnet BI, to line H3. As explained in the mechanical description, energization of magnet BI will eiect resetting oi the accumulators and will cause a cycle of operation of the P cam contacts of which contacts ?U (the lower part of Fig. 8) close to set up the minor control circuit and contacts PS operate to set up the major control circuit. The detailed manner in which the group control mechanism GC functions to control the operation of the machine is well known in the art and fully set forth in the Patent No, 1,976,617 above referred to so that such detailed description will be unnecessary here. Sumce it to say that upon a change in the minor group classification perforations which in the present case relate to “folio–number", relay magnets R43, RSE will become deenergizecl and s change in the major group classiiicaticn perforations which in the present case relate to the “recite ntunber”, will cause deenergization of relay magnet R42 along with R43 and RM. Starting circuit.–With the group control set up, that is, with magnets R42, RAS, and RH enercized; and the accumulators cleared, the machine is in readiness to feed cards and analyze the data thereon. Depression 'of start key and closure of contacts I |`9 will complete a circuit from line |ll,w'lre ll2, contacts IIB, relay magnet RHS, contacts Rdilb, relay magnet R32, to line JUS. The contact points R33a are in parallel with the contacts R30a and will complete the following circuit through the driving clutch magnet and cause operation of thc motor TM. From line H3, magnet II1, relay RI, magnet R25, contacts R33a, wire II5, contacts R48a and Hd to line lil. Relay magnet R32 is provided with a pair of contacts R32a which are adapted on closure to complete a. circuit to the card feed clutch control relay magnet R39. This circuit is traceable from llne H3, magnet R39, contacts R32a, stop key contacts ||4u. (operable concurrently. with the contacts Ill), contacts R43c of the minor control relay magnet R43 which are now closed, contacts Rlllbg, R55g, contacts PS, wire H2, to. line Ili. This circuit, it will be observed, can only be con;– pleted when the group control relay magnet 43 is energized. Magnet R39 will close its points R.39a to provide a holding circuit for the magnet and a. second pair of points R39la wired in series with the card feed clutch magnet IB will energize the latter so that cards may commence to feed. The holding circuit for magnet R39 is traceable from line H3, magnet R39, contacts R.39a, contacts LCLp, Ella, R43c,\RllJDg, R.99g, PB, wire H2 to line Ill _ ' ' Card lever circuits.–As the cards are advanced past the upper set of analyzing brushes UB, the usual card lever contacts |28 are closed to complete a. circuit. from line Ill, contacts |2(l, relay magnet R21, magnet UCL, wire |2|, to line II3. Magnetf UCL controls a number of contacts which are disposed in various circuits for controlling purposcs. One of these contacts, for example UCLa pointed out above as being in the holding circuit of the motor drive clutch, will open to interrupt this circuit, if cards fail to feed past the upper brushes. Since the card lever contacts |20 open between the successive cards, a holding circuit is provided through contacts R2'la and cam contacts L5 which serve to maintain magnet UCL energized during the interval when contacts 628 are open. In a similar manner, the ‘lower card lever contacts H22 cause energlzetion oi relay magnet R29 and lower card lever relay LSL and the contact points R2Sa. cooperate with cam contacts LG to proidde a similar holding circult. Lisung circuits.–The circuit for the listing magnet '26 is completed from line ill, ‘wire Ht. contacts L2..1="lO, list car./1 clutch :magnet EQ, to line HS. Through this circuit, magnet 29 is energized each cycle oi operation of the machine and the printing roechanism will fuxlction acccrdinglir. As the record cards advance past the lower brushes LB the entries made in the fields containing descriptive data are directly entered on the type ba–rs as explained in connection with Fig. 9 and any data. contained in the “deme.nd", “tax” or “a1‘reai–s” fields entered into ACC#3, ACC#rl. and éiCC#ii, respectively. Entries in the “hill” fields Will be printed on the bill directly and upon closure of contacts will he thereupon entered into ACCQM, These entering circuits are show; in Figs. 8a and Sb and e, representative circuit illustrating the manner of entering from the bill ield of the card will be traced thereon. Connection G5 in the lower part of Fig. Bc ia connected to a lower brush and will receive –current 'through a periorction in the bill flelol from right side of line ill, thence through contacts 9811, connection W6 (Fig. So), contacts 895, con–_ nection I|l'l, contacts Mila, connection lull, to printing magnet Bl and through plug connections DDE to similar printing magnets 31 in the appropriate positions for duplicate Drintine' of the amount sensed. With the circuit just traced, the amount perforated in the selected card col–~ umn will be printed in three places on the bill and as each type bar is interrupted, the associated pairs of contacts 52 will be closed at the same time if the bars are correctly positioned. The contacts 52 are shcwnin Fig. Sa. and arranged in groups as shown. Assuming the three lowermost contacts to be associated with the three type bars positioned as just explained, their concurrent closure will complete 'a circuit from right side of line »i H i, through the emitter, generally designated |23, Wire 124, the three lowermqst contacts 52, wire 125, enclosed in the cable as shown, contacts Rllllb, accumulator magnet 58 of ACC#|, to left side of line II3. As exDlained in the mechanical description, the contacts 52 close momentarily at the time the upward movement of the type bar is intercepted and unless the three associated type bars are intercepted at the same time, the last traced circuit will' not be completed and no entry will be made in the accumulator. Error indicating circuits.–The circuit traced through

contacts 52 in series has a parallel branch circuit extending from the contacts through the right hand coil of a double wound relay magnet R15 and through wire |26 to line II3 so that the relay becomes energized whenever there is correct duplication of the printing. Energlzation of the relay will close associated pairs of contacts R,15a and R15b, the former providing a holding circuit for the relay which extends from line I|3, through wire I26, left hand winding of relay R15, contacts R15a, wire I21, cam contacts LB, to right side of line III. This circuit is maintained until contacts L8 open near the end of the cycle. Contacts R15b are wired in series with silnilar contacts associated with other groups of type bar positions so that if correct printing–takes place in all positions, all of the contacts R15b will be closed and a circuit will be completed therethrough extending from line III, through wire I2II, contacts R.15b, relay magnet RSE, to line I I3, Relay magnet R36 is normally held energized through a circuit extending from line ill, magnet R3G, cam contacts LIII to right side of line. Near the end of each card feeding and analyzing cycle, cam contacts LID open momentarily and if there has been agreement in all printing positions, the circuit through the relay will be malntained through the serlesscontacts R1 5b as traced. If one of the contacts R15b fails to close, the relay circuit will be deenerglzed. _gt; Referring now to Fig. 8 the deenergization of relay magnet R36 will permit closure of its contacts Riia thereby establishing a circuit from right side of line I I I, through wire III, contacts RSSZ7, contacts R3$a, relay magnet R35 to line |I3. A parallel circuit will also now from contacts R3Ea through a lamp I28. Magnet R35 will close its contacts R35a to provide a holding circuit to maintain the lamp illuminated. The contacts R35a also provide for causing the machine to stop after the next succeeding total taking operation of the machine. This is brought about as follows: During the total taking cycle when cam contacts P5 close near the end of the cycle, a circuit is established from line |I3, through relay magnets R38, RI1, contacts P5, switch ISU, contacts 113541, contacts 3321, wire I I2, to line I I I.” Magnet R11 closes its contacts R31a to provide a holding circuit for the relays through cam contacts LI, Relay magnet RSI opens its contacts 38a which are in the main clutch magnet circuit at the upper part of Fig. 8, so that the machine will stop at the end of the cycle. _ It will be apparent from the foregoing that the lamp |29 w'l1l be illuminated at the time an error in Drlntlng is detected but the machine will nevertheless complete the preparation of the bill and will then come to a stop with the lamp |29 indicating the reason for stopping. As will be pointed out hereinafter, the machine may automatically stop at this time for other reasons and the lamp |29 ,serves to identify the stopping action as being due to the non–conformity of the duplicate printing. , Thus far we have seen hoW~the data perforated in the three fields of the card, namely, the "bill" field, the “tax” and the “arrears” fields, are entered into ACC#I, ACCF4 and ACC#5, respectively and the amount of the bill printed. This cycle of operations takes place for each of the cards of the group having the same folio number. i Tan: trans/er cz/cle setup.–Referring now to Fig. 8, a plug socket ISI is provided from which a plug connection is made to the lower brush LB associated with column 22 of the record card R. Record cards containing a perforation in the “X” index point position of this column are thereby identified as containing "tax" data which is to be cross added with the other amounts on the bill. ' The analysis of this "X" perforation as it passes the lower brushes will complete circuits to prepare thc machine for a transferring operation at the end of the analysis of the group of cards reiating to the particular account which have “tax” or “arrears” items thereon. The initial circuit extends from the right side of line I I I, lower card lever contacts I22, wire I32, cam contacts P2, circuit breakers I33, cam contacts FI, lower brush common, X22 perforation, plug connection such as I34, socket I3|, contacts FE, relay magnets R45 and R41 in parallel, wire I2|, to line IIS. This circuit is held through contacts Rlia extending from line II I, through relay contacts R52a, contacts R46a, relay magnets R46 and RH, wire Ill, to line Ill, Magnet R41 is adapted to close 9. pair of contacts R41a which will set up a circuit upon completion of the analysis of the card group as will be explained later, A second pair of contacts R41b will also be opened' at this time. Thus an X22 perforation in any of the cards of the group will energize relay magnet R41 which will thereafter remain energized to control the "tax" amount transferring operations during later cycles. I Arrears transfer cycle setu1J.~An exactly similar set of circuits is completed to prepare the machine for transferring the "arrears" amount. In this case, the socket I35 is provided which is plug connected to the lower brush LB which traverses column 80 and an perforation in this column wlll, through cam contacts FS, cause energizatlon of relay magnet R45 whose contacts R45a provide a holding circuit and whose contacts R45b prepare an “arrears” transfer circuit in the same manner as contacts R.41a. Thus, if the “tax” amount is to be transferred, relay magnet R41 will be energized during the analysis of the card or group of cards and its related contacts will be operated and if the "arrears" amount is to be transferred, the relay magnet R45 will have been similarly energized and' its related pairs of contacts also shifted. `C]ICIES of operation Initiation of transferring operations.–In the following lt will be assumed that the machine is to perform successive tax and arrears transferring operations upon the completion of the analysis of a group of cards and the various step; A involved in these operations are now to be explalned. ' _ It may be explained at this point that a group of cards relating to a particular account are arranged with service cards, such as gas and elec– 2,111,119 _ 7 trlclty cards, leading and any cards having data relatlng to merchandise placed at the end of the group. In order that the merchandise item appear as the last item on the bill (see Fig. 10) the machine is arranged to perform the tax and/or arrears transferring operations before the merchandise card is analyzed. The manner in which such analysis is suspended until transferring has been effected will be explained hereinafter. Record cards bearing data relating to merchandise have an “X” punching in column 54 and the upper brush traversing this column is connected to a plug socket 136 (Fig. Ba_gt; and on the sensing of this “X” perforation, a circuit will be completed from line 113 (Fig. 8), cam contacts L1 1, LIZ, upper brush common. X54 perforation, upper brush UB, 'plug connection such as 131 (Fig. 811) , socket 135. cam contacts FII, relay magnet R55, wire 138, upper card lever relay contacts UCLIJ, to line HI. Relay magnet R55 closes its contacts R55a to provide a holding circuit through cam contacts FIU– whose time of closure is the same as contacts F2 and F3 except that the point of opening of contacts F1 Il is slightly earlier in the cycle. Relay magnet R55 will close a second pair of contacts R55b so that near the end of the cycle, closure of cam contacts L13 will complete a circuit from right side of line Ill, cam contacts L13, contacts R55b, contacts R41a, relay magnet RBS, wire 121, to line llil. Magnet RS! will close its contacts R9Bd to provide a holding circuit through cam contacts L11 and P8. A second pair of contacts R§5g in the stop circuit of the machine opens to break the above traced holding circuit which extends through stop key contacts 1|4a and includes relay magnet R39. The consequent deenergization of magnet RIB will cause opening of its contact points RSBD in the card feed clutch magnet circuit so that cardfeed clutch magnet 111 will therefore become deenerglzed and further

card feeding suspended until transferring operations have taken place. If the group of cards contains no merchandise card with the distinguishing X54 perforation, the same interruption of card feedlngand energizatlon of relay magnet R99 will be brought about under control of the group control mechanism GC shown ln the loweri part of Fig. 8 which in the well known manner will cause deenergization of relay magnets 4| and 48. Magnet |3 will open its contacts Rl3c in series with the contacts R999 and will cause interruption of card feeding ln the same manner. Deenergization of relay magnet R44 will permit closure* of its contacts Rlla, wired in parallel with the relay contacts R555 so that cam contacts L13 may effect energizatlon of relay magnet R99. T411 transfer cycle.–The machine is now prepared to transfer the tex amount from ACC#| to ACC#1. This transferring is again controlled through the type bar contacts; that is, the data is read from the accumulator and entered upon the type bars, which, if properly set for duplicate printing, will effect the entry in ACC#|. Referring now to Fig, 8b the amount standing in ACC#| will be represented by the location of the various brush structures 55 which bridge the individual segments'51 and common strips 55. The emitter shown in the lower portion of Fig. Sa will have ~lts common strip 811 connected to the right side of line 111 through wire 139 (see also Fig. 8), impulse distributors 133, contacts PZ, wire 132, and lower card lever contacts 112. Impulses will thus be successively impressed upon the segments 81 through the brushes 85 in the order 9, 8, '1, etc., to transmit these impulses to all of the nine segments 51, all of the eight segments 51, and so on in succession. Wherever a. segment is connected by a brush 55 to its related strip 58 the circuit will be completed as follows: Assuming that the brush EE in the hlghwt denominational order of the ACC#4 is set (as indicated ln dotted outline) to bridge the “5” segment 61– and its strip 58, at the “5” time ln the cycle, therefore. 9. circuit will be completed from line 111, to common 88 of the emitter brushes 86, “5” segment 81, to all of the "5" segments 51, brush 55 in the highest order of ACC#4, strip 68, contacts 9911, now closed due to the energization of magnet R99, wlre 1111, contacts llllla. wire 1111, to one of the print magnets 31, and through plug connections 1118 to other print magnets 31. Printing will take place in the same manner as explained' above in connection with the direct entries from the card and as the type bars are selected for printing, the associated contacts 52 will be closed and now again. if the setting of the type bars is identical in the three positions ln which the tax is printed, the same entering circuit for ACC#1` will be completed and the tax data will accordingly be added therein. In this manner, the amount standing in ACC#4 will be transferred to the type bars. their setting checked, and the amount thence entered into A.CC#I. As before, if there is any disagreement ln the type bar setting, the signal lamp 129 will be illuminated to call the discrepancy to the attention of the operator. The previous energizatlon of magnet R99 has closed a pair of contacts R99e (Fig. 8) completing a circuit from line I1 1, cam contacts L16, contacts R99e. relay mag– –net R52, wire 121, to line 113. Contacts Rub provide a holding circuit which runs through cam contacts P8 so that the magnet R52 will remain energized until total printing operations have been performed. A second pair of contacts R52a will he opened upon energizatlon of magnet R52 thereby interrupting the holding circuit through the tax pickup relay magnets R45 and R41 which in turn will now permit opening of contacts R41a and closure ol' contacts R41b so that relay magnet R99 can now be deenergized when cam contacts LI1 open. Arrears taa: cycle.–Near the end of the tax transfer cycle, cam contacts L13 will again close, this time completing a circuit from line 1 1 1, contacts_L1S, contacts R55b or R44a as the case may be. contacts R41b, contacts R4517. closed as explained above, relay magnet RI110, wire 121, to line 'I I3. Magnet R100 will close its contacts RllllId to provide a holding circuit for itself through cam contacts L11 and PB and a pair oi’ contacts R1110e w'11l~close to energize relay magnet R51 when cam contacts L15 close later. ' In Fig. Bb. relay magnet R100 will close its contacts RIhllb so that transferring during this cycle may take place from ACC#5 to the type bars 81. Such transferring circuit is traceable from the read–out strip 5| of ACC#5, through contacts Rillllb, Wire 101, to the print magnets I1 and again as ln the case of the tax amount, if the type bars are all positioned alike. the entry will be made into ACC#1 and lamp 125 illuminated If there is any discrepancy. After this transferring of the arrears amount has been effected, cam contacts L11 open so that magnet R1 Il) will be deenerglzed and its varlouc l contacts will return to the positions shown in the circuit. Entering the merchandise amount.–If the group of cards contains a merchandise card following the service cards, the machine will enter upon one or more card feeding cycles during which the merchanidse amount will be printed and entered into ACC#|. Resumption of card feeding is brought about as follows: When both relay magnets R99 and Rllllll are deenerglzed their related contacts R§!y and Rllllllg will be closed and the circuit through relay magnet R39 re–established so that in turn contacts R39b will be closed to energize the card feed clutch magnet Ill and the merchandise card will proceed past the lower brushes which will complete the printing and entering circuits in the same manner as explained in connection with the entry of data from the gross and net bill flelds. It is in these same nelds that the merchandise amount is perforated. Total printing and reset cycle The circuit through relay magnet R39 includes the minor control relay magnet contacts R|3c and R|3d which upon detection of a group number change by the automatic group control mechanism GC will interrupt further card feeding and automatically initiate total taking and resetting operations. Opening of contacts Rllc will interrupt card feeding in the now familiar manner and closure of contacts R|3d will complete a circuit from line III, wlre ||2, contacts P9, R§847, Rlllbg, Rlid, cam contacts LIB, relay magnets RM and R49 to line Ill. The contacts Rilla of relay magnet RIO are in the reset magnet circuit and upon closure will cause energlzatlon of this magnet through a clrcult extending from line II3. reset magnet Ill, contacts Rilla, cam contacts LI, wlre ||2, to line Ill. Through the mechanism controlled by magnet il, theshaft carrying the cams for controlling the P contacts wlll function. The nrst operation to take place will be printing of the total standing in ACC#|. This is brought about as follows: A pair of contacts Rlllb in the upper part of Fig. 8a wlll close to complete a circuit extending from llne H3 (Fig. 8) contacts R,|3b,wire llll (Fig. Ba), contacts Rmb. relay magnet RSI, cam contacts LIB, wire lll (Fig. 8), cam contacts LI1 and Pl, to line Ill. Energizatlon of magnet R98 will close its contacts Rllb in the lower part of Flg. 8a and open its contacts R!la so that the emitter brushes U5 will establish circuits from the read–out strips G! of ACC#|, through contacts R9lb, wire IIIG, contacts R99a and Rlhlla, now closed. wire llll, to the print magnets 31, Once more the checking contacts I2 will determine whether printing is correctly efllected in the several portions of the blll. Relay magnet RID! ln parallel with magnet Rl! wlll cause closure of its contacts_R.l02a in the lower part of Fig. Ba and opening of its contacts R|I2b so that the entering circuits extending from contacts 51 through wires |25 will extend to the adding magnet ll of ACC#2 instead of to the adding magnets of ACC#l as before. . In this manner, the entry in ACC#l is printed on the bill and through the checking contacts B2 to the route total ACC#2.

Later in the reset cycle, the resetting lnstrumentallties will come into play to zerolze the several accumulators in the manner explained above. In connection with ACC#2, however, the resetting mechanism is inef!ective and the amounts ln this accumulator will continue to accumulate to obtain a grand total of all the entries transferred from ACC#l. Automatic resumption of card feeding Cam contacts L3 (Fig. 8) are provided to energize the start relay magnets R32 and R33 near the end of the resetting cycle of operations to pick up and energize the card feed clutch magnet l8. The circuits lnvolved in the starting of the machine have already been traced in detail and the operations controlled thereby will proceed in the same manner as explained above. If it is desired to have the machine stop after the completion of the resetting operation, switch |30 (Fig. 8) is initially set ln its dotted line position a.nd near the end of the resetting cycle cam contacts P5 close momentarily to complete a clrcult through the relay magnets R31 and RSI, the former of which provides a holding circuit through contacts R.3`la and cam contacts Ll. The relay magnet R38 opens its contacts Ella in the upper part of Fig. B to prevent the reestabllshment of the starting circuit and the machine will consequently come to rest at the completion of the resetting cycle of operations and resumption of operations may then proceed through initiation of the start key to close contacts IIB. As explained above, the failure of the type bars to record identical information ln the several portions of the bill will effect energlzatlon of relay magnets R35 and R36 and will illuminate lamp |29 and with switch |30 in its full line position during the total taking 09813– tlon closure of cam contacts P5 wlll complete a circuit from line l|3, through relay magnets R38. R/31, contacts PE, switch lill, contacts Rlia, R33b, wire ||2, to line III. As just stated energizatlon of relay magnets R31 and R38 will cause the machine to stop at the completion of resetting and the continued illumination of lamp Ill will indicate to the operator that the stopping of the machine has been occasioned by a discrepancy In printing in one or more lines of the bill Major total stop The machine ls arranged to automatically stop upon a major group change; that is, when all record cards having the same group number ln columns 9 to 12 have passed through the machine. In such event, the group control mechanism GC will cause deenerglzatlon of the major control relay magnet RI! permitting closure of its contacts R420 which will establish a circuit from line III, contacts Rlla, wire Ill, in parallel through lamp Ili and relay magnet RH, cam contacts LIS, contacts Rnd, Rllllg, RUM, cam contacts P9, wire ||2, to llne I I I. R/elay magnet RAI opens its contacts Rlla in the starting circuit, preventing the completion of the same. The machine will come to rest with lamp IIS illuminated. It will thus be apparent that the machine will automatically come to a. stop under two conditions. First, when there has been a discrepancy ln printing, and second, when there has been a. major group change. In order to indicate under which of these conditions the machine has come to rest, the lamps |19 and ll! are provided, for former indicating by its illumination that the stopping is due to a. printing discrepancy, and the latter, that the cards relating to a particular route have all been analyzed, Single transfer e1/cle !Where one of the cards of the group contains an X22 perforation but none contains an XDR perforation, only the tax transfer relay circuits controlled by relay 'magnet RI1 will be ener» gized so that upon the operation of the group control mechanism or the analysis of the merchandise card, the machine will proceed tlizcough the tax printing and transferring eycie of operations as described above. At the completion of this transfer cycle, since the arrears pick.–up magnet R45 was not energized duiiuf; ihe analysis cf the group, its contacts R455 will be opened, the arrears transfer magnet RIM! will not be energized, and consequently both contacts R.i0'J§y and R999 will be closed at the end of the tae; transfer cycle so that the total taking and rel setting cycle or merchandise feed cycle will be initiated at this time as explained. If a card of the group contained an X80 perforation but no X22 perforation, then only the arrears pick–up relay magnet R45 would be energized and not the tax pick–up relay magnet RH, so that upon the iriiniatiou of transferring operations, magnet RIM will be energized instead of magnet R99 due to the fact that coutacts. R41 will open and contacts RUE and R–45% close. At the completion of the transfer cycle, durine which the arrears amount or total in Awaékii is transferred to ACC#l, magnet RHIC! Wm be deenergized and again contacts B.l00g emi 353g are closed at the end of the cycle se that total taking and resetting cycles or merchandise feed cycle willimmediately follow. Where none of the cards of the group contain either the X22 or X80 perforation, indicating 'that no transferring operations are to 'cake place fox: that group, contacts Rilliig and RSM will both be closed at the end of the iasi; card cycle so that closure of contacts MQ near the end of that cycle will initiate the total iaekirig resetiing operations withowh intewemng ti'ens= ferring cydes. While there has been shown and deseziiiezi and pointed out the fundamental novel Eeetuires of the invention as applied io s single r;'mdi6_ee;m1on, it will be understood theb V3'Z'IU\lE} omiesinzvs sind sukistitutions and changes in the iam? ani; dietsils of the device illustrated erzéi iz; its agemtion may he made by iirinse skillet! in 51;–ri: without departing frnm the spirie–ef i11ven~ tion– it is the iuterxieu therefore te ice iimted amy as indicated by the scope of time feilovrizig eiaims. Abstract:
Source: US2009301601A The present invention comprises apparatus and methods employing a gas produced from a tetrazine−based energetic material such as that known as "BTATz" containing 3;6−BtS(1H−1,2,3,4−Tetrazol−5−ylamino)1−,2,4,5−tetrazine 3;6−BtS(1H−1,2,3,4−Tetrazol−5−ylamino)1−,2,4,5−tetrazine or salts thereof. The tetrazinebased energetic material is ignited through the use of a percussion cap, a piezoelectric crystal or a battery−supplied electric spark or by encapsulating it in a container that is then exposed to a burning flame. The gas produced upon ignition is employed a propellant such as to inflate life rafts, life vests, emergency evacuation slides, tires, air bags and other inflatable devices. The gas produced upon ignition is alternatively employed to power an engine and many other applications such as a fire suppressant.

Abstract:
Source: DE102010005264A1 Besonders tiefe Bohrloecher (14–30 km fuer 300 degrees centigrade und mehr) sind mit der jetzigen Technik sehr teuer oder nicht moeglich. Dann, wenn 300 degrees centigrade ueberall wirtschaftlich erreicht werden koennen, koennen alte Kernkraftwerke und alte Kohlekraftwerke weiter verwendet werden, da dann der Dampf durch Erdwaerme erzeugt wird. Dies liegt daran, dass bei Tiefbohrungen noch so gebohrt wird, wie vor 150 Jahren: Oben ist der Antrieb, unten der Bohrmeissel (Steuerung „von oben"). Stahlplatten koennen durch Wasserstrahlen hoher Geschwindigkeit zersaegt werden. Ein Ring mit zahlreichen, im Regelfall schraeg orientierten Duesen, z. B. alle zwei Millimeter eine Duese, bei zwei oder mehr Meter Durchmesser, aus denen Wasser mit sehr hohem Druck austritt, bewirkt, dass Gestein ringfoermig zerkleinert wird. Duesen entlang Radien zerteilen den entstehenden Kern in z. B. drei Segmente, die vom Bohrgeraet verpackt und an eine Foerdereinrichtung uebergeben werden. Diese faehrt einige hundert Meter nach oben und uebergibt ein Kernsegment an eine weitere Foerdereinrichtung (Stafettenprinzip). Abwaerts fahrend nimmt die Foerdereinrichtung z. B. Wandsegmente und Ausruestung mit. Strom, Wasser, Daten (LAN–Kabel) etc. findet sich in der Bohrlochwand. Die Arbeiten werden von Kameras etc. Ueberwacht und durch Manipulatoren/Greifer ausgefuehrt. Bohrlochwand, Foerdereinrichtungen, Bohrgeraet und Rechner bilden ein Bohrsystem, mit dem so, ohne Bohrstrang und ohne Bohrmeissel, sehr grosse Tiefen rasch erreich werden koennen.

Machine translation: Particularly deep boreholes (14–30 km for 300 degrees centigrade and more) are very expensive or not possible with the current technology. Then, if 300 degrees centigrade can be achieved everywhere economically, old nuclear power stations and old coal–fired power stations can be further used, since steam is then produced by terrestrial heat. This is because of it that with deep wells one bores still in such a way, as before 150 years: Above the drive is, down the drilling bit (control „from above "). Steel plates can be sawed by water jets of high speed. A ring with numerous, as a rule diagonally oriented nozzles, e.g. all two millimeters a nozzle, with two or more meters of diameters, from which water with very high pressure withdraws, causes that rock is circularly cut up. Nozzles along radii divide the developing core into e.g. three segments, which are packed by the drilling equipment and handed over to a conveyer system. This drives some hundred meters upward and hands a core segment over to a further conveyer system (Stafettenprinzip). Downward driving the conveyer system e.g. takes. Wall segments and equipment also. River, water, data (LAN cable) etc. is in the borehole wall. The work is supervised by cameras etc. and implemented by manipulators/grip arms. Borehole wall, conveyer systems, drilling equipment and computers form a drilling system, with which so, without boring rank and without drilling bits, very large depths rapidly achieve become can.

Abstract:
Source: CN204055684U The utility model relates to an automobile self rescuing device, in particular to a self power supply type automobile pit escaping device capable of conducting self rescuing when an automobile is located on a muddy, wet and slippery road surface or road pit. The automobile self rescuing device comprises an axle and hubs installed on the two sides of the axle. The self power supply type automobile pit escaping device is characterized in that long bolts on the hubs are connected with a plurality of bolts through long nuts, winding wheels are installed on the bolts, traction ropes are wound on the winding wheels, the traction ropes penetrate through a claw rod, and a plurality of claw pins are installed on the claw rod. The self power supply type automobile self rescuing device has the advantages that in the rotation process of tires of the automobile, the automobile can be slowly and automatically pulled out of the small muddy road surface pit, other mechanical power and manpower are not needed, and the self power supply type automobile pit escaping device can be detached after being used. The self power supply type automobile pit escaping device has the advantages of being simple in structure, convenient to use, high in efficiency, safe and reliable.

Abstract:
Source: US3839665A A transducer coupled to a motor shaft provides both position and velocity information for use in a closed loop control system. The transducer includes a disk with deposited metallic parallel conductors each conductor carrying current in a direction opposite to the adjacent conductor. Relative movement of one disk with respect to another produces a position signal in a manner well known in the art. However, multiple windings are used to provide multiple position signals displaced in space phase which are then processed by differentiation and commutation to provide a velocity signal used as a control voltage in the control loop. A reference signal is also derived by commutation from the position signal.

Abstract:
Source: US5090256A A method and apparatus for sampling the gaseous content of a liquid laden with solids initially involves sampling the liquid as close as possible to the source of the liquid. A strainer housing having a strainer plate for filtering out debris in the liquid is connected to a suction pump for sucking the liquid into the housing and to the pump. The pump delivers the sampled liquid to a degassing device mounted on a frame with the pump. The degassing device agitates the liquid to liberate gases suspended therein. The gases are then collected from the degassing device so that the gases may be analyzed. A motor mechanism on the frame drives the pump, a rotating agitator in the degassing device and a rotating scraper on the exterior of the strainer plate simultaneously. This method and apparatus are particularly applicable to the sampling of drilling mud from an oil well exploration site for purposes of analyzing the hydrocarbon content of the drilling mud.

Abstract:
Source: US2013085642A The invention proposes a system that uses a novel method to analyze the surface being about to be traversed by a vehicle. The system can be used to enhance vehicle safety and control. The system makes use of AER cameras such as the Silicon Retina. The Silicon Retina is used monitor the surface to be traversed, and a processing unit analyzes the surface based on the signal provided by the Silicon Retina. The proposed surface analysis method carried out by the system surpasses state–of–art analysis methods.

Abstract:
The vehicle has an on–board source of energy for feeding the electric motor (22) of the motor and reduction gear complex. A steering mechanism is mechanically connected to a steering wheel. Control devices are provided for the motor and reduction gear complex and for the steering mechanism. An electronic unit may be provided for receiving radio signals for remote control of the motor. Slide runners (32) are fitted under the lower part of the chassis (14) in order to be in permanent contact with the ice surface. Each runner is joined to the chassis by a spring telescopic mechanical connection, providing the suspension of the vehicle. Shock absorbers extend from the periphery of the chassis in order to absorb shocks in the event of a collision.

Abstract:
The invention relates to a gearing (G) for a motor vehicle, comprising an input shaft (GW1), an output shaft (GW2), a first planetary gear set (P1), a second planetary gear set (P2), and at least one first switching element (14), one second switching element (15) and one third switching element (04), said first and second planetary gear sets (P1, P2) being designed as minus gear sets, a sun gear (E11) of said first planetary gear set (P1) being permanently connected to a sun gear (E12) of the second planetary gear set (P2) and thus being a component of a first coupling shaft (V1), a planet carrier (E21) of the first planetary gear set (P1) being permanently connected to a ring gear (E32) of the second planetary gear set (P2) and thus being a component of a second coupling shaft (V2), the input shaft (GW1) being connectible to a ring gear (E31) of the first planetary gear set (P1) by means of the second switching element (15), the output shaft (GW2) being directly attached to the second coupling shaft (V2), the planet carrier (E22) of the second planetary gear set (P2) being securable, in a rotationally–fixed manner, by engagement of the third switching element (04), the input shaft (GW1) being connectible to the planet carrier (E22) of the second planetary gear set (P2) by means of the first switching element (14), and said gearing (G) comprising a first electric machine (EM1) with a non–rotatable stator (S1) and a rotatable rotor (R1), said rotor (R1) being connected either switchably or permanently to the first coupling shaft (V1), the first and third switching elements (14, 04) being designed to be power–shiftable switching elements that produce a force–fitting connection when engaged, and the second switching element (15) being designed to be a form–fitting switching element, particularly a jaw–type switching element.

Abstract:
Source: GB2221499A A buoyant structure comprises an anchored stator SRC surrounded by a rotatable ring of buoyant wings (SSW, SHW WW, DSW,DBW, BFW and BW, Fig. 2). Water flow acting upon the wings causes the ring to rotate thereby generating power. The structure is stated to function as a city and is serviced by floating roads NFR, SFR. Each road FR (Figure 1) is provided with breakwaters and wave power generators 13. The roads and structure can be used to span a stretch of water. Various functional details are disclosed.

Abstract:
Source: GB723595A 723,595. Sewing–machines. BRITISH UNITED SHOE MACHINERY CO., Ltd. (United Shoe Machinery Corporation). Aug. 28, 1953 [Aug. 29, 1952], No. 21705/52. Addition to 630,639. Class 112. In a thread–tensioning device according to the parent Specification, the braking band has an end portion extending more or less tangentially from its turns to be engaged by the member which causes it to grip the brake drum, and the latter member, while thus engaging the end portion of the band, exerts a frictional force lengthwise of it in a direction to assist in the required effect. Modified means are used for holding and adjusting the other end of the band, and provision is made for the application of only a reduced tension during the first stitch–forming cycle on starting (the tension being substantially removed when the machine is at rest) to avoid the possibility of pulling the thread out of the thread–end holder; the full tension is restored during the second cycle. In the form shown in Fig. 5 the brake band 20 surrounding the brake drum 17, which is secured to a spindle 16 rotating in needlebearings under the action of the thread passing over a wheel on the spindle, has one end 43 adjustably secured by means described below and the other end 19 extending tangentially into engagement with a roller 22 carried by the take–up lever 8. The arrangement is such that as the take–up lever moves to set a stitch it deflects the end 19 of the brake band to the left and at the same time exerts a frictional force drawing it downwards, both these actions serving to tighten the band on the drum to increase the thread tension; the second action ensures that the first turn of the band engages the drum to ensure smooth and correct action. When the take–up moves to give up thread the reverse effect occurs, the end of the band being lifted frictionally to disengage the first turn from the drum. The other end 43 of the band is guided in a fork 50 of a member 44 pivotally mounted on one of the bearings of the drum spindle, a screw 52, with lock–nut, being provided for adjustment of the band whereby the thread tension is adjusted. The member 44 is normally held in a position to tighten the brake band by a lever 60 engaging under the end of an arm 56 of the member 44 under the action of a spring 70: when the machine is stopped, the lever 60 is tilted to the position shown by a rod 82 to relieve the stress in the brake band and remove the tension in the thread. In the arrangement shown in Fig. 8 in the position in which the brake band is slackened, the member 84 engaging the end 43 of the band rests on a lever 90 spring–pressed clockwise and connected by a link 116 with a pivoted arm 114 in engagement with a second arm 110 which is moved anti–clockwise when the machine stops and which thus lifts the. arms 114 to the position shown. When the machine is started, the arm 114 is lowered by a spring 126 until stopped by a latch 118 engaging a nose 115 on the arm 114; in this position the member 90 engages the incline of a cam projection 85 on the member 84 so as to tighten the brake band enough to apply a tension less than normal to the thread. On its return from setting the first stitch, the take–up lever engages a nose 124 to draw the latch 115 clear of 114, so that the arm 114 can fall further and restore full tension to the thread by moving the member 90 right under the projection 85. Specification 656,765 also is referred to.

Abstract:
Source: US2011320040A The invention relates to a method for adjusting concrete rheology requiring only that load size and target rheology value be selected initially rather than requiring inputs into and consultation of a lookup table of parameters such as water and hydration levels, mix components, temperature, humidity, aggregate components, and others. Dosage of particular rheology−modifying agent or combination of rheology−modifying agents is calculated based on a percentage of a nominal dose calculated with reference to a nominal dose response ("NDR") curve or profile. The NDR profile is based on a correlation between a rheology value (e.g., slump, slump flow, yield stress) and the rheology−modifying agent(s) dose required to change rheology value by one unit (e.g., slump change from 2 to 3 inches) such that exemplary methods can employ corrective dosing based on the NDR and the measured deviation by the system.

Abstract:
Source: KR20170075681A In company that manufactured objects should be shipped, it is why even without knowing it. He must know where the fundamental reason should come from. In one example, we use the wrong. In general passes is a vehicle such as a bus or a different passenger vehicle wheels are when I was a whimper, there is a difference. The first condition is to create a vehicle wheel zooms up to the stratosphere, there is a need to know. According to the weight of the vehicle is the difference of the intensity impinging on the wheel rim in the road surface it can be seen that. Vehicle weight, less weight than cars and buses, leaving the vehicle is operated, the roar from generating the sejoing wheels are smaller than a car, but when the contrary to occur a sound that occurs in the bus passes are made more, larger the wheel roar cars. The reason is that the vehicle weight is less out or the front passenger cars is now hitting upside–down to the ground, the air and free up, relative to the weight of the weight of the car in his car wheel relative to the intensity of the sound to hit the road surface size can be seen that it would be more significantly. Car bus as a vehicle, such as when the weight is more effective than air is not good, it can be seen that. Of course, the front glass of the vehicle bus, such as the effect to lower the air. Further they think the human to gravitational acceleration of air. Only the air vehicle proceeds without considering gravity it encountered in front of vehicles such as cars, buses and dispersed than the air, but might occur less noise, to the contrary, the roar cars bus as a vehicle wheels are greater than the sounds that occur when proceed. That is, appearance is not in the car. In cars so far in such a manner as to distribute air to the front glass, and distribute the air it is not up. Dispersing the front passenger vehicle proceed, upside–down, up, to distribute the windshield of the vehicle than the upper surface of the shape to the front further out forward to the air of the air encountered in a dispersion, it is possible to reduce the weight of the gravity. Now, as a vehicle fuel economy but the lower speeds, in accordance with the vehicle speed by the weight of the vehicle fuel consumption is lowered rather prevents the accumulation of snow in winter, preventing the vehicle windshield. The speed at which the vehicle is proceeding normally has a downward according to further reduce vehicle weight as dispersing, rather as also better fuel economy. Thus, experts are more cars exterior shape of cars in weight to further reduce the vehicle speed On the road had said comb. In addition, the asphalt road surface is in contact with the wheels of the vehicle area is greater than the force to more wheels that occur in the vehicle, it is not transmitted to the side of the tire and the road is how strongly the contact force of the engine, depending on the further well passed the wheels. So far behind the front glass shape as vending cars it is not enough to be laid in front of the windshield, and make laid. In addition to the US, there are many things that are in reverse. For example, to distribute the passenger cars spoiler is available now as the front fairing so worried vehicles it is not rounded. As shown front portion to distribute the air knife blade and have greater effect. In addition, as an airplane wing. The front part of dispersing the air will be sure to have sharply. Two years now, an airplane wing" the reasons that could be rounded birds such as swallows, and that he could not help thinking of shape and mimic. Wings of birds is not a strong material, such as a strength is weak hairs from weak flesh is distributed to the force of the air in the streamlined would automatically changes that we distribute air to a rigid material such as metal, it is not enough to forward the preserves in the fairing. And pointed toward the front of the knife blade made as described above. Moreover helicopter loud gareumyeo the air, it can be seen that. Now with air to ground the wings, which means that the loud blow to the next. The helicopter also like wings as arc through the air toward the front part so as to be among the most sharply as soon as the blade reduces fuel consumption and do. In addition, screw the vessel through water. So as now before contacting the water could be rounded so that the cross–section of the screw, as shown in the front side of the sharp knife blade must have sharply, engine fuel consumption is less. [Index terms; dispersing effect. Whimper. Fluid. The cross–sectional area.

Abstract:
The object of this invention is to provide a motor–operated snow chain system for automobiles. This chain system is installed at a wheel of an automobile using the wheel locking bolts (16), and consists of a chain (1), a motor (11), an RF receiver (12) and a battery (13). The chain system is radio–controlled by a driver to wrap or remove the chain (1) on or from the tread of a tire to give increased traction on snow or a steep slope. That is, when it is desired to increase traction of the tires while driving the automobile on snow or a steep slope, the driver sitting in the driver's seat radio–controls the chain system without stopping the automobile. In such a case, the chain (1) of the system is automatically wrapped around the tread of the tire. The driver thus easily and quickly uses the chain system when necessary.

Abstract:
A device for converting wind–produced rotation energy into electrical energy in which a rotor turns around a vertical axis, with blades arranged in the rotation plane. Each hollow blade (2) runs in a recess (5) like a hollow shell, in which a gyrowheel (6) rotates around a vertical axis (C).

Abstract:
Source: JP2099411A PURPOSE:To extend automotive spikes when a road is covered with snow during travel of a car and to retract it when the snow on the road is eliminated by operating a device capable of telescoping the pistons with claw from and into the periphery of a wheel during travel of a car by increasing or decreasing the hydraulic oil quantity remotely. CONSTITUTION:A rotary wheel 3 is closely fitted rotatably in a stationary wheel 1 and a hydraulic oil groove wheel 4 supplying hydraulic oil through a pressure oil feed pipe 2 is formed between both wheels 1 and 3. Multiple cylinders 5 connected to the hydraulic oil groove wheel 4 are formed in the rotary wheel in radial direction at equal angular interval and pistons 6 with claw are provided in these cylinders. Each piston 6 with claw is telescoped in the cylinder 5 hydraulically and a claw at the top of the piston is so provided that it extends from and retracted into the outer periphery of a wheel 7. The stationary wheel 1 is secured to an axle cover 8 and the rotary wheel 3 is secure to a drum 9.

Abstract:
ECOLOGICAL MACHINE FOR MANUFACTURING ADOBE BRICKS, BLOCKS AND BRICKS, WHICH CONSISTS OF A MIXER INTEGRAL WITH A DRY SAND HEATER, A THERMOFORMING MANUFACTURING MODULE INCLUDING ITS OWN UNITARY CARRIER, WHICH HAS THE REQUIRED MECHANISM FOR MANUFACTURING BRICKS BY THERMOFORMING USING COMPACTING HEATED MUD, AND A STACKING ROTATING MECHANISM, THE INVENTION ALSO COMPRISING CARTS FOR TRANSPORTING THE FINISHED PRODUCT THROUGH A LINEAR COOKER, A COOKER INTEGRAL WITH A VAPORISER (2), A METALLIC–CONSTRUCTION STYLISED TANK, A FILTER FOR RECOVERING POLLUTING SUBSTANCES INCLUDING A CONDENSER ALSO IN A METALLIC CONSTRUCTION. THE INVENTION MAY USE A THERMOFORMING MANUFACTURING MACHINE INTEGRAL WITH THE AFOREMENTIONED ELEMENTS, WHICH HAS A PLURALITY OF MOULDINGS SO AS TO ACHIEVE A HIGH PRODUCTION; THE MACHINE HAS A DISC SHAPE, WHEREIN THE UPPER PORTION THEREOF HAS A HALF SPHERE SHAPE WHERE THE WHOLE ESSENTIAL MECHANISM ARE HOUSED THEREIN SO AS TO CARRY OUT THE AFORESAID MANUFACTURE PROCESS, THE THERMO FORMING MANUFACTURING MACHINE BEING BUILT IN SUCH A MANNER THAT THE COMPONENTS THEREOF ROTATE AROUND A CORE, ALSO INCLUDING A PLURALITY OF GUIDES OR NOTCHES FOR SYNCHRONISING THE DIFFERENT INNER MECHANISMS; THE DISC FURTHER ACTS AS A HOUSING OF OTHER MECHANISMS THAT ARE ATTACHED THERETO IN DIFFERENT FORMS AND WHICH ARE REQUIRED FOR ACHIEVING A HIGH PRODUCTION.

Abstract:
Source: US2008161968A A unique piece of engineering device "BT' Smart Machine" (BTSM) is described with the capability of lawn mowing, leave blowing/vacuuming, snow blowing, and general purpose blowing/vacuuming with other extra functionalities such as vehicle jump starter, heavy duty air compressor, vertical trolley, horizontal trolley, and outlets for AC and DC devices. BTSM' uniqueness lies in the fact that it can be run in manual (semi–automatic mode) or automatic mode (hands free mode). In manual mode (semi–automatic mode) BTSM anticipates and helps you along the way while in full–automatic mode BTSM does the work for you while you are home away from home or simply use that time to do something else and with a minimum of 10 to 12 hr uninhibited rechargeable battery life, BTSM has more than enough power to traverse your entire compound. In addition to all that, BTSM also runs off of solar energy which further maximizes battery life.

Abstract:
Source: US2001055671A Substantially solvent−free multilayer articles characterized by excellent color retention and gloss retention, solvent resistance and recyclability comprise a substrate layer comprising a first material selected from the group consisting of a metal, ceramic, glass, a celluosic material, a thermoset resin, and a thermoplastic resin, and a resinous coating layer which comprises at least one auxiliary color stabilizer additive and an arylate polymer comprising ester structural units derived from a resorcinol or alkylresorcinol isophthalate−terephthalate. An intermediate layer may also be present.

Abstract:
Source: GB529844A 529,844. Record–card–controlled statistical machines. BRITISH TABULATING MACHINE CO., Ltd. (Deutsche Hollerith Maschinen Ges.). May 23, 1939, No. 15350. [Class 106 (i)] Sorting cards.–In a machine for sorting code cards, the card column on which sorting is effective is selected by a column–selector 32a, 53, which, when sorting of the cards on that column is completed, is automatically adjusted to the next column by a special last card, the cards being fed transversely of the columns, whereby the time in the cycle at which the selected column is read is according to the setting of the selector. The special card also auto–transfers the control from one designation to the next in the one column, the cards from the reject box after each designation sorting being re–inserted by hand in the supply magazine. Fig. 1 shows a code card with upper and lower card fields punched according to the code of Fig. 2; the combination " S " is punched in each column of the special card. The cards are fed through the machine in a direction at right angles to the line of the columns. The reading means consist of four wire brushes 10 to read the four hole positions of a column simultaneously and this set of brushes is adjusted laterally along the rod 17 to read the upper or lower card field. The cards are fed from the supply magazine by picker 12 and three pairs of rollers 13 to a " selected " pocket A or the " reject " pocket R under control of the sorting magnet 15. The code readings are decoded in known manner by four magnets 60 controlling ladder circuits 61a and ten lines 81 connected to studs 81a, of which line 81–S corresponds to the holecombination S for the special card; the latter is placed on top of the cards in the supply magazine. The column–selecting device consists of a wheel 35 continuously driven from the card–feed mechanism and carrying contact means 34 which bridge a stationary contact ring 33 and an insulated conducting spot 32a carried on a stationary shaft 30. Time of bridging in the cycle will therefore depend upon the setting of the angular part 32a, the shaft 30 being adjustable. The pointer 53 carried with the part 32a, coacts with a scale 53a to show which of the fifteen card columns has been selected as the first column for sorting. Contact means 43 carried by the shaft 30 bridge a stationary contact ring 44 and a ring 40 which is conductive except for an insulating spot 42. This ring 40 is manually adjustable, for last column selection, by a pointer 41, so that if it is set at " 7 " as shown in Fig. 3, when after seven automatic adjustments from column " 14 " the pointer 53 reaches column " 7 " the spot 42 interrupts the holding circuit 87 of the motor and brings the machine to rest At each card run, the arm 21 on shaft 25 is moved automatically one stud to the next designation of the card column and an indicator shows the designation being dealt with. Circuits.–When start key 50 is closed, relay 65 closes contacts 88 to energize motor 11 and closes contacts 87 to give a holding circuit for relay 65 through stop key 52 and parts 44, 43, 40. Sorting proceeds for designation " O " column " 14," of the card and at the end of this first run, cards so punched are in box A all others in box R, and the last, special card S, has energized line 81–S. Magnet 23 actuates pawl 85 to move the shaft 25 and arm 21 one step to the " 1 " stud 81a. The cards from reject box R are replaced manually in the supply magazine and sorting proceeds on designation "1," column " 14." Such cards go into box A on top of the cards punched " O," column "14" and the rest into box R. At the end of ten such sortings for column " 14 " as arm 21 passes from stud " 9 " to stud " O," the insulated conductive end 83 bridges contact 26 to energize the relay 27 which then actuates pawl 29a to advance the shaft 30, together with parts 32a and 43, one step. The movement of part 32a alters the timing relatively to continuously rotated parts 35, 34 that circuit is now made as the brushes read column " 13." Ten more sortings occur on column " 13 " and then a further shift to column " 12 " and so on. After column " 7 " has been fully dealt with, the next timing adjustment of part 32a coincides with arm 43 reaching the insulated spot 42, so that the latter breaks the holding circuit 51b, 87, relay 65 is de–energized and opens contacts 88 to stop the motor 11. After selecting column " 14, " say, as the first column for sorting, if it is desired to start at, say, designation " 5 in column " 14," key 24 is closed the requisite length of time for magnet

23 to advance arm 21 to the number " 5 " stud 81a.

Abstract:
Source: DE19502143A1 The grip chain (15) is made of interlocking elements which slide into each other to reduce the chain length. The chain is stored on the side of the wheel and is attached to flexible mountings (42) which are wound on servo drives (3) on the side of the wheel. When extra grip is required the servo drives are activated to move the chain onto the wheel tread. A simple design uses flexible steel tape supports wound onto servo driven drums. Another flexible support is obtained from a chain of ball shaped elements guided in a flexible guide. The servo drives include sprocket wheels engaging the support contour e.g. slits in the steel tapes. The control system includes position control switches to regulate the end positions of the drives, as well as centrifugal switches.

Abstract:
Source: GB715115A 715,115. Typewriters c. LEGLISE, P. Feb. 15, 1951 [March 17, 1950], No. 3668/51. Class 100 (4) In an end–of–line justifying typewriter wherein the first part of the line is typed in the usual manner and justification is effected in a terminal segment (comprising e.g. 20 normal letter spaces) by contraction or expansion of the text, a first member, longitudinally adjustable and fixed to the frame of the machine, is engaged by a second member, carried by the escapement rack or the carriage of the machine, when the escapement rack reaches a predetermined position, to cause either, both the platen and carnage or the platen only to have a differential sliding motion of pre–selected amplitude and direction in relation to the escapement rack of said machine and causing the justification on the terminal segment. In the embodiments described, texts comprising 16–24 character spaces c. are justified into a normal 20 letter–space terminal segment by giving a movement to the platen 21 relative to that of the escapement held rack Cr. The platen carriage Ch may be integral with either the platen or the rack in any of the various embodiments so that justifying mechanisms to be described may be fitted either on the carriage plus platen assembly or on the carriage plus rack block causing relative movements to the rack or platen respectively. In an example described with regard to Figs. 8 and 9 the first member in the form of a rectilinear guide 57 pivoted at 58 on a piece 68, is slidably adjusted and locked by a latch 63–64, on a margin stop rack 69 so that the commencement 58 of the guide 57 is coincident with the commencement of the terminal segment. The second member is in the form of a touching–rod 32 displaced according to the inclination of the guide 57. The rod 32 carries a slider 30 having an oblique slot 29 in which travels a pin 28 fixed to an arm 26. The end of the arm 26 carries a catch–pin 25 engaging in a groove 24 of the platen 21 so that as the touching rod 32 is displaced the action of the slot 29 on the pin 28 will effect a leftward or rightward movement of the platen 21 according to whether the guide 57 inclines upwardly or downwardly. The parts 29–30 forming the transmission means may be fixed to (a) the escapement rack, (b) the platen plus carriage block with suitable connection of the arm to the rack or (c) to carriage plus rack block. The inclination of the guide, which may also take the form of a grooved or slotted rod, is set according to the amount of contraction or extension required, by locating a catch 60a in one of the notches 62 in an arc 61 attached to the piece 68. The notches marked +IV to –IV correspond to whether the terminal text has to be increased or decreased by four character spaces. The positions of the notches are determined in the manner indicated on Fig. 23 (not shown). The manner in which the touching rod 32 transmits its displacements to effect displacements of the platen relative to the rack may be arranged (a) as shown in Fig. 11, in which the gear wheels 35–37 may be of fixed ratio to give equal, greater or less movements to the arm 26, (b) by slotted bell–crank mechanisms, (c) by a helically grooved sleeve arrangement, or (d) by a simple lever action. The means for adjusting the relative movement between the platen plus carriage assembly and the rack, instead of being part of the first member or rectilinear guide 57 attached to the margin stop rack, may be incorporated in the second member with the guide 57 fixed at a constant inclination. Fig. 24 shows one

example in which the pin 28 of the touching rod 32 reciprocates in a slot 29 in a disc 37 carried by a slider 30 moving in a frame 31. The disc 37 can be rotated to vary the inclination of the slot. The slot may also be formed on a rotatable arm which can be located in notches in a sector integral with the arm 26. The arm 26 and sector may be mounted on (a) the platen 21, (b) the carriage plus platen assembly, (c) carriage pius rack block or, (d) the rack, and the touching rod and the frame 31 carried on the corresponding relatively moving system viz carriage plus rack block, rack, platen or carriage plus platen assembly respectively. In the second type of justifier described with reference to Figs. 42–61 of which Figs. 51 and 58 only are shown, the justifying means comprises a justifying lever L which is pivotally mounted at 0 on (a) carriage plus rack block, (b) the rack, (c) the platen or (d) platen plus carriage assembly. This lever L contacts an actuating stop B adjustable along the margin stop rack 69 so that the lever L is engaged at the commencement of the terminal segment. When letter–spacing now occurs the lever L pivots, and in the embodiment shown in Fig. 51, in which the lever L is mounted on the rack Cr, a groove or slot G engages a pin member A adjustably mounted on a notched rod T fixed to the carriage. According to whether the pin member A is above or below the pivot of the lever L, contraction or extension movement is imparted to the carriage relative to the rack. The pin member A may be mounted on a slider C to which is attached a flat spring l engaging the notches +IV to –IV; alternatively, the pin A may be formed at the end of a flat bar and slide in a slot in the rod T. In such embodiments (Figs. 53–57 not shown) the spring l is mounted on the rod T and urges the flat bar, which is notched with the adjustment settings IV to –IV, into a locating pin on the rod T. Further, the lever L and the rod T may be formed of channel section, Fig. 58, with the pin A adjustable by a rod T^1. The pivot 0 for the lever L is mounted by four screws and blocks u; to the back of the channel, and the boss h of the pivot is located in a bearing hole D^1 in the rack Cr. In a third type of justifying mechanism described with reference to Figs. 62 to 81, of which Figs. 67, 79 and 81 only are shown, the justifying lever L is pivotally fixed to a slider C, Fig. 81, adjustable along the margin stop rack 69 and the relative movement between the carriage rack Cr and the platen carriage Ch is derived by the engagement of the rack Cr and carriage Ch at different points of the lever L. Up to the commencement of the terminal segment, the rack and platen are locked together by a locking–pin e, Fig. 67, on a rocking–bar pivoted (e.g. in the embodiment shown in Figs. 79, 81) on the rack Cr. When the rod T, slidably adjustable on the platen plus carriage assembly, approaches the commencement of the terminal segment the pin e is depressed and a back–support finger d rises to engage the rear of the lever L so that when the point P on the rod T, which is part of the carriage assembly, now moves the finger d, the rack Cr will move to a different extent. With the rod T slidingly set in a guide g to engage notch –IV the lever L moves from a line passing through a point marked "zero" on the axis X–X to a line O–M; it will be seen that while the point P associated with the carriage Ch travels horizontally from zero letter space (point S) to 19+P, the finger d associated with the rack Cr travels only from zero to 15+P. The increment y in this and previously described embodiments indicates the actual position in which printing takes place when using escapement mechanisms in which letter spacing is split into two movements, one before, and one after printing. The rod T has flanges T1 and T2 which ensure that the pin e is depressed for each adjustment in the guide g and whilst it moves relatively to the rod T during justification. The positions of the rod T and the finger d may be interchanged as in the embodiments relating to the two types previously referred to.

Abstract:
Source: DE2025520B2 The snow tack is made up of an elastic band to encircle the tyre, with a pattern of grip teeth fitted to the band. The track is normally housed in a special container on the car and is released by a dashboard control. This feeds the track towards the tyre, which is rotating slowly. The leading edge of the track is fitted with hinged clamps which grip the tyre by swinging into an upwards position i.e. towards the hub. A special coupling pad is fitted to the rear of the band, extending over the leading edge so that the trailing edge is automatically clipped in place. Extra security can be obtained by fitting a clamp after the track is in place.

Abstract:
The drive has an automated gear box including transmission input shafts (W–1, W–3) and a transmission output shaft (W–2) axially arranged parallel to each other. Switchable idle gears (z12–z15, z31–z34) and association of gear switching devices (S1–S4) are arranged on the input shafts. The input shafts are coupled together on an input side of an input wheel set plane (Z1). The input shafts are rotatably arranged in one of the switchable idle gears via the respective gear switching device. The input wheel set plane is provided with non–switchable intermediate gears (z21, z21a).

Abstract:
Source: US6619177B An apparatus, especially for clearing landmines, wherein there is arranged on a carrier

machine (1) a flail unit (11) connected to an engine to power a flail rotor (12) equipped with chains and weights, which unit (11) comprises two flail arms (13) which at a first end support the flail rotor (12) and at a second end are made in the form of a frame (14), where the arms (13) are pivotally supported at a pivot point (17), so that when the flail rotor (12) is in operation the unit (11) will be maintained in a floating position relative to the surface of the terrain, which apparatus is equipped with a protective shield (15) between the flail rotor (12) and the carrier machine (1). The impacts of the chains and weights against the ground provide an uplift equal to the weight of the flail rotor (12), including the flail arms (13) up to the support point (17), and the protective shield (15) is arranged on the flail unit (11), preferably on the flail frame (14), so that it floats therewith and is thus capable of bending backwards when the unit (11) is raised or lowered as a consequence of, e.g., a detonation.

Abstract:
Source: GB618267A 618,267. Typewriters and c. BRITISH TABULATING MACHINE CO., Ltd. July 31, 1946, No. 22863. Convention date, Aug. 9, 1945. [Class 100(iv)] [Also in Group XIX] A machine in which record cards control the printing of data on a record strip comprises an endless perforated tape moving synchronously with and controlling the feeding of the record strip, the sensing of a succession of data on the perforated tape controlling means for feeding the record strip predetermined distances. The tape TP, Fig. 3, has perforations lt– 9t which are sensed electrically and, in co–operation with special perforations in the grouped control cards, control the feeding of the record strip; the tape is gummed at A so that it can be formed into a continuous loop TP, Fig. 16, for passing round a feeding roller 231 which has pins 232 co–operating with perforations 30 in the tape. The tape control mechanism is located at the right of the platen P, Fig. 17. It is driven by a continuously–running electric motor, the mainshaft of which carries a worm 59, Fig. 10, driving a gear 60 fixed to a shaft 63. Either of two gear trains 61, 67 or 64, 68 for high and low speed feeding respectively, are adapted to continue the drive through a clutch 103, 104 or a clutch 94, 99 to gears 107 or 108, Fig. 17, fixed to a shaft 110 carrying also a stopping disc 109, Fig. 9. The selection and operation of the clutches are controlled by relays LS and HS, Fig. 9. Energisation of magnet LS rocks a threearmed member 176 clockwise, lifting a hook 177 out of engagement with the stopping disc 109 and pressing down a T–member 181, Fig. 14, which, through an interposer 182. depresses a lug 186 on an arm 188 carrying a cam disc 200 which forces the clutch member 94, Fig. 10, into engagement with member

99 and so completes the slow−speed drive. If magnet HS, Fig. 9, is energized first, however, an arm 205 is rocked counterclockwise about a pivot 206 moving interposers 182, 183 Fig, 14, relative to the T−member 181 so that subsequent depression of the latter causes movement of the cam disc 201 to operate the clutch mechanism 103, 104, Fig. 10, for the highspeed drive. The longitudinal movement of interposer 182, Fig. 14, following energization of relay HS is transmitted by an insulated button 215, Fig. 9, to close contacts 216 to cause energization of relay LS. The drive to gears 107, 108, Fig. 17, is continued to integral gears 161, 162 comprising clutch teeth 167 adapted to engage similar teeth 168 on a disc 159 which is mounted on a sleeve 158 slidable along shaft 113 under the control of an arm 172 engaging between flanges 173 on the sleeve. The arm 172 is manually controlled from a knob D, Fig. 16, through a simple linkage 306 to engage or disengage clutch 167, 168. When the clutch 167, 168 is in engagement, the drive from the sleeve 158 is completed through a pin 156, bevel gears 151; 142, 150 to shaft 113, and thence through a coupling 122 to the platen P. Normally no relative movement occurs between the bevel gears 151, 142, 150, but this arrangement provides for fine adjustment of the platen by manual operation of a knob 136 which, when rotated, causes the planet bevel 142 to be carried round, rolling on the teeth of bevel gear 151. By virtue of the fact that bevel gears 150, 151 have different numbers of teeth, the second bevel gear 150 is thus given a slow motion which provides for fine adjustment of the platen, coarse adjustment being provided for by a knob 123 fixed to the shaft 113. The tape drum 231, Fig. 17, is mounted on the shaft 110 carrying the gears 107, 108 and comprises pins 232 for engaging perforations 30, Fig. 3, in the tape, a metal surface for co−operating with the six sensing brushes at each side of the centre, and commutator segments 242 set in insulation 241 for co−operation with further sensing brushes. The tape TP, Fig. 16, is passed over the drum 231 and over one of three supports 256, according to its length, the supports being carried on a slidable frame 247 clamped in position on a slidable 249. The tape sensing brushes B1 are mounted in a frame 263 pivoted at 266 which is swung upwards to facilitate fitting the tape. After fitting, the frame is pressed down until a latch 271 engages beneath a square pin 273. In this position a protruding portion 261 presses on the tape, tautening it. To avoid sparking at the brushes, a pair of contact breakers 285, 286, co−operating with arms 291, 292 and contacts 295, 296 provide that no current is supplied to the sensing brushes when they are just about to enter or leave a perforation in the tape. The type−selecting mechanism, Fig. 7, comprises a bar T, carrying type arranged as shown and moving upwardly in synchronism with the sensing of a card, Fig. 6. The presence of a perforation in one of the positions 9−1 causes energisation of a magnet PR and, through linkage 129, 128, 127, 126 causes an abutment 118 to engage the corresponding step 117 and so stop the bar T with a type Z, Y or X and c. opposite the platen P. The member 118 is held by a lever 131 rockable about a shaft a under the control of a bail 133, until the sensing of the O, X and R positions, when upward movement is resumed until a spring−urged pawl 139 is released to engage in one of the teeth O, X, R in the lever 131. A second impulse to the magnet PR effects this release through a linkage 147, 146, 140 previously rendered inoperative by a bail 148.

Abstract:
Source: DE19650162A1 Here is something new. A steel studded tyre (5) is used in addition to the conventional car tyres (1), preventing loss of control on ice. Preferably the new tyre and wheel can be lowered into position by hand, or automatically. Winter driving safety is increased.

Abstract:
Source: US4843742A A trenching apparatus (10) is for excavating deep trenches in which inground concrete retaining or foundation walls may be formed. The trenching apparatus (10) has a crawler base (11) on which a carrier assembly (14) is pivotally supported by pivots (16) whereby it may be tilted by rams (17) to maintain the platform horizontal. An automatic control device (64) is provided for this purpose. The carrier assembly (14) has a pair of rails (18/19) along which a carriage (21) may move. The carriage (21) supports a sleeve (24) through which a trenching arm (25) may be lowered to excavate a trench section as the carriage (21) is driven along the rails (18/19).

Abstract:
Source: DE3400827A1 Tyre studs are prohibited in the Federal Republic of Germany and in many other countries. It is however recommended that vehicles adhere firmly to smooth road surfaces in emergency situations. These plates for firm adhesion to the road are intended to be fitted under the vehicle next to the wheels. By means of fan suction motors the air is sucked up from the suction cups, but also blown in in order to clean the filters, which are in front of the air pipes in order to prevent clogging, but only after lifting again. Narrow wheels provided with suction cups are fitted between the normal wheels and the vehicle, with the same suction cups and filters and fan suction motor as before. When cornering air is sucked much more sharply out of those wheels which lie on the inside of the curve than out of the tyres which run on the outside of the curve. In an emergency sharp braking occurs. For this reason a suction motor is fitted on each side of the vehicle so that the plates fitted between the wheels for self–adhesion on smooth roads are automatically lowered to the ground by means of a lowering and raising device and computer control, to enable the vehicle to adhere to the smooth road. Echo sounding beams or other beams measure remote, moving and non–moving objects at a distance from the moving vehicle, which the computer constantly uses in order to calculate... Abstract:
Source: US2005158554A Disclosed is a multilayer article assembly comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) an uncured thermoset or uncured cyclic oligomer substrate layer, wherein the coating layer is in contiguous contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for preparing said multilayer article assembly.

Abstract:
Source: FR1241788A [Source: Claim 1] 1. **ATTENTION** debut du champ CLMS peut contenir fin de DESC **. tant, le parallelisme des bras 10 et 10 bis et celui des roues en rectifiant au besoin par les vis 12 l'orientation verticale des miroirs 11 sur les bras 10 et 10 bis. L'invention prevoit aussi que les deux appareils il voient leurs reflexions entrecoupees par un ecran translucide 16 reposant sur le sol par un pied 17 a mi–distance entre–11 et 11 bis de telle sorte que l'on puisse voir concorder ou non l'un par transparenee, l'autre directement les spots lumineux correspondants a l'epure. On concoit que tous les autres angles soient mesures par ce dispositif en tenant compte que la pointe 7 pouvant tourner, l'axe 8 bis (fig. 4) peut etre oriente verticalement, oscillant sur son milieu et solidaire du bras 10 ter qui porte l'appareil optique 11 ter dont l'ace d'oscillation est horizontal comme 10 ter et dont les projections se mesurent soit sur l'appareil oppose, soit sur l'ecran 16 interpose. L'invention prevoit essentiellement que le plan translucide 16 soit remplace, soit: a. par une glace a double face rayee sur chacune de traits reperes concordant en hauteur ou qu'une glace a une seule face soit montee sur socle a pivot pour pouvoir faire face sans denivellation aux appareils II et II bis, soit: b. par un plan opaque 16 gradue sur chacune de ses faces a des niveaux correspondants de toute la gamme des graduations ou echelles necessaires aux mesures deja citees. Il est prevu aussi que ce plan 16 peut porter en son centre une source lumineuse pouvant alimenter a la fois les miroirs 11 et 11 bis dont les effets se portent sur le panneau 16. Il est prevu que le plan 16 represente porte sur le sol sur un socle 17 soit fixe au vehicule en dessous de toute membrure telle que pare–choc, en son milieu d'ou il resulte que ledit plan 16 se deplace avec le vehicule comme les ensembles appliques sur les roues. L'invention prevoit que la liaison entre les deux cotes soit assuree par le positionnement d'une regle droite 13 bis instantanement amovible qui vienne s'encastrer par ses extremites dans les rainures de deux plateaux 18 orientables sur le bras 10 et bordes de deux secteurs gradues avec reperes sur le bras 10 (fig. 5). L'axe d'orientation de ce plateau, vertical pour les mesures de parallelisme sera horizontal et monte sur charnieres a axe vertical pour les mesures de chasse et de carrossage ou d'inclinai son des pivots qui concernent des deviations complexes d'axes verticaux au cours du bracage. L'invention prevoit que sur chaque bras 10 soit monte un pendule sur rotule a balancier 18, fig. 7, dont la pointe superieure 19 indique a travers un verre bombe 20 gradue de cercles concentriques et de rayons (fig. 8) les valeurs comparatives des debattements des deux roues, etant dit qu'un niveau a segment spherique peut etre utilise mais presente moins de precision. Ainsi la regle ou les systemes optiques pourront etre completes eventuellement par les coupoles decrites. On voit fig. 7 que la coupole 20 est fixee par un bras 21 avec un systeme a pince ou coulissant permettant la mise a zero de l'aiguille avant debattement d'orientation des roues. L'invention prevoit enfin que la fixation 4 par charniere et rotule deportee eventuellement soit remplacee pour les mesures sur des angles importants par un accrochage sur le dessus du pneu suivant la figure 6 combinee avec la figure [Source: Claim 1] 1. ** WARNING ** start of CLMS field may contain end of DESC **. As the parallelism of the arms 10 and 10a and the grinding wheels as required by the screws 12, the vertical orientation of mirrors 11 on the arms 10 and 10a. The invention provides for the two devices as it see their reflections interspersed by a translucent screen 16 resting on the ground by a foot 17 is halfway between 11 and 11–bis so that we can see the match or not one by transparenee, the other directly corresponding bright spots has epure. It conceives all other angles are measures by this device considering that the tip 7 rotatable axis 8a (Fig. 4) can be oriented vertically oscillating on the middle and fixed to the arm 10b which carries the optical device 11b whose oscillation ace is horizontal as 10b and whose projections are measured either on the device opposes either on the screen 16 interposed. The invention provides for essentially the translucent plane 16 is replaced by: a. by a glass double sided striped on each of benchmarks traits consistent height or ice that one side is montee Stand pivot has to cope without elevation change to the devices and He He bis or b. by an opaque plane 16 graduated on each of its faces a corresponding levels of the full range of scale or scales needed to already cited measures. It is also expected that this plan 16 can carry in its center a light source that can power has both mirrors 11 and 11a whose effects relate to the panel 16. It is expected that the plan represents 16 touches the ground on a base 17 is fixed to the vehicle under any chord as bumpers, in the middle of or it follows that the plan 16 moves with the vehicle as the sets appliques on wheels. The invention provides that the

connection between the two sides is ensured by the positioning of a right rule 13a instantly removable who comes to built its ends into the grooves of two adjustable plates 18 on the arm 10 and hoardings of two sectors GRADUATED with benchmarks on the arm 10 (fig. 5). The tray of this orientation axis, vertical to the parallelism measures will horizontal and hinged with a vertical axis for hunting and measures camber or bowed its pivots which involve complex deviations of vertical axes during the bracage. The invention provides that on each arm 10 is mounted on a pendulum balance patella 18, fig. 7, the upper edge 19 states through a glass bomb 20 graduated concentric circles and rays (fig. 8) the comparative values of the deflections of the two wheels, being told that a spherical segment level can be used but presents less precision. Thus the rule or optical systems will eventually be supplemented by the described domes. We see Fig. 7 that the dome 20 is fixed by an arm 21 with a clip system or sliding to the setting to zero of travel front needle wheel orientation. The invention further provides that the fixing by 4 hinge and ball deportee eventually be replaced for measurements on large angles by hanging on top of the tire according to Figure 6 combined with Figure

Abstract:
Source: US2001021734A The color stability of thermoplastic polymers comprising structural units derived from at least one 1,3−dihydroxybenzene and at least one organodicarboxylic acid is enhanced by combination with at least one photobleachable 4−aminocinnamic compound such as 4−dimethylaminocinnamaldehyde. The latter absorbs radiation in the range between about 360 nanometers and about 390 nanometers, balancing the radiation absorbed by hydroxybenzophenone moieties formed in the polymer.

Abstract:
Source: US4691593A A limited slip differential system in the drive train of a motor vehicle with continuous all−wheel drive is provided with a direct through drive acted on by an intermediate planetary transmission and an engageable braking device. The transmission ratio between the planetary transmission and the braking device is substantially higher than the transmission ratio for the direct through drive. This keeps the required braking moment small and allows the use of a relatively small braking device.

Abstract:
Source: FR2657597A Device which can be fitted to the driving wheels of a motor vehicle which has got stuck in the sand or in the mud. The invention relates to a device making it possible, regardless of the nature of the ground, to tow one's vehicle out of its poor position by fitting to the front or rear driving wheels two grapnel winches the tensioners of which are fixed inside vent orifices (4) of the wheel rim (14). It consists of: – an outer sleeve (1) in the form of a funnel conical at its base (28), carrying the automatic roller compartment (7) with a strap (3), and taking up position on the wheel rim (14) by application of its ring (18), – an inner sleeve (2) with a spring (11) with manual immobilisation (5) so that the ring (19) exerts its pressure on the wheel nuts (17), – several tensioners of the same type, from four to five, each of them forming an assembly (3–10–12–13–15–20–24–25), returning the sleeve (1) via firm pressure on to any part whatsoever of the wheel rim (14) about its axis (23). The device according to the invention is particularly intended to be fitted to the driving wheels of a motor vehicle.

Abstract:
Source: US5507994A A process for the production of a plate with a polymer frame shaped onto the edge of the plate. The frame is extruded onto the plate while the latter is held stationary in a working station of a handling automaton or robot with a support device which corresponds to the shape of the plate in such a way that the edge of the plate projects freely over the support face of the support device. With the aid of the robot, an extrusion die having a through, mouth–like slot with two jaws engages the top and bottom surfaces of the circumferential edge of the plate as the mouth–like slot engages the plate edge. At the front end of the two jaws of the die mouth, there are sealing ledges movable at right angles to the plate surfaces, which are supported on the latter during the extrusion process.

Abstract:
Source: JP4066307A PURPOSE: To prevent both tire slip and road damage by moving metal bars outward and inward through movable plates in response to rotation of a cam provided on a wheel, so that spikes can project from and retreat in a tire tread. CONSTITUTION: When a vehicle is to run on a snow–covered or frozen road, a cam 3 provided on a wheel 18 is rotated by a predetermined angle so as to push outward several movable plates 2 and to push out spikes on the tips of metal bars 1 housed inside a tire 17, thus allowing the tire 17 to exhibit its drive and control performance which is similar to that of a conventional spike tire. When a vehicle is to run under road conditions which do not require spikes, the cam is rotated by a predetermined angle while a pin 11 is pulled. Since each movable plate 2 and metal bar 1 are equipped with each compressed coil spring 9, which applies pressure toward the central port of a wheel 18 at the time the movable plate 2 and the metal bar 1 automatically move toward the central part of the wheel 18 when they are released from the force of the cam 3, withdrawing the spikes from the surface of the tire.

Abstract:
Source: US5350035A This invention relates to a vehicle comprising an antihydroplaning system, particularly for improving the wheel adhesion despite the presence of a sheet of water on the road. Output signals from sensors for detecting body and chassis vibrations, ambient temperature and other parameters are analyzed to determine when hydroplaning is occurring or about to occur, and to activate antihydroplaning measures.

Abstract:
Source: US5692267A A fiber processing apparatus includes a plurality of serially−arranged fiber processing components for forming and advancing a fiber web and for gathering the web into a sliver. Some of the components are spaced by a clearance from one another such that the fiber web, while passing from one of the components to an adjoining, spaced component has a length portion unsupported by either of the adjoining components. There are further provided an imaging apparatus which has an illuminating device directing a light beam onto a surface area of the unsupported length portion of the running web; and a camera for sensing the light of the surface area lit by the illuminating device. An electronic image processing unit is connected to the camera for examining signals received therefrom.

Abstract:
The object of this invention is to provide a large scale but low cost windmill by maximizing wind–contact out of the least cost of materials with least cost of maintenance. This is attained by making the sails (100) as large as possible using light materials such as framed fabrics or aluminum sheets, by arranging the large sails (100) to form a long line of parading sails in one direction transverse to the wind and another long line of the same kind parallel to the first line but moving to the opposite direction with which the first line makes a closed loop, by using a strong light weight cable chain (101) that is tugged by the large sails and which also turns the terminal gears (102) located at the two ends of the loop, by using light weight vehicles to carry the large sails.

Abstract:
Source: DE3411088A1 The invention relates to a vehicle wheel which is specially developed for winter use and which permits special brackets to be plugged into the wheel in the event of ice and snow and thus to offer protection against slipping. The brackets engage around the tyre as far as the tread and consist of plastic, metal or a combination of the two. The handling of the brackets is characterised by the greatest possible degree of simplicity and can be performed in seconds. The bracket is plugged in and locks automatically. It is unlocked by pressing a lever. Bolts or tools are not necessary.

Abstract:
Source: BRPI0700324A MAQUINA CONFORMADORA GRAMPEADORA SEQUENCIAL DE RECIPIENTES LAMINADOS DE MADEIRA PARA MUDAS DE VIVIEIROS. Refere–se a uma maquina para a execucao automatica do processo de fabricacao de recipientes laminados de madeira para mudas de viveiros florestais e agricolas. Atualmente esta conformacao e manual, o operador pega o laminado de madeira e com as maos da ao laminado a forma de tubo e o grampeia. Uma tarefa dificil, dado ao enorme volume de producaoe pode causar problemas como: de saude, repetibilidade e outros, atrapalhando os processos produtivos do cultivo. O ciclo de funcionamento da maquina e definido em duas etapas paralelas que atuam de forma simultanea e sincronizada: etapa de alimentacao e etapa de conformacao. o motor (01) aciona o eixos (04) e (20), e aciona o excentrico (07) que avanca o carro aumentador (09) que empurra o ultimo laminado de madeira da pilha do carregador (11) deslocando o laminado pelo trilho guia (13) ate a base de retencao (14), os eixos (04) e (20) acionam tambem os carros (16) (23), (24) e (28) de forma sequencial, moldando o laminado de madeira contra o macho central (18) dando a forma de tubo cilindrico ao mesmo, grampeando–o e sequeencialmente o braco extrator (32) avanca a camisa extratora (35) que se desloca fazendo a extracao do recipiente laminado de madeira pronto para o uso.

Machine translation: STAPLER SEQUENTIAL MACHINES IN COMPLIANCE PACKAGE LAMINATED WOOD FOR SEEDLINGS VIVIEIROS. Refers to a machine for automatic execution of the process of manufacture of wooden containers rolled seedling nurseries and agriculture. Currently this conformation and manual, the operator picks up the wood laminate and the hands of the rolled tube form and staples. A difficult task, given the enormous volume of producaoe can cause problems such as healthcare, repeatability and others, disrupting the processes of cultivation. The duty cycle of the machine and set in two parallel steps that act simultaneously and synchronized: step step power supply and conformation. the motor (01) drives the shaft (04) and (20), and drives the eccentric (07) which brought the car increases (09) which pushes the last wood laminate battery charger (11) the laminate moving by rail guide (13) to the base retention (14), axes (04) and (20) also trigger the cars (16) (23) (24) and (28) sequentially, shaping the laminated wood against the male central (18) giving the form of cylindrical tube to it, tapping it and sequeencialmente the extractor arm (32) advances the shirt extraction (35) that moves making the extraction of container laminate wood ready for use.

Abstract:
The transport trailer has a loading area, a rubber spring axle and a guide (20), where the loading area is movable with the guide from a driving position to a storage position with respect to the rubber spring axle. The rubber spring axle has similar orientation in both the driving position or the storage position with respect to the loading area. The loading area is movable by the guide in a manual manner or by using tools.

Abstract:
Source: DE20200997U1 (Claim 1) 1. Vorrichtung zur Fahr– und Anfahrhilfe bei Schnee– und Eisglaette an Kraftfahrzeugen, vorzugsweise an LkW, dadurch gekennzeichnet, dass das Kraftfahrzeug mit wenigstens einem Behaelter (1) fuer Streugut, insbesondere Sand, ausgeruestet ist und mit zugehoerigen, vom Fahrzeuginneren steuerbaren Foerdermitteln (2, 3) zur Befoerderung des Streugutes auf die Fahrbahn in Streubereiche, die unmittelbar vor und hinter den Antriebsraedern liegen.

Machine translation: (Claim 1) 1. Device to the driving and starting assistance with snow and ice smoothness characterized in motor vehicles, preferably in truck, by the fact that the motor vehicle is equipped with at least one container (1) for grit, in particular sand, and with associated conveyances controllable of the vehicle inside (2, 3) for the transport of the grit on the roadway into scattering ranges, which lie directly before and behind the drive wheels.

Abstract:
Source: BRPI0901148A 1 Resumo A "Trava de Engate Rapido" e um invento para ser colocado rapidamente no setor da industrializacao, devido a sua utilidade, necessidade atual de diminuicao de custos, por sua rapidez na fabricacao, utilizacao e 5 manutencao de equipamentos de varios setores da Industria e Comercio. – A "Trava de Engate Rapido" e de facil manuseio, para travar e so encaixa–la nos pinos frisados de engate rapido (8) nos orificios de entrada (9) na estrutura (5) e empurrar a "Trava de Engate Rapido" ela se travara automaticamente e para soltar e so apertar e ficar apertando o botao de liberacao (1) da estrutura (5) que a 10 "Trava de Engate Rapido" se destravara automaticamente soltando o que o sistema foi instalado e depois puxar a "Trava de Engate Rapido" liberando–a do pino frisado de engate rapido (8), depois sim, soltar o botao de liberacao, abrangendo assim uma infinidade de itens para sua utilizacao. 15 1 Summary The "Lock Quick Hitch" and an invention to be placed quickly in the industrialization sector, due to its usefulness, the current need for lessening costs for its speed in manufacture, use and 5 maintenance of various sectors of industry equipment and Trade. – The "Lock hitch Rapido" and easy handling, to lock and so fit it in beaded pin quick coupler (8) in the inlet holes (9) in the structure (5) and push the "Hitch Lock Rapido" it automatically had fought and drop and so tighten and be pressing the release button (1) of the structure (5) to 10 "Lock Quick Hitch" to unlock automatically releasing what the system was installed and then pull the "Lock Quick hitch "releasing the beaded pin quick coupler (8), then yes, release the button release, thus covering a multitude of items for their utilization. 15

Abstract:
Source: BRPI0903232A EQUIPAMENTO E METODO PARA COMPOSTAGEM. Que consiste num equipamento para compostagem que faz a mudanca automatizada de uma leira para a outra, compreendidos por uma estrutura basica similar a uma ponte rolante, que contem um sistema de entrega de dejetos e um sistema de agitacao do substrato; sendo que estrutura basica similar a uma ponte rolante e constituida por duas barras tubulares(1) dispostas paralelamente uma em relacao a outra, onde e posicionado um carro(2) de agitacao, com pas agitadoras(21), parte do sistema de agitacao, e outra barra tubular(8) disposta paralela as barras tubulares(1); e cada uma das extremidades das barras tubulares(1 e 8) estarem fixadas numa base(1O) que possui rodas(1O1) e sao posicionadas sobre trilhos(1 10) dispostos sobre as paredes longitudinais externas(1 1) das leiras(1 15 e 117); compreendendo ainda um meio para armazenar os dejetos antes de serem despejados sobre as leiras(115 e 117) e realizar deslocamento longitudinal e transversal ao longo das leiras(1 15 e 117) por meio de cabos de aco.

Machine translation: EQUIPMENT AND METHOD FOR COMPOSTING. What is a composting equipment for making the change to an automated windrow to the other, understood by a basic structure similar to a crane, which contains a slurry delivery system and a system of agitation of the substrate, which is basically similar structure a crane and consisting of two tubular bars (1) parallel to one another in relation to, and positioned where a car (2) of agitation, with paddles (21), part of the system of agitation, and other tubular bar (8) disposed parallel tubular bars (1), and each end of the tubular bars (1 and 8) are fixed basis (1O) having wheels (1O1) and are positioned on rails (1 10) arranged on the walls longitudinal external (1 1) the windrows (January 15 and 117), further comprising a means for storing the wastes before being dumped on the ridges (115 and 117) and perform longitudinal and transverse ridges along the (1 15 and 117) by means of steel cables.

Abstract:
Source: US3951194A Anti−skid means for front or rear vehicle tires comprising shoes of pliant material around the tire held in place by lengthwise chains terminating in hooks lying against the outer and inner side walls, which shoes are one−piece with a ribbed and textured central portion for the tread and sides and means for removably holding the shoes and associated shackles in place during rotation of the wheel of the vehicle. The parts are specially designed to give good traction and comfortable riding qualities on icy and snowy surfaces with reduced wear.

Abstract:
Source: DE2620525A1 PATENTANS PRUE CHE 1 Gleitschutzvorrichtung offener Bauart zum Anbringen an einem Reifen eines Motorfahrzeuges, ohne es zu heben oder schieben, mit zwei zueinander parallel verlaufenden Seitentraegern (1, 2), an welchen ein Laufnetz (3) aus Greifelementen aufgehaengt ist, wobei der eine Traeger (2), der beim Verlegen des Gleitschutzes ueber dem Reifen (9) zum Anliegen an der Aussenseite des Rei fens kommt, auf einem seiner Enden eine Oese (7) und auf dem anderen Ende einen in die Oese einhaengbaren Verschlusshaken ring (8) traegt, dadurch gekennzeichnet, dass die beiden Enden des anderen Traegers (1), der beim Verlegen der Vorrichtung ueber dem Reifen (9) zum Anliegen an der Innenseite des Reifens kommt, mit je einer Spannschlaufe (4, 4a) versehen sind, in welcher ein Verlaengerungsstueck (5, 5a) mit einem Endhaken (6, 6a) ein gesetzt ist, welche Verlaengerungsstuecke (5, 5a) mit den Endha ken (6, 6a), nachdem die Vorrichtung von oben ueber dem Reifen (9t gelegt ist, gegenseitig durch die Spannschlaufen (4, 4a) des jeweils anderen Traegerendes an der Innenseite des Reifens (9) durchfuehrbar und zusammenziehbar sind, um an der Aussenseite des Reifens (9) durch die Oese (7), in welcher der Verschluss hakenring (8) eingehaengt ist, durchgefuehrt und mit ihren End haken (6, 6a) an dem einen Traeger (2) verschlauft und abnehm bar befestigt zu werden 2. The snowchain is fitted with fastening strands (2) on both sides, with the side away from the car on the outside of the wheel having simple hoops (7) and clips (8) to secure the chain. The inside edge has extended fitting lengths (5, 5a) with hooks (6, 6a) at the ends. The chain is draped over the wheel and the inside lengths threaded through open loops (4, 4a) near the ends of the chain pattern, and tightened, and with the hooked ends taken to the outside of the wheel. The chain can be fitted rapidly without having to reach behind the wheel. The long lengths are thrown past the rear of the tyre and threaded through the hoops at the tyre edges. With all the hooked ends on the outside of the wheel, fitting is a simple operation.

Abstract:
Source: DE2556263A1 Patentanspr ue c 12 e: 9 Gleitschutzeinrichtung fuer Fahrzeuge, insbesondere tuer die Raeder von Strassen– oder Schienenfahrzeugen, dadurch gekenn zeichnet, dass am Fahrzeug (1) ein oder mehrere Aufnahmebe haelter (11, 12) fuer die Aufnahme von Streugut angeordnet sind und dass zumindest jedem Fahrzeugrad (15) einer Fahrzeug achse eine das Streugut zwischen die Radlaufflaeche (65) und die Fahrbahn (F) einstreuende, steuerbare Vorrichtung (45, 461 48) zugeordnet ist 2. Grit reservoirs are mounted in front of each wheel and have a double skinned construction. The space between the walls is heated by coupling it to the cooling water circuit or by passing some of the exhaust gases through it. The grit can also be heated by heating coils in the grit to prevent it clogging. The release of the grit is automatic, linked to the operation of the brake pedal, with a main control switch to prevent release in normal driving conditions. The system provides good wheel grip on roads where spiked tyres are banned, without having to fit snow chains.

Abstract:
Source: US2010125383A A method of programming and setting parameters for a computer unit that regulates the interface between the operator of a marine vessel and the vessel's electric generation and propulsion systems. The invention describes the regulation of energy producing devices, energy storage devices and drive motors and propellers in both propulsion and regeneration modes. This invention simplifies and automates most of the operation of marine electric, hybrid electric, or diesel electric propulsion because the only controls requiring operator intervention are three generator modes: OFF, AUTO and ON, an alarm, an override switch and one or more throttle(s). This helm control can be duplicated in different areas of the vessel. All automatic modes required to regulate forward movement, reverse, emergency power, zero drag, propeller freeze and regeneration are all controlled by a logic using a combination of generator mode, the position of the throttles, the speed and the stored parameters of the vessel.

Abstract:
The invention relates to a driven liquid–cleaning device for the railtrack grooves of tram rails, comprising a cleaning unit (1). A pressure–generating device (2) is located upstream and a separating unit (3) for the dirt mixture from the groove is situated downstream of said cleaning unit. A driven dirt–storage unit (4) and a dirt–discharge unit (5) for the dirt from the groove which has been separated, are arranged downstream of the separating unit. The cleaning unit (1) consists of a high–pressure jet device (9), a guide chute (11) and a bag conveyer (12) and is guided by two front and two rear flange wheels (14, 15) along a rail (17) which runs parallel to the railtrack (7). The height of the cleaning unit can be adjusted. The pressure–generating device (2), mounted upstream of the separating unit (3), a fine–filtration or decantation device (21) and a cleaning–fluid storage unit

(22) are mounted on the carriage chassis (18).

DE10151005,

Abstract:
Source: US5806899A A flexible connection tube for an automotive exhaust system comprises a flexible metal bellows adapted to be connected between a run of exhaust piping for absorbing expansion or contraction of the exhaust piping, and an outer knitted metal−wire braid covering the outer periphery of the bellows for protecting the bellows from damage and for preventing the bellows from stretching to its full length. The outer knitted metal−wire braid is formed into a substantially cylindrical shape by knitting plural metal−wire bundles (each bundle being produced by a plurality of parallelly bonded metal wires) alternately with each other in spiral directions with respect to the axial direction of the bellows. Apertures are defined by many groups of four adjacent metal−wire bundles knitted alternately with each other. A total opening area of all of the apertures is set within a range of 20 percent to 50 percent with respect to an over−all area of a curved surface of the outer knitted metal wire braid, for providing a substantially cylindrical low−density knitted outer metal wire braid.

Abstract:
Source: GB471069A [Class 31 (ii)] [Also in Group XVI] In a machine for punching and printing on record–cards, of the kind that comprises typebars and associated code–punches and is operable alternatively by a keyboard or under control of a master–card fed past a holedetecting device, means is provided for rendering the hole–detecting device operative during only a predetermined part of the feed of the master–card so that part only of the matter is reproduced on the record–card, the remaining parts being reproduced by means of the keyboard, or skipped. In the mechanism shown in Fig. 2, each type–lever 234 engages a sublever 250 abutting on a bell–crank 259 in connection with a slide 257 which is provided with a pivoted, spring–urged hook 272 for engaging a toothed driving–shaft 74. A lug 272a on the hook normally abuts on the arm 271 of a keylever 230 and prevents the hook from engaging the driving–shaft. An arm 271a for preventing repeat operation of the type–lever if the keylever is held down or sticks is pivoted on the arm 271 and is held in contact therewith by a spring 274. The arm 271a is slightly longer than the arm 271, and both arms are cut away to provide a recess which is slightly narrower than the lug 272a. On depression of the keylever, the arm 271 releases the lug, the hook 272 rises into the path of a tooth on the drivingshaft, the slide 257 is drawn forwards, and the arm 271a is rocked. During movement of the slide, the type–lever is operated, and when it has travelled about 45, a lug 272b on the hook engages a tooth of the driving–shaft, the hook is released, and the stroke of the type–lever is completed by momentum. On release of the key–lever, the type–lever and slide are returned by springs 253, 266, the arm 271a re–engages the arm 271, the lug 272a rides under the arm 271a, and is thereby prevented from re–engaging the driving–shaft, and then rises slightly and re–engages the arm 271. To ensure full engagement of the hook 272 with the teeth of the driving–shaft, the hook is provided on the inner face with a spring–urged, pivoted dog. If the hook, when released from the arm 271, moves towards the tip of a tooth, the dog is caught by the cooth, and prevents the hook from engaging that tooth. Under these conditions, the hook enters into full engagement with the succeeding tooth and the dog yields. For automatic operation, each key–lever 230 is connected by linkage 505, 503 to the armature 504 of a magnet KSS. Punches 280, for code–perforating the card simultaneously with the typing of letters or numerals, are connected by bellcranks 288, links 290, and bell–cranks 291 to slides 292, each having a lug 292a co–operating with one of a set of bails 295 engaged by lugs 257c on the slides 257. On operation of any type–lever, one or two punches are operated to make the corresponding code–perforations for a numeral or letter respectively. For positively withdrawing the punches, a universal bail 213 in the path of the bell–cranks 291 is connected by a slide to a bell–crank 259b which co–operates with a star–wheel 74a on the driving–shaft. The card is supported by rails 120, 121 and is fed step–by–step by means similar to those described in Specification 375,884 and comprising a card–carriage associated with escapement mechanism, and

mechanism for ejecting a finished card and initiating return of the cardcarriage. Column−stops 302, Fig. 5, mounted on a rack 300 on the card−carriage co−operate with a pivoted stop−finger 303 which rests on a link 313 connected to the armature 310 of a magnet TS. The link is connected to a pivoted frame 315 provided with a revoluble brake 319 in connection with a pinion 321 for raising a rack 194 to release the card−carriage. The tabulating−key closes contacts TKC1, TKC2, Fig. 11b, for energizing the magnet TS. A magnet TKS is provided for automatically operating the tabulating−key. When the magnet TS is energized, a spring 318 raises the stop−finger, and the card−carriage is released and runs until arrested by engagement of a column−stop and the stop−finger. On engagement, the stop−finger moves a short distance laterally and closes contacts SC, TEC in circuit with the magnet TS and the escapement magnet EM respectively. For automatic control, there are employed, in addition to the ordinary column−stops, referred to as No. 6, five kinds of column−stops, referred to as No. 1... No. 5, each having a contactoperating lug 302b which is arranged in a different position from the other lugs, and co−operates with a lever 387, Fig. 8, abutting on a contact−operating pin 386. Column−stops No. 1... No. 4 close contacts ATC, PEC, SCC, DSC1 respectively, and column−stop No. 5 opens contacts DSC2. As described below, the contacts ATC, PEC initiate tabulating, and an eject−cycle respectively, the contacts SCC cause the escapement−magnet EM to operate once for the purpose of skipping a column, and contacts DSC1, DSC2 cause automatic operation to stop and start at a predetermined column respectively. An ejectkey 233 closes contacts EKC for energizing the magnet TS, and rocks a lever 377 for obstructing the stop−finger 303 to prevent engagement thereof with the column−stops during the run of the card−carriage. A magnet EKS is provided for automatically operating the eject−key. When the card−carriage has run to the final position it closes and opens contacts LCC1, LCC2, a magnet ECS is energized, a clutch is thrown in, the motor coupled to the ejecting mechanism, the finished card is discharged, the card−carriage is returned, and a new card is fed thereto in the manner described in the above−mentioned Specification. A master−card for automatically controlling the machine is placed on a table 420, Fig. 9, at the top of the machine, and is fed in unison with the cardcarriage by means of blocks 463 secured to arms 460,461 on the card−carriage. A contactroller CR is mounted in a housing 429 which is pivoted at 425 and is provided with an arm 431 for engaging a latch 432. Brushes BO... B12 in circuit with the key−lever magnets KSS are mounted in a support 438 which is rocked, to move the brushes into and out of contact with the master−card, by means of a magnet BM. The support 438 also carries another brush for connecting the contact−roller to the automaticcontrol circuits. Each brush BO... B12 is in circuit with one of a set of relays, of which only the relays R11, R12 are shown in Fig. 11b. The relays R1... R9 are each arranged to close contacts in circuit with more than one of the magnets KSS, and the relays RO, R12 close contacts in circuit with one magnet KSS, and open contacts C in circuit with other magnets. The relays close also contacts A for establishing holding−circuits through the brushes. When a single hole, for instance the 1 hole, is read, the relay R1 is energized and the circuit of the associated magnet KSS is established, the other magnets in circuit therewith remaining unenergized. When two holes, for instance the holes 9, 11 designating the letter R, are read, the relays R9, R11 are energized and circuits are established through the two associated magnets KSS. Before a master−card is inserted, a switch ESS is opened and the eject−key 233 is depressed, thereby establishing through contacts CS4, EKC and relays R16, R17, R18 a circuit through a wire W2. The relay R18 opens contacts A and thereby disconnects a wire W4 in the automatic−control circuits. The relay R17 closes and opens contacts A, C to connect the magnet TS to the wire W1, and the relay R16 closes contacts B to complete the circuit of the magnet, the card−carriage thereafter moving to final position, and the contacts LCC1 being automatically closed. The master−card is now inserted and, assuming that automatic duplication of columns 40 to 65 is required, No. 5 and No. 4 column−stops are placed opposite columns 40 and 66 respectively. A No. 4 column−stop is placed also opposite column 1. The arm 431 is then depressed, closing contacts CLC, DC, and the switch ESS is closed to initiate the eject−cycle, during which the card−carriage is returned to initial position. The first No. 4 column−stop closes the contacts DSC1, and a relay opens contacts to disconnect the relays RO... R12, solenoid KSS, and brushes from the wire W4. The machine is now operated manually until column 40 is reached, when the No. 5 columnstop opens the contacts DSC2 to initiate automatic−control. When the card−carriage reaches column 66, the second No. 4 columnstop disconnects the automatic control−circuits, and manual operation can be restuned. For automatically causing the card−carriage to jump when a column without holes occurs in the master−card, there are employed a slowacting relay R20 in circuit with contacts which are closed by the escapement mechanism, and a quick−acting relay R21 in series with the relays RO... R12. If a column without holes is presented, the relay R20 only is energized, its contacts are closed, and the magnet EM is energized to operate the escapement. If holes are presented, the relay R21 opens the contacts before the contacts of the relay R20 can close, and the magnet EM is prevented from operating. If full automatic−control is required, a switch AES is raised, and a switch SS is closed to place the magnet EM in series with the contacts TSC which are closed during tabulating. If for instance, it is required to skip columns 1 to 10 and 66 to 72, to duplicate columns 11 to 30, 32 to 65, and 73 to 76, to skip column 31 containing a hole, and to initiate an eject−cycle at column 77, No. 1, No. 6, No. 3 and No. 2 column stops are placed opposite columns 1 and 66, columns 10 and 72, column 31, and column 77 respectively. At the end of the eject−cycle No. 1 column−stop closes contacts ATC, the magnets TS, TKS are energized, and the card

Abstract:
Source: US4244412A The invention relates to an anti−skid device for vehicle wheels, formed by a plurality of U−shaped elements adapted to radially fit on the wheel tire and rim, said elements being connected with one another by spacers allowing the device to be put flat on the ground and to be automatically mounted on the wheel by simply advancing said wheel on the device.

Abstract:
Source: KR20050095802A The present invention car remote–mount snow chains attached to the wheel, and the right size apparently cover, there is no difference in normal alloy wheel and lightweight and the structure is simple, by giving a minimal load wheel horsepower performance and appearance of the vehicle, one button without affecting during traveling or stops, and general remote mounting / release without even otherwise adapted for the vehicle may also be equipped with an existing there are those features. "After the vehicle when he met at 40~42 proof / attached to the product in the unhaengjung driver seat of the vehicle relative to one–button if at 1 second car accident is mounted on/off suddenly appeared at most unhaengjung //car, the fact that the winter off a large effect on the prevention of accidents. What is expected. However, if the structure for mounting the excessive weight of the weight of the wheel so that the first vehicle maneuverability excessively to cause a serious adverse effect on, there is no practical use, secondly, because there are many parts that are projected to the outside wheel and damage, there is a serious problem that collision, third, is not good in appearance, there is a disadvantage that is mounted. In addition, most of the conventional automatic–mount design is a driver of a flat tire replacement, there is a problem that it is impossible to. The following features to solve the invention devised to meet. 1. Driver's, one button for 1 to 2 seconds will be long / desorption. 2. Production of the present invention to any differences in conventional vehicles or it can be attached without modification. 3. The minimum weight of, but attached to the wheel itself horsepower that minimal impact on the wheel. 4. Usually there will be no difference in general wheel and the appearance. 5. During regular equipped for sufficient power as snow chains would be wound on the tire. 6. Minimizes the protruding part will suppress the damage risk and impact. 7. Even when the flat tire and tire replacement can be represented. 8. Structure of flock to simply to be produced. To this end the present invention provides a vehicle seat portion to install a small remote control or remote control attached to the lower portion in the engine room of the vehicle, it actuates the small hydraulic pump. The hydraulic pressure is mounted on the inner surface of the pipe to a vehicle wheel, the cylindrical part cylindrical part opposite to the back portion of the piston acts on the gear. And then rotated by a gear cover is open when rotating the central axes of the other two plates using a distance difference occurring in the tire is equipped with a special spike. Is in the reverse order. This product is mounted on the wheel wheel so to have a structure, automatic snow chains, but can also be seen as a special wheel mounting type is preferable to satisfy the above functions because the title of the invention of the car object remote was snow chains in the long / removal and lightweight. Bythe brake drum/caliper, wheel base, flat center, greater the rim flange, beads, hydraulic pump

Abstract:
Source: GB546590A [Class 106 (i)] [Also in Group VIII] A machine of the kind comprising means for sensing perforation patterns in master and detail cards, means for making a set–up of the master and pattern, separate pockets for receiving master and detail cards separate means for conveying master and detail cards to their receiving pockets, deflecting means for each conveying means arranged when operated to prevent the passing of cards to their respective pockets includes the combination with means for making a direct comparison between a perforation pattern sensed from a detail card and the contemporaneous setup made from a master card of means under the control of the comparing means to operate both said deflecting means when the result of the comparison is disagreement. The card feeding and comparing mechanism may be similar to that described in Specification 510,910, [Group VIII], and the driving and c. mechanism similar to that described in U.S.A. Specification 2,044,119. Master cards are fed singly from a box 290, Fig. 25, by a picker 292 into a sensing space between perforated plates 330, 331 against a stop 335 and whilst therein their perforations are sensed by a reciprocating pin box 360, of which certain pins located opposite to perforations in the card are locked in downwardly displaced position by slides 362 so that corresponding pins 395 in the reading retaining pin–box are also downwardly displaced and locked by slides 397, the displaced pins 395 in turn displacing pins 435 in the master card comparing pin assembly 425. Detail cards are fed singly from a box 170, Fig. 26, by a picker 172 into a sensing space between plates 220, 221 against a stop 265 and sensed by a reciprocating pin assembly 226, of which the displaced pins displace other pins 250, translator pins 260 and finally pins 455 in the detail card comparing pin assembly 445. The displaced comparing pins 435 and 455 interact through comparing levers 460 having forked ends engaging projections 464, 466 of smaller diameter than the forks so that a displacement of a pin 435 will transmit through a lever 460 only a partial displacement of a pin 455, and. vice versa; other projections 472, 474 coact with cam points 471, 473 in slots on comparison slides 470 and unless the perforation columns in the compared cards correspond one or more of the projections 472, 474 will remain located on a cam point or points 471, 473 causing comparison slide 470 to be held displaced to the front of the machine with the result that the wide part of an interponent bar 476 in its raised effective position will prevent the free rearward swing of a bail bar 640. The cams controlling the feeding, punching, sorting and stopping of the machine are mounted on a sleeve 600, Fig. 60, to which are keyed two ratchets 605, 615 each with four teeth and four dwells arranged staggered and adapted to be engaged by pawls 608, 618 mounted on levers 610, 620 so disposed that normally pawl 608 engages a dwell on ratchet 605 and pawl 618 is held out of engagement with ratchet 615 by a pin 623 on pawl 608. When as the result of a disagreement between compared master and detail cards bail 640 is unable to complete its rearward swing as shown in Fig. 60 the bell crank lever 639 prevents downward movement of lever 610 on the next downward movement of push rod 625 and lever 620 moves down alone causing pawl 618 to become free of pin 623 and later to engage a tooth on ratchet 615 and then on the next rise of push rod 625 to rotate the control cam sleeve 600 through one step. Master card picker operating link 294 is operated as shown in Fig. 32 by a bell crank 299 and slide 301 moved forwardly by a cam 190 and rearwardly by a spring 303 detail card picker operating link 174 is operated by an arm 177 and slide 179 moved forwardly by cam 190 and rearwardly by spring 303; slide 301 can be held out of action by engaging a pin 304 thereon with a latch 305 on a

rock shaft 195 and slide 179 by engaging a pin thereon with a second latch 194 on rock shaft 195. For this purpose shaft 195 is rocked by a crank and vertical link 647 adapted to be operated through levers and links by one or more of the cams on the control cam sleeve 600, link 647 in its high position locking feed slide 179 allowing master card feeding only and in its low position locking feed slide 301 allowing detail card feeding only and in its intermediate position locking neither feed slide and allowing simultaneous feeding of both master and record card. The various control cams on sleeve 600 are referred to later. Punching mechanism.–In many types of operation the entire perforation pattern in the master card is punched in the detail card by mechanism including a removable punch translator 485, Fig. 50, the pins 490 of which transfer the displacements of the master card comparing pins 435 to a reciprocal set pin box 495 with which reciprocates a plate 516 carrying punch pins 517 so that the detail card which has been passed to a punch space between two plates 520, 523 is perforated to agree with the master card. If certain columns of data are not to be transferred the requisite keys 385, Fig. 25, are set in their locking positions. Perforation may take place in the event of agreement of designation data in corresponding columns of master and c. record cards for which the requisite interponent 476 has been set in elevated position and prevented when there is disagreement. The punch translator 485 is placed in position only when detail cards are to be punched. Feed control mechanism.–Five feed control cams are mounted on the control sleeve 600 which as set out above is rotated through 45 degrees when a disagreement is sensed by the comparison mechanism each of which cams may be rendered operative by lever mechanism operated by projecting lugs on an equal number of discs on a parallel sleeve 702, Fig. 32, settable by an operation selector dial at the front of the machine. One of these control cams is in the form of a plain disc 710, Fig. 32, engaged by a roller 711 on a lever 712 carried by another lever 714 and connected by a link 715 to an arm of a shaft 650 having another arm 648 connected to the link 647 controlling the locking of the feed slides. This feed control cam or ring 710 is of such diameter as to effect locking of neither feed slide and permits master and record cards to be fed simultaneously both on agreement and disagreement since although roller 711 is held in contact with cam 710 by the projection 717 on operation selector disc 718 rotation of the concentric cam 710 will have no influence on link 647. Other cams on sleeve 600 may be operative during this type of feeding to effect an agreement or disagreement card sorting, card punching, or stopping of the machine to insert extra cards. In addition to feed cam 710 four other feed control cams mounted on sleeve 600 may be caused to operate the link 647 and are rendered operative by the selector dial. All five feed cams are shawn in Fig. 69. The second cam 720 has four high dwells of a height permitting simultaneous master and detail card feeding on agreement and four lower dwells causing detail card feeding only on disagreement or vice versa since as shown in Fig. 69 this cam has a second key way for setting it displaced through 45 degrees on sleeve 600. Also on a low part of cam 720 becoming operative a rearward arm 655, Fig. 70, releases a shoulder 417 on a catch 416 from the arm 418 allowing the latter to be lifted by push rod 422 without raising arm 415 and rotating shaft 412 whereby operation of the retract bar 405, Fig. 25, by the link 410 is prevented and the set–up of the last fed master card reading retaining pins 395 is retained until an agreeing detail card is sensed whereupon sleeve 600 is rotated to bring a high dwell of cam 720 into operation. The third feed control cam 730 is a concentric ring of smaller radius causing detail card feeding only both on agreement and disagreement, the set–up by the master card reading retaining pins being maintained. The fourth feed control cam 740 has four low dwells of the radius of disc 710 causing simultaneous master and detail card feeding on agreement and four high dwells which on disagreement lift link 647 to its highest position causing master card feeding only. Since the last sensed detail card has to be retained in the sensing space until a corresponding master card is again sensed the card stop 265, Fig. 42, is held in its lower closed position all the time a high dwell on cam 740 is effective by a hook 660 on an arm 649 on shaft 650 engaging lever arm 281. The fifth feed control cam 750 has low dwells of same radius as the highs of cam 740 causing detail radius a cam disc 730 and high dwells of same card feeding only on agreement and master card feeding only on disagreement, the low dwells also causing retention of the set–up of the master card reading retaining pins and the high dwells also causing detail card stop 265 to be held closed. Cams 740 and 750 have second key ways at 45 degrees for adjustment in sleeve 600 to effect above operations on agreement and disagreement or vice versa. Sorting control mechanism.–Referring to Fig. 25 the master cards may be sorted into a rear box 25 or into an eject box 26 by operating a deflector 680 and the detail cards into a rear box 27, 27a, or into an eject box 28 by operating a deflector 690. These deflectors may be operated to eject master cards and detail cards for which there are no detail cards or master cards with corresponding designation punchings and are controlled by a cam 780, Fig. 71, with four low dwells and four high dwells such that when sleeve 600 is rotated bringing a high dwell into contact with roller 781 on bell crank 782 deflector 680 is raised by link 683 and deflects a d

Abstract:
The vehicle has a battery for electric drive, a vertically adjustable springy rider seat (13), suspension elements, front wheel (10), rear wheel (3), and right and left base plates (1). The base plates include main wheels which include axles (2–3) and wheel hubs (2–4) and/or disc brakes. A steering wheel is provided for steering the wheels at different rotational speeds while moving the front wheel in predetermined direction. The load carrier/load container and rider seat are maintained in equal height. The velocity delimiters are provided for each wheel.

Source: FR1379425A [Source: Claim 1] **ATTENTION** debut du champ CLMS peut contenir fin de DESC **. 172 soi1t solidaires aux moyens de supports 229 aux deux poutres 201 du pont roulant 200. Le second transporteur 172 comporte le tambour moteur 222, entraine par un dispositif moteur tel que moteur electrique, le tambour de renvoi 224 comportant le dispositif de tension 225 compose des vis, des coussinets et des glissieres et d'une pluralite de rouleaux 226, ces rouleaux soutenant aussi bien le brin porteur 227 que le brin retour 228. Le second transporteur 172 deverse les produits repris dans une goulotte 287 qui en etant solidaire aux poutres a treillis 21 par des supports 230 se deplace en meme temps que le pont roulant. La partie inferieure 231 de cette goulotte d'alimentation 229 se trouve au–dessus de la courroie 232 d'un troisieme transporteur 233 identique a tout point de vue au premier transporteur 1 et les produits deverses sur cette courroie 232 sont amenes par le troisieme transporteur 233 a l'atelier d'utilisation des produits. Ces differents appareils presentent de nombreux avantages et notamment L'ensemble des elements, servant a apporter les differents produits, est allege au maximum ce qui permet d'eviter les depenses supplementaires et onereuses pour la realisation de fondations importantes sur lesquelles sont scelles les rails servant de chemin de roulement. En outre l'ensemble des elements de reprise 101 et 117 est plus facilement malleable, d'ou une eco– nomie certaine de la force motrice et cette economie permet une reduction des prix de revient des produits finis. Le palpeur 92 dispose a la tete 58 de la fleche 54 du tripper 45 permet de doser tres exactement l'epaisseur de chaque couche des differents produits stockes meme si l'epaisseur de cette couche est tres minime. Le transporteur a raclettes 101 par le deplacement des couteaux racleurs 102 assure d'une part le glissement vers le has des produits stockes et d'autre part le melange des differents produits. L'utilisation de la couronne a billes 179 placee entre la partie superieure 145 et la partie inferieure 180 du chariot, mobile transversalement, permet de pivoter l'ensemble des elements de reprise compose par le transporteur a raclettes 101 et la roue–pelle 117. Ainsi on peut proceder au deplacement dans les deux sens de l'ensemble et il n'est plus necessaire de ramener celui–ci a son point de depart. On peut faire fonctionner continuellement les elements de reprise, malgre l'inversement du sens de la marche du pont roulant 200. Par le fonctionnement continu des elements de reprise 101 et 117 on augmente considerablement le rendement de l'installation. On evite egalement les frais supplementaires necessaires soit a l'installation d'un second ensemble des elements de reprise, soit d'un transbordeur. La cabine 167, abritant la personne chargee de surveiller le fonctionnement des appareils de reprise 101 et 117 est placee sur le chariot mobile 180 et se deplace en meme temps que l'ensemble forme par le transporteur a raclettes 101 et la roue–pelle 117 et la personne chargee de la surveillance voit tres facilement si les deux elements travaillent a plein rendement. L'articulation centrale 219 du pont roulant 200 absorbe les denivellations du terrain et meme si les trois rails 2071, 2072 et 2073 ne sont pas de niveau, le poids de l'ensemble des elements de reprise 101, 117 est reparti uniformement sur les trois rails 207l, 2072 et 2073 et les galets 210 des boggies 206 sont en contact permanent avec le dessus des rails 2071, 2072 et 2073. Bien entendu l'invention n'est pas limitee aux exemples de reaLisation ci–dessus decrits et representes et a partir desquels on pourra prevoir d'autres modes et d'autres formes de realisation sans pour cela sortir du cadre de l'invention. RESUME L'invention s'etend aux caracteristiques ci–apres et a leurs diverses combinaisons possibles 1D Installation de manutention notamment pour le stockage et la reprise de materiaux, installation caracterisee parce qu'elle comporte, en combinaison des moyens de mise en stock automatique des materiaux en provenance du lieu de dechargement et des moyens de reprise de ces memes

produits, pour acheminer ceux−ci vers un atelier d'utilisation, permettant de placer les aires de stockage dans le prolongement l'une de l'autre, ce qui permet d'une part, de reduire considerablement la surface de stockage, et d'autre part, d'eviter une perte de temps due au daplacement des differents elements composant l'installation de manutention; 20 Les moyens de reprises sont constitues par un ensemble d'elements formant un bloc dont la partie superieure pivote horizontalement par rapport a la partie inferieure, ce qui permet de continuer, en sens oppose du precedent et sans perte de temps, la reprise des produits stockes et de prendre alternativement des produits des differents amoncellements sur les aires de stockage disposees de part et d'autre de cet ensemble; 30 Le transporteur a raclettes comportant des couteaux raleurs fixes par un moyen quelconque sur une chaine attaque de front les differentes couches superposees triangulairement des produits stockes. Les couteaux raleurs provoquent le glissement vers le has des produits et par ce glissement on realise le melange des differents produits; 4 La roue−pelle, ayant sur son pourtour une pluralite de godets, ramasse les produits glisses a la base de l'amoncellement et elle les deverse sur un transporteur a courroie continue; 5 Le transporteur a courroie continue fonctionne a l'interieur de l'ossature metallique servant de support a la roue−pelle, et son brin porteur achemine les produits deverses par la roue−pelle vers une tremie; 60 Des rouleaux amortisseurs, situes sous le brin porteur de la courroie continue du transporteur a l'emplacement ou tombent les produits deverses par la roue−pelle absorbent au maximum l'effet de choc provoque par la chute des produits et reduisent considerablement l'usure de la courroie contínte; 7" Le bras de levier, permettant de lever ou de rabaisser le transporteur a raclettes solidaire de la roue−pelle, assure le contact permanent des couteaux racleurs avec le plan du coin des produits stockes et, en soulevant au maximum les deux appareils, il permet de pivoter l'ensemble et d'attaquer une aire de stockage situee de l'autre cote de l'axe longitudinal du transporteur transversal; s" Le treuil scelle sur le caisson contenant les contrepoids, permet, a l'aide d'un cable, de relever ou de rabaisser le bras de levier; 90 Le transporteur a courroie continue a axe transversal, sur lequel ont ete deverses les produits par la tremie, modifie perpendiculairement le par. cours du transport des produits et les achemine vers le transporteur longeant les aires de stockage; 10 Des boggies solidaires du bati de l'element mobile, assurent le deplacement transversal de l'ensemble des elements de reprise c'est−a−dire le transporteur a raclettes et la roue−pelle; 11" Des rails, reposant sur des poutres a treillis du pont roulant servent de chemin de roulement transversal a l'element mobile transversalement; 12" Le pont roulant se deplace longitudinalement sur trois rails paralleles aux aires de stockage et la combinaison du deplacement transversal avec le deplacement longitudinal permet de balayer toute la surface des aires de stockage; 130 L'articulation centrale du pont roulant absorbe les denivellations existantes entre les trois rails et assure la repartition du poids de l'ensemble sur ces trois rails en permettant aux deux tron cons du pont roulant de former une ligne brisee; i 40 Le transporteur a courroie continue longeant les aires de stockage, amene les produits deverses par le transporteur transversal a l'atelier duti− lisation; 15 Le transporteur a courroie continue para. lele aux aires de stockage apporte depuis le lieu de dechargement les produits destines a etre emmagasines a l'emplacement de stockage prevu; 160 Le chariot elevateur souleve le brin porteur du transporteur a courroie continue et permet d'elever les produits a la hauteur necessaire a leur deversement sur un autre transporteur; 17 Le transporteur a courroie continue perpendiculaire au transporteur precedent et place a l'interieur de l'ossature metallique de la fleche du tripper deverse les produits apportes sur le terrain destine au stockage; 18" Le piston a double effet, alimente par une pompe a huile, releve ou rabaisse la fleche du tripper et permet de doser tres exactement l'epaisseur de la couche des differents produits; 19 Le dispositif palpeur en liaison avec un indicateur de position, est situe a la tete de la fleche du tripper et actionne le relevement automatique de ladite fleche; 200 Le dispositif de controle, des formation de l'epaisseur voulue de la couche d'un certain produit, provoque l'arret de l'alimentation et un signal avertisseur quelconque transmet a un poste de commande central l'arret d'arrivee de ce produit et declenche le branchement de manutention deun autre produit; 21 Le tripper repose sur trois pieds realises en charpente metallique, et se deplace longitudinalement sur un chemin de roulement par l'interme− diaire d'une pluralite de boggies moteurs; 220 Les galets des boggies sont mis en mouvement par une transmission solidaire au reducteur accouple au moteur electrique et ils se deplacent sur les rails formant le chemin de roulement; 230 Les articulations solidarisent le tripper et le chariot elevateur et tout deplacement longitudinal du tripper entraine automatiquement le deplacement du chariot elevateur. [Source: Claim 1] ** WARNING ** start of CLMS field may contain late 172 soi1t solidarity to support means 229 to the two beams 201 crane. 200. the second carrier 172 includes the drum motor 222, driven by a motor device such as electric motor, the return drum 224 with the tensioning device 225 consists of screws, bearings and glissieres and a plurality of rollers 226, these rollers supporting both the carrier strand that strand 227 228. the second carrier 172 products listed pours into a chute 287 which being integral to beams a mesh 21 by supports 230 moves concurrently with the crane. the lower part 231 of the feed chute 229 is located above the belt 232 of a third carrier 233 identical in every respect to the first conveyor 1 and the dumped products on the belt 232 are brought by the third carrier 233 has the product use workshop. These different devices many PRESENT benefits including all of the elements serving to make the different products is maximum allege thereby avoid the additional expenses and onerous for the realization of important foundations on which are sealed track for road rolling. Also all resumption of Elements 101 and 117 is more easily malleable, hence a certain eco− nomy of the driving force and the economy allows a reduction in costs finished products. the probe 92 has a head 58 of the arrow 54 of 45 for the determination tripper very precisely the thickness of each layer of different products stored even if the thickness of this layer is very minimal. the carrier squeegees 101 by the displacement of the scraper blades 102 ensures both the slide into the hAS of stored products and also the mixture of different products. the use of the krona ball 179 placed between the upper part 145 and the lower portion 180 of the carriage transversely movable, allows you to rotate all recovery Elements made by the carrier 101 and squeegees bucket wheel 117. So you can proceed to the displacement in both directions of the whole and it is not necessary to bring it to its starting point. it can be continuously operate the resumption of elements, despite the reversal of the direction of travel of the crane 200. for the continuous operation of recovery elements 101 and 117 is increased considerably the efficiency of the plant. It also avoids the additional costs necessary either to install a second set of recovery Elements or a ferry. The cab 167, housing the person charged to monitor the operation of the devices resume 101 and 117 is placed on the carriage 180 and moves at the same time that the entire form by the carrier 101 scrapers and bucket wheel 117 and the person

charged surveillance seen very easily if both work Elements has full capacity. the central joint 219 crane 200 absorbs ground drop−offs, and even if the three rails 2071, 2072 and 2073 are not level, the weight of all recovery Elements 101, 117 and left evenly over the three rails 207L, 2072 and 2073 and the rollers 210 bogies 206 are in permanent contact with the top of the rails 2071, 2072 and 2073. course the invention is not limited to the embodiments described above and represented and from which we can predict other modes and other forms of realization without departing from the scope of the invention. SUMMARY The invention extends to the characteristics listed after and their various combinations 1D Installation handling including storage and recovery materials, the installation being characterized because it comprises, in combination means for automatically placing in storage of materials from the place of unloading and means of recovery of these same products, to transport them to a user workshop for placing the storage areas in the extension of one another, which allows on one hand to significantly reduce the storage surface, and secondly, to avoid a waste of time due to daplacement of different elements component handling facility; 20 means of times are constituted by a set of elements forming a block whose upper part rotates horizontally relative to the lower part, allowing to continue in opposite direction of precedent and without loss of time, recovery of stored products and alternately take products of various piles on ARRANGED storage areas on either side of this whole; 30 the carrier with squeegees moaners knives fixed by any means on a chain frontal attack the different layers superimposed triangularly of stored products. The knives moaners cause the slide to the HAS products and this shift is realized the mixture of different products; 4 wheel excavator, having on its periphery a plurality of buckets, picks snowsports products based the accumulation and pours them on a continuous carrier belt; 5 the carrier continuous belt works in the interior of the metal frame for supporting a bucket wheel, and carrying strand carries products spilled from the bucket wheel to a hopper; 60 rolls dampers, situated under the carrier strand continuous conveyor belt at the location or the fall spills by bucket wheel absorb maximum effect shock caused by falling goods and considerably reduce the wear of the belt contínte; 7 "The lever arm to lift or lower the carrier squeegees secured to the bucket wheel, ensures permanent contact with the scraper blades with the plane of the corner of stored products, raising the maximum both devices, it can rotate together and attack a storage area situated on the other side of the longitudinal axis of the cross conveyor; S "the winch seals on the box containing the counterweights, allows, with the aid of a cable, to raise or lower the lever arm; 90 the carrier has a continuous belt transverse axis, on which the products were dumped by the hopper, change the angles by. during the transport of goods and routes them to the carrier along the storage areas; 10 Supportive bati bogies of the mobile element, ensure the transverse displacement of all recovery Elements that is, −dire the carrier scrapers and bucket wheel; 11 "rails, beams resting on a lattice crane serve transverse runway to the mobile element transversely; 12" the crane moves longitudinally parallel rails on three storage areas and the combination of the transverse displacement with the longitudinal displacement allows to scan the entire surface of storage areas; the central joint 130 crane absorbs existing drop−offs between the three rails and ensures the weight distribution of all these three rails allowing two sections cons crane form a brisee line; 40 i the carrier continuous belt along the storage areas, brings products dumped by the transverse carrier is duti− workshop lisation; 15 the carrier continuous belt para.Lele storage areas brings from the place of unloading the goods intended to be stored in the planned storage location; 160 The carriage elevator raises the carrier side of the conveyor belt and allows a continuous of raising Products to the necessary height to their spill on another carrier; 17 the carrier continuous belt perpendicular to the previous spot and carrier inside the metal frame of the arrow of the tripper pours bringest products intended field storage; 18 "the double acting piston, powered by an oil pump, notes or demeans the arrow of the tripper and allows to dose very precisely the thickness of the layer of different products; 19 the probe device in connection with a position indicator is located at the head of the arrow of the tripper and operates the automatic increase of that arrow; 200 the control device, training the desired thickness of the layer a certain product causes the food and stop any alarm signal transmitted to a central control station for the arrival of this and stop triggers the connection ofone another product handling; 21 the tripper rests on three legs realized in metal structural, and moves longitudinally on a track through the intermediary of a plurality of bogies engines; 220 bogies rollers are set in motion by a transmission solidarity in reducer coupled to electric motor and they move on the rails forming the runway; 230 joints clamp the tripper and the lift truck and any longitudinal displacement of tripper automatically causes the displacement of the lift truck.

Abstract:
Source: AU2002301175A What had been created are various new processes with the corresponding newly created devices that support or to handle the new processes in order to attained the desired outcome of the new processes. One desired outcome is to produce a low technology cooling system that can be easily made by the ordinary man for himself and this is answered by the creation of a misting tube having a plurality of water misting nozzles and a blower blows wind thru the water mist towards a place or into a house or into an office. An alternative of this is a blower that blows wind thru the water mist created by an atomizer and into a house, a building, a work shop, a play area, or into a green house or plantation. An improvement of this is misting tube being place infront of a blower by attaching the misting tube to the frame/shell of the blower so that the misting tube goes freely with the left and right oscillation of the blower. A further improvement of this water–mist–blower system is where the water is mist sprayed inside a vacuumed air duct to speed up water evaporation wherein air is passed thru a multi–tube radiator inside the vacuumed air duct and the cold air from the air duct is passed thru a hybrid Centrifugal Cyclone separator to remove surplus water mist. Further created are desalination devices.

Abstract:
Source: US2005245845A A supply of lancets for a multi−use lancing device are carried by a tape and sequentially brought from a storage position to an activating position by advancing the tape around a bend. The lancets are non−circular in cross−section along their longitudinal lengths, and in their activating position they extend from the tape such that their sharp tips are available for lancing tissue. The carrying tape can be arranged in reel−to−reel format in a housing having a lancing opening. The lancets can be integral with the tape and activated to move the lancet through the lancing opening by moving the tape along its tape path or by translating a dedicated service loop of the tape. The lancets can also be independent from the tape and activated through the lancing opening by a separate lancing actuator. A test media can be included on the carrying tape and the housing can contain a sensor to yield an integrated lancing and testing device.

Abstract:
Source: US2003146331A A device is provided on a spinning preparation machine for receiving a sliver from a discharge device of the spinning preparation machine and transporting the sliver to a downstream machine, the spinning preparation machine having a depositing region. The device has a support for receiving the sliver deposited from the discharge device in the depositing region, and a moving device for moving the deposited sliver relative to the discharge device in the depositing region for forming a free standing sliver bundle, and for moving the free standing sliver bundle out of the depositing region for transport to a downstream machine.

Abstract:
Source: US2008203735A A system for increasing the efficiency of the movement of a railroad car over a length of rail, including a fluid reservoir for containing a quantity of efficiency enhancing fluid, a fluid dispensing member, a fluid pump connected in fluidic communication between the reservoir and the fluid dispensing member for dispensing a predetermined quantity of fluid through the fluid dispensing member, a microprocessor operationally connected to the fluid pump, and a first sensor for generating a first sensor signal in response to a railroad car crossing a predetermined section of track and operationally connected to the microprocessor. The fluid dispensing member is positioned along a railroad portion substantially equal in length to the circumference of a railroad car wheel to provide a substantially continuous flow of efficiency enhancing fluid substantially equal in length to the circumference of a railroad car wheel onto the rail portion when the predetermined quantity of fluid is dispensed.

Abstract:
The invention relates to a gearing (G) for a motor vehicle, comprising an input shaft (GW1), an output shaft (GW2), a first planetary gear set (P1) which is designed as a stepped planetary gear set and the planet gears (PL1) of which have two different effective diameters, and a second planetary gear set (P2), said first and second planetary gear sets (P1, P2) being designed as minus gear sets, a first sun gear (E111) of the first planetary gear set (P1) engaging with the larger effective diameter of the planet gears (PL1), a second sun gear (E112) of the first planetary gear set (P1) engaging with the smaller effective diameter of the planet gears (PL1), the second sun gear (E112) of the first planetary gear set (P1) being permanently connected to a sun gear (E12) of the second planetary gear set (P2), a planet carrier (E21) of the first planetary gear set (P1) being permanently connected to a ring gear (E32) of the second planetary gear set (P2), the input shaft (GW1) being able to be connected, by means of a first switching element (18), to the planet carrier (E22) of the second planetary gear set (P2) and, by means of a second switching element (14), to the second sun gear (E112) of the first planetary gear set (P1), the output shaft (GW2) being attached to the ring gear (E32) of the second planetary gear set (P2), and said gearing (G) comprising a first electric machine (EM1) with a non−rotatable stator (S1) and a rotatable rotor (R1), the input shaft (GW1) being connectible, by means of a third switching element (13), to the rotor (R1) of said first electric machine (EM1), the first sun gear (E111) of the first planetary gear set (P1) being connected to the rotor (R1) of the first electric machine (EM1) either switchably by means of an additional switching element (K), or permanently, and a ring gear (E31) of the first planetary gear set (P1) being securable, in a rotationally−fixed manner, by means of a fourth switching element (06).

Abstract:
Source: US5211258A PCT No. PCT/SE90/00103 Sec. 371 Date Aug. 13, 1991 Sec. 102(e) Date Aug. 13, 1991 PCT Filed Feb. 15, 1990 PCT Pub. No. WO90/09293 PCT Pub. Date Aug. 23, 1990.An auxiliary vehicle control device for maneuvering a vehicle (1) from a position other than the driver's position is disclosed which includes an operations unit (3) composed of an operating panel, a drive unit (40) and a control unit (23). The control unit (23) is mounted beneath the steering wheel (20) of the vehicle and coacts with the steering wheel (20) through a multi−disc clutch. The drive unit (40) is disposed in the region of the universal joint of the vehicle and coacts with a flange or collar on the output shaft of the gearbox, through a slip coupling arrangement. The front of the vehicle is equipped with a collision guard (50) which, when activated, is operative to activate devices, via operating devices, which apply one of the standard brake systems of the vehicle. The auxiliary vehicle control device can be fitted advantageously to many different types of vehicles.

Abstract:
Source: US5241875A A robot system with robot specific effects. Reconstructable for other fields of activities with few manipulations by the users themselfs. This objective is achieved in accordance with the present invention by standard robot−block parts of nearly the similar design for the installation of multiblock−robots with self operating walk, drive and manipulation faculties, with horizontally and vertically fitting, rotation flange plug connections, with turntables and driving motors and with current and communication channels which are leading through the center of the rotation plug connections and which provide current and communication supply lines and current and communication control lines. These lines are leaded to inside and outside slip−ring and induction units and to equipment components, composed of accumulators, sensors and electronic boards inside the block chamber. The multiblock−robots achieve only by rotary power and in accordance with the individual plug connection installations, variable manipulations, locomotions and walk−movements, with multi−axis free−motion efficiency, for the most different user applications and objectives.

N. WEING ART BY United States Pateilt Offic(t MACB]NES FOR PRINTINTG AND ISSUING TICKE, TS AND BUSINESS FO–RIMS Richard 1. N. We_ngart, Broo_kvifle, N.Y., assi,–nor to Burroughs Corporation, Detroit, Mich., a corporation of AUchigan ri !led Dec. 17, 1954, Ser. No. 475,940 10 22 CWms. (Cl. This invention relates to machines and methods for issuin– business forms and to forms or tickets issued by the machine and in accordance with said methods. The general objects of the present invention relate to the issuance of business forins and particularly transportation tickets in such fashion as to avoidthe necessity f(yr carrying on hand stocks of preprinted tickets which, by virtue of their nature, represent documents of value, to provide accounting records of the tickets issued from which all essential data may be secured, to insure against falsification of records, and to facilitate the issuance of tickets. In accordance with the invention, a mechanism for issuing tickets and maintaining records is provided which is relatively simple and inexpensive and, hence, is particiilarly adapted for use at stations, airports, – relatively small ticket –agencies, etc., where the number of sales of tickets made would not warrant the cost of more elaborate machines. However, as will become apparent hereafter, machines of the type herein disclosed are by no means so limited in their capabilities that they would be inapplicable even to stations, or the like, where large volume sales are involved. Furthermore, the machines are adapted to other than transportation use, though for consistency of description they will be hereafter referred to as for that use. In brief, the machines of the present invention are ar– ran,–ed to print tickets from sheet stock, which may be in part preprinted, through the use of removable slugs corresponding to particular tickets to be issued. These slugs not only print suitable matters on the ticket strip toi form the tickets to be issued, but additionally provide complete printed records of the transactions involved' Furthermore, the machine is arranged to issue, and record the issuance of, tickets of "write–in" type in which certain information must be written in the ticket by the ticketissuin.–a.–ent. Such tickets may be involved, for exam– ple, when it does not pay to provide at the station of issuance slugs involving the issuance of tickets to small stations or destinations to which the traffic from the issuing station may be quantitatively very low. Write–in operation may also be involved in the case of issuance of puuman or coach reservation tickets, in which instances the ticket issuing agent may be required to ascertain space available and identffy on the ticket the particular space sold. The general objects of the invention outlined above, as well as other objects relating particularly to det0s of the machine, its operation, procedure in issuing tickets, and the tickets themselves, will become apparent from tne following description read in conjunction with the

accompanying drawings, in which: r Patented Sept. 6, −1960 cated at 2−2 in Figure 1, the, view being taken in the direction of the arrows; Figure 3 is a vertical section taken on the plane indicated at 3−3 in Figure 1; Figure 4 is a vertical section taken on the plane indicated at 4−4 in Figure 1; Figure 5 is a vertical section taken on the plate indicated at 5−5 in Figure 1; Figure 6 is a ver−tical section taken on the plane indicated at 6−6 in Figure 1; Figure 7 is a vertical section taken on the plane indicated at 7−7 in Figure 1; Figure 8 is an elevation viewed from the plane indicated at 3−8 in Figure 1 in the direction of the arrows; Figure 9 is an elevation, with part of the casing broken anvay, of a printing box located above the main top plate of the machine and containing various printing elements and devices associated therewith; Figure 10 is an inverted plan view of the printing box shown in Figure 9; Figure I 1 is a vertical section taken on the plane indicated at 11 in Figure 9; Figure 12 is a vertical section taken on the plane indi_cated at 12 in Figure 9; Figure 13 is a vertical section taken on the plane indicated at in Figure 9; Figure 14 is a vertical section taken on the plane indicated at in Figure 9; Fi,_ure 15 is in part a section and in part an elevation taken on the broken surface indicated at 15−15 in Figure 9; Figure 16 is a plan view of the machine with the top plate removed and various other parts broken away to show details; Figure 17 is a plan view of the top of the machine but with portions of the printing box broken away to show elements therebeneath; FigLire 18 is a vertical section through the machine particularly showing the storage provisions for the ticket strip and record members and illustrating the paths thereof through the operating mechanism; Figtire 19 is a perspective view of the upper. portion of the machine particularly showing the printing box in opened position for write−in purposes; Figure 20 is a perspective view of the machine showing the printing box in its normal partially tilted position in which it is ready to, receive a slug; Figure 21 is a plan view showing a typical preprinted ticket stook− Figur.e 2_ is a top plan view of a typical slug provided for use in the machine; FigLire 23 is a front elevation of the slug; Figure 24 is a bottom plan view of the slug; Figure 25 is a plan view showing the matter printed by a slug on one type of ticket; Figure 26 is a plan view showing the matter printed on −a ticket by a slug which is arranged for the issuance of a round−trip interline ticket; Figure 27 is a plan view showing matter typically printed on a ticket by a slug designed for the issuance of pullman or similar reservations; Figure 28 is a plan view of a tick−et which is typical of tickets issued for one−way transportation; Figure 29 is a plan view of a ticket typical of tickets ,),5 issued for round−tiip transportation on a single line; Figure I is a general Plan view of the operating mecha− Figures 30 and 31 are plan views showing coupon elements which are associated with the ticket strip for the nism of a preferred type of machine, showing, in particuproductio n of a round−trip interline ticket,, lar, the mechanism located below a top plate of the ma− Figure 32 is a plan view showing an asserhbly of coupon chitie, with various parts broken away to show details 7o elements associated to provide a round−trip interline of construction; ticket; Figure 2 is a partial elevation taken on the plane indi− Figure 33 is a fragmentary plan view showin,− a plor− tion of a ticket journal strip as printed in the machine, there being indicated in this figure certain legends indicative of types of sale; Figure 34 is a plan. view with portions broken away irustra_ve of a three−ply ptillman reservation ticket stock of preprinted type; I Figure 35 is a plan view showing associated pullman reservation coupons as provided by the machine and with certain data written therein; I _ Figure 3 6 is −a, fragmentary plan_ view, of a ptillmanreservation ticket journal as printed in the machine, and . Figure 37 is a plan view of a commutation ticket Nvhich may be issued by the machine. The preferred form of machine provided in accofdance with the invention will be first described, this descripti6n being followed by a description 6f the machine operation and by a description of the types of tickets and the various alternative ticket issuinmethods which may be employed in accordance with the invention. The machine comprises a housing vvhich incorporates various supporting frame elements the arrangement of which will become clear as the descripti6n proceeds withoiit the necessity for detailed description of these elements_ − Power for operation is provided by a motor 2 the sliaft of which through its pinion 4 drives gear 6 which, in turn, is conneeted to rotate with a pirlion S. A clutch arrangement is provided by a gear 10 arranged to mesh with p.inion 8 but having a portion of its circumference cut away to be completed by the teeth on a lever 12 pivoted at 14 to the gear 110 and urged in a counterclocknvise direction, as viewed in Figure 3, by a spring 16. The gear 10 is carried by a shaft 11 which furnishes drive to certain parts of the machine as will hereafter appear. 'ne lever 12 is provided with a pin 18 with which is engageable the hook end 20 of a lever 22 pivoted at 24 and normally urged in a clockwise direction, as viewed in Figure 3, by a spring 26. The lever 22 is held in engagement with the pin 18 by means of a lever 28 to which further reference will hereafter be made. The gear 10 meshes with a gear 30 which is secured to a shaft −32 from which various operations of the mechanism are derived. A pin 34 carried by lever 22 is arranged to engage a movable switch member 36 to produce circuit closure through the motor 2 by engagement of contacts 38− The shaft 11 is provided with a cam 40 arranged to act upon the roller 42 carried by the pivoted lever 44 which is ur.−ed by spring 46 to produce contact between roller 42 and cam 40. The lower end of the lever 44 is also a ranged to engage the switch member 36 to close the contacts. The switch member is normally ur−,ed into circuit opening position by a spring 45. Secured to the shaft 32 is a gear segment. 48 subtending 180' and arranged to drive through haff of a cycle of operation a pinion 50 secured to a shaft to which there is also secured a sproclet wheel 52 over which a _.ain 54 is trained to drive a second sprocket wheel 56 secured to a transverse shaft 58. A disk 51 secured to pinion 50 is provided with a notch to receive a detent roller 53 carried by a lever 55 urged by a spring 57 to provide a yielding detent action. The shaft 58 is provid6d with a pair of pin−,vheels 60 each carrying pins 62 for the driva of a ticket strip T. Edge stripping member_ 64 embrace portions of the circumferences of the pinwheels 60 to remove and deliver dowiawardly the perforat_d edge portions T' of the ticket strip T. A plate 66 is arr_nged to divert the central main portion of the ticket strip T outwardly of the machine. The shaft 58 carlies the Geneva drive member 68 which cooperates with a driven member 70 to which is secured a pinion 72 meshing with a gear 74 secured to a second transverse shaft 76. The shaft 76 is longitudinally slidable and is urged toward the left, as viewed in Figure 1, by means of a spring 78 to engage a pin 80 carried by shaft 76 wifliin a notch in the,end of a sleeve 82. It will be noted that the pinion 72 is provided with a wide face so that the lengthwise movements of shaft 76 will not disenga−,e the pinion 72 and gear 74. For the purpose of imparting movements to the shaft 76 toward the right, as viewed in Figure 1, to disengage pin 80 from sleeve 32,there is guided in Llie frame a pin 77 engageable with a head 75 formed on the end of shaft 76. This arrangement permits manual axial movement of the shaft while preventing the projection through the housing of the ro− tating shaft. The arrangement thus prevents m−,Lnual interference Nvith the shaft

rotation. The sleeve 82 is provided with a pair of pinwheels 84 provided with pins 86 for the feed of a pair of record strips R and R' Nvhich areperforated at their edges. A member 88 serves to hold these strips in engagement with the pins and forms together with a plate 90 an outlet opening for the delivery at –the rear of the machine of the record strip R. The tick–et strip T is provided from a bin 92 in the housing, as shown in Figure 19. The severed edges T' of this strip are received in a bin 94. A bin 96 supplies the record strips R and R' Nvhich are fan–folded in parahel in the bin. The record strip R' is ultimately delivered to a receiving bin 98 Nvherein it is automatically refolded. 2,5 To prevent interference of the several strips with each other, they are fed past spacing rollers 100 and 102 and over plate 103. The edge portions T' are guided to the bin 94 through guide members 104, while a plate 106 serves to control and guide the movement of the record strip R' to the bin 98. Secured to the shaft 32 are a pair of eccentrics 16,3 the straps 110 of which are pivoted at 112 to a carriage 114 which is mounted for horizontal sliding movements in the machine frame. A shaft 116 moun'Led in this cqrr,.age is provided with a pinion 118 which meshes with another pinion 120 carried by the carriage and which, in turn, ineshes with a fixed rack 122 mounled on a machine frame' The shaft 116 carries a seniicircular platen 124 of yielding rubber niaterial which, as will appear, serves to Press the several strips against type to effect printin,_. The carriage 114 is provided with a plate 126 which provides a backing for the writing of information on tickets. A housing 128, which will be referred to hereafter as printing box, is provided with ears 130 which serve to mount it pivotally on the ends of shaft 58, this being merely a convenient mounting. The bottom of the printing box 128 is open and mounted therein is a plate 132 provided Nvith lips 134 for the guidance of an introduced pair of magnets 136 are fixed above the plate 132 and are arranged to attract and hold upwardly a slug S inserted below the plate 132 which is of non–magnetic material. To the rear of the plate 132 and in position to be engaged by an inserted slug is a slide 133 which is slotted for guidance by pins 140, the slide being urged in r fo ,,5 a rward direction by springs 143. The slide 138 is provided at one end with a projection 142 which is arranged to cooperate with a shoulder 154 formed on an arcuate link 144 which is slotted at 146 for the passage of a screw 148 to secure it shdably to the printing box 128. _The depending portion of the Enk 144 is provided– witli an arcuate slot 150 embracing a pin 152 fixed to the m_,chine frame. A pair of rollers 156 and _158 serve to inount the reeled ends of an inked ribbon C. Knobs 160 ;_nd 162 serve for 66 control of movement of the ribbon C. N"ite its movement could be made automatic in obvious fashio–.i, this is unnecessary, the ribbon being idvanced manually through manipulation of the knobs as required. The ribbon is guided about rollers 164 and,166 and –also about guide strips 168 and 170 provided with slidable giiide pins which are urged downwardly by leaf springs 169 and il7l carried by the printing box. The members 168 and 170 also serve for the guidance of a slug S by cooperation with guide slots 172 and _174. In normal conditions prior tp ac_ual printing, the s ace between the plate 132 and the ribbon C is g_–eater than required for the reception of the slug and the slug is kept from engaging the ribbon C by means of the ma,–nets 132. However, as platen pressure is applied the members 168 and 170 are forced upwardly and serve to hold the slug in positive fashion and in defmite position by reason of the gliides 1,72 and 174 which receive projections on the slug as hereafter described. It may be remarked that the member li7O additionally normally holds the ribbon C away from other type surfaces involved in the printing box. Projecting through the top of the printing box are wheels 176 which carry date designations and are respectively coupled by means of gear trains _178 to correspond– , ing type wheels 180 which are located in the printing plane of the type surfaces of a slug. When particular date designations are uppermost on wheels 176, corresponding type elements are in lowermost printing positions. A printing numbering head is indicated at 182 and is ofconventional type provided with an arm 184 normally urged upwardly by a spring 186 and being arraiged vvhen depressed to advance the numbering head by one unit. For this purpose, a pin carried by the arm 184 is engaged by the forked end of a lever 188 pivoted in the box and provided with a pin !190 which is arranged to be engaged by the upper end of a slide 192 guided for vertical slidin–. movement in the machine frame by studs 194 and normally urged downwardly by a spring 196. The lever I 88 is connected by a link 198 to an arm depending from a shaft 200 journalled in the printing box and provided with dependiiag fingers 202 for the purpose of ejection of slugs. 'Ihese fingers are arranged to engage the slide 140 to move it forwardly. An operator's key 204 is arran.–Od to be inserted in the printing box and is provided with a code or other designation indicative of a particular operator of the machine, printing being effected through the medium of a type surface indicated at 206. The key 204 also serves to control operability of the machine and for this purpose is provided with a notch 208 engageable by the tapered nose of a slide 210 which is guided for horizontal sliding movement in the printin–, box an is normally urged toward the right, as viewed in Figure 9, by means of a spring 212. The end of the slide '210 is arranged to engage a shoulder 214 formed on _ vertical slide member 216 which is slotted at 218 for its vertical guidance. An opening 220 in the lower poftion of this slide which projects below the printing plane of the printing box is provided for purposes hereafter described. A projecting ear 222 is supplied at the opposite end of the printing box and is provided with a similar openin.– 224. For the purpose of providing coding of tickets to indicate types of sales involved, there projects through the upper surface of the printing box a –,vheel 226 carrying suitabl,– designations and geared as indicated at 228 to a printing type wheel 230 carrying type elements correspondin.– to the designations on wheel 226, corresponding designations and type elements being respectively uppermost and lowermost simultaneously. The printing box also contains fixed, but replaceable printing slu–,s for the printing of special data. For example, a slug 225 may be provided to print a member of code identifying the machine, and a slug .23]L may be provided to print the validating signature of some alithorized officer or agent of the transportation company. It will be evident that various other relatively unchangeable matters may be printed by suitably arranged slugs. A slide 232 is slotted to embrace pins 234 and 236 secured in the frame to mount it for vertical movements. A spring 238 normally urges this slide upwardly. The upper end of this slide is arranged to be engaged by the member 216 previously mentioned when the printing box is lowered. The slide 232 has a pin and slot connection :240 with lever 28 and when the slide is depressed by the member 216 operation of the machine is initiate(f by the removal of lever 28 from the lower end of lever 22. At 242 the slide 232 has a pin and slot connection with one arm of a bell crank 244. the other arm of which is pivoted to a link 246 which is in turn pivoted to a lever 248 pivoted to the frame at 24 and arranged to be engaged by a rofler 250 carried by the gear On the opposite side of the machine a slide 232' is mounted similarly to 232 and is similarly actuated through bell crank 244' and link 246' from a lever 248' which is acted upon by a

stud 250' carried by a disc 10' carried by shaft lil. _The shaft 32 carries a cam 254 and is arranged to act over an extent of approximately 180' upon a follower roller 256 carried by a link 258 which is slotted at 260 to embrace the shaft 32 for guidance. The link 260 is connected at its forward end at 262 with the operating arm 264 of a counter 266 which registers the number of operations of the mechanism. At its other end, the link 258 is pivoted at 268 to an arm 270 which is secured to a shaft 272 which carries a second arm 274 similar to 270. The respective arms have hooks at their upper ends arranged to cngage within the respective openings 220 and 222 of the members associated with the printing box.. A spring 276 normahy urges both of these arms to disengaging positions. A lever '278 is provided with a handle 280 projecting out,_vardly of the machine and is pivoted at 282 to the machine frame. A link 294 connects this lever with a second 1–ver 286 pivoted at 283 to the frame and tirged counterclockwise, as viewed in Figure 7, by a spring 287. At its lower end lever 286 is connected by link 292 to a lever 294 pivoted to the frame at its lower end at 296. This lever 294 is pivoted at 298, where a follower roller is provided, to a slide 300 which is slotted and mourited in the frame by pins 302 and 304, being urged toward t'_le left, as viewed in Figure 2, by a spring 306. At its upper end, the lever 236 is provided with a roller 308 arranged to enter a depression in a disc 310 carried by the shaft 58. Sectired to the ear 130 of the printing box is a cam 312 which is arranged to act upon the roller 298 at the upp–,r end of lever 294. The cam 312 is also provided with depressions 318 and 320 arranged to cooperate with a roller 316 mouiated in the forward end of a lever 322 which is pivoted to the frame at 324 and urged countercloc se as viewed in Figure 2 by a spring 326. A notch 327 in the lever 322 is arranged to cooperate with a lug 329 carried by the lever 286. A pin 328 on lever 286 is arranged to engage the depending arm of a bell crank 330 which is urged in a clockwise direction, as viewed in Figure 7, by a spring 331. This bell crank is carried by a shaft 333 which supports the plate 66, previously mentioned, and serves to provide swin,–ing of the free edge of plate 66 towards and from the portion of the cover plate 335 adjacent to the opening 337 thus clamping or releasing the ticket strip. A lever 332 pivoted to the frame at 334 has its rear end pivoted to the slide 192 previously referred to, and at its other end is provided with a roller 336 arranged to be acted upon by a cam 338 secured to the sbaft 11. As shown in Figure 20, the top of the machine housitig is provided in front of the print.ing box with a led.–e 340 the purpose of which is to prevent the removal of a pr;nting slug S when the box is in its lowermost position. it has a bevelled forward surface which is of assistance in guiding a slug int(_gt; position in the box. An inked ribbon D passes between the two record strips R and R' transversely across the machine, bein– supplied from a reel 342 and tak(,n up by the reel 344 which may be manually rolled by means of a knurled roller 346 projecting upwardly throu.–h the top plate of the housing. By means of this libbon the impressions to be recorded are impressed on both record strips R and R'. To attain this end, the ribbon D is of a type to apply ink from both of its faces and the upper record strip R is made of thin paper so that matter imprinted on its under side is visible from its top side. The strip R' may be of relatively heavier paper. Before describing the operation of the machine, reference may be made to the construction of a typical slug S as particularly illustrated in Figures 22, 23 and 24. This slug comprises a body 350 of steel having its side edges folded at 352 and shaped to provide ridges 354 presenti_l–g angular edges arranged to seat in the bottoms of the gu;Litgrooves 172 and 174. As a result of this construction, when the strips 168 and 170 are raised and upward pressure is applied to the sILig it is precisely and fixedly positioned in the printing box. The lower edge of the body, as viewed in Figur– 24, is inturned and cooperates with punched out tabs 359 to hold the printing matrix 360 which is held at its sides by lugs366and368pLmehedoutwardlyfromthebody. The matrlx, –%vhich is of the inexpensive type commonly used in addressing machines, has type elements thereon of t,,Vo groups, the first, 362, arranged to print matters on tickets only, and the latter, 364, arranged to print matters on both tickets and record or joumal strips. The latter, it will be noted, occupy only narrow strips on the matric,–s, i–n printing being aligned with the active type on the nl,–mbering b–ead, the type faces on the operator's key and slug 225, and the active type on the type wheel 230. The upper edge 370 of the body is inturned and cooperates with plinched out tabs 372 and 374 and with punched out lucs 376 and 378 to hold a slug identifying card 330 on wnich may be printed data corresp6nding to the matrix, i–iicluding, for ready reference by the tick–et agent, the price to be charged for the ticket issued through use of the slug. A large number of these sliigs may be stored in a rack in overlapping arrangement with their identifying cards 380 exposed to view. X's as indicated in Figure 24 may be provided to fill spaces on a ticket which should not receive insertions. They serve the further purpose of _providing even pressure to maintain the slug in proper printing position when the useful matter to be printed is asymmetrically locatd on the slu– as in the particular sltia illustrated. The structure of the machine havin_ been described there may now be considered the operations involved in printing a ticket throu.–h the use of a slug which contains all the m,,itters required to identify the ticket, i.e., reqtiiring no write–in. When the machine is in rest position, the printing box occupies a slightly tilted position as iuustrated, for example, in Figures 2, 3, 6 and 20. It is retained in this position by the 3,ielding engagement of roller 316 in the notch 318 of cam 312. The discs 176 will have been aditisted for the printing of a proper date by the printing of a proper date by the pri–iting type wheels 180. The operator's key 204 will be in position serving to locate the end of slide 210 over the shoulder 214 of the slide 216. The operator will adjust the disc 226 to secure printing by the Nvheel 230 of the designation on the ticket to correspond with the type of sale involved. The sILig corresponding to the tici_et desired is now iiitroduced, matrix down and held by the ed.–c containing the card 380, into the printing head, being guided thereinto over the member 340 and under the ears 134, and beiilg pushed into the opening between the plate 132 and the inking,ribbon C. The magnets 136 will attract the slug in its inward movement, raising it upwardly so as to avoid engagement of its advancing edge with the ribbon C. Prior to the insertion of the slug, the portion 142 of slide 138 will be resting on the shol–ilder 154 of the link 144 which will be prevented from do–,vnward movement by the fixed pin 152 in engagement with the upper end of the slot 150. As the slug reaches its innermost position, the slide 138 will be forced rearwardly so as to clear the portion 142 from the shoulder 154, thus freeing the print– ing box for downward inovement. To effect initiation of the operation the printing box is now pressed downwardly, the roller 316 yieldin–, to perniit such movement. It may be noted that if the slug was entered upside down, the ribs 354 would prevent guides 168 and 170 from moving upwardly relatively to the printin.– box so that by engagement with plate 126 they would prevent sufficient donvnward movement of the printing box to start the machine. The downward movement of the printing box produces downward movement of slide 232 against the action of spring

238 through the slide 216 which is backed up by the slide 210 because of the presence of the operator's key, tne slide 216 then being, in effect, ri.–id with tlle 1,5 printing box. The downward movement of the slide 232 rocks the lever 28 to release the lever 22 for movemeit under the action of spring 26. The gear segment 12 is thus released into mesh Nvith the pinion 3. SimLItaneously, the pin 34 acts upon the switch member 36 to caiis–, enaagement of con'Lacts 33 and thus close the eircui'c for operation of motor

Abstract:
Source: IN00726CH2013A 'Smart Active Tyre Pressure Optimising System [TPOS] 102 is a highly time sensitive design and technique that instantaneously sense and controls the tire pressure particularly in imminent and inevitable critical driving situations to reduce emergency and high speed breaking distance, mitigate – loss of traction, hydroplaning, roll over or loss of stability, over and under steering, break failure, loss of control due to puncture by smartly sensing, perform context aware computing and directing the Tyre Pressure Control Units [TPCU] 104 to instantaneously control the tyre pressure in right time with right pressure on right tyres thereby actively controlling the footprint and sidewall deformation rate to enhance traction and stability simultaneously sustaining drivability or steerability ultimately to avoid or reduce the impact of collusion and overcome or mitigate critical situations for protecting the vehicles, occupants, pedestrians and other objects around or on the way; also according to design, configurations and scenarios the system instantaneously optimises the tyre pressure on all tyres for further safe driving till next restoration else restores the pressure to optimum preset value utilising inbuilt reservoir or other external restoration systems immediately after the vehicle overcomes the critical situation to continue with safe and comfortable driving. In critical situations TPOS performs sensing, pre computing, current computing for controlling the tire pressure during critical situation, post computing to optimise tire pressure after overcoming accordingly. TPOS 102 utilise smart and adaptive closed loop processing algorithm with predetermined and tested lookup table to instantaneously check and compare the effects between predetermined and tested real world scenarios to the actual real world scenarios for actively sensing, computing and controlling the tire pressure accordingly to mitigate the critical situations. The controlling of tyre pressure is computed mainly based on parameters comprising of sensor system, vehicle safety and stability systems, nature of breaking and break force distribution, tires upper and lower cut–off pressure values, sensing reservoirs and tires internal and external pressure, temperature, moisture, humidity, wheel and tire specifications, vehicle and wheel speed, acceleration and deceleration, vehicle orientation and axial rotation, transverse motion and lateral acceleration, tires position or angle of attack, load and torque distribution, tire traction, steering position, cornering effects, change in Centre of gravity, over and under steering, hydroplaning, sensing road conditions, etc and to further enhance the efficiency, the system interoperates with vehicles existing safety and stability systems like ABS, EBD, ESC, TCS, Rollover mitigation systems, ECU, BA, Precrash systems, suspension and vertical dynamics, radar assisted auto breaking, cruise control system, aerodynamics and airbrakes etc. Other aspects of present invention are controlling the tire temperature according to environmental temperature, moisture and humidity thereby to enhance traction and vary tire pressure according to change in centre of gravity and load, driving modes – comfort, standard and sports modes. Abstract:
Source: US5778796A An electromagnetic switching system for use in a Personal Rapid Transit (PRT) system having a personal rapid transit vehicle with an attached chassis operating over a network of interconnected guideways. The electromagnetic switching system comprises an electromagnetic switching unit mounted on each side of the chassis for directing the transit vehicle into a predetermined path at a switch section of the guideway. The electromagnetic switching unit has an electromagnet for exerting magnetic force on a continuous reaction rail which is attached to an internal sidewall of the guideway.

Abstract:
Source: GB341017A 27021. [Classes 106 (i) and 106 (iv).] Recording–mechanism is set by liquid–delivery apparatus, actuation being completed and the mechanism returned to zero position by a single member. As shown in Figs. 3, 4, 5 a cam rotated by the pump crank closes a mercury switch once for each half gallon delivered. A solenoid 88 is thus energized ; a pin 84 on the armature 86 draws forward the arm 80 of a bell–crank lever and engages a pawl 76 with a ratchet wheel 72 inside the type–wheel 10. When the solenoid is de–energized, a spring 82 causes the pawl 76 to advance the wheel 10 by one–tooth space. A pin 108 then ceases to obstruct a three–armed lever 110 which rocks under the influence of a spring blade 112 and lifts the depending arm of the lever from engagement with a notch in a lever 18. The type–wheel is mounted in a pivoted frame 12 and may now be raised by depressing the lever 18 thus making contact with a paper strip 22 and ink–ribbon 28. A second pivoted frame 30 is formed with a bar 34 which bears on the frame 12 and carries on an extension 38 a spring–restrained pivoted hook 40. When the lever 18 is actuated, the hook 40 swings clear of a pin 42 and engages a pin 44 on which is a catch 46 engaging a notch in the edge of the cash drawer 36. As the hook 40 falls with the return of the lever 18, the catch 46 is withdrawn, and the drawer opens automatically due to the engagement with a part thereon of a spring–impelled bar 54. A pawl 58 on the bar 54 at the same time rotates a ratchet wheel 62 on the spindle of the paper reel which is thus advanced. A cam 66 rotated by an external knob serves for lifting the pawls 68, 58 to allow a completed reel to be withdrawn. The lifting of the wheel 10 permits the spring 82, after advancing the wheel by means of the pawl 76, to lift the latter from engagement with the ratchet teeth leaving it supported by the upper end of the projection 106 carried by the armature 86. A tail–piece 59 lifts the retaining pawl 74 and allows the wheel 10 to swing back to zero under the influence of a coil spring 70. The zero position is determined by the engagement of the pin 108 with lever 110, which also relocks the lever 18. The blade–spring 112 also 'acts as a switch contact for a lamp 116 illuminated during the recording operation only. Any number of type–wheels may be included in one casing, each wheel carrying corresponding type for indicating the amount and price of liquid delivered, together with the pump number. Duplicate records, one of which is to be torn off, may be provided by adding a reel 122, Fig. 11, carrying a strip which passes beneath a roller 124, through a curved guide 126, beneath the platen 24 and out through a slot 128. The roller 124 is geared to the spindle of the first paperreel so that the second strip moves about six times as fast as the first. The ink–ribbon is led between the type and the second strip and back between this strip and that to be retained in the apparatus. In a modified construction, electric control is replaced by a Bowden wire, and the lever 18 by a hollow lock–barrel actuated by any one of a series of keys, the record made indicating which key–user is responsible. The insertion of a key 140 into the pivoted hollow lever 158 first pushes aside a catch 162. The lever 164 is thus released and falls forward until its end snaps into a recess in the underside of the key and prevents withdrawal. The spindle 170 of arm 164 carries an arm to which is connected a pivoted hook held by a spring in the path of the pump plunger which is thus released for operation by the movement of the arm 164. A lever 182 pivoted to and passing into the hollow lever 158 has its upper end in the path of the key, while a pin 186 abuts against a second lever 188 also pivoted to the hollow lever 158. The movement of the key against lever 182 allows lever 188 to swing until a pin 192 on lever 164 is just above a notch 190. The pump–delivery mechanism sets the type–wheel through a lever 204 and slide 156 which acts on the lever 80 controlling the ratchet advancing pawl 76. The key is then depressed, lifting the type–wheel into printing position, and allowing pin 192 to enter notch 190. During the return downward movement the bar 188 swings down the arm 164 sufficiently to release the key 140. At the same time, the pawls 74, 76 are released by a weighted detent 208 formed as a bell–crank lever rocked by a cam on the slide 156, and the type–wheel returns to zero under the influence of its enclosed coil spring. The. paper reel is advanced by pawl 196 mounted on a slide 194, having a pin and slot connection with the end of the hollow lever

158. In order that the keys may print distinctively, type−levers 212 corresponding in number and outline to the keys are pivoted at 214. Printing and the return to zero position may be effected automatically by the return to initial position of an operating member of the delivering apparatus. Electromagnetic means may be so employed, or the hanging up of the delivery nozzle may be the actuating medium. The Provisional Specification describes a construction in which operation is effected by a sliding bar having a V−notch engaged by a link depending from the platen mechanism. As the bar is withdrawn, the end of the link is lifted, trails along a serrated portion and drops into a semicircular notch. A small pivoted dog is drawn along by the link, and prevents reversal except at the extreme positions by jamming in the serrated part of the bar. Rack teeth are also formed on the bar and mesh with a pinion for turning the paper feed rollers. A ramp formed on the bar disengages the pawl holding the typewheel, and permits the latter to return to zero. A small projection advances the ink−ribbon. The paper strips are wider than the type−wheel permitting signature by the attendant, and the use of different price−scales, and affording a blank zone for use where liquid is to be withdrawn for a purpose other than sale.

Abstract:
Source: US2001016626A Block copolyestercarbonates may be prepared by first conducting a reaction between at least one of resorcinol or an alkyl– or haloresorcinol and at least one aromatic dicarboxylic acid dichloride, preferably isophthaloyl dichloride, terephthaloyl dichloride or a mixture thereof, to produce a hydroxy–terminated polyester intermediate, and then conducting a reaction of the intermediate with a carbonate precursor, preferably in the presence of a dihydroxy compound such as bisphenol A. The products have excellent physical properties, including a high degree of weatherability. They may be blended with other polymers such as polycarbonates, poly(alkylene dicarboxylates), polyarylates, polyetherimides, and addition polymers to improve the weatherability thereof.

Abstract:
Source: BRPI1005974A DISPOSITIVO PARA O CORTE DE ROCHAS, CONCRETO E/OUTROS MATERIAIS, PROCESSO PARA CORTE, MANDRIL APERFEICOADO. A presente invencao proporciona um dispositivo e um processo para o corte de rochas, concretos e/outros materiais, e um mandril aperfeicoado. O dispositivo da invencao e particularmente util para o corte de granitos, marmores, ardosias, outras rochas, pedras, concretos e materiais diversos, e compreende: um sistema automatizado do avanco da mesa e aprofundamento do corte; sistema de corte capaz de abrigar multiplos discos de corte; e sistema de controle de rotacao dos discos. O mandril aperfeicoado da invencao e capaz de abrigar um ou mais discos de corte com diametro igual ou variavel, proporcionando vantagens nos processos de corte de rochas e afins.

Machine translation: DEVICE FOR CUTTING OF ROCKS, CONCRETE AND / OTHER MATERIALS, PROCESS FOR CUTTING, CHUCK improved. The present invention provides a device and process for cutting rock, concrete and / other material, and a mandrel perfected. The device of the invention is particularly useful for cutting granite, marble, slate, other rocks, stones, concrete, and miscellaneous materials, and comprises: an automated system of advancement and deepening of the table cut, cutting system capable of holding multiple discs cutting, and control system of rotation disks. Chuck perfected the invention and capable of housing one or more cutting discs with diameter equal or variable, providing advantages in the processes of rocks and the like.

Abstract:
Source: IN04542CH2011A Smart Active Tyre Pressure Optimising System [TPOS] 102 is a highly time sensitive design and technique that sense and instantaneously controls the tire pressure particularly in imminent and inevitable critical driving situations to reduce emergency and high speed breaking distance, mitigate –loss of traction, hydroplaning, roll over or loss of stability, over and under steering, loss of control due to puncture by smartly sensing, performing context aware computing and directing the Tyre Pressure Control Units [TPCU] 104 to instantaneously control the tyre pressure in right time with right pressure on right tyres thereby actively controlling the footprint and sidewall deformation rate to enhance traction and stability ultimately to avoid or reduce the impact of collusion and overcome or mitigate critical situations for protecting the vehicles, occupants, pedestrians and other objects around or on the way; also according to design, configurations and scenarios the system instantaneously optimises the tyre pressure on all tyres for further safe driving till next restoration else restores the pressure to optimum preset value utilising inbuilt reservoir or other external restoration systems immediately after the vehicle overcomes the critical situation to continue with safe and comfortable driving. In critical situations TPOS performs sensing, pre computing, current computing for controlling the tire pressure during critical situation, post computing to optimise tire pressure after overcoming accordingly. TPOS 102 utilise smart and adaptive closed loop processing algorithm with predetermined and tested lookup table to instantaneously check and compare the effects between predetermined and tested real world scenarios and parameters to the actual real world scenarios for actively sensing, computing and controlling the tire pressure accordingly to mitigate the critical situations. The controlling of tyre pressure is computed mainly based on parameters comprising of sensor system, vehicle safety and stability systems, nature of breaking and break force, tires upper and lower cut–off [threshold] pressure values, sensing reservoirs and tires internal and external pressure, temperature, moisture, humidity, wheel and tire specifications, vehicle and wheel speed, acceleration and deceleration, vehicle orientation and axial rotation, transverse motion and lateral acceleration, tires position or angle of attack, load and torque distribution, tire traction, steering position, cornering effects, change in Centre of gravity, over and under steering, hydroplaning, sensing road conditions, etc and to further enhance the efficiency, the system interoperates with vehicles existing systems like ABS, EBD, ESC, TCS, Rollover mitigations systems, ECU, BA, Precrash systems, Suspension and vertical dynamics, radar assisted auto breaking, cruise control system, aerodynamics and airbrakes etc. Other aspects of present invention are controlling the tire temperature according to weather or environmental temperature, moisture and humidity thereby to enhance traction and vary tire pressure according to change in centre of gravity and load, driving modes – comfort, standard and sports modes.

Abstract:
Source: US2111119A een staggered. tacts associated with the even number are placed at the upper level and their links 41 have only the upper nose SI. tacts associated with the odd number are placed at the lower level and their ljnks 41 have only the lower nose 51. The contype bars operating The comtype _baxs operating ' Briefly then, the energization of the printing magnet 31 will interrupt the type bar 20 with a printing element in position. Immediately following the interruption of the type bar movement, the resultant relative movement between interposer 46 and camming element I5 Wil] cause momentary closure of the associated pair of crmtacts 52. These contacts are utilized to conwol the entry into the accumulator of the value set up on the type bar in the manner to be pres–= ently explained. ~ ' Accumulating mechanism The adding mechanism is entirely similar to that shown and described in the application rcferred to and the description thereof will accordingly be limited to a brief explanation of its manner of operation. The accumulator _dive shaft 53 (Fig. S) is geared directly 1.0 the pulley shaft 5 of Fig. 1 so that it is in operation as long as the driving motor of the machine functicns and the driving ratio is such that shaft 53 makes one revolution for each card feeding cycle of the malchine. Shaft 53 has slidably mounted thereon but keyed for rotation therewith a clutch element 54, one for each dE!1OIT1i1'1BtiGI1_1 order 'of the accumulator. The element 513 is provided with s. groove in which Hts the short mm of zz lever 55 which is pivoted as shown and provided with a block 56 normally held as in Fig, 6 by armaturc latch 51 of adding magnet SE. A leaf spring 59 bears against the extremity of the longer arm of lever 55 and moves the same in a counterclockwise direction upon release of block 56 by armature 51. This movement will bring clutching member 54 intp engagement with cooperating teeth GB integral with z» gear 65 loosely mounted on shaft 53. Gear EH, when thus cou~ pled to shaft 53, will rotate ca. gear which meshes therewith and will displace the accumulator index wheel 63. ' The rearward extremity of member 55 is adapt– 'ed to be engaged by a linger EQ toward the end of the cycle for the purpose of disengagmg the clutch element 54 from teeth GK! and re–latching izlock'56 on armatuse 51. Briehy summarizing the adding uyeration, the magnet 58 may be energized at various points in the cycle of the machine, depending upon the location of a perforation in the column of a record card analyzed by the 'lower brushes LB. This energization may take place in response to 9. perforation in –any of the index point positions from 9 to 1, inclusive. A perforation in the “9” index point position will trip the clutch element El" nine steps before finger 54 is operated to declutch it and 2. perforation in the “E” index point position will trip the clutch element 513 one step before it is declutched by the finger GBE, Each step of clutching engagement corresponds to a. tenth of a revolution in the 'accumulator index wheel 63 so that a “9” hole will move it £5 cf a, revolution and the “1” hole will move it 1% si a revolution. _ ` ThE' energization of magnet SS is controlled by the closure of the contacts 52 associated with the printing méchanism. The manner in which the circuits are completed will be set forth in connection with the explanation of the circuit diagram. Read–out meciumism Also driven by gear GI! (Fig. 6) is a. gear 65. Since the ratio of gears 65 and 62 is 211, the former will turn through a. halirevolution for each revolution' of the latter. Carried by and insulated from geir 65 is sc pair of electrically connected brushes 66, one of which cooperates successively mth ten conducting segments 61 while the other cooperates with an arcuate con~» ducting strip 813. ' The relationship of the parts is such that when the index wheel S3 is inlits zero position, one of the brushes 68 is in contact with the zero seZ~ ment ET and the other brush is in contact with the strip 68, thus forming an electrical con;1ec»~ iiion between the two. If the wheel 53 is displaced; to indicate, –say "S", then one of the brushes EEE will be in contact with the “S” segment S7 and the other brush will be in contact with the arcuairs– strip "fine positioning of the brushes 66 provides zz convenient electrical read–out mechanism lox' controlling total transferring and total priming operations and the electrical circuits involved in these functions will be more fully explained connection with the circuit diagram. Accumilator reseiting mechanism The shsit (Elia.

6_gt;.upon' which the index wheels G3 of an accumulator are loosely mcuntafl is slotted for coo;_gt;era,ticn with spring–pnessecl pawls (mot shown) pivotecl upon ami carried by the individual index wheels in such manner cowntercluclwdse rotation of shaft 69 will engage and :Hive the index wheels G3 forwardly to zera posliicm during; a. single revolution of shaft Referzing to Fig. 2, shaft G9 carries 2. gear W at its extremity which is in engagement with gear WS mmmted upon reset shaft 72. Gear `H,' of which there is one for each accumulator, ;:m:1 be selectively coupled to the resetting shaft Fil in 'blue well known manner more fullylexplained in the application above referred to. At the cr;– tremity M shaft 72 is a. gear U3 (see also 5) which is adapted to be driven by an intermediate gear irli– which is secured to shaft 35. Also to shaft H is an arm TIG which carries spIr§\;fgpresses clutch dag W normally held in the ;:scsition shcvm 131 2 by a latching mm 'EB su§9= ported by armsymre shaft ‘MB of magnet amass ture U®. ` Energlzzmtinn oi magnet 8| Will release dog 171' for enga–gemeiit with clutch driving elemeniy SZ, Element 32 is integral with a gear 33 which meshes with 9. gear (XC secured upon constantly running shaiiz GQ. ‘With tltls a,rrsLll3e311en'h;_c11'ive element is in constant `\;_ta,tion and Whenever it is desifecl to effect resetting of the accumudatovs, magnet SU is energized to provide a co'nnection 'between the slement B2 and the ycsettlng shaft 72; Resetting is usually an accompsmiraemt of total taking and by virtue of the mtelmittexaiz gear connection occurs during the latter pmt of Q total taking cycle. ` ` C'ércui1§ controlling devices) ‘ln ‘E‘ig'. Q is shown a, so–called emitter wlcich cooperates with the read–out devices of the ELCCQmulator for ideal printing; or total transferring operatimns. /Garried by 9. stud S5 coaxially with the T5 is az, pair of electrically connected ga so as so ss: “O G5 4 V' V – A 1,111,119 I brushes lil, one of which contacts with conducting segments I1 while the other wipes over a common arcuate conducting strip IB. The brushes Ili are carried by a gear I! driven through an idler 90 from a gear 9| carried by constantly running shaft |9. The emitter used for controlling total Printing operations is' timed so that a brush 85 successively contacts with each of the segments I1 as the corresponding type elements 33 of Fig. 3 approach printing position opposite platen Sl. The emitter used for controlling total transferring operations is timed so that one ol' its brushes 15 successively contacts with each of the segments I1 at times appropriate to the entry of corresponding digits into the accumulators. In Fig, 3 are shown a. plurality of cam controlled contacts whose operation is controlled by cams carried by a shaft 92 driven from shaft 15. The contacts are prenxed “P” to indicate that they function only during totalytaklng and resetting operations. Similar cam controlled, contact devices prefixed with the letter "L" are carried by or may be driven' from the shaft £8 and these are in constant operation as long as the driving motor functions. In Fig. 1 is shown a shaft B3 which is driven from the gears of the card feeding mechanism and. rotates only when cards are being advanced. Controlled by suitable cams on shaft 53 are con–V tact devices, each of which is designated by the letter “F" indicating that they are associated with the feeding mechanism and operative only when the feeding mechanism functions. All these cam contact devices are indicated in the timing diagram (Fig. 7) where their relative timing may be observed. General explanation of the circuit diagram 'I'he wiring diagram of the' electric circuits is shown in Figs. B, Ba and 8b wherein the various cam controlled contact devices are diagrammatically shown and suitably labelled F, L or P for identincatlon as lust explained. The exact timing of these contact devices is shown in Fig. 7 to which reference may be made for the actual time in the cycle of operation during which they function. Due to the numerous interlocking relays employed in the present arrangement, it has not been advisable in all instances to show relay magnets and their associated contacts in close proximity to one another. For purposes of clarity in the wiring arrangement, the relay contact points are shown in the circuits which they control and their relay magnets a.re repeated adjacent thereto. Further than this, the contacts are designated with the same reference numeral as their controlling magnet, followed by a lower case letter. General operation.–The general operation of the machine will first be outlined with particular reference to Figs. 9 and,10. The record card R ls provided with data fields labelled as shown, which are to control the printing by type bars 2U and certain of which will control the entry of data into the accumulators 1–5 indicated below the row of type bars. All of the card fields from which printing is to be controlled are connected directly to the appropriately located type bars 20 as by connections indicated Sl. This is with the exception of fields labelled "Demand," “Gross Tax,", “Net Tax" and “Arrears” These fields are connected directly tc the accumulators #3, #4 and #5 as by connections 95. Some of the connections 9| from the direct llstina llelds are branched to effect the same entry into more than one section of the type bars; for example, the consumption field enters its data in two places, In such case, these positions of the type bars are provided with the checking contacts 52 to insure that printing will actually be the same in the related positions. The “gross bill” and “net bill" nelds are connected for entry into three sections of the type bars through a connection indicated at 91 as follows: from the card fields through connection 91, relay contacts R9Ba, 119911, and Rllllla in series. connection IDI, to the appropriate type bars lll, as indicated by 'vertical lines extending upwardly from connection llll.' It the data is correctly prlnted in the several positions on the bill, the same information is entered ln ACC#| through connections 98 which, under control of the type bar contacts 52, transfer the data through connection 96, relay contacts R.IU2a, to ACC#|, The timing of ACC#| is adjusted to take account of the time delay between the analysis of the card lleld and the eventual entry into the accumulator. If a record card contains “tax” or “arrears” perforations, a cycle of operations follows an lnltial entering cycle, during which following cycle the datavstandlng in ACC#| is printed and transferred to ACC#i, and during a succeeding cycle the data in ACC#5 is similarly Printed and transferred. . During the "tax" transfer cycle the contacts R8811 are open and contacts Rl9b are closed and the data is read from the upper or read–out section of ACC#4 through connection HIP., contacts R99b, contacts Rl Ma, connectlon IIII, to the "gross and net bill" sections of the type bars and from there, if the duplicate printing is correct, through the checking contacts 52 and connections 56 to ACC#£. During the “arrears” transfer cycle, contacts Rllllla are open and Rllllllb closed so that the transfer ls similarly effected from the read–out section of ACC#5 through connection llll, contacts Rllllllb, connection I0 I, to the type bars, and from thence to ACC#i. After all the record ‘cards for a particular account or folio number have been analyzed, the machine will enter into a total taking cycle of operations during which contacts R98a, andRID2u. are open so that the total in ACC#–H may be transferred from the read–out section thereof through connection IGS, contacts R98b, now closed, contacts R.99a, Rllllla, connection IDI, to the several sections of the type bars and, again. if the printing ls the same in all positions, through connections 96, contacts Rl02b, to ACC#2. At the completion of this total taking cycle, ACC#l is cleared but the data ls retained ln ACC#2 which will receive all totals and at the completion of all tabulatlng operations will

show what is termed the "route" total which may be compared with a known value, After all the record cards for a particular “route” have been analyzed the machine will stop. Initial reset cycle,–In the lower part of Fig. 8 is shown the usual group control mechanism, generally designated GC, and as is usual in tabulating machines, it is nrst necessary to set up the major and minor holding relays RA2 and RAS before the machine can be started. This is effected by depression of the reset key to close contacts Ill), thereby completing a circuit from right side of line Ill, wire Ill. contacts Ill), relay contacts RBSC. Rllllc, relay coil RSD, to left side of line IIS. Energizatlon of magnet R30 will close its contacts R300 in the upper part of sill! Fig. 8 which will thereupon complete a circuit from right side of line Ill, stop key contacts Ill, contacts R4Ba, wire ||5, contacts `R30a, relay magnet R25, `conta.cts IIB, main drive clutch magnets II1, to line HS. Energization of magnets ||1 will cause coupling of the driving motor to the pulley shaft 6, mentioned above, and will, incidentally, cause opening of contacts M6 whereupon relay RI will be included in the series circuit through magnet II1 andpwill close its contacts Rla to complete the circuit through motor TM. ' I Contacts R25a provide a holding circuit which is traceable from the contacts through cam contacts LI and wire H2 to line Ill. Cam contacts LI open toward the end of each cycle, and at such time, the circuit through magnet R25 is maintained through either contacts‘”UCLa, or contacts LCLa which are in_series with contacts RSQU., Rlla, R49a, andstop key contacts I 54. The manner in which one or more of these contacts in the holding circuit may be opened to interrupt the same will be explained hereinafter. When the machine is set for automatic resetting, following total taking operations, switch is closed to short–circuit contacts R491 The relay magnet RI–ID, energized by depression of the reset key will close a second pair of contact points R305 for completing a circuit from line UM, wire H2, cam contacts L2, contacts Ritllb, reset magnet BI, to line H3. As explained in the mechanical description, energization of magnet BI will eiect resetting oi the accumulators and will cause a cycle of operation of the P cam contacts of which contacts ?U (the lower part of Fig. 8) close to set up the minor control circuit and contacts PS operate to set up the major control circuit. The detailed manner in which the group control mechanism GC functions to control the operation of the machine is well known in the art and fully set forth in the Patent No, 1,976,617 above referred to so that such detailed description will be unnecessary here. Sumce it to say that upon a change in the minor group classification perforations which in the present case relate to “folio–number", relay magnets R43, RSE will become deenergizecl and s change in the major group classiiicaticn perforations which in the present case relate to the “recite ntunber”, will cause deenergization of relay magnet R42 along with R43 and RM. Starting circuit.–With the group control set up, that is, with magnets R42, RAS, and RH enercized; and the accumulators cleared, the machine is in readiness to feed cards and analyze the data thereon. Depression 'of start key and closure of contacts I |`9 will complete a circuit from line |ll,w'lre ll2, contacts IIB, relay magnet RHS, contacts Rdilb, relay magnet R32, to line JUS. The contact points R33a are in parallel with the contacts R30a and will complete the following circuit through the driving clutch magnet and cause operation of thc motor TM. From line H3, magnet II1, relay RI, magnet R25, contacts R33a, wire II5, contacts R48a and Hd to line lil. Relay magnet R32 is provided with a pair of contacts R32a which are adapted on closure to complete a. circuit to the card feed clutch control relay magnet R39. This circuit is traceable from llne H3, magnet R39, contacts R32a, stop key contacts ||4u. (operable concurrently. with the contacts Ill), contacts R43c of the minor control relay magnet R43 which are now closed, contacts Rlllbg, R55g, contacts PS, wire H2, to. line Ili. This circuit, it will be observed, can only be con;– pleted when the group control relay magnet 43 is energized. Magnet R39 will close its points R.39a to provide a holding circuit for the magnet and a. second pair of points R39la wired in series with the card feed clutch magnet IB will energize the latter so that cards may commence to feed. The holding circuit for magnet R39 is traceable from line H3, magnet R39, contacts R.39a, contacts LCLp, Ella, R43c,\RllJDg, R.99g, PB, wire H2 to line Ill _ ' ' Card lever circuits.–As the cards are advanced past the upper set of analyzing brushes UB, the usual card lever contacts |28 are closed to complete a. circuit. from line Ill, contacts |2(l, relay magnet R21, magnet UCL, wire |2|, to line II3. Magnetf UCL controls a number of contacts which are disposed in various circuits for controlling purposcs. One of these contacts, for example UCLa pointed out above as being in the holding circuit of the motor drive clutch, will open to interrupt this circuit, if cards fail to feed past the upper brushes. Since the card lever contacts |20 open between the successive cards, a holding circuit is provided through contacts R2'la and cam contacts L5 which serve to maintain magnet UCL energized during the interval when contacts 628 are open. In a similar manner, the ‘lower card lever contacts H22 cause energlzetion oi relay magnet R29 and lower card lever relay LSL and the contact points R2Sa. cooperate with cam contacts LG to proidde a similar holding circult. Lisung circuits.–The circuit for the listing magnet '26 is completed from line ill, ‘wire Ht. contacts L2..1="lO, list car./1 clutch :magnet EQ, to line HS. Through this circuit, magnet 29 is energized each cycle oi operation of the machine and the printing roechanism will fuxlction acccrdinglir. As the record cards advance past the lower brushes LB the entries made in the fields containing descriptive data are directly entered on the type ba–rs as explained in connection with Fig. 9 and any data. contained in the “deme.nd", “tax” or “a1‘reai–s” fields entered into ACC#3, ACC#rl. and éiCC#ii, respectively. Entries in the “hill” fields Will be printed on the bill directly and upon closure of contacts will he thereupon entered into ACCQM, These entering circuits are show; in Figs. 8a and Sb and e, representative circuit illustrating the manner of entering from the bill ield of the card will be traced thereon. Connection G5 in the lower part of Fig. Bc ia connected to a lower brush and will receive –current 'through a periorction in the bill flelol from right side of line ill, thence through contacts 9811, connection W6 (Fig. So), contacts 895, con–_ nection I|l'l, contacts Mila, connection lull, to printing magnet Bl and through plug connections DDE to similar printing magnets 31 in the appropriate positions for duplicate Drintine' of the amount sensed. With the circuit just traced, the amount perforated in the selected card col–~ umn will be printed in three places on the bill and as each type bar is interrupted, the associated pairs of contacts 52 will be closed at the same time if the bars are correctly positioned. The contacts 52 are shcwnin Fig. Sa. and arranged in groups as shown. Assuming the three lowermost contacts to be associated with the three type bars positioned as just explained, their concurrent closure will complete 'a circuit from right side of line »i H i, through the emitter, generally designated |23, Wire 124, the three lowermqst contacts 52, wire 125, enclosed in the cable as shown, contacts Rllllb, accumulator magnet 58 of ACC#|, to left side of line II3. As exDlained in the mechanical description, the contacts 52 close momentarily at the time the upward movement of the type bar is intercepted and unless the three associated type bars are intercepted at the same time, the last traced circuit will' not be completed and no entry will be made in the accumulator. Error indicating circuits.–The circuit traced through

contacts 52 in series has a parallel branch circuit extending from the contacts through the right hand coil of a double wound relay magnet R15 and through wire |26 to line II3 so that the relay becomes energized whenever there is correct duplication of the printing. Energlzation of the relay will close associated pairs of contacts R,15a and R15b, the former providing a holding circuit for the relay which extends from line I|3, through wire I26, left hand winding of relay R15, contacts R15a, wire I21, cam contacts LB, to right side of line III. This circuit is maintained until contacts L8 open near the end of the cycle. Contacts R15b are wired in series with silnilar contacts associated with other groups of type bar positions so that if correct printing–takes place in all positions, all of the contacts R15b will be closed and a circuit will be completed therethrough extending from line III, through wire I2II, contacts R.15b, relay magnet RSE, to line I I3, Relay magnet R36 is normally held energized through a circuit extending from line ill, magnet R3G, cam contacts LIII to right side of line. Near the end of each card feeding and analyzing cycle, cam contacts LID open momentarily and if there has been agreement in all printing positions, the circuit through the relay will be malntained through the serlesscontacts R1 5b as traced. If one of the contacts R15b fails to close, the relay circuit will be deenerglzed. _gt; Referring now to Fig. 8 the deenergization of relay magnet R36 will permit closure of its contacts Riia thereby establishing a circuit from right side of line I I I, through wire III, contacts RSSZ7, contacts R3$a, relay magnet R35 to line |I3. A parallel circuit will also now from contacts R3Ea through a lamp I28. Magnet R35 will close its contacts R35a to provide a holding circuit to maintain the lamp illuminated. The contacts R35a also provide for causing the machine to stop after the next succeeding total taking operation of the machine. This is brought about as follows: During the total taking cycle when cam contacts P5 close near the end of the cycle, a circuit is established from line |I3, through relay magnets R38, RI1, contacts P5, switch ISU, contacts 113541, contacts 3321, wire I I2, to line I I I.” Magnet R11 closes its contacts R31a to provide a holding circuit for the relays through cam contacts LI, Relay magnet RSI opens its contacts 38a which are in the main clutch magnet circuit at the upper part of Fig. 8, so that the machine will stop at the end of the cycle. _ It will be apparent from the foregoing that the lamp |29 w'l1l be illuminated at the time an error in Drlntlng is detected but the machine will nevertheless complete the preparation of the bill and will then come to a stop with the lamp |29 indicating the reason for stopping. As will be pointed out hereinafter, the machine may automatically stop at this time for other reasons and the lamp |29 ,serves to identify the stopping action as being due to the non–conformity of the duplicate printing. , Thus far we have seen hoW~the data perforated in the three fields of the card, namely, the "bill" field, the “tax” and the “arrears” fields, are entered into ACC#I, ACCF4 and ACC#5, respectively and the amount of the bill printed. This cycle of operations takes place for each of the cards of the group having the same folio number. i Tan: trans/er cz/cle setup.–Referring now to Fig. 8, a plug socket ISI is provided from which a plug connection is made to the lower brush LB associated with column 22 of the record card R. Record cards containing a perforation in the “X” index point position of this column are thereby identified as containing "tax" data which is to be cross added with the other amounts on the bill. ' The analysis of this "X" perforation as it passes the lower brushes will complete circuits to prepare thc machine for a transferring operation at the end of the analysis of the group of cards reiating to the particular account which have “tax” or “arrears” items thereon. The initial circuit extends from the right side of line I I I, lower card lever contacts I22, wire I32, cam contacts P2, circuit breakers I33, cam contacts FI, lower brush common, X22 perforation, plug connection such as I34, socket I3|, contacts FE, relay magnets R45 and R41 in parallel, wire I2|, to line IIS. This circuit is held through contacts Rlia extending from line II I, through relay contacts R52a, contacts R46a, relay magnets R46 and RH, wire Ill, to line Ill, Magnet R41 is adapted to close 9. pair of contacts R41a which will set up a circuit upon completion of the analysis of the card group as will be explained later, A second pair of contacts R41b will also be opened' at this time. Thus an X22 perforation in any of the cards of the group will energize relay magnet R41 which will thereafter remain energized to control the "tax" amount transferring operations during later cycles. I Arrears transfer cycle setu1J.~An exactly similar set of circuits is completed to prepare the machine for transferring the "arrears" amount. In this case, the socket I35 is provided which is plug connected to the lower brush LB which traverses column 80 and an perforation in this column wlll, through cam contacts FS, cause energizatlon of relay magnet R45 whose contacts R45a provide a holding circuit and whose contacts R45b prepare an “arrears” transfer circuit in the same manner as contacts R.41a. Thus, if the “tax” amount is to be transferred, relay magnet R41 will be energized during the analysis of the card or group of cards and its related contacts will be operated and if the "arrears" amount is to be transferred, the relay magnet R45 will have been similarly energized and' its related pairs of contacts also shifted. `C]ICIES of operation Initiation of transferring operations.–In the following It will be assumed that the machine is to perform successive tax and arrears transferring operations upon the completion of the analysis of a group of cards and the various step; A involved in these operations are now to be explalned. ' _ It may be explained at this point that a group of cards relating to a particular account are arranged with service cards, such as gas and elec– 2,111,119 _ 7 trlclty cards, leading and any cards having data relatlng to merchandise placed at the end of the group. In order that the merchandise item appear as the last item on the bill (see Fig. 10) the machine is arranged to perform the tax and/or arrears transferring operations before the merchandise card is analyzed. The manner in which such analysis is suspended until transferring has been effected will be explained hereinafter. Record cards bearing data relating to merchandise have an “X” punching in column 54 and the upper brush traversing this column is connected to a plug socket 136 (Fig. Ba_gt; and on the sensing of this “X” perforation, a circuit will be completed from line 113 (Fig. 8), cam contacts L1 1, LIZ, upper brush common. X54 perforation, upper brush UB, 'plug connection such as 131 (Fig. 811) , socket 135. cam contacts FII, relay magnet R55, wire 138, upper card lever relay contacts UCLIJ, to line HI. Relay magnet R55 closes its contacts R55a to provide a holding circuit through cam contacts FIU– whose time of closure is the same as contacts F2 and F3 except that the point of opening of contacts F1 Il is slightly earlier in the cycle. Relay magnet R55 will close a second pair of contacts R55b so that near the end of the cycle, closure of cam contacts L13 will complete a circuit from right side of line Ill, cam contacts L13, contacts R55b, contacts R41a, relay magnet RBS, wire 121, to line llil. Magnet RS! will close its contacts R9Bd to provide a holding circuit through cam contacts L11 and P8. A second pair of contacts R§5g in the stop circuit of the machine opens to break the above traced holding circuit which extends through stop key contacts 1|4a and includes relay magnet R39. The consequent deenergization of magnet RIB will cause opening of its contact points RSBD in the card feed clutch magnet circuit so that cardfeed clutch magnet 111 will therefore become deenerglzed and further

card feeding suspended until transferring operations have taken place. If the group of cards contains no merchandise card with the distinguishing X54 perforation, the same interruption of card feedlngand energizatlon of relay magnet R99 will be brought about under control of the group control mechanism GC shown ln the loweri part of Fig. 8 which in the well known manner will cause deenergization of relay magnets 4| and 48. Magnet |3 will open its contacts Rl3c in series with the contacts R999 and will cause interruption of card feeding ln the same manner. Deenergization of relay magnet R44 will permit closure* of its contacts Rlla, wired in parallel with the relay contacts R555 so that cam contacts L13 may effect energizatlon of relay magnet R99. T411 transfer cycle.–The machine is now prepared to transfer the tex amount from ACC#| to ACC#1. This transferring is again controlled through the type bar contacts; that is, the data is read from the accumulator and entered upon the type bars, which, if properly set for duplicate printing, will effect the entry in ACC#|. Referring now to Fig, 8b the amount standing in ACC#| will be represented by the location of the various brush structures 55 which bridge the individual segments'51 and common strips 55. The emitter shown in the lower portion of Fig. Sa will have ~lts common strip 811 connected to the right side of line 111 through wire 139 (see also Fig. 8), impulse distributors 133, contacts PZ, wire 132, and lower card lever contacts 112. Impulses will thus be successively impressed upon the segments 81 through the brushes 85 in the order 9, 8, '1, etc., to transmit these impulses to all of the nine segments 51, all of the eight segments 51, and so on in succession. Wherever a. segment is connected by a brush 55 to its related strip 58 the circuit will be completed as follows: Assuming that the brush EE in the hlghwt denominational order of the ACC#4 is set (as indicated ln dotted outline) to bridge the “5” segment 61– and its strip 58, at the “5” time ln the cycle, therefore. 9. circuit will be completed from line 111, to common 88 of the emitter brushes 86, “5” segment 81, to all of the "5" segments 51, brush 55 in the highest order of ACC#4, strip 68, contacts 9911, now closed due to the energization of magnet R99, wlre 1111, contacts llllla. wire 1111, to one of the print magnets 31, and through plug connections 1118 to other print magnets 31. Printing will take place in the same manner as explained' above in connection with the direct entries from the card and as the type bars are selected for printing, the associated contacts 52 will be closed and now again. if the setting of the type bars is identical in the three positions ln which the tax is printed, the same entering circuit for ACC#1` will be completed and the tax data will accordingly be added therein. In this manner, the amount standing in ACC#4 will be transferred to the type bars. their setting checked, and the amount thence entered into A.CC#I. As before, if there is any disagreement ln the type bar setting, the signal lamp 129 will be illuminated to call the discrepancy to the attention of the operator. The previous energizatlon of magnet R99 has closed a pair of contacts R99e (Fig. 8) completing a circuit from line I1 1, cam contacts L16, contacts R99e. relay mag– –net R52, wire 121, to line 113. Contacts Rub provide a holding circuit which runs through cam contacts P8 so that the magnet R52 will remain energized until total printing operations have been performed. A second pair of contacts R52a will he opened upon energizatlon of magnet R52 thereby interrupting the holding circuit through the tax pickup relay magnets R45 and R41 which in turn will now permit opening of contacts R41a and closure ol' contacts R41b so that relay magnet R99 can now be deenergized when cam contacts LI1 open. Arrears taa: cycle.–Near the end of the tax transfer cycle, cam contacts L13 will again close, this time completing a circuit from line 1 1 1, contacts_L1S, contacts R55b or R44a as the case may be. contacts R41b, contacts R4517. closed as explained above, relay magnet RI110, wire 121, to line 'I I3. Magnet R100 will close its contacts RllllId to provide a holding circuit for itself through cam contacts L11 and PB and a pair oi’ contacts R1110e w'11l~close to energize relay magnet R51 when cam contacts L15 close later. ' In Fig. Bb. relay magnet R100 will close its contacts RIhllb so that transferring during this cycle may take place from ACC#5 to the type bars 81. Such transferring circuit is traceable from the read–out strip 5| of ACC#5, through contacts Rillllb, Wire 101, to the print magnets I1 and again as ln the case of the tax amount, if the type bars are all positioned alike. the entry will be made into ACC#1 and lamp 125 illuminated If there is any discrepancy. After this transferring of the arrears amount has been effected, cam contacts L11 open so that magnet R1 Il) will be deenerglzed and its varlouc l contacts will return to the positions shown in the circuit. Entering the merchandise amount.–If the group of cards contains a merchandise card following the service cards, the machine will enter upon one or more card feeding cycles during which the merchanidse amount will be printed and entered into ACC#|. Resumption of card feeding is brought about as follows: When both relay magnets R99 and Rllllll are deenerglzed their related contacts R§!y and Rllllllg will be closed and the circuit through relay magnet R39 re–established so that in turn contacts R39b will be closed to energize the card feed clutch magnet Ill and the merchandise card will proceed past the lower brushes which will complete the printing and entering circuits in the same manner as explained in connection with the entry of data from the gross and net bill flelds. It is in these same nelds that the merchandise amount is perforated. Total printing and reset cycle The circuit through relay magnet R39 includes the minor control relay magnet contacts R|3c and R|3d which upon detection of a group number change by the automatic group control mechanism GC will interrupt further card feeding and automatically initiate total taking and resetting operations. Opening of contacts Rllc will interrupt card feeding in the now familiar manner and closure of contacts R|3d will complete a circuit from line III, wlre ||2, contacts P9, R§847, Rlllbg, Rlid, cam contacts LIB, relay magnets RM and R49 to line Ill. The contacts Rilla of relay magnet RIO are in the reset magnet circuit and upon closure will cause energlzatlon of this magnet through a clrcult extending from line II3. reset magnet Ill, contacts Rilla, cam contacts Ll, wlre ||2, to line Ill. Through the mechanism controlled by magnet il, theshaft carrying the cams for controlling the P contacts wlll function. The nrst operation to take place will be printing of the total standing in ACC#|. This is brought about as follows: A pair of contacts Rlllb in the upper part of Fig. 8a wlll close to complete a circuit extending from llne H3 (Fig. 8) contacts R,|3b,wire llll (Fig. Ba), contacts Rmb. relay magnet RSI, cam contacts LIB, wire lll (Fig. 8), cam contacts LI1 and Pl, to line Ill. Energizatlon of magnet R98 will close its contacts Rllb in the lower part of Flg. 8a and open its contacts R!la so that the emitter brushes U5 will establish circuits from the read–out strips G! of ACC#|, through contacts R9lb, wire IIIG, contacts R99a and Rlhlla, now closed. wire llll, to the print magnets 31, Once more the checking contacts I2 will determine whether printing is correctly efllected in the several portions of the blll. Relay magnet RID! ln parallel with magnet Rl! wlll cause closure of its contacts_R.l02a in the lower part of Fig. Ba and opening of its contacts R|I2b so that the entering circuits extending from contacts 51 through wires |25 will extend to the adding magnet ll of ACC#2 instead of to the adding magnets of ACC#I as before. . In this manner, the entry in ACC#I is printed on the bill and through the checking contacts B2 to the route total ACC#2.

Later in the reset cycle, the resetting lnstrumentallties will come into play to zerolze the several accumulators in the manner explained above. In connection with ACC#2, however, the resetting mechanism is inef!ective and the amounts ln this accumulator will continue to accumulate to obtain a grand total of all the entries transferred from ACC#l. Automatic resumption of card feeding Cam contacts L3 (Fig. 8) are provided to energize the start relay magnets R32 and R33 near the end of the resetting cycle of operations to pick up and energize the card feed clutch magnet l8. The circuits lnvolved in the starting of the machine have already been traced in detail and the operations controlled thereby will proceed in the same manner as explained above. If it is desired to have the machine stop after the completion of the resetting operation, switch |30 (Fig. 8) is initially set ln its dotted line position a.nd near the end of the resetting cycle cam contacts P5 close momentarily to complete a clrcult through the relay magnets R31 and RSI, the former of which provides a holding circuit through contacts R.3`la and cam contacts Ll. The relay magnet R38 opens its contacts Ella in the upper part of Fig. B to prevent the reestabllshment of the starting circuit and the machine will consequently come to rest at the completion of the resetting cycle of operations and resumption of operations may then proceed through initiation of the start key to close contacts IIB. As explained above, the failure of the type bars to record identical information ln the several portions of the bill will effect energlzatlon of relay magnets R35 and R36 and will illuminate lamp |29 and with switch |30 in its full line position during the total taking 09813– tlon closure of cam contacts P5 wlll complete a circuit from line l|3, through relay magnets R38. R/31, contacts PE, switch lill, contacts Rlia, R33b, wire ||2, to line III. As just stated energizatlon of relay magnets R31 and R38 will cause the machine to stop at the completion of resetting and the continued illumination of lamp Ill will indicate to the operator that the stopping of the machine has been occasioned by a discrepancy In printing in one or more lines of the bill Major total stop The machine ls arranged to automatically stop upon a major group change; that is, when all record cards having the same group number ln columns 9 to 12 have passed through the machine. In such event, the group control mechanism GC will cause deenerglzatlon of the major control relay magnet RI! permitting closure of its contacts R420 which will establish a circuit from line III, contacts Rlla, wire Ill, in parallel through lamp Ili and relay magnet RH, cam contacts LIS, contacts Rnd, Rllllg, RUM, cam contacts P9, wire ||2, to llne I I I. R/elay magnet RAI opens its contacts Rlla in the starting circuit, preventing the completion of the same. The machine will come to rest with lamp IIS illuminated. It will thus be apparent that the machine will automatically come to a. stop under two conditions. First, when there has been a discrepancy ln printing, and second, when there has been a. major group change. In order to indicate under which of these conditions the machine has come to rest, the lamps |19 and ll! are provided, for former indicating by its illumination that the stopping is due to a. printing discrepancy, and the latter, that the cards relating to a particular route have all been analyzed, Single transfer e1/cle !Where one of the cards of the group contains an X22 perforation but none contains an XDR perforation, only the tax transfer relay circuits controlled by relay 'magnet RI1 will be ener» gized so that upon the operation of the group control mechanism or the analysis of the merchandise card, the machine will proceed tlizcough the tax printing and transferring eycie of operations as described above. At the completion of this transfer cycle, since the arrears pick.–up magnet R45 was not energized duiiuf; ihe analysis cf the group, its contacts R455 will be opened, the arrears transfer magnet RIM! will not be energized, and consequently both contacts R.i0'J§y and R999 will be closed at the end of the tae; transfer cycle so that the total taking and rel setting cycle or merchandise feed cycle will be initiated at this time as explained. If a card of the group contained an X80 perforation but no X22 perforation, then only the arrears pick–up relay magnet R45 would be energized and not the tax pick–up relay magnet RH, so that upon the iriiniatiou of transferring operations, magnet RIM will be energized instead of magnet R99 due to the fact that coutacts. R41 will open and contacts RUE and R–45% close. At the completion of the transfer cycle, durine which the arrears amount or total in Awaékii is transferred to ACC#l, magnet RHIC! Wm be deenergized and again contacts B.l00g emi 353g are closed at the end of the cycle se that total taking and resetting cycles or merchandise feed cycle willimmediately follow. Where none of the cards of the group contain either the X22 or X80 perforation, indicating 'that no transferring operations are to 'cake place fox: that group, contacts Rilliig and RSM will both be closed at the end of the iasi; card cycle so that closure of contacts MQ near the end of that cycle will initiate the total iaekirig resetiing operations withowh intewemng ti'ens= ferring cydes. While there has been shown and deseziiiezi and pointed out the fundamental novel Eeetuires of the invention as applied io s single r;'mdi6_ee;m1on, it will be understood theb V3'Z'IU\lE} omiesinzvs sind sukistitutions and changes in the iam? ani; dietsils of the device illustrated erzéi iz; its agemtion may he made by iirinse skillet! in 51;–ri: without departing frnm the spirie–ef i11ven~ tion– it is the iuterxieu therefore te ice iimted amy as indicated by the scope of time feilovrizig eiaims. Abstract:
Source: US2009301601A The present invention comprises apparatus and methods employing a gas produced from a tetrazine−based energetic material such as that known as "BTATz" containing 3;6−BtS(1H−1,2,3,4−Tetrazol−5−ylamino)1−,2,4,5−tetrazine 3;6−BtS(1H−1,2,3,4−Tetrazol−5−ylamino)1−,2,4,5−tetrazine or salts thereof. The tetrazinebased energetic material is ignited through the use of a percussion cap, a piezoelectric crystal or a battery−supplied electric spark or by encapsulating it in a container that is then exposed to a burning flame. The gas produced upon ignition is employed a propellant such as to inflate life rafts, life vests, emergency evacuation slides, tires, air bags and other inflatable devices. The gas produced upon ignition is alternatively employed to power an engine and many other applications such as a fire suppressant.

Abstract:
Source: DE102010005264A1 Besonders tiefe Bohrloecher (14–30 km fuer 300 degrees centigrade und mehr) sind mit der jetzigen Technik sehr teuer oder nicht moeglich. Dann, wenn 300 degrees centigrade ueberall wirtschaftlich erreicht werden koennen, koennen alte Kernkraftwerke und alte Kohlekraftwerke weiter verwendet werden, da dann der Dampf durch Erdwaerme erzeugt wird. Dies liegt daran, dass bei Tiefbohrungen noch so gebohrt wird, wie vor 150 Jahren: Oben ist der Antrieb, unten der Bohrmeissel (Steuerung „von oben"). Stahlplatten koennen durch Wasserstrahlen hoher Geschwindigkeit zersaegt werden. Ein Ring mit zahlreichen, im Regelfall schraeg orientierten Duesen, z. B. alle zwei Millimeter eine Duese, bei zwei oder mehr Meter Durchmesser, aus denen Wasser mit sehr hohem Druck austritt, bewirkt, dass Gestein ringfoermig zerkleinert wird. Duesen entlang Radien zerteilen den entstehenden Kern in z. B. drei Segmente, die vom Bohrgeraet verpackt und an eine Foerdereinrichtung uebergeben werden. Diese faehrt einige hundert Meter nach oben und uebergibt ein Kernsegment an eine weitere Foerdereinrichtung (Stafettenprinzip). Abwaerts fahrend nimmt die Foerdereinrichtung z. B. Wandsegmente und Ausruestung mit. Strom, Wasser, Daten (LAN–Kabel) etc. findet sich in der Bohrlochwand. Die Arbeiten werden von Kameras etc. Ueberwacht und durch Manipulatoren/Greifer ausgefuehrt. Bohrlochwand, Foerdereinrichtungen, Bohrgeraet und Rechner bilden ein Bohrsystem, mit dem so, ohne Bohrstrang und ohne Bohrmeissel, sehr grosse Tiefen rasch erreich werden koennen.

Machine translation: Particularly deep boreholes (14–30 km for 300 degrees centigrade and more) are very expensive or not possible with the current technology. Then, if 300 degrees centigrade can be achieved everywhere economically, old nuclear power stations and old coal–fired power stations can be further used, since steam is then produced by terrestrial heat. This is because of it that with deep wells one bores still in such a way, as before 150 years: Above the drive is, down the drilling bit (control „from above "). Steel plates can be sawed by water jets of high speed. A ring with numerous, as a rule diagonally oriented nozzles, e.g. all two millimeters a nozzle, with two or more meters of diameters, from which water with very high pressure withdraws, causes that rock is circularly cut up. Nozzles along radii divide the developing core into e.g. three segments, which are packed by the drilling equipment and handed over to a conveyer system. This drives some hundred meters upward and hands a core segment over to a further conveyer system (Stafettenprinzip). Downward driving the conveyer system e.g. takes. Wall segments and equipment also. River, water, data (LAN cable) etc. is in the borehole wall. The work is supervised by cameras etc. and implemented by manipulators/grip arms. Borehole wall, conveyer systems, drilling equipment and computers form a drilling system, with which so, without boring rank and without drilling bits, very large depths rapidly achieve become can.

Abstract:
Source: CN204055684U The utility model relates to an automobile self rescuing device, in particular to a self power supply type automobile pit escaping device capable of conducting self rescuing when an automobile is located on a muddy, wet and slippery road surface or road pit. The automobile self rescuing device comprises an axle and hubs installed on the two sides of the axle. The self power supply type automobile pit escaping device is characterized in that long bolts on the hubs are connected with a plurality of bolts through long nuts, winding wheels are installed on the bolts, traction ropes are wound on the winding wheels, the traction ropes penetrate through a claw rod, and a plurality of claw pins are installed on the claw rod. The self power supply type automobile self rescuing device has the advantages that in the rotation process of tires of the automobile, the automobile can be slowly and automatically pulled out of the small muddy road surface pit, other mechanical power and manpower are not needed, and the self power supply type automobile pit escaping device can be detached after being used. The self power supply type automobile pit escaping device has the advantages of being simple in structure, convenient to use, high in efficiency, safe and reliable.

Abstract:
Source: US3839665A A transducer coupled to a motor shaft provides both position and velocity information for use in a closed loop control system. The transducer includes a disk with deposited metallic parallel conductors each conductor carrying current in a direction opposite to the adjacent conductor. Relative movement of one disk with respect to another produces a position signal in a manner well known in the art. However, multiple windings are used to provide multiple position signals displaced in space phase which are then processed by differentiation and commutation to provide a velocity signal used as a control voltage in the control loop. A reference signal is also derived by commutation from the position signal.

Abstract:
Source: US5090256A A method and apparatus for sampling the gaseous content of a liquid laden with solids initially involves sampling the liquid as close as possible to the source of the liquid. A strainer housing having a strainer plate for filtering out debris in the liquid is connected to a suction pump for sucking the liquid into the housing and to the pump. The pump delivers the sampled liquid to a degassing device mounted on a frame with the pump. The degassing device agitates the liquid to liberate gases suspended therein. The gases are then collected from the degassing device so that the gases may be analyzed. A motor mechanism on the frame drives the pump, a rotating agitator in the degassing device and a rotating scraper on the exterior of the strainer plate simultaneously. This method and apparatus are particularly applicable to the sampling of drilling mud from an oil well exploration site for purposes of analyzing the hydrocarbon content of the drilling mud.

Abstract:
Source: US2013085642A The invention proposes a system that uses a novel method to analyze the surface being about to be traversed by a vehicle. The system can be used to enhance vehicle safety and control. The system makes use of AER cameras such as the Silicon Retina. The Silicon Retina is used monitor the surface to be traversed, and a processing unit analyzes the surface based on the signal provided by the Silicon Retina. The proposed surface analysis method carried out by the system surpasses state–of–art analysis methods.

Abstract:
The vehicle has an on–board source of energy for feeding the electric motor (22) of the motor and reduction gear complex. A steering mechanism is mechanically connected to a steering wheel. Control devices are provided for the motor and reduction gear complex and for the steering mechanism. An electronic unit may be provided for receiving radio signals for remote control of the motor. Slide runners (32) are fitted under the lower part of the chassis (14) in order to be in permanent contact with the ice surface. Each runner is joined to the chassis by a spring telescopic mechanical connection, providing the suspension of the vehicle. Shock absorbers extend from the periphery of the chassis in order to absorb shocks in the event of a collision.

Abstract:
The invention relates to a gearing (G) for a motor vehicle, comprising an input shaft (GW1), an output shaft (GW2), a first planetary gear set (P1), a second planetary gear set (P2), and at least one first switching element (14), one second switching element (15) and one third switching element (04), said first and second planetary gear sets (P1, P2) being designed as minus gear sets, a sun gear (E11) of said first planetary gear set (P1) being permanently connected to a sun gear (E12) of the second planetary gear set (P2) and thus being a component of a first coupling shaft (V1), a planet carrier (E21) of the first planetary gear set (P1) being permanently connected to a ring gear (E32) of the second planetary gear set (P2) and thus being a component of a second coupling shaft (V2), the input shaft (GW1) being connectible to a ring gear (E31) of the first planetary gear set (P1) by means of the second switching element (15), the output shaft (GW2) being directly attached to the second coupling shaft (V2), the planet carrier (E22) of the second planetary gear set (P2) being securable, in a rotationally–fixed manner, by engagement of the third switching element (04), the input shaft (GW1) being connectible to the planet carrier (E22) of the second planetary gear set (P2) by means of the first switching element (14), and said gearing (G) comprising a first electric machine (EM1) with a non–rotatable stator (S1) and a rotatable rotor (R1), said rotor (R1) being connected either switchably or permanently to the first coupling shaft (V1), the first and third switching elements (14, 04) being designed to be power–shiftable switching elements that produce a force–fitting connection when engaged, and the second switching element (15) being designed to be a form–fitting switching element, particularly a jaw–type switching element.

Abstract:
Source: GB2221499A A buoyant structure comprises an anchored stator SRC surrounded by a rotatable ring of buoyant wings (SSW, SHW WW, DSW,DBW, BFW and BW, Fig. 2). Water flow acting upon the wings causes the ring to rotate thereby generating power. The structure is stated to function as a city and is serviced by floating roads NFR, SFR. Each road FR (Figure 1) is provided with breakwaters and wave power generators 13. The roads and structure can be used to span a stretch of water. Various functional details are disclosed.

Abstract:
Source: GB723595A 723,595. Sewing–machines. BRITISH UNITED SHOE MACHINERY CO., Ltd. (United Shoe Machinery Corporation). Aug. 28, 1953 [Aug. 29, 1952], No. 21705/52. Addition to 630,639. Class 112. In a thread–tensioning device according to the parent Specification, the braking band has an end portion extending more or less tangentially from its turns to be engaged by the member which causes it to grip the brake drum, and the latter member, while thus engaging the end portion of the band, exerts a frictional force lengthwise of it in a direction to assist in the required effect. Modified means are used for holding and adjusting the other end of the band, and provision is made for the application of only a reduced tension during the first stitch–forming cycle on starting (the tension being substantially removed when the machine is at rest) to avoid the possibility of pulling the thread out of the thread–end holder; the full tension is restored during the second cycle. In the form shown in Fig. 5 the brake band 20 surrounding the brake drum 17, which is secured to a spindle 16 rotating in needlebearings under the action of the thread passing over a wheel on the spindle, has one end 43 adjustably secured by means described below and the other end 19 extending tangentially into engagement with a roller 22 carried by the take–up lever 8. The arrangement is such that as the take–up lever moves to set a stitch it deflects the end 19 of the brake band to the left and at the same time exerts a frictional force drawing it downwards, both these actions serving to tighten the band on the drum to increase the thread tension; the second action ensures that the first turn of the band engages the drum to ensure smooth and correct action. When the take–up moves to give up thread the reverse effect occurs, the end of the band being lifted frictionally to disengage the first turn from the drum. The other end 43 of the band is guided in a fork 50 of a member 44 pivotally mounted on one of the bearings of the drum spindle, a screw 52, with lock–nut, being provided for adjustment of the band whereby the thread tension is adjusted. The member 44 is normally held in a position to tighten the brake band by a lever 60 engaging under the end of an arm 56 of the member 44 under the action of a spring 70: when the machine is stopped, the lever 60 is tilted to the position shown by a rod 82 to relieve the stress in the brake band and remove the tension in the thread. In the arrangement shown in Fig. 8 in the position in which the brake band is slackened, the member 84 engaging the end 43 of the band rests on a lever 90 spring–pressed clockwise and connected by a link 116 with a pivoted arm 114 in engagement with a second arm 110 which is moved anti–clockwise when the machine stops and which thus lifts the. arms 114 to the position shown. When the machine is started, the arm 114 is lowered by a spring 126 until stopped by a latch 118 engaging a nose 115 on the arm 114; in this position the member 90 engages the incline of a cam projection 85 on the member 84 so as to tighten the brake band enough to apply a tension less than normal to the thread. On its return from setting the first stitch, the take–up lever engages a nose 124 to draw the latch 115 clear of 114, so that the arm 114 can fall further and restore full tension to the thread by moving the member 90 right under the projection 85. Specification 656,765 also is referred to.

Abstract:
Source: US2011320040A The invention relates to a method for adjusting concrete rheology requiring only that load size and target rheology value be selected initially rather than requiring inputs into and consultation of a lookup table of parameters such as water and hydration levels, mix components, temperature, humidity, aggregate components, and others. Dosage of particular rheology−modifying agent or combination of rheology−modifying agents is calculated based on a percentage of a nominal dose calculated with reference to a nominal dose response ("NDR") curve or profile. The NDR profile is based on a correlation between a rheology value (e.g., slump, slump flow, yield stress) and the rheology−modifying agent(s) dose required to change rheology value by one unit (e.g., slump change from 2 to 3 inches) such that exemplary methods can employ corrective dosing based on the NDR and the measured deviation by the system.

Abstract:
Source: KR20170075681A In company that manufactured objects should be shipped, it is why even without knowing it. He must know where the fundamental reason should come from. In one example, we use the wrong. In general passes is a vehicle such as a bus or a different passenger vehicle wheels are when I was a whimper, there is a difference. The first condition is to create a vehicle wheel zooms up to the stratosphere, there is a need to know. According to the weight of the vehicle is the difference of the intensity impinging on the wheel rim in the road surface it can be seen that. Vehicle weight, less weight than cars and buses, leaving the vehicle is operated, the roar from generating the sejoing wheels are smaller than a car, but when the contrary to occur a sound that occurs in the bus passes are made more, larger the wheel roar cars. The reason is that the vehicle weight is less out or the front passenger cars is now hitting upside–down to the ground, the air and free up, relative to the weight of the weight of the car in his car wheel relative to the intensity of the sound to hit the road surface size can be seen that it would be more significantly. Car bus as a vehicle, such as when the weight is more effective than air is not good, it can be seen that. Of course, the front glass of the vehicle bus, such as the effect to lower the air. Further they think the human to gravitational acceleration of air. Only the air vehicle proceeds without considering gravity it encountered in front of vehicles such as cars, buses and dispersed than the air, but might occur less noise, to the contrary, the roar cars bus as a vehicle wheels are greater than the sounds that occur when proceed. That is, appearance is not in the car. In cars so far in such a manner as to distribute air to the front glass, and distribute the air it is not up. Dispersing the front passenger vehicle proceed, upside–down, up, to distribute the windshield of the vehicle than the upper surface of the shape to the front further out forward to the air of the air encountered in a dispersion, it is possible to reduce the weight of the gravity. Now, as a vehicle fuel economy but the lower speeds, in accordance with the vehicle speed by the weight of the vehicle fuel consumption is lowered rather prevents the accumulation of snow in winter, preventing the vehicle windshield. The speed at which the vehicle is proceeding normally has a downward according to further reduce vehicle weight as dispersing, rather as also better fuel economy. Thus, experts are more cars exterior shape of cars in weight to further reduce the vehicle speed On the road had said comb. In addition, the asphalt road surface is in contact with the wheels of the vehicle area is greater than the force to more wheels that occur in the vehicle, it is not transmitted to the side of the tire and the road is how strongly the contact force of the engine, depending on the further well passed the wheels. So far behind the front glass shape as vending cars it is not enough to be laid in front of the windshield, and make laid. In addition to the US, there are many things that are in reverse. For example, to distribute the passenger cars spoiler is available now as the front fairing so worried vehicles it is not rounded. As shown front portion to distribute the air knife blade and have greater effect. In addition, as an airplane wing. The front part of dispersing the air will be sure to have sharply. Two years now, an airplane wing" the reasons that could be rounded birds such as swallows, and that he could not help thinking of shape and mimic. Wings of birds is not a strong material, such as a strength is weak hairs from weak flesh is distributed to the force of the air in the streamlined would automatically changes that we distribute air to a rigid material such as metal, it is not enough to forward the preserves in the fairing. And pointed toward the front of the knife blade made as described above. Moreover helicopter loud gareumyeo the air, it can be seen that. Now with air to ground the wings, which means that the loud blow to the next. The helicopter also like wings as arc through the air toward the front part so as to be among the most sharply as soon as the blade reduces fuel consumption and do. In addition, screw the vessel through water. So as now before contacting the water could be rounded so that the cross–section of the screw, as shown in the front side of the sharp knife blade must have sharply, engine fuel consumption is less. [Index terms; dispersing effect. Whimper. Fluid. The cross–sectional area.

Abstract:
The object of this invention is to provide a motor–operated snow chain system for automobiles. This chain system is installed at a wheel of an automobile using the wheel locking bolts (16), and consists of a chain (1), a motor (11), an RF receiver (12) and a battery (13). The chain system is radio–controlled by a driver to wrap or remove the chain (1) on or from the tread of a tire to give increased traction on snow or a steep slope. That is, when it is desired to increase traction of the tires while driving the automobile on snow or a steep slope, the driver sitting in the driver's seat radio–controls the chain system without stopping the automobile. In such a case, the chain (1) of the system is automatically wrapped around the tread of the tire. The driver thus easily and quickly uses the chain system when necessary.

Abstract:
Source: JP2099411A PURPOSE:To extend automotive spikes when a road is covered with snow during travel of a car and to retract it when the snow on the road is eliminated by operating a device capable of telescoping the pistons with claw from and into the periphery of a wheel during travel of a car by increasing or decreasing the hydraulic oil quantity remotely. CONSTITUTION:A rotary wheel 3 is closely fitted rotatably in a stationary wheel 1 and a hydraulic oil groove wheel 4 supplying hydraulic oil through a pressure oil feed pipe 2 is formed between both wheels 1 and 3. Multiple cylinders 5 connected to the hydraulic oil groove wheel 4 are formed in the rotary wheel in radial direction at equal angular interval and pistons 6 with claw are provided in these cylinders. Each piston 6 with claw is telescoped in the cylinder 5 hydraulically and a claw at the top of the piston is so provided that it extends from and retracted into the outer periphery of a wheel 7. The stationary wheel 1 is secured to an axle cover 8 and the rotary wheel 3 is secure to a drum 9.

Abstract:
ECOLOGICAL MACHINE FOR MANUFACTURING ADOBE BRICKS, BLOCKS AND BRICKS, WHICH CONSISTS OF A MIXER INTEGRAL WITH A DRY SAND HEATER, A THERMOFORMING MANUFACTURING MODULE INCLUDING ITS OWN UNITARY CARRIER, WHICH HAS THE REQUIRED MECHANISM FOR MANUFACTURING BRICKS BY THERMOFORMING USING COMPACTING HEATED MUD, AND A STACKING ROTATING MECHANISM, THE INVENTION ALSO COMPRISING CARTS FOR TRANSPORTING THE FINISHED PRODUCT THROUGH A LINEAR COOKER, A COOKER INTEGRAL WITH A VAPORISER (2), A METALLIC–CONSTRUCTION STYLISED TANK, A FILTER FOR RECOVERING POLLUTING SUBSTANCES INCLUDING A CONDENSER ALSO IN A METALLIC CONSTRUCTION. THE INVENTION MAY USE A THERMOFORMING MANUFACTURING MACHINE INTEGRAL WITH THE AFOREMENTIONED ELEMENTS, WHICH HAS A PLURALITY OF MOULDINGS SO AS TO ACHIEVE A HIGH PRODUCTION; THE MACHINE HAS A DISC SHAPE, WHEREIN THE UPPER PORTION THEREOF HAS A HALF SPHERE SHAPE WHERE THE WHOLE ESSENTIAL MECHANISM ARE HOUSED THEREIN SO AS TO CARRY OUT THE AFORESAID MANUFACTURE PROCESS, THE THERMO FORMING MANUFACTURING MACHINE BEING BUILT IN SUCH A MANNER THAT THE COMPONENTS THEREOF ROTATE AROUND A CORE, ALSO INCLUDING A PLURALITY OF GUIDES OR NOTCHES FOR SYNCHRONISING THE DIFFERENT INNER MECHANISMS; THE DISC FURTHER ACTS AS A HOUSING OF OTHER MECHANISMS THAT ARE ATTACHED THERETO IN DIFFERENT FORMS AND WHICH ARE REQUIRED FOR ACHIEVING A HIGH PRODUCTION.

Abstract:
Source: US2008161968A A unique piece of engineering device "BT' Smart Machine" (BTSM) is described with the capability of lawn mowing, leave blowing/vacuuming, snow blowing, and general purpose blowing/vacuuming with other extra functionalities such as vehicle jump starter, heavy duty air compressor, vertical trolley, horizontal trolley, and outlets for AC and DC devices. BTSM' uniqueness lies in the fact that it can be run in manual (semi–automatic mode) or automatic mode (hands free mode). In manual mode (semi–automatic mode) BTSM anticipates and helps you along the way while in full–automatic mode BTSM does the work for you while you are home away from home or simply use that time to do something else and with a minimum of 10 to 12 hr uninhibited rechargeable battery life, BTSM has more than enough power to traverse your entire compound. In addition to all that, BTSM also runs off of solar energy which further maximizes battery life.

Abstract:
Source: US2001055671A Substantially solvent−free multilayer articles characterized by excellent color retention and gloss retention, solvent resistance and recyclability comprise a substrate layer comprising a first material selected from the group consisting of a metal, ceramic, glass, a celluosic material, a thermoset resin, and a thermoplastic resin, and a resinous coating layer which comprises at least one auxiliary color stabilizer additive and an arylate polymer comprising ester structural units derived from a resorcinol or alkylresorcinol isophthalate−terephthalate. An intermediate layer may also be present.

Abstract:
Source: GB529844A 529,844. Record–card–controlled statistical machines. BRITISH TABULATING MACHINE CO., Ltd. (Deutsche Hollerith Maschinen Ges.). May 23, 1939, No. 15350. [Class 106 (i)] Sorting cards.–In a machine for sorting code cards, the card column on which sorting is effective is selected by a column–selector 32a, 53, which, when sorting of the cards on that column is completed, is automatically adjusted to the next column by a special last card, the cards being fed transversely of the columns, whereby the time in the cycle at which the selected column is read is according to the setting of the selector. The special card also auto–transfers the control from one designation to the next in the one column, the cards from the reject box after each designation sorting being re–inserted by hand in the supply magazine. Fig. 1 shows a code card with upper and lower card fields punched according to the code of Fig. 2; the combination " S " is punched in each column of the special card. The cards are fed through the machine in a direction at right angles to the line of the columns. The reading means consist of four wire brushes 10 to read the four hole positions of a column simultaneously and this set of brushes is adjusted laterally along the rod 17 to read the upper or lower card field. The cards are fed from the supply magazine by picker 12 and three pairs of rollers 13 to a " selected " pocket A or the " reject " pocket R under control of the sorting magnet 15. The code readings are decoded in known manner by four magnets 60 controlling ladder circuits 61a and ten lines 81 connected to studs 81a, of which line 81–S corresponds to the holecombination S for the special card; the latter is placed on top of the cards in the supply magazine. The column–selecting device consists of a wheel 35 continuously driven from the card–feed mechanism and carrying contact means 34 which bridge a stationary contact ring 33 and an insulated conducting spot 32a carried on a stationary shaft 30. Time of bridging in the cycle will therefore depend upon the setting of the angular part 32a, the shaft 30 being adjustable. The pointer 53 carried with the part 32a, coacts with a scale 53a to show which of the fifteen card columns has been selected as the first column for sorting. Contact means 43 carried by the shaft 30 bridge a stationary contact ring 44 and a ring 40 which is conductive except for an insulating spot 42. This ring 40 is manually adjustable, for last column selection, by a pointer 41, so that if it is set at " 7 " as shown in Fig. 3, when after seven automatic adjustments from column " 14 " the pointer 53 reaches column " 7 " the spot 42 interrupts the holding circuit 87 of the motor and brings the machine to rest At each card run, the arm 21 on shaft 25 is moved automatically one stud to the next designation of the card column and an indicator shows the designation being dealt with. Circuits.–When start key 50 is closed, relay 65 closes contacts 88 to energize motor 11 and closes contacts 87 to give a holding circuit for relay 65 through stop key 52 and parts 44, 43, 40. Sorting proceeds for designation " O " column " 14," of the card and at the end of this first run, cards so punched are in box A all others in box R, and the last, special card S, has energized line 81–S. Magnet 23 actuates pawl 85 to move the shaft 25 and arm 21 one step to the " 1 " stud 81a. The cards from reject box R are replaced manually in the supply magazine and sorting proceeds on designation "1," column " 14." Such cards go into box A on top of the cards punched " O," column "14" and the rest into box R. At the end of ten such sortings for column " 14 " as arm 21 passes from stud " 9 " to stud " O," the insulated conductive end 83 bridges contact 26 to energize the relay 27 which then actuates pawl 29a to advance the shaft 30, together with parts 32a and 43, one step. The movement of part 32a alters the timing relatively to continuously rotated parts 35, 34 that circuit is now made as the brushes read column " 13." Ten more sortings occur on column " 13 " and then a further shift to column " 12 " and so on. After column " 7 " has been fully dealt with, the next timing adjustment of part 32a coincides with arm 43 reaching the insulated spot 42, so that the latter breaks the holding circuit 51b, 87, relay 65 is de–energized and opens contacts 88 to stop the motor 11. After selecting column " 14, " say, as the first column for sorting, if it is desired to start at, say, designation " 5 in column " 14," key 24 is closed the requisite length of time for magnet

23 to advance arm 21 to the number " 5 " stud 81a.

Abstract:
Source: DE19502143A1 The grip chain (15) is made of interlocking elements which slide into each other to reduce the chain length. The chain is stored on the side of the wheel and is attached to flexible mountings (42) which are wound on servo drives (3) on the side of the wheel. When extra grip is required the servo drives are activated to move the chain onto the wheel tread. A simple design uses flexible steel tape supports wound onto servo driven drums. Another flexible support is obtained from a chain of ball shaped elements guided in a flexible guide. The servo drives include sprocket wheels engaging the support contour e.g. slits in the steel tapes. The control system includes position control switches to regulate the end positions of the drives, as well as centrifugal switches.

Abstract:
Source: GB715115A 715,115. Typewriters c. LEGLISE, P. Feb. 15, 1951 [March 17, 1950], No. 3668/51. Class 100 (4) In an end–of–line justifying typewriter wherein the first part of the line is typed in the usual manner and justification is effected in a terminal segment (comprising e.g. 20 normal letter spaces) by contraction or expansion of the text, a first member, longitudinally adjustable and fixed to the frame of the machine, is engaged by a second member, carried by the escapement rack or the carriage of the machine, when the escapement rack reaches a predetermined position, to cause either, both the platen and carnage or the platen only to have a differential sliding motion of pre–selected amplitude and direction in relation to the escapement rack of said machine and causing the justification on the terminal segment. In the embodiments described, texts comprising 16–24 character spaces c. are justified into a normal 20 letter–space terminal segment by giving a movement to the platen 21 relative to that of the escapement held rack Cr. The platen carriage Ch may be integral with either the platen or the rack in any of the various embodiments so that justifying mechanisms to be described may be fitted either on the carriage plus platen assembly or on the carriage plus rack block causing relative movements to the rack or platen respectively. In an example described with regard to Figs. 8 and 9 the first member in the form of a rectilinear guide 57 pivoted at 58 on a piece 68, is slidably adjusted and locked by a latch 63–64, on a margin stop rack 69 so that the commencement 58 of the guide 57 is coincident with the commencement of the terminal segment. The second member is in the form of a touching–rod 32 displaced according to the inclination of the guide 57. The rod 32 carries a slider 30 having an oblique slot 29 in which travels a pin 28 fixed to an arm 26. The end of the arm 26 carries a catch–pin 25 engaging in a groove 24 of the platen 21 so that as the touching rod 32 is displaced the action of the slot 29 on the pin 28 will effect a leftward or rightward movement of the platen 21 according to whether the guide 57 inclines upwardly or downwardly. The parts 29–30 forming the transmission means may be fixed to (a) the escapement rack, (b) the platen plus carriage block with suitable connection of the arm to the rack or (c) to carriage plus rack block. The inclination of the guide, which may also take the form of a grooved or slotted rod, is set according to the amount of contraction or extension required, by locating a catch 60a in one of the notches 62 in an arc 61 attached to the piece 68. The notches marked +IV to –IV correspond to whether the terminal text has to be increased or decreased by four character spaces. The positions of the notches are determined in the manner indicated on Fig. 23 (not shown). The manner in which the touching rod 32 transmits its displacements to effect displacements of the platen relative to the rack may be arranged (a) as shown in Fig. 11, in which the gear wheels 35–37 may be of fixed ratio to give equal, greater or less movements to the arm 26, (b) by slotted bell–crank mechanisms, (c) by a helically grooved sleeve arrangement, or (d) by a simple lever action. The means for adjusting the relative movement between the platen plus carriage assembly and the rack, instead of being part of the first member or rectilinear guide 57 attached to the margin stop rack, may be incorporated in the second member with the guide 57 fixed at a constant inclination. Fig. 24 shows one

example in which the pin 28 of the touching rod 32 reciprocates in a slot 29 in a disc 37 carried by a slider 30 moving in a frame 31. The disc 37 can be rotated to vary the inclination of the slot. The slot may also be formed on a rotatable arm which can be located in notches in a sector integral with the arm 26. The arm 26 and sector may be mounted on (a) the platen 21, (b) the carriage plus platen assembly, (c) carriage pius rack block or, (d) the rack, and the touching rod and the frame 31 carried on the corresponding relatively moving system viz carriage plus rack block, rack, platen or carriage plus platen assembly respectively. In the second type of justifier described with reference to Figs. 42–61 of which Figs. 51 and 58 only are shown, the justifying means comprises a justifying lever L which is pivotally mounted at 0 on (a) carriage plus rack block, (b) the rack, (c) the platen or (d) platen plus carriage assembly. This lever L contacts an actuating stop B adjustable along the margin stop rack 69 so that the lever L is engaged at the commencement of the terminal segment. When letter–spacing now occurs the lever L pivots, and in the embodiment shown in Fig. 51, in which the lever L is mounted on the rack Cr, a groove or slot G engages a pin member A adjustably mounted on a notched rod T fixed to the carriage. According to whether the pin member A is above or below the pivot of the lever L, contraction or extension movement is imparted to the carriage relative to the rack. The pin member A may be mounted on a slider C to which is attached a flat spring l engaging the notches +IV to –IV; alternatively, the pin A may be formed at the end of a flat bar and slide in a slot in the rod T. In such embodiments (Figs. 53–57 not shown) the spring l is mounted on the rod T and urges the flat bar, which is notched with the adjustment settings IV to –IV, into a locating pin on the rod T. Further, the lever L and the rod T may be formed of channel section, Fig. 58, with the pin A adjustable by a rod T^1. The pivot 0 for the lever L is mounted by four screws and blocks u; to the back of the channel, and the boss h of the pivot is located in a bearing hole D^1 in the rack Cr. In a third type of justifying mechanism described with reference to Figs. 62 to 81, of which Figs. 67, 79 and 81 only are shown, the justifying lever L is pivotally fixed to a slider C, Fig. 81, adjustable along the margin stop rack 69 and the relative movement between the carriage rack Cr and the platen carriage Ch is derived by the engagement of the rack Cr and carriage Ch at different points of the lever L. Up to the commencement of the terminal segment, the rack and platen are locked together by a locking–pin e, Fig. 67, on a rocking–bar pivoted (e.g. in the embodiment shown in Figs. 79, 81) on the rack Cr. When the rod T, slidably adjustable on the platen plus carriage assembly, approaches the commencement of the terminal segment the pin e is depressed and a back–support finger d rises to engage the rear of the lever L so that when the point P on the rod T, which is part of the carriage assembly, now moves the finger d, the rack Cr will move to a different extent. With the rod T slidingly set in a guide g to engage notch –IV the lever L moves from a line passing through a point marked "zero" on the axis X–X to a line O–M; it will be seen that while the point P associated with the carriage Ch travels horizontally from zero letter space (point S) to 19+P, the finger d associated with the rack Cr travels only from zero to 15+P. The increment y in this and previously described embodiments indicates the actual position in which printing takes place when using escapement mechanisms in which letter spacing is split into two movements, one before, and one after printing. The rod T has flanges T1 and T2 which ensure that the pin e is depressed for each adjustment in the guide g and whilst it moves relatively to the rod T during justification. The positions of the rod T and the finger d may be interchanged as in the embodiments relating to the two types previously referred to.

Abstract:
Source: DE2025520B2 The snow tack is made up of an elastic band to encircle the tyre, with a pattern of grip teeth fitted to the band. The track is normally housed in a special container on the car and is released by a dashboard control. This feeds the track towards the tyre, which is rotating slowly. The leading edge of the track is fitted with hinged clamps which grip the tyre by swinging into an upwards position i.e. towards the hub. A special coupling pad is fitted to the rear of the band, extending over the leading edge so that the trailing edge is automatically clipped in place. Extra security can be obtained by fitting a clamp after the track is in place.

Abstract:
The drive has an automated gear box including transmission input shafts (W–1, W–3) and a transmission output shaft (W–2) axially arranged parallel to each other. Switchable idle gears (z12–z15, z31–z34) and association of gear switching devices (S1–S4) are arranged on the input shafts. The input shafts are coupled together on an input side of an input wheel set plane (Z1). The input shafts are rotatably arranged in one of the switchable idle gears via the respective gear switching device. The input wheel set plane is provided with non–switchable intermediate gears (z21, z21a).

Abstract:
Source: US6619177B An apparatus, especially for clearing landmines, wherein there is arranged on a carrier

machine (1) a flail unit (11) connected to an engine to power a flail rotor (12) equipped with chains and weights, which unit (11) comprises two flail arms (13) which at a first end support the flail rotor (12) and at a second end are made in the form of a frame (14), where the arms (13) are pivotally supported at a pivot point (17), so that when the flail rotor (12) is in operation the unit (11) will be maintained in a floating position relative to the surface of the terrain, which apparatus is equipped with a protective shield (15) between the flail rotor (12) and the carrier machine (1). The impacts of the chains and weights against the ground provide an uplift equal to the weight of the flail rotor (12), including the flail arms (13) up to the support point (17), and the protective shield (15) is arranged on the flail unit (11), preferably on the flail frame (14), so that it floats therewith and is thus capable of bending backwards when the unit (11) is raised or lowered as a consequence of, e.g., a detonation.

Abstract:
Source: GB618267A 618,267. Typewriters and c. BRITISH TABULATING MACHINE CO., Ltd. July 31, 1946, No. 22863. Convention date, Aug. 9, 1945. [Class 100(iv)] [Also in Group XIX] A machine in which record cards control the printing of data on a record strip comprises an endless perforated tape moving synchronously with and controlling the feeding of the record strip, the sensing of a succession of data on the perforated tape controlling means for feeding the record strip predetermined distances. The tape TP, Fig. 3, has perforations lt– 9t which are sensed electrically and, in co–operation with special perforations in the grouped control cards, control the feeding of the record strip; the tape is gummed at A so that it can be formed into a continuous loop TP, Fig. 16, for passing round a feeding roller 231 which has pins 232 co–operating with perforations 30 in the tape. The tape control mechanism is located at the right of the platen P, Fig. 17. It is driven by a continuously–running electric motor, the mainshaft of which carries a worm 59, Fig. 10, driving a gear 60 fixed to a shaft 63. Either of two gear trains 61, 67 or 64, 68 for high and low speed feeding respectively, are adapted to continue the drive through a clutch 103, 104 or a clutch 94, 99 to gears 107 or 108, Fig. 17, fixed to a shaft 110 carrying also a stopping disc 109, Fig. 9. The selection and operation of the clutches are controlled by relays LS and HS, Fig. 9. Energisation of magnet LS rocks a threearmed member 176 clockwise, lifting a hook 177 out of engagement with the stopping disc 109 and pressing down a T–member 181, Fig. 14, which, through an interposer 182. depresses a lug 186 on an arm 188 carrying a cam disc 200 which forces the clutch member 94, Fig. 10, into engagement with member

99 and so completes the slow−speed drive. If magnet HS, Fig. 9, is energized first, however, an arm 205 is rocked counterclockwise about a pivot 206 moving interposers 182, 183 Fig, 14, relative to the T−member 181 so that subsequent depression of the latter causes movement of the cam disc 201 to operate the clutch mechanism 103, 104, Fig. 10, for the highspeed drive. The longitudinal movement of interposer 182, Fig. 14, following energization of relay HS is transmitted by an insulated button 215, Fig. 9, to close contacts 216 to cause energization of relay LS. The drive to gears 107, 108, Fig. 17, is continued to integral gears 161, 162 comprising clutch teeth 167 adapted to engage similar teeth 168 on a disc 159 which is mounted on a sleeve 158 slidable along shaft 113 under the control of an arm 172 engaging between flanges 173 on the sleeve. The arm 172 is manually controlled from a knob D, Fig. 16, through a simple linkage 306 to engage or disengage clutch 167, 168. When the clutch 167, 168 is in engagement, the drive from the sleeve 158 is completed through a pin 156, bevel gears 151; 142, 150 to shaft 113, and thence through a coupling 122 to the platen P. Normally no relative movement occurs between the bevel gears 151, 142, 150, but this arrangement provides for fine adjustment of the platen by manual operation of a knob 136 which, when rotated, causes the planet bevel 142 to be carried round, rolling on the teeth of bevel gear 151. By virtue of the fact that bevel gears 150, 151 have different numbers of teeth, the second bevel gear 150 is thus given a slow motion which provides for fine adjustment of the platen, coarse adjustment being provided for by a knob 123 fixed to the shaft 113. The tape drum 231, Fig. 17, is mounted on the shaft 110 carrying the gears 107, 108 and comprises pins 232 for engaging perforations 30, Fig. 3, in the tape, a metal surface for co−operating with the six sensing brushes at each side of the centre, and commutator segments 242 set in insulation 241 for co−operation with further sensing brushes. The tape TP, Fig. 16, is passed over the drum 231 and over one of three supports 256, according to its length, the supports being carried on a slidable frame 247 clamped in position on a slidable 249. The tape sensing brushes B1 are mounted in a frame 263 pivoted at 266 which is swung upwards to facilitate fitting the tape. After fitting, the frame is pressed down until a latch 271 engages beneath a square pin 273. In this position a protruding portion 261 presses on the tape, tautening it. To avoid sparking at the brushes, a pair of contact breakers 285, 286, co−operating with arms 291, 292 and contacts 295, 296 provide that no current is supplied to the sensing brushes when they are just about to enter or leave a perforation in the tape. The type−selecting mechanism, Fig. 7, comprises a bar T, carrying type arranged as shown and moving upwardly in synchronism with the sensing of a card, Fig. 6. The presence of a perforation in one of the positions 9−1 causes energisation of a magnet PR and, through linkage 129, 128, 127, 126 causes an abutment 118 to engage the corresponding step 117 and so stop the bar T with a type Z, Y or X and c. opposite the platen P. The member 118 is held by a lever 131 rockable about a shaft a under the control of a bail 133, until the sensing of the O, X and R positions, when upward movement is resumed until a spring−urged pawl 139 is released to engage in one of the teeth O, X, R in the lever 131. A second impulse to the magnet PR effects this release through a linkage 147, 146, 140 previously rendered inoperative by a bail 148.

Abstract:
Source: DE19650162A1 Here is something new. A steel studded tyre (5) is used in addition to the conventional car tyres (1), preventing loss of control on ice. Preferably the new tyre and wheel can be lowered into position by hand, or automatically. Winter driving safety is increased.

Abstract:
Source: US4843742A A trenching apparatus (10) is for excavating deep trenches in which inground concrete retaining or foundation walls may be formed. The trenching apparatus (10) has a crawler base (11) on which a carrier assembly (14) is pivotally supported by pivots (16) whereby it may be tilted by rams (17) to maintain the platform horizontal. An automatic control device (64) is provided for this purpose. The carrier assembly (14) has a pair of rails (18/19) along which a carriage (21) may move. The carriage (21) supports a sleeve (24) through which a trenching arm (25) may be lowered to excavate a trench section as the carriage (21) is driven along the rails (18/19).

Abstract:
Source: DE3400827A1 Tyre studs are prohibited in the Federal Republic of Germany and in many other countries. It is however recommended that vehicles adhere firmly to smooth road surfaces in emergency situations. These plates for firm adhesion to the road are intended to be fitted under the vehicle next to the wheels. By means of fan suction motors the air is sucked up from the suction cups, but also blown in in order to clean the filters, which are in front of the air pipes in order to prevent clogging, but only after lifting again. Narrow wheels provided with suction cups are fitted between the normal wheels and the vehicle, with the same suction cups and filters and fan suction motor as before. When cornering air is sucked much more sharply out of those wheels which lie on the inside of the curve than out of the tyres which run on the outside of the curve. In an emergency sharp braking occurs. For this reason a suction motor is fitted on each side of the vehicle so that the plates fitted between the wheels for self–adhesion on smooth roads are automatically lowered to the ground by means of a lowering and raising device and computer control, to enable the vehicle to adhere to the smooth road. Echo sounding beams or other beams measure remote, moving and non–moving objects at a distance from the moving vehicle, which the computer constantly uses in order to calculate... Abstract:
Source: US2005158554A Disclosed is a multilayer article assembly comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) an uncured thermoset or uncured cyclic oligomer substrate layer, wherein the coating layer is in contiguous contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for preparing said multilayer article assembly.

Abstract:
Source: FR1241788A [Source: Claim 1] 1. **ATTENTION** debut du champ CLMS peut contenir fin de DESC **. tant, le parallelisme des bras 10 et 10 bis et celui des roues en rectifiant au besoin par les vis 12 l'orientation verticale des miroirs 11 sur les bras 10 et 10 bis. L'invention prevoit aussi que les deux appareils il voient leurs reflexions entrecoupees par un ecran translucide 16 reposant sur le sol par un pied 17 a mi–distance entre–11 et 11 bis de telle sorte que l'on puisse voir concorder ou non l'un par transparenee, l'autre directement les spots lumineux correspondants a l'epure. On concoit que tous les autres angles soient mesures par ce dispositif en tenant compte que la pointe 7 pouvant tourner, l'axe 8 bis (fig. 4) peut etre oriente verticalement, oscillant sur son milieu et solidaire du bras 10 ter qui porte l'appareil optique 11 ter dont l'ace d'oscillation est horizontal comme 10 ter et dont les projections se mesurent soit sur l'appareil oppose, soit sur l'ecran 16 interpose. L'invention prevoit essentiellement que le plan translucide 16 soit remplace, soit: a. par une glace a double face rayee sur chacune de traits reperes concordant en hauteur ou qu'une glace a une seule face soit montee sur socle a pivot pour pouvoir faire face sans denivellation aux appareils II et II bis, soit: b. par un plan opaque 16 gradue sur chacune de ses faces a des niveaux correspondants de toute la gamme des graduations ou echelles necessaires aux mesures deja citees. Il est prevu aussi que ce plan 16 peut porter en son centre une source lumineuse pouvant alimenter a la fois les miroirs 11 et 11 bis dont les effets se portent sur le panneau 16. Il est prevu que le plan 16 represente porte sur le sol sur un socle 17 soit fixe au vehicule en dessous de toute membrure telle que pare–choc, en son milieu d'ou il resulte que ledit plan 16 se deplace avec le vehicule comme les ensembles appliques sur les roues. L'invention prevoit que la liaison entre les deux cotes soit assuree par le positionnement d'une regle droite 13 bis instantanement amovible qui vienne s'encastrer par ses extremites dans les rainures de deux plateaux 18 orientables sur le bras 10 et bordes de deux secteurs gradues avec reperes sur le bras 10 (fig. 5). L'axe d'orientation de ce plateau, vertical pour les mesures de parallelisme sera horizontal et monte sur charnieres a axe vertical pour les mesures de chasse et de carrossage ou d'inclinai son des pivots qui concernent des deviations complexes d'axes verticaux au cours du bracage. L'invention prevoit que sur chaque bras 10 soit monte un pendule sur rotule a balancier 18, fig. 7, dont la pointe superieure 19 indique a travers un verre bombe 20 gradue de cercles concentriques et de rayons (fig. 8) les valeurs comparatives des debattements des deux roues, etant dit qu'un niveau a segment spherique peut etre utilise mais presente moins de precision. Ainsi la regle ou les systemes optiques pourront etre completes eventuellement par les coupoles decrites. On voit fig. 7 que la coupole 20 est fixee par un bras 21 avec un systeme a pince ou coulissant permettant la mise a zero de l'aiguille avant debattement d'orientation des roues. L'invention prevoit enfin que la fixation 4 par charniere et rotule deportee eventuellement soit remplacee pour les mesures sur des angles importants par un accrochage sur le dessus du pneu suivant la figure 6 combinee avec la figure [Source: Claim 1] 1. ** WARNING ** start of CLMS field may contain end of DESC **. As the parallelism of the arms 10 and 10a and the grinding wheels as required by the screws 12, the vertical orientation of mirrors 11 on the arms 10 and 10a. The invention provides for the two devices as it see their reflections interspersed by a translucent screen 16 resting on the ground by a foot 17 is halfway between 11 and 11–bis so that we can see the match or not one by transparenee, the other directly corresponding bright spots has epure. It conceives all other angles are measures by this device considering that the tip 7 rotatable axis 8a (Fig. 4) can be oriented vertically oscillating on the middle and fixed to the arm 10b which carries the optical device 11b whose oscillation ace is horizontal as 10b and whose projections are measured either on the device opposes either on the screen 16 interposed. The invention provides for essentially the translucent plane 16 is replaced by: a. by a glass double sided striped on each of benchmarks traits consistent height or ice that one side is montee Stand pivot has to cope without elevation change to the devices and He He bis or b. by an opaque plane 16 graduated on each of its faces a corresponding levels of the full range of scale or scales needed to already cited measures. It is also expected that this plan 16 can carry in its center a light source that can power has both mirrors 11 and 11a whose effects relate to the panel 16. It is expected that the plan represents 16 touches the ground on a base 17 is fixed to the vehicle under any chord as bumpers, in the middle of or it follows that the plan 16 moves with the vehicle as the sets appliques on wheels. The invention provides that the

connection between the two sides is ensured by the positioning of a right rule 13a instantly removable who comes to built its ends into the grooves of two adjustable plates 18 on the arm 10 and hoardings of two sectors GRADUATED with benchmarks on the arm 10 (fig. 5). The tray of this orientation axis, vertical to the parallelism measures will horizontal and hinged with a vertical axis for hunting and measures camber or bowed its pivots which involve complex deviations of vertical axes during the bracage. The invention provides that on each arm 10 is mounted on a pendulum balance patella 18, fig. 7, the upper edge 19 states through a glass bomb 20 graduated concentric circles and rays (fig. 8) the comparative values of the deflections of the two wheels, being told that a spherical segment level can be used but presents less precision. Thus the rule or optical systems will eventually be supplemented by the described domes. We see Fig. 7 that the dome 20 is fixed by an arm 21 with a clip system or sliding to the setting to zero of travel front needle wheel orientation. The invention further provides that the fixing by 4 hinge and ball deportee eventually be replaced for measurements on large angles by hanging on top of the tire according to Figure 6 combined with Figure

Abstract:
Source: US2001021734A The color stability of thermoplastic polymers comprising structural units derived from at least one 1,3−dihydroxybenzene and at least one organodicarboxylic acid is enhanced by combination with at least one photobleachable 4−aminocinnamic compound such as 4−dimethylaminocinnamaldehyde. The latter absorbs radiation in the range between about 360 nanometers and about 390 nanometers, balancing the radiation absorbed by hydroxybenzophenone moieties formed in the polymer.

Abstract:
Source: US4691593A A limited slip differential system in the drive train of a motor vehicle with continuous all−wheel drive is provided with a direct through drive acted on by an intermediate planetary transmission and an engageable braking device. The transmission ratio between the planetary transmission and the braking device is substantially higher than the transmission ratio for the direct through drive. This keeps the required braking moment small and allows the use of a relatively small braking device.

Abstract:
Source: FR2657597A Device which can be fitted to the driving wheels of a motor vehicle which has got stuck in the sand or in the mud. The invention relates to a device making it possible, regardless of the nature of the ground, to tow one's vehicle out of its poor position by fitting to the front or rear driving wheels two grapnel winches the tensioners of which are fixed inside vent orifices (4) of the wheel rim (14). It consists of: – an outer sleeve (1) in the form of a funnel conical at its base (28), carrying the automatic roller compartment (7) with a strap (3), and taking up position on the wheel rim (14) by application of its ring (18), – an inner sleeve (2) with a spring (11) with manual immobilisation (5) so that the ring (19) exerts its pressure on the wheel nuts (17), – several tensioners of the same type, from four to five, each of them forming an assembly (3–10–12–13–15–20–24–25), returning the sleeve (1) via firm pressure on to any part whatsoever of the wheel rim (14) about its axis (23). The device according to the invention is particularly intended to be fitted to the driving wheels of a motor vehicle.

Abstract:
Source: US5507994A A process for the production of a plate with a polymer frame shaped onto the edge of the plate. The frame is extruded onto the plate while the latter is held stationary in a working station of a handling automaton or robot with a support device which corresponds to the shape of the plate in such a way that the edge of the plate projects freely over the support face of the support device. With the aid of the robot, an extrusion die having a through, mouth–like slot with two jaws engages the top and bottom surfaces of the circumferential edge of the plate as the mouth–like slot engages the plate edge. At the front end of the two jaws of the die mouth, there are sealing ledges movable at right angles to the plate surfaces, which are supported on the latter during the extrusion process.

Abstract:
Source: JP4066307A PURPOSE: To prevent both tire slip and road damage by moving metal bars outward and inward through movable plates in response to rotation of a cam provided on a wheel, so that spikes can project from and retreat in a tire tread. CONSTITUTION: When a vehicle is to run on a snow–covered or frozen road, a cam 3 provided on a wheel 18 is rotated by a predetermined angle so as to push outward several movable plates 2 and to push out spikes on the tips of metal bars 1 housed inside a tire 17, thus allowing the tire 17 to exhibit its drive and control performance which is similar to that of a conventional spike tire. When a vehicle is to run under road conditions which do not require spikes, the cam is rotated by a predetermined angle while a pin 11 is pulled. Since each movable plate 2 and metal bar 1 are equipped with each compressed coil spring 9, which applies pressure toward the central port of a wheel 18 at the time the movable plate 2 and the metal bar 1 automatically move toward the central part of the wheel 18 when they are released from the force of the cam 3, withdrawing the spikes from the surface of the tire.

Abstract:
Source: US5350035A This invention relates to a vehicle comprising an antihydroplaning system, particularly for improving the wheel adhesion despite the presence of a sheet of water on the road. Output signals from sensors for detecting body and chassis vibrations, ambient temperature and other parameters are analyzed to determine when hydroplaning is occurring or about to occur, and to activate antihydroplaning measures.

Abstract:
Source: US5692267A A fiber processing apparatus includes a plurality of serially−arranged fiber processing components for forming and advancing a fiber web and for gathering the web into a sliver. Some of the components are spaced by a clearance from one another such that the fiber web, while passing from one of the components to an adjoining, spaced component has a length portion unsupported by either of the adjoining components. There are further provided an imaging apparatus which has an illuminating device directing a light beam onto a surface area of the unsupported length portion of the running web; and a camera for sensing the light of the surface area lit by the illuminating device. An electronic image processing unit is connected to the camera for examining signals received therefrom.

Abstract:
The object of this invention is to provide a large scale but low cost windmill by maximizing wind–contact out of the least cost of materials with least cost of maintenance. This is attained by making the sails (100) as large as possible using light materials such as framed fabrics or aluminum sheets, by arranging the large sails (100) to form a long line of parading sails in one direction transverse to the wind and another long line of the same kind parallel to the first line but moving to the opposite direction with which the first line makes a closed loop, by using a strong light weight cable chain (101) that is tugged by the large sails and which also turns the terminal gears (102) located at the two ends of the loop, by using light weight vehicles to carry the large sails.

Abstract:
Source: DE3411088A1 The invention relates to a vehicle wheel which is specially developed for winter use and which permits special brackets to be plugged into the wheel in the event of ice and snow and thus to offer protection against slipping. The brackets engage around the tyre as far as the tread and consist of plastic, metal or a combination of the two. The handling of the brackets is characterised by the greatest possible degree of simplicity and can be performed in seconds. The bracket is plugged in and locks automatically. It is unlocked by pressing a lever. Bolts or tools are not necessary.

Abstract:
Source: BRPI0700324A MAQUINA CONFORMADORA GRAMPEADORA SEQUENCIAL DE RECIPIENTES LAMINADOS DE MADEIRA PARA MUDAS DE VIVIEIROS. Refere–se a uma maquina para a execucao automatica do processo de fabricacao de recipientes laminados de madeira para mudas de viveiros florestais e agricolas. Atualmente esta conformacao e manual, o operador pega o laminado de madeira e com as maos da ao laminado a forma de tubo e o grampeia. Uma tarefa dificil, dado ao enorme volume de producaoe pode causar problemas como: de saude, repetibilidade e outros, atrapalhando os processos produtivos do cultivo. O ciclo de funcionamento da maquina e definido em duas etapas paralelas que atuam de forma simultanea e sincronizada: etapa de alimentacao e etapa de conformacao. o motor (01) aciona o eixos (04) e (20), e aciona o excentrico (07) que avanca o carro aumentador (09) que empurra o ultimo laminado de madeira da pilha do carregador (11) deslocando o laminado pelo trilho guia (13) ate a base de retencao (14), os eixos (04) e (20) acionam tambem os carros (16) (23), (24) e (28) de forma sequencial, moldando o laminado de madeira contra o macho central (18) dando a forma de tubo cilindrico ao mesmo, grampeando–o e sequeencialmente o braco extrator (32) avanca a camisa extratora (35) que se desloca fazendo a extracao do recipiente laminado de madeira pronto para o uso.

Machine translation: STAPLER SEQUENTIAL MACHINES IN COMPLIANCE PACKAGE LAMINATED WOOD FOR SEEDLINGS VIVIEIROS. Refers to a machine for automatic execution of the process of manufacture of wooden containers rolled seedling nurseries and agriculture. Currently this conformation and manual, the operator picks up the wood laminate and the hands of the rolled tube form and staples. A difficult task, given the enormous volume of producaoe can cause problems such as healthcare, repeatability and others, disrupting the processes of cultivation. The duty cycle of the machine and set in two parallel steps that act simultaneously and synchronized: step step power supply and conformation. the motor (01) drives the shaft (04) and (20), and drives the eccentric (07) which brought the car increases (09) which pushes the last wood laminate battery charger (11) the laminate moving by rail guide (13) to the base retention (14), axes (04) and (20) also trigger the cars (16) (23) (24) and (28) sequentially, shaping the laminated wood against the male central (18) giving the form of cylindrical tube to it, tapping it and sequeencialmente the extractor arm (32) advances the shirt extraction (35) that moves making the extraction of container laminate wood ready for use.

Abstract:
The transport trailer has a loading area, a rubber spring axle and a guide (20), where the loading area is movable with the guide from a driving position to a storage position with respect to the rubber spring axle. The rubber spring axle has similar orientation in both the driving position or the storage position with respect to the loading area. The loading area is movable by the guide in a manual manner or by using tools.

Abstract:
Source: DE20200997U1 (Claim 1) 1. Vorrichtung zur Fahr– und Anfahrhilfe bei Schnee– und Eisglaette an Kraftfahrzeugen, vorzugsweise an LkW, dadurch gekennzeichnet, dass das Kraftfahrzeug mit wenigstens einem Behaelter (1) fuer Streugut, insbesondere Sand, ausgeruestet ist und mit zugehoerigen, vom Fahrzeuginneren steuerbaren Foerdermitteln (2, 3) zur Befoerderung des Streugutes auf die Fahrbahn in Streubereiche, die unmittelbar vor und hinter den Antriebsraedern liegen.

Machine translation: (Claim 1) 1. Device to the driving and starting assistance with snow and ice smoothness characterized in motor vehicles, preferably in truck, by the fact that the motor vehicle is equipped with at least one container (1) for grit, in particular sand, and with associated conveyances controllable of the vehicle inside (2, 3) for the transport of the grit on the roadway into scattering ranges, which lie directly before and behind the drive wheels.

Abstract:
Source: BRPI0901148A 1 Resumo A "Trava de Engate Rapido" e um invento para ser colocado rapidamente no setor da industrializacao, devido a sua utilidade, necessidade atual de diminuicao de custos, por sua rapidez na fabricacao, utilizacao e 5 manutencao de equipamentos de varios setores da Industria e Comercio. – A "Trava de Engate Rapido" e de facil manuseio, para travar e so encaixa–la nos pinos frisados de engate rapido (8) nos orificios de entrada (9) na estrutura (5) e empurrar a "Trava de Engate Rapido" ela se travara automaticamente e para soltar e so apertar e ficar apertando o botao de liberacao (1) da estrutura (5) que a 10 "Trava de Engate Rapido" se destravara automaticamente soltando o que o sistema foi instalado e depois puxar a "Trava de Engate Rapido" liberando–a do pino frisado de engate rapido (8), depois sim, soltar o botao de liberacao, abrangendo assim uma infinidade de itens para sua utilizacao. 15 1 Summary The "Lock Quick Hitch" and an invention to be placed quickly in the industrialization sector, due to its usefulness, the current need for lessening costs for its speed in manufacture, use and 5 maintenance of various sectors of industry equipment and Trade. – The "Lock hitch Rapido" and easy handling, to lock and so fit it in beaded pin quick coupler (8) in the inlet holes (9) in the structure (5) and push the "Hitch Lock Rapido" it automatically had fought and drop and so tighten and be pressing the release button (1) of the structure (5) to 10 "Lock Quick Hitch" to unlock automatically releasing what the system was installed and then pull the "Lock Quick hitch "releasing the beaded pin quick coupler (8), then yes, release the button release, thus covering a multitude of items for their utilization. 15

Abstract:
Source: BRPI0903232A EQUIPAMENTO E METODO PARA COMPOSTAGEM. Que consiste num equipamento para compostagem que faz a mudanca automatizada de uma leira para a outra, compreendidos por uma estrutura basica similar a uma ponte rolante, que contem um sistema de entrega de dejetos e um sistema de agitacao do substrato; sendo que estrutura basica similar a uma ponte rolante e constituida por duas barras tubulares(1) dispostas paralelamente uma em relacao a outra, onde e posicionado um carro(2) de agitacao, com pas agitadoras(21), parte do sistema de agitacao, e outra barra tubular(8) disposta paralela as barras tubulares(1); e cada uma das extremidades das barras tubulares(1 e 8) estarem fixadas numa base(1O) que possui rodas(1O1) e sao posicionadas sobre trilhos(1 10) dispostos sobre as paredes longitudinais externas(1 1) das leiras(1 15 e 117); compreendendo ainda um meio para armazenar os dejetos antes de serem despejados sobre as leiras(115 e 117) e realizar deslocamento longitudinal e transversal ao longo das leiras(1 15 e 117) por meio de cabos de aco.

Machine translation: EQUIPMENT AND METHOD FOR COMPOSTING. What is a composting equipment for making the change to an automated windrow to the other, understood by a basic structure similar to a crane, which contains a slurry delivery system and a system of agitation of the substrate, which is basically similar structure a crane and consisting of two tubular bars (1) parallel to one another in relation to, and positioned where a car (2) of agitation, with paddles (21), part of the system of agitation, and other tubular bar (8) disposed parallel tubular bars (1), and each end of the tubular bars (1 and 8) are fixed basis (1O) having wheels (1O1) and are positioned on rails (1 10) arranged on the walls longitudinal external (1 1) the windrows (January 15 and 117), further comprising a means for storing the wastes before being dumped on the ridges (115 and 117) and perform longitudinal and transverse ridges along the (1 15 and 117) by means of steel cables.

Abstract:
Source: US3951194A Anti−skid means for front or rear vehicle tires comprising shoes of pliant material around the tire held in place by lengthwise chains terminating in hooks lying against the outer and inner side walls, which shoes are one−piece with a ribbed and textured central portion for the tread and sides and means for removably holding the shoes and associated shackles in place during rotation of the wheel of the vehicle. The parts are specially designed to give good traction and comfortable riding qualities on icy and snowy surfaces with reduced wear.

Abstract:
Source: DE2620525A1 PATENTANS PRUE CHE 1 Gleitschutzvorrichtung offener Bauart zum Anbringen an einem Reifen eines Motorfahrzeuges, ohne es zu heben oder schieben, mit zwei zueinander parallel verlaufenden Seitentraegern (1, 2), an welchen ein Laufnetz (3) aus Greifelementen aufgehaengt ist, wobei der eine Traeger (2), der beim Verlegen des Gleitschutzes ueber dem Reifen (9) zum Anliegen an der Aussenseite des Rei fens kommt, auf einem seiner Enden eine Oese (7) und auf dem anderen Ende einen in die Oese einhaengbaren Verschlusshaken ring (8) traegt, dadurch gekennzeichnet, dass die beiden Enden des anderen Traegers (1), der beim Verlegen der Vorrichtung ueber dem Reifen (9) zum Anliegen an der Innenseite des Reifens kommt, mit je einer Spannschlaufe (4, 4a) versehen sind, in welcher ein Verlaengerungsstueck (5, 5a) mit einem Endhaken (6, 6a) ein gesetzt ist, welche Verlaengerungsstuecke (5, 5a) mit den Endha ken (6, 6a), nachdem die Vorrichtung von oben ueber dem Reifen (9t gelegt ist, gegenseitig durch die Spannschlaufen (4, 4a) des jeweils anderen Traegerendes an der Innenseite des Reifens (9) durchfuehrbar und zusammenziehbar sind, um an der Aussenseite des Reifens (9) durch die Oese (7), in welcher der Verschluss hakenring (8) eingehaengt ist, durchgefuehrt und mit ihren End haken (6, 6a) an dem einen Traeger (2) verschlauft und abnehm bar befestigt zu werden 2. The snowchain is fitted with fastening strands (2) on both sides, with the side away from the car on the outside of the wheel having simple hoops (7) and clips (8) to secure the chain. The inside edge has extended fitting lengths (5, 5a) with hooks (6, 6a) at the ends. The chain is draped over the wheel and the inside lengths threaded through open loops (4, 4a) near the ends of the chain pattern, and tightened, and with the hooked ends taken to the outside of the wheel. The chain can be fitted rapidly without having to reach behind the wheel. The long lengths are thrown past the rear of the tyre and threaded through the hoops at the tyre edges. With all the hooked ends on the outside of the wheel, fitting is a simple operation.

Abstract:
Source: DE2556263A1 Patentanspr ue c 12 e: 9 Gleitschutzeinrichtung fuer Fahrzeuge, insbesondere tuer die Raeder von Strassen– oder Schienenfahrzeugen, dadurch gekenn zeichnet, dass am Fahrzeug (1) ein oder mehrere Aufnahmebe haelter (11, 12) fuer die Aufnahme von Streugut angeordnet sind und dass zumindest jedem Fahrzeugrad (15) einer Fahrzeug achse eine das Streugut zwischen die Radlaufflaeche (65) und die Fahrbahn (F) einstreuende, steuerbare Vorrichtung (45, 461 48) zugeordnet ist 2. Grit reservoirs are mounted in front of each wheel and have a double skinned construction. The space between the walls is heated by coupling it to the cooling water circuit or by passing some of the exhaust gases through it. The grit can also be heated by heating coils in the grit to prevent it clogging. The release of the grit is automatic, linked to the operation of the brake pedal, with a main control switch to prevent release in normal driving conditions. The system provides good wheel grip on roads where spiked tyres are banned, without having to fit snow chains.

Abstract:
Source: US4127434A A hand operated dry wall taping machine includes an elongated tubular body, to be held by the operator, having a tape applicator head portion at the end thereof adjacent the seam being taped. A supply roll of tape is carried from the tubular body. The applicator head includes a dry wall cement dispensing box through which the dry wall tape is fed. Cement is dispensed onto the side of the tape which is to face the wall being taped. A rotary tape shear is disposed up–tape from the cement dispensing box. A thumb actuated pneumatically operated cylinder actuates the rotary shear at the end of the seam being taped and advances a short length of tape through the cement dispensing box in readiness to commence taping of the next seam. A whisker valve in an air line is actuated by the pneumatically operated cylinder for delivering a momentary blast of air into the cement dispensing box for feeding mud onto the advanced leading end of the sheared tape. A second thumb actuated pneumatically operated cylinder controls operation of a cornering wheel for folding the cement laden tape into corner seams. A third thumb actuated pneumatically operated cylinder controls the supply of dry wall cement to the cement dispensing box from a tank of mud carried from the body of the operator, such tank being pressurized with air from an air compressor. The tank is connected via an air line to the air compressor which is carried from a hand truck. The air line is payed out from a spring loaded reel also carried from the hand truck.

Abstract:
Source: US6159127A PCT No. PCT/DE99/00314 Sec. 371 Date Oct. 29, 1999 Sec. 102(e) Date Oct. 29, 1999 PCT Filed Feb. 6, 1999 PCT Pub. No. WO99/50572 PCT Pub. Date Oct. 7, 1999A drive train (10, 10a, 10b) for a motor vehicle is proposed, in which an interruption in the traction force transferred by an internal combustion engine (12) to a transmission (36) dictated by disengaging at least one clutch (16, 42) is bypassed. This purpose is served by a device (21, 21a, 21b), which has an electrical machine (22, 22a, 22b) that is connected to a power takeoff side, in particular an output shaft (36) of the transmission (38). Thus when the traction force is interrupted by a clutch (16, 42), a traction force is transferred, which increases driving safety and comfort.

Abstract:
Source: US4463989A A device for cutting a receptacle in pavement to receive a reflector designed to reflect automobile lights, which reflector is contained in a housing so that it is protected from a snowplow mold board during normal plowing operations. Such reflectors are becoming standard in separating traffic lanes and are embedded in the pavement in epoxy. The device simultaneously cuts a receptacle of a shape such that the reflector and its protective cast iron housing may be readily inserted in the pavement. The device enables the receptacle to be cut at right angles to a tangent to the curved portion of the crown of the road, permits rapid exact positioning of the receptacle location and enables the receptacle to be formed in approximately five seconds.

Abstract:
Source: GB245202A Skid.–Vehicle brake mechanism of the kind comprising scotch blocks or skid pans adapted to be lowered into engagement between the wheel and the track, to prevent the vehicle running downhill comprises, according to one construction, Fig. 1, a transverse shaft provided with a pair of crank arms 2 carrying blocks 1 and rotatably mounted in vertically slotted guides 5 secured to the chassis. Springs 7 are interposed between blocks 8, 9 disposed in the slots, the block 8 bearing on the shaft, which is thus able to move upwardly against the springs to compensate for variation of load or inequalities of the track when the blocks are applied. The blocks are normally held raised by a hand or foot controlled rod 13 connected to an arm on the shaft. The blocks are adapted to fall into engagement with the wheels by their own weight, which is, however, partly counterbalanced by weights 13a on arms extending from the shaft. Fig. 4 shows another construction in which the arms 37 carrying the blocks 1 are slidable against the action of springs 39 in the tubular end parts 36 of the shaft 34 mounted in brackets 35. The blocks are normallv held raised bv cables 41 connected to arms 42 on the shaft. Two pairs of blocks and operating mechanism therefor are provided in this case, adapted respectively to check forward or rearward movement of the vehicle. Skid pans may be used instead of blocks of the form shown. The blocks may be formed as an aluminium casting lined with friction fabric. For snow covered or frozen roads the under surface of the blocks may be serrated, such blocks being interchangeable with those for ordinary use. Blocks may be arranged for engagement with either the front or rear wheels. According to one of the Provisional Specifications, the blocks may be operated by electrical means and may be brought into engagement automatically whenever the vehicle is stopped.

Abstract:
The design has two booms arranged either alternatively or equilaterally, where the booms are temporarily connectable with each other in a pair as well as variable. Multiple sliding guides are fastened between the booms and a hull side, where the sliding guides are alternatively regulatable in a potential manner. The two booms are elongated and located opposite to a boom hull. A kite e.g. towing kite, is connected in a top deck of an e.g. ferry ship, in a distant height and range with a rope, where the rope is specifically adjustable in the length and force.

Abstract:
Source: US2014014424A The present "Advanced Propulsion Engineless Vehicle" invention is revolutionary land vehicle that operates without internal combustion engine that require fossil or other fuels to operate, nor uses "plug–in or hybrid" electric vehicle technology. It is powered by conventional off–the–shelve electric vehicle components and uses standard car batteries as primary or secondary power source. The invention's most revolutionary and important feature is its ability to automatically re–charge its batteries while the vehicle is in motion or not. This critical instantaneous re–charging ability is achieved through the deployment of redundant, radical on–board non–polluting power generating systems that may be used to re–charge batteries or used as primary power source to propel the vehicle. It utilizes a plurality of eco–friendly power generating/re–charging apparatuses allowing it to operate without practical driving limitations, capable of operating for thousands of miles plus, without stopping to re–charge, travelling at sustained, varied highway speeds, on almost all weather and road conditions, day or night, in full comfort, safety and style, permanently negating the use of plugged–in, hybrid vehicles or internal combustion engine technologies. The present invention is the most ideal, practical and cost effective non–ICE, non–plug or non–hybrid land vehicle that is simply called "Engineless", the vehicle that uses the most common of prior art/components assembled in most simplest way but achieving history–making breakthroughs that will forever change the way people of the world drive, work and play while helping Planet Earth get back to pink health. The new engineless vehicle power source technologies, concepts and principles are also applicable for select air and water crafts as well. The present invention is a "back to basic" approach to car manufacturing without the trappings of new, ultra high tech contraptions or gizmos, use of ear–busting and polluting internal combustion engine and astronomical components and production costs. Simplicity is pure beauty, the essence of Advanced Propulsion Engineless Vehicle invention that will usher a new dawn of healthy civilizations, a very green, clean, cool and peaceful Planet Earth, now and for centuries to come.

Abstract:
Source: KR20030075470A PURPOSE: A nonskid device for a vehicle is provided to restrict slip of the vehicle completely on a snowy or frozen road by mounting the slip preventive device in the tire wheel, and to use conveniently by automatically restricting the slip with operating a switch simply. CONSTITUTION: A nonskid device is composed of a wheel assembly(10) separably combined with a tire wheel and rotated; plural guide units(20) having plural guide cylinders radially formed in the wheel assembly, and guide shafts longitudinally installed in the guide cylinders with rotating and reversing; a slip preventive unit(30) having a slider combined spirally and reciprocated radially to the tire wheel along the guide cylinder in rotating the guide shaft, and a contact spike formed in the outer end of the slider; a driving unit installed in the center of the wheel assembly to rotate and reverse the guide shafts; a drive control unit(50) controlling operation of the driving unit; and an operating switch installed in the vehicle to adjust control of the drive control unit.

Abstract:
Source: US5259082A A mechanism is provided for dislodging a submersible cleaning device from a vertical wall after a predetermined time period on such wall. The mechanism includes an operating gear that engages when the cleaning device climbs the wall. Once engaged, the gear drives a cam mechanism which in turn engages a device for pushing the cleaner off the wall thereby breaking the suction of the cleaning device and causing the cleaning device to drop from the wall. A turning brush is used to break the suction but it will be appreciated that any lever or similar device can be employed.

Abstract:
Source: DE2836444A1 (Claim 1) Patentanspruch fuer Kfz – eigene – Streuvorrichtung bei Schnee und Eisglaette Gekennzeichnet durch Unter einem KFZ zu befestigender Streukopf mit Duesenoeffnungen zu allen vier Raedern. Der Streukopf ist mit einer Kunststoff oder Metall Leitung zu einem Sandvorratsbehaelter im Motorraum verbunden. The sand sprayer is fitted under a motor vehicle to spray sand on ice covered road under all four wheels. The sprayer head is connected by a tube to a sand storage box in the engine compartment. Engine heat dries the sand which is sprayed by a small compressor operated when required from the dashboard controls. The sand sprayer system can be connected to the brake light switch, and the compressor can be operated on actuating the brake pedal. The fine grain dry sand is entrained by the air stream and sprayed in front of individual wheels by the nozzles to ensure stable braking on ice covered road.

Abstract:
Source: US2004028907A Disclosed are weatherable multilayer articles comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) a substrate layer, wherein the coating layer is in contiguous superposed contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for making the multilayer article.

Abstract:
ECOLOGICAL MACHINE FOR MANUFACTURING ADOBE BRICKS, BLOCKS AND BRICKS, WHICH CONSISTS OF A MIXER INTEGRAL WITH A DRY SAND HEATER, A THERMOFORMING MANUFACTURING MODULE INCLUDING ITS OWN UNITARY CARRIER, WHICH HAS THE REQUIRED MECHANISM FOR MANUFACTURING BRICKS BY THERMOFORMING USING COMPACTING HEATED MUD, AND A STACKING ROTATING MECHANISM, THE INVENTION ALSO COMPRISING CARTS FOR TRANSPORTING THE FINISHED PRODUCT THROUGH A LINEAR COOKER, A COOKER INTEGRAL WITH A VAPORISER (2), A METALLIC–CONSTRUCTION STYLISED TANK, A FILTER FOR RECOVERING POLLUTING SUBSTANCES INCLUDING A CONDENSER ALSO IN A METALLIC CONSTRUCTION. THE INVENTION MAY USE A THERMOFORMING MANUFACTURING MACHINE INTEGRAL WITH THE AFOREMENTIONED ELEMENTS, WHICH HAS A PLURALITY OF MOULDINGS SO AS TO ACHIEVE A HIGH PRODUCTION; THE MACHINE HAS A DISC SHAPE, WHEREIN THE UPPER PORTION THEREOF HAS A HALF SPHERE SHAPE WHERE THE WHOLE ESSENTIAL MECHANISM ARE HOUSED THEREIN SO AS TO CARRY OUT THE AFORESAID MANUFACTURE PROCESS, THE THERMO FORMING MANUFACTURING MACHINE BEING BUILT IN SUCH A MANNER THAT THE COMPONENTS THEREOF ROTATE AROUND A CORE, ALSO INCLUDING A PLURALITY OF GUIDES OR NOTCHES FOR SYNCHRONISING THE DIFFERENT INNER MECHANISMS; THE DISC FURTHER ACTS AS A HOUSING OF OTHER MECHANISMS THAT ARE ATTACHED THERETO IN DIFFERENT FORMS AND WHICH ARE REQUIRED FOR ACHIEVING A HIGH PRODUCTION.

Abstract:
Source: GB546604A 546,604. Statistical machines; perforating cards. REMINGTON RAND, Inc. Aug. 16, 1939, No. 4819/41. Convention date, Sept. 3, 1938. Divided out of 546,590. Drawings to Specification. [Class 31 (ii)] A machine for sensing master and detail cards fed to the machine comprises in combination mechanism for comparing perforated patterns in preselected portions of such cards, punch mechanism for transferring additional perforations from the master cards to the detail cards and a punch control mechanism operable under the control of the comparing mechanism to render the punch mechanism ineffective for transferring additional perforation patterns when the patterns in the preselected portions of the master and detail cards are identical. The card feeding mechanism generally may be similar to that described in Specification 510,910 and the driving and c. mechanism similar to that described in U.S.A. Specification 2,044,119. The' detailed apparatus described is identical with that set out in Specification 546,590; Specifications 546,602, 546,603 and 546,605, [all in Group XIX], also are referred to.

Abstract:
Source: US2008161968A A unique piece of engineering device "BT' Smart Machine" (BTSM) is described with the capability of lawn mowing, leave blowing/vacuuming, snow blowing, and general purpose blowing/vacuuming with other extra functionalities such as vehicle jump starter, heavy duty air compressor, vertical trolley, horizontal trolley, and outlets for AC and DC devices. BTSM' uniqueness lies in the fact that it can be run in manual (semi–automatic mode) or automatic mode (hands free mode). In manual mode (semi–automatic mode) BTSM anticipates and helps you along the way while in full–automatic mode BTSM does the work for you while you are home away from home or simply use that time to do something else and with a minimum of 10 to 12 hr uninhibited rechargeable battery life, BTSM has more than enough power to traverse your entire compound. In addition to all that, BTSM also runs off of solar energy which further maximizes battery life.

Abstract:
Source: US2001055671A Substantially solvent−free multilayer articles characterized by excellent color retention and gloss retention, solvent resistance and recyclability comprise a substrate layer comprising a first material selected from the group consisting of a metal, ceramic, glass, a celluosic material, a thermoset resin, and a thermoplastic resin, and a resinous coating layer which comprises at least one auxiliary color stabilizer additive and an arylate polymer comprising ester structural units derived from a resorcinol or alkylresorcinol isophthalate−terephthalate. An intermediate layer may also be present.

Abstract:
Source: GB529844A 529,844. Record–card–controlled statistical machines. BRITISH TABULATING MACHINE CO., Ltd. (Deutsche Hollerith Maschinen Ges.). May 23, 1939, No. 15350. [Class 106 (i)] Sorting cards.–In a machine for sorting code cards, the card column on which sorting is effective is selected by a column–selector 32a, 53, which, when sorting of the cards on that column is completed, is automatically adjusted to the next column by a special last card, the cards being fed transversely of the columns, whereby the time in the cycle at which the selected column is read is according to the setting of the selector. The special card also auto–transfers the control from one designation to the next in the one column, the cards from the reject box after each designation sorting being re–inserted by hand in the supply magazine. Fig. 1 shows a code card with upper and lower card fields punched according to the code of Fig. 2; the combination " S " is punched in each column of the special card. The cards are fed through the machine in a direction at right angles to the line of the columns. The reading means consist of four wire brushes 10 to read the four hole positions of a column simultaneously and this set of brushes is adjusted laterally along the rod 17 to read the upper or lower card field. The cards are fed from the supply magazine by picker 12 and three pairs of rollers 13 to a " selected " pocket A or the " reject " pocket R under control of the sorting magnet 15. The code readings are decoded in known manner by four magnets 60 controlling ladder circuits 61a and ten lines 81 connected to studs 81a, of which line 81–S corresponds to the holecombination S for the special card; the latter is placed on top of the cards in the supply magazine. The column–selecting device consists of a wheel 35 continuously driven from the card–feed mechanism and carrying contact means 34 which bridge a stationary contact ring 33 and an insulated conducting spot 32a carried on a stationary shaft 30. Time of bridging in the cycle will therefore depend upon the setting of the angular part 32a, the shaft 30 being adjustable. The pointer 53 carried with the part 32a, coacts with a scale 53a to show which of the fifteen card columns has been selected as the first column for sorting. Contact means 43 carried by the shaft 30 bridge a stationary contact ring 44 and a ring 40 which is conductive except for an insulating spot 42. This ring 40 is manually adjustable, for last column selection, by a pointer 41, so that if it is set at " 7 " as shown in Fig. 3, when after seven automatic adjustments from column " 14 " the pointer 53 reaches column " 7 " the spot 42 interrupts the holding circuit 87 of the motor and brings the machine to rest At each card run, the arm 21 on shaft 25 is moved automatically one stud to the next designation of the card column and an indicator shows the designation being dealt with. Circuits.–When start key 50 is closed, relay 65 closes contacts 88 to energize motor 11 and closes contacts 87 to give a holding circuit for relay 65 through stop key 52 and parts 44, 43, 40. Sorting proceeds for designation " O " column " 14," of the card and at the end of this first run, cards so punched are in box A all others in box R, and the last, special card S, has energized line 81–S. Magnet 23 actuates pawl 85 to move the shaft 25 and arm 21 one step to the " 1 " stud 81a. The cards from reject box R are replaced manually in the supply magazine and sorting proceeds on designation "1," column " 14." Such cards go into box A on top of the cards punched " O," column "14" and the rest into box R. At the end of ten such sortings for column " 14 " as arm 21 passes from stud " 9 " to stud " O," the insulated conductive end 83 bridges contact 26 to energize the relay 27 which then actuates pawl 29a to advance the shaft 30, together with parts 32a and 43, one step. The movement of part 32a alters the timing relatively to continuously rotated parts 35, 34 that circuit is now made as the brushes read column " 13." Ten more sortings occur on column " 13 " and then a further shift to column " 12 " and so on. After column " 7 " has been fully dealt with, the next timing adjustment of part 32a coincides with arm 43 reaching the insulated spot 42, so that the latter breaks the holding circuit 51b, 87, relay 65 is de–energized and opens contacts 88 to stop the motor 11. After selecting column " 14, " say, as the first column for sorting, if it is desired to start at, say, designation " 5 in column " 14," key 24 is closed the requisite length of time for magnet

23 to advance arm 21 to the number " 5 " stud 81a.

Abstract:
Source: DE19502143A1 The grip chain (15) is made of interlocking elements which slide into each other to reduce the chain length. The chain is stored on the side of the wheel and is attached to flexible mountings (42) which are wound on servo drives (3) on the side of the wheel. When extra grip is required the servo drives are activated to move the chain onto the wheel tread. A simple design uses flexible steel tape supports wound onto servo driven drums. Another flexible support is obtained from a chain of ball shaped elements guided in a flexible guide. The servo drives include sprocket wheels engaging the support contour e.g. slits in the steel tapes. The control system includes position control switches to regulate the end positions of the drives, as well as centrifugal switches.

Abstract:
Source: GB715115A 715,115. Typewriters c. LEGLISE, P. Feb. 15, 1951 [March 17, 1950], No. 3668/51. Class 100 (4) In an end–of–line justifying typewriter wherein the first part of the line is typed in the usual manner and justification is effected in a terminal segment (comprising e.g. 20 normal letter spaces) by contraction or expansion of the text, a first member, longitudinally adjustable and fixed to the frame of the machine, is engaged by a second member, carried by the escapement rack or the carriage of the machine, when the escapement rack reaches a predetermined position, to cause either, both the platen and carnage or the platen only to have a differential sliding motion of pre–selected amplitude and direction in relation to the escapement rack of said machine and causing the justification on the terminal segment. In the embodiments described, texts comprising 16–24 character spaces c. are justified into a normal 20 letter–space terminal segment by giving a movement to the platen 21 relative to that of the escapement held rack Cr. The platen carriage Ch may be integral with either the platen or the rack in any of the various embodiments so that justifying mechanisms to be described may be fitted either on the carriage plus platen assembly or on the carriage plus rack block causing relative movements to the rack or platen respectively. In an example described with regard to Figs. 8 and 9 the first member in the form of a rectilinear guide 57 pivoted at 58 on a piece 68, is slidably adjusted and locked by a latch 63–64, on a margin stop rack 69 so that the commencement 58 of the guide 57 is coincident with the commencement of the terminal segment. The second member is in the form of a touching–rod 32 displaced according to the inclination of the guide 57. The rod 32 carries a slider 30 having an oblique slot 29 in which travels a pin 28 fixed to an arm 26. The end of the arm 26 carries a catch–pin 25 engaging in a groove 24 of the platen 21 so that as the touching rod 32 is displaced the action of the slot 29 on the pin 28 will effect a leftward or rightward movement of the platen 21 according to whether the guide 57 inclines upwardly or downwardly. The parts 29–30 forming the transmission means may be fixed to (a) the escapement rack, (b) the platen plus carriage block with suitable connection of the arm to the rack or (c) to carriage plus rack block. The inclination of the guide, which may also take the form of a grooved or slotted rod, is set according to the amount of contraction or extension required, by locating a catch 60a in one of the notches 62 in an arc 61 attached to the piece 68. The notches marked +IV to –IV correspond to whether the terminal text has to be increased or decreased by four character spaces. The positions of the notches are determined in the manner indicated on Fig. 23 (not shown). The manner in which the touching rod 32 transmits its displacements to effect displacements of the platen relative to the rack may be arranged (a) as shown in Fig. 11, in which the gear wheels 35–37 may be of fixed ratio to give equal, greater or less movements to the arm 26, (b) by slotted bell–crank mechanisms, (c) by a helically grooved sleeve arrangement, or (d) by a simple lever action. The means for adjusting the relative movement between the platen plus carriage assembly and the rack, instead of being part of the first member or rectilinear guide 57 attached to the margin stop rack, may be incorporated in the second member with the guide 57 fixed at a constant inclination. Fig. 24 shows one

example in which the pin 28 of the touching rod 32 reciprocates in a slot 29 in a disc 37 carried by a slider 30 moving in a frame 31. The disc 37 can be rotated to vary the inclination of the slot. The slot may also be formed on a rotatable arm which can be located in notches in a sector integral with the arm 26. The arm 26 and sector may be mounted on (a) the platen 21, (b) the carriage plus platen assembly, (c) carriage pius rack block or, (d) the rack, and the touching rod and the frame 31 carried on the corresponding relatively moving system viz carriage plus rack block, rack, platen or carriage plus platen assembly respectively. In the second type of justifier described with reference to Figs. 42–61 of which Figs. 51 and 58 only are shown, the justifying means comprises a justifying lever L which is pivotally mounted at 0 on (a) carriage plus rack block, (b) the rack, (c) the platen or (d) platen plus carriage assembly. This lever L contacts an actuating stop B adjustable along the margin stop rack 69 so that the lever L is engaged at the commencement of the terminal segment. When letter–spacing now occurs the lever L pivots, and in the embodiment shown in Fig. 51, in which the lever L is mounted on the rack Cr, a groove or slot G engages a pin member A adjustably mounted on a notched rod T fixed to the carriage. According to whether the pin member A is above or below the pivot of the lever L, contraction or extension movement is imparted to the carriage relative to the rack. The pin member A may be mounted on a slider C to which is attached a flat spring l engaging the notches +IV to –IV; alternatively, the pin A may be formed at the end of a flat bar and slide in a slot in the rod T. In such embodiments (Figs. 53–57 not shown) the spring l is mounted on the rod T and urges the flat bar, which is notched with the adjustment settings IV to –IV, into a locating pin on the rod T. Further, the lever L and the rod T may be formed of channel section, Fig. 58, with the pin A adjustable by a rod T^1. The pivot 0 for the lever L is mounted by four screws and blocks u; to the back of the channel, and the boss h of the pivot is located in a bearing hole D^1 in the rack Cr. In a third type of justifying mechanism described with reference to Figs. 62 to 81, of which Figs. 67, 79 and 81 only are shown, the justifying lever L is pivotally fixed to a slider C, Fig. 81, adjustable along the margin stop rack 69 and the relative movement between the carriage rack Cr and the platen carriage Ch is derived by the engagement of the rack Cr and carriage Ch at different points of the lever L. Up to the commencement of the terminal segment, the rack and platen are locked together by a locking–pin e, Fig. 67, on a rocking–bar pivoted (e.g. in the embodiment shown in Figs. 79, 81) on the rack Cr. When the rod T, slidably adjustable on the platen plus carriage assembly, approaches the commencement of the terminal segment the pin e is depressed and a back–support finger d rises to engage the rear of the lever L so that when the point P on the rod T, which is part of the carriage assembly, now moves the finger d, the rack Cr will move to a different extent. With the rod T slidingly set in a guide g to engage notch –IV the lever L moves from a line passing through a point marked "zero" on the axis X–X to a line O–M; it will be seen that while the point P associated with the carriage Ch travels horizontally from zero letter space (point S) to 19+P, the finger d associated with the rack Cr travels only from zero to 15+P. The increment y in this and previously described embodiments indicates the actual position in which printing takes place when using escapement mechanisms in which letter spacing is split into two movements, one before, and one after printing. The rod T has flanges T1 and T2 which ensure that the pin e is depressed for each adjustment in the guide g and whilst it moves relatively to the rod T during justification. The positions of the rod T and the finger d may be interchanged as in the embodiments relating to the two types previously referred to.

Abstract:
Source: FI5916A 1 ... katkaisija 55, kuv. 2, Johon vaikuttaa osaksi Jousi, osaksi saatavassa hammaspyoeraessae 32 oleva nasta. Eteenpaein, X and KIXXiÿ'tapahtuvassa liikkeessae, Jolloin kuvalasln eri osat ovat tMkArrf' paljastwat esitettaeviksi taittokaiterin kirkkaiden pintojen lapl, on lamppu sytytetty,mutta kun paeinvastainen liike tapahtuu, on lamppu sam– mutettu. . Sitaepaitsi voidaan kaeyttaeae katkaisijavartta vastustusnavan kytkemis– tae varten moottorin virtapiiriin Ja siitae erille, niin ettae kone kulkee hitaammin kun kuvaa esitetaeaen, mutta saa suuremman nopeuden, kun luisti siirretaeaen pois Ja uusi saatetaan asemilleen. Sen sijaan ettae poeytae pidetaeaen liikkeessae pienen telkirattaan 37 avulla, kuten osoitetaan kuvissa 1 ja 2, saattaa sen reuna olla varus– tettu hampailla tai syvennyksillae 37a /osoitettu pilkutetuilla viivoil– la kuvassa 23/, Joihin vaikuttaa telkihaka 36a varressa 38, jonon tanko– niveleen avulla vaikuttaa viputanko 59, mikae kannattaa pilkutetuilla viivoilla osoitettua vartta 60, johon taas saattaa vaikuttaa kampitapin– varressa 19 oleva tela 33ss ijawn Viputanko 59 saattaa kiertyae nastan 61 ympaeri Ja siilien saattaa vai– ss kuttaa Jousi 62. Siirtaemaellae tankonivei aukkoon 63 Ja Jousi aukkoon 64 aikaansaadaan ettae telkihakavarsi 58 ottaa ainoastaan joka toisen poey– daessae olevan hampaan multaansa, minkae kautta Joka toinen eikae Jokainen poeytaeaen sovitettu luisti siirtyy eteenpaein esitettaevaeksi. Telklhaka 36a aikaansaa kllnnilukltsemisen, kun se sattuu pysaekeruuviln 64. Telklpyaeraeae varten asetetun suojustimen, kuv. 1 Ja 2, avulla voi– daan telklhaka 36 saattaa vaikuttamaan siten, ettae kukin tai Joka toi– nen luisti poeydaessae Joutuu kaesittelyn alaiseksi, kuten yllae on seli– tetty. Kuvassa 23 on osoitettu kilntonalsessa jalustassa oleva suojalai– te 65, Joka on vallan poeydaen 14 alla, Ja tukee telaa 16a niin ettae, Jos laite asetetaan kaltevaan asentoon, mikae on tavallista elaevien ku– vien teaterissa, luistit eivaet luisu ulos, kun ne saapuvat poeydaen alem– paan puoliskoon. 66 osoittaa vartta, Joka vaikuttaa teloihin 16a niis– sae luistlssa, mitkae mahdollisesti ovat siirtyneet, Ja vie ne jaelleen asemilleenss Ne laitteen laadintamuodot, Joissa luistit kaeaennetaeaen asemilleen, ja joissa kaeytetaeaen yhteistae taittokalterla, ovat esitetyt ainoastaan mah– dollisuuksina, samalla kun kuvissa I0–20 osoitettu muoto, jossa kuvale– vy ja taittokalterl ovat sovitetut kehystaeaen, mikae muodostaa kokonaisuu– den selitettyyn laitteesen naehden semmoisen luistin vaikutuksen alai– sek3lsaattamlsta varten, on paras laadintamuoto keksinnoestae Ja kokeissa osoittautunut sopivimmaksi ja kaeytaennoellisimmaeksi. Patenttivaatimus. 1. laite kinematografisen kuvavaikutuksen aikaansaamista varten yhdistettyjen luistien avulla, joihin kuhunkin kuuluu laepikuultava kuva– levy ja taittokalterl, tunnettu laitteista, mitkae automaattisesti vievaet luistit yhden kerrallaan valalstuspaikkaan ja siltae pois, sekae laitteis– ta, jotka automaattisesti saattavat kunkin luistin vaikutuksen alaisek– si, silloin kun taemae on valaistuskohdassa, niin ettae se synnyttaeae kine– matograflsen vaikutuksen. ... 1 circuit breaker 55, Fig. 2, which depends on into the spring, into accessible on the gear wheel 32, a pin. Forward, and the X KIXXiy'tapahtuvassa motion, In the various components of the kuvalasln tMkArrf 'paljastwat presented to an overseer diverting the surfaces of bright LAPL, the lamp is switched on, but when the opposite movement occurs, the lamp is switched off.. Besides, the resistance can be used katkaisijavartta hub coupling of the motor circuit and it heats, so that the machine runs slower when displaying an image, but not a higher speed when the slide is moved out of their stations and the new may be. Instead of a table kept in motion by low telkirattaan 37, as shown in figures 1 and 2, may be its periphery be provided with teeth or recesses 37a / addressed primed by the solid line configuration in Figure 23 /, which are affected by telkihaka 36a of the arm 38, the queue rod joint control interacts with an arm 59, which is worth primed lines assigned to the arm 60, which in turn may be affected by a crank–arm 19 of the roller 33 ss ijawn lever rod 59 may pivot pin 61 around and hedgehogs may or–ss affect spring 62 moving tankonivei into the opening 63 and the spring opening 64 is achieved by the telkihakavarsi 58 to take only every other feeding table of the tooth mold trap, through which every second and every table with a slider moves forward presentation. Telklhaka 36a provides a kllnnilukltsemisen when it happens to pysaekeruuviln 64 Telklpyaeraeae set for the shielding, Fig. 1 and 2, allows for the telklhaka 36 may influence, such that each or every second slide table He has to treatment; as described above is explained. Figure 23 has been shown to kilntonalsessa the base of the suojalai–te 65, which has a power table 14 below, and supports the roller 16a so that, if the device is placed in an inclined position, which is typical of living as shown in FIGS teater in, pads do not slip out when they arrive at the table lower halves. 66 shows the arm, which appeared in the rollers 16a niis–SA

luistlssa, which may have been transferred to, and takes them back their stations ss The device preparation of forms in which the slides turned to their stations, and with a common taittokalterla, are presented only for opportunities, while the images I0 –20 addressed to the form in which the kuvale plate and taittokalterl are made up of a framework, which forms the overall described the device via a relation to such a one skate under the influence of sek3lsaattamlsta, is the best form of preparation of the invention and the tests proved to be the most appropriate and practical. The claims. 1 device kinematografisen image effect in order to obtain a combined slides through each including a transparent image plate and taittokalterl, characterized in equipment which automatically take up the slides one at a time valalstuspaikkaan in and out of and apparatus used for automatically may each slide influence of alaisek–si, when it is lighting section, so that it generates matograflsen the influence kinetics.

Abstract:
Source: DE2025520B2 The snow tack is made up of an elastic band to encircle the tyre, with a pattern of grip teeth fitted to the band. The track is normally housed in a special container on the car and is released by a dashboard control. This feeds the track towards the tyre, which is rotating slowly. The leading edge of the track is fitted with hinged clamps which grip the tyre by swinging into an upwards position i.e. towards the hub. A special coupling pad is fitted to the rear of the band, extending over the leading edge so that the trailing edge is automatically clipped in place. Extra security can be obtained by fitting a clamp after the track is in place.

Abstract:
The drive has an automated gear box including transmission input shafts (W–1, W–3) and a transmission output shaft (W–2) axially arranged parallel to each other. Switchable idle gears (z12–z15, z31–z34) and association of gear switching devices (S1–S4) are arranged on the input shafts. The input shafts are coupled together on an input side of an input wheel set plane (Z1). The input shafts are rotatably arranged in one of the switchable idle gears via the respective gear switching device. The input wheel set plane is provided with non–switchable intermediate gears (z21, z21a).

Abstract:
Source: US6619177B An apparatus, especially for clearing landmines, wherein there is arranged on a carrier

machine (1) a flail unit (11) connected to an engine to power a flail rotor (12) equipped with chains and weights, which unit (11) comprises two flail arms (13) which at a first end support the flail rotor (12) and at a second end are made in the form of a frame (14), where the arms (13) are pivotally supported at a pivot point (17), so that when the flail rotor (12) is in operation the unit (11) will be maintained in a floating position relative to the surface of the terrain, which apparatus is equipped with a protective shield (15) between the flail rotor (12) and the carrier machine (1). The impacts of the chains and weights against the ground provide an uplift equal to the weight of the flail rotor (12), including the flail arms (13) up to the support point (17), and the protective shield (15) is arranged on the flail unit (11), preferably on the flail frame (14), so that it floats therewith and is thus capable of bending backwards when the unit (11) is raised or lowered as a consequence of, e.g., a detonation.

Abstract:
Source: GB618267A 618,267. Typewriters and c. BRITISH TABULATING MACHINE CO., Ltd. July 31, 1946, No. 22863. Convention date, Aug. 9, 1945. [Class 100(iv)] [Also in Group XIX] A machine in which record cards control the printing of data on a record strip comprises an endless perforated tape moving synchronously with and controlling the feeding of the record strip, the sensing of a succession of data on the perforated tape controlling means for feeding the record strip predetermined distances. The tape TP, Fig. 3, has perforations lt– 9t which are sensed electrically and, in co–operation with special perforations in the grouped control cards, control the feeding of the record strip; the tape is gummed at A so that it can be formed into a continuous loop TP, Fig. 16, for passing round a feeding roller 231 which has pins 232 co–operating with perforations 30 in the tape. The tape control mechanism is located at the right of the platen P, Fig. 17. It is driven by a continuously–running electric motor, the mainshaft of which carries a worm 59, Fig. 10, driving a gear 60 fixed to a shaft 63. Either of two gear trains 61, 67 or 64, 68 for high and low speed feeding respectively, are adapted to continue the drive through a clutch 103, 104 or a clutch 94, 99 to gears 107 or 108, Fig. 17, fixed to a shaft 110 carrying also a stopping disc 109, Fig. 9. The selection and operation of the clutches are controlled by relays LS and HS, Fig. 9. Energisation of magnet LS rocks a threearmed member 176 clockwise, lifting a hook 177 out of engagement with the stopping disc 109 and pressing down a T–member 181, Fig. 14, which, through an interposer 182. depresses a lug 186 on an arm 188 carrying a cam disc 200 which forces the clutch member 94, Fig. 10, into engagement with member

99 and so completes the slow−speed drive. If magnet HS, Fig. 9, is energized first, however, an arm 205 is rocked counterclockwise about a pivot 206 moving interposers 182, 183 Fig, 14, relative to the T−member 181 so that subsequent depression of the latter causes movement of the cam disc 201 to operate the clutch mechanism 103, 104, Fig. 10, for the highspeed drive. The longitudinal movement of interposer 182, Fig. 14, following energization of relay HS is transmitted by an insulated button 215, Fig. 9, to close contacts 216 to cause energization of relay LS. The drive to gears 107, 108, Fig. 17, is continued to integral gears 161, 162 comprising clutch teeth 167 adapted to engage similar teeth 168 on a disc 159 which is mounted on a sleeve 158 slidable along shaft 113 under the control of an arm 172 engaging between flanges 173 on the sleeve. The arm 172 is manually controlled from a knob D, Fig. 16, through a simple linkage 306 to engage or disengage clutch 167, 168. When the clutch 167, 168 is in engagement, the drive from the sleeve 158 is completed through a pin 156, bevel gears 151; 142, 150 to shaft 113, and thence through a coupling 122 to the platen P. Normally no relative movement occurs between the bevel gears 151, 142, 150, but this arrangement provides for fine adjustment of the platen by manual operation of a knob 136 which, when rotated, causes the planet bevel 142 to be carried round, rolling on the teeth of bevel gear 151. By virtue of the fact that bevel gears 150, 151 have different numbers of teeth, the second bevel gear 150 is thus given a slow motion which provides for fine adjustment of the platen, coarse adjustment being provided for by a knob 123 fixed to the shaft 113. The tape drum 231, Fig. 17, is mounted on the shaft 110 carrying the gears 107, 108 and comprises pins 232 for engaging perforations 30, Fig. 3, in the tape, a metal surface for co−operating with the six sensing brushes at each side of the centre, and commutator segments 242 set in insulation 241 for co−operation with further sensing brushes. The tape TP, Fig. 16, is passed over the drum 231 and over one of three supports 256, according to its length, the supports being carried on a slidable frame 247 clamped in position on a slidable 249. The tape sensing brushes B1 are mounted in a frame 263 pivoted at 266 which is swung upwards to facilitate fitting the tape. After fitting, the frame is pressed down until a latch 271 engages beneath a square pin 273. In this position a protruding portion 261 presses on the tape, tautening it. To avoid sparking at the brushes, a pair of contact breakers 285, 286, co−operating with arms 291, 292 and contacts 295, 296 provide that no current is supplied to the sensing brushes when they are just about to enter or leave a perforation in the tape. The type−selecting mechanism, Fig. 7, comprises a bar T, carrying type arranged as shown and moving upwardly in synchronism with the sensing of a card, Fig. 6. The presence of a perforation in one of the positions 9−1 causes energisation of a magnet PR and, through linkage 129, 128, 127, 126 causes an abutment 118 to engage the corresponding step 117 and so stop the bar T with a type Z, Y or X and c. opposite the platen P. The member 118 is held by a lever 131 rockable about a shaft a under the control of a bail 133, until the sensing of the O, X and R positions, when upward movement is resumed until a spring−urged pawl 139 is released to engage in one of the teeth O, X, R in the lever 131. A second impulse to the magnet PR effects this release through a linkage 147, 146, 140 previously rendered inoperative by a bail 148.

Abstract:
Source: US4843742A A trenching apparatus (10) is for excavating deep trenches in which inground concrete retaining or foundation walls may be formed. The trenching apparatus (10) has a crawler base (11) on which a carrier assembly (14) is pivotally supported by pivots (16) whereby it may be tilted by rams (17) to maintain the platform horizontal. An automatic control device (64) is provided for this purpose. The carrier assembly (14) has a pair of rails (18/19) along which a carriage (21) may move. The carriage (21) supports a sleeve (24) through which a trenching arm (25) may be lowered to excavate a trench section as the carriage (21) is driven along the rails (18/19).

Abstract:
Source: DE3400827A1 Tyre studs are prohibited in the Federal Republic of Germany and in many other countries. It is however recommended that vehicles adhere firmly to smooth road surfaces in emergency situations. These plates for firm adhesion to the road are intended to be fitted under the vehicle next to the wheels. By means of fan suction motors the air is sucked up from the suction cups, but also blown in in order to clean the filters, which are in front of the air pipes in order to prevent clogging, but only after lifting again. Narrow wheels provided with suction cups are fitted between the normal wheels and the vehicle, with the same suction cups and filters and fan suction motor as before. When cornering air is sucked much more sharply out of those wheels which lie on the inside of the curve than out of the tyres which run on the outside of the curve. In an emergency sharp braking occurs. For this reason a suction motor is fitted on each side of the vehicle so that the plates fitted between the wheels for self–adhesion on smooth roads are automatically lowered to the ground by means of a lowering and raising device and computer control, to enable the vehicle to adhere to the smooth road. Echo sounding beams or other beams measure remote, moving and non–moving objects at a distance from the moving vehicle, which the computer constantly uses in order to calculate... Abstract:
Source: CO4180428A UN ARTICULO DE FABRICACION QUE TIENE UNA MATRIZ ESTRUCTURAL CONRELLENO INORGANICO QUE COMPRENDE UN AGLUTINANTE ORGANICO DISPERSABLE EN AGUA; UN AGREGADO INORGANICO QUE TIENE UNA CONCENTRACION DENTRO DEL RANGO DE ENTRE 40 percent Y 98 percent EN VOLUMEN DEL TOTAL DE SOLIDOS EN LA MATRIZ ESTRUCTURAL CON RELLENO INORGANICO; Y UN MATERIAL FIBROSO, TENIENDO DICHA MATRIZ ESTRUCTURAL CON RELLENO INORGANICO UN GROSOR DENTRO DEL RANGO DE ENTRE 0.01 nm Y 20 nm.7UN METODO PARA FABRICAR UN ARTICULO COMPRENDIENDO EL METODO LOS PASOS DE: MEZCLAR UN AGLUTINANTE DE POLIMERO ORGANICO, UN AGREGADO INORGANICO, AGUA Y FIBRAS CON EL FIN DE FORMAR UNA MEZCLA MOLDEABLE, ESTANDO INCLUIDO EL AGREGADO INORGANICO EN UNA CANTIDAD DENTRO DEL RANGO ENTRE 40 percent Y 98 percent EN VOLUMEN DEL TOTAL DE SOLIDOS EN LA MEZCLA; MOLDEAR LA MEZCLA EN LA FORMA ESTABLE DEL ARTICULO Y ENDURECER LA MEZCLA EN UNA FORMA ESTABLE DEL ARTICULO, TENIENDO EL ARTICULO UNA MATRIZ ESTRUCTURAL.18UN SISTEMA PARA FABRICAR UN ARTICULO, QUE COMPRENDE: UNA MEZCLADORA ESTRUCTURADA PARA PREPARAR UNA MEZCLA MOLDEABLE QUE INCLUYA UN AGLUTINANTE DE POLIMERO ORGANICO, UN AGREGADO INORGANICO QUE TIENE UNA CONCENTRACION EN EL RANGO ENTRE 40 percent Y 98 percent EN VOLUMEN DEL TOTAL DE SOLIDOS EN LA MEZCLA, AGUA Y FIBRAS; MEDIOS PARA MOLDEAR LA MEZCLA MOLDEABLE EN LA FORMA DESEADA Y LOGRAR ESTABILIDAD DE FORMA EN MENOS DE UN MINUTO Y MEDIOS PARA ENDURECER LA MEZCLA EN LA FORMA DESEADA DEL ARTICULO. An article of manufacture having a structural CONRELLENO MATRIX INORGANIC ORGANIC comprising a binder dispersible in water; INORGANIC an aggregate having a concentration in the range between 40 percent and 98 percent by volume of the total solids in MATRIX FILLED STRUCTURAL INORGANIC; And a fibrous material, said structural matrix STUFFED WITH INORGANIC a thickness in the range between 0.01 nm and 20 nm.7UN method for making an article the method comprising the steps of: mixing an organic polymer binder, an aggregate inorganic WATER And fibers in order to form a moldable mixture, BEING INCLUDED IN THE AGGREGATE INORGANIC an amount within the range of between 40 percent and 98 percent by volume of the total solids in the mixture; Molding the mixture in stable shape of the article and curing the mixture into a stable form of the article, the article having MATRIX SYSTEM ESTRUCTURAL.18UN making an article, comprising: a STRUCTURED MIXER FOR PREPARING A moldable mixture including a binder ORGANIC POLYMER, INORGANIC an aggregate having a concentration in a range between 40 percent and 98 percent by volume of the total solids in the mixture, water and fibers; MEDIA MOLDEABLE molding the mixture into desired shape and form stability ACHIEVE IN LESS THAN ONE MINUTE AND MEANS FOR HARD MIX IN ARTICLE desired shape.

Abstract:
Source: US2005158554A Disclosed is a multilayer article assembly comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) an uncured thermoset or uncured cyclic oligomer substrate layer, wherein the coating layer is in contiguous contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for preparing said multilayer article assembly.

Abstract:
Source: FR1241788A [Source: Claim 1] 1. **ATTENTION** debut du champ CLMS peut contenir fin de DESC **. tant, le parallelisme des bras 10 et 10 bis et celui des roues en rectifiant au besoin par les vis 12 l'orientation verticale des miroirs 11 sur les bras 10 et 10 bis. L'invention prevoit aussi que les deux appareils il voient leurs reflexions entrecoupees par un ecran translucide 16 reposant sur le sol par un pied 17 a mi–distance entre–11 et 11 bis de telle sorte que l'on puisse voir concorder ou non l'un par transparenee, l'autre directement les spots lumineux correspondants a l'epure. On concoit que tous les autres angles soient mesures par ce dispositif en tenant compte que la pointe 7 pouvant tourner, l'axe 8 bis (fig. 4) peut etre oriente verticalement, oscillant sur son milieu et solidaire du bras 10 ter qui porte l'appareil optique 11 ter dont l'ace d'oscillation est horizontal comme 10 ter et dont les projections se mesurent soit sur l'appareil oppose, soit sur l'ecran 16 interpose. L'invention prevoit essentiellement que le plan translucide 16 soit remplace, soit: a. par une glace a double face rayee sur chacune de traits reperes concordant en hauteur ou qu'une glace a une seule face soit montee sur socle a pivot pour pouvoir faire face sans denivellation aux appareils II et II bis, soit: b. par un plan opaque 16 gradue sur chacune de ses faces a des niveaux correspondants de toute la gamme des graduations ou echelles necessaires aux mesures deja citees. Il est prevu aussi que ce plan 16 peut porter en son centre une source lumineuse pouvant alimenter a la fois les miroirs 11 et 11 bis dont les effets se portent sur le panneau 16. Il est prevu que le plan 16 represente porte sur le sol sur un socle 17 soit fixe au vehicule en dessous de toute membrure telle que pare–choc, en son milieu d'ou il resulte que ledit plan 16 se deplace avec le vehicule comme les ensembles appliques sur les roues. L'invention prevoit que la liaison entre les deux cotes soit assuree par le positionnement d'une regle droite 13 bis instantanement amovible qui vienne s'encastrer par ses extremites dans les rainures de deux plateaux 18 orientables sur le bras 10 et bordes de deux secteurs gradues avec reperes sur le bras 10 (fig. 5). L'axe d'orientation de ce plateau, vertical pour les mesures de parallelisme sera horizontal et monte sur charnieres a axe vertical pour les mesures de chasse et de carrossage ou d'inclinai son des pivots qui concernent des deviations complexes d'axes verticaux au cours du bracage. L'invention prevoit que sur chaque bras 10 soit monte un pendule sur rotule a balancier 18, fig. 7, dont la pointe superieure 19 indique a travers un verre bombe 20 gradue de cercles concentriques et de rayons (fig. 8) les valeurs comparatives des debattements des deux roues, etant dit qu'un niveau a segment spherique peut etre utilise mais presente moins de precision. Ainsi la regle ou les systemes optiques pourront etre completes eventuellement par les coupoles decrites. On voit fig. 7 que la coupole 20 est fixee par un bras 21 avec un systeme a pince ou coulissant permettant la mise a zero de l'aiguille avant debattement d'orientation des roues. L'invention prevoit enfin que la fixation 4 par charniere et rotule deportee eventuellement soit remplacee pour les mesures sur des angles importants par un accrochage sur le dessus du pneu suivant la figure 6 combinee avec la figure [Source: Claim 1] 1. ** WARNING ** start of CLMS field may contain end of DESC **. As the parallelism of the arms 10 and 10a and the grinding wheels as required by the screws 12, the vertical orientation of mirrors 11 on the arms 10 and 10a. The invention provides for the two devices as it see their reflections interspersed by a translucent screen 16 resting on the ground by a foot 17 is halfway between 11 and 11–bis so that we can see the match or not one by transparenee, the other directly corresponding bright spots has epure. It conceives all other angles are measures by this device considering that the tip 7 rotatable axis 8a (Fig. 4) can be oriented vertically oscillating on the middle and fixed to the arm 10b which carries the optical device 11b whose oscillation ace is horizontal as 10b and whose projections are measured either on the device opposes either on the screen 16 interposed. The invention provides for essentially the translucent plane 16 is replaced by: a. by a glass double sided striped on each of benchmarks traits consistent height or ice that one side is montee Stand pivot has to cope without elevation change to the devices and He He bis or b. by an opaque plane 16 graduated on each of its faces a corresponding levels of the full range of scale or scales needed to already cited measures. It is also expected that this plan 16 can carry in its center a light source that can power has both mirrors 11 and 11a whose effects relate to the panel 16. It is expected that the plan represents 16 touches the ground on a base 17 is fixed to the vehicle under any chord as bumpers, in the middle of or it follows that the plan 16 moves with the vehicle as the sets appliques on wheels. The invention provides that the

connection between the two sides is ensured by the positioning of a right rule 13a instantly removable who comes to built its ends into the grooves of two adjustable plates 18 on the arm 10 and hoardings of two sectors GRADUATED with benchmarks on the arm 10 (fig. 5). The tray of this orientation axis, vertical to the parallelism measures will horizontal and hinged with a vertical axis for hunting and measures camber or bowed its pivots which involve complex deviations of vertical axes during the bracage. The invention provides that on each arm 10 is mounted on a pendulum balance patella 18, fig. 7, the upper edge 19 states through a glass bomb 20 graduated concentric circles and rays (fig. 8) the comparative values of the deflections of the two wheels, being told that a spherical segment level can be used but presents less precision. Thus the rule or optical systems will eventually be supplemented by the described domes. We see Fig. 7 that the dome 20 is fixed by an arm 21 with a clip system or sliding to the setting to zero of travel front needle wheel orientation. The invention further provides that the fixing by 4 hinge and ball deportee eventually be replaced for measurements on large angles by hanging on top of the tire according to Figure 6 combined with Figure

Abstract:
Source: US2001021734A The color stability of thermoplastic polymers comprising structural units derived from at least one 1,3−dihydroxybenzene and at least one organodicarboxylic acid is enhanced by combination with at least one photobleachable 4−aminocinnamic compound such as 4−dimethylaminocinnamaldehyde. The latter absorbs radiation in the range between about 360 nanometers and about 390 nanometers, balancing the radiation absorbed by hydroxybenzophenone moieties formed in the polymer.

Abstract:
Source: US4691593A A limited slip differential system in the drive train of a motor vehicle with continuous all−wheel drive is provided with a direct through drive acted on by an intermediate planetary transmission and an engageable braking device. The transmission ratio between the planetary transmission and the braking device is substantially higher than the transmission ratio for the direct through drive. This keeps the required braking moment small and allows the use of a relatively small braking device.

Abstract:
Source: FR2657597A Device which can be fitted to the driving wheels of a motor vehicle which has got stuck in the sand or in the mud. The invention relates to a device making it possible, regardless of the nature of the ground, to tow one's vehicle out of its poor position by fitting to the front or rear driving wheels two grapnel winches the tensioners of which are fixed inside vent orifices (4) of the wheel rim (14). It consists of: – an outer sleeve (1) in the form of a funnel conical at its base (28), carrying the automatic roller compartment (7) with a strap (3), and taking up position on the wheel rim (14) by application of its ring (18), – an inner sleeve (2) with a spring (11) with manual immobilisation (5) so that the ring (19) exerts its pressure on the wheel nuts (17), – several tensioners of the same type, from four to five, each of them forming an assembly (3–10–12–13–15–20–24–25), returning the sleeve (1) via firm pressure on to any part whatsoever of the wheel rim (14) about its axis (23). The device according to the invention is particularly intended to be fitted to the driving wheels of a motor vehicle.

Abstract:
Source: US5507994A A process for the production of a plate with a polymer frame shaped onto the edge of the plate. The frame is extruded onto the plate while the latter is held stationary in a working station of a handling automaton or robot with a support device which corresponds to the shape of the plate in such a way that the edge of the plate projects freely over the support face of the support device. With the aid of the robot, an extrusion die having a through, mouth–like slot with two jaws engages the top and bottom surfaces of the circumferential edge of the plate as the mouth–like slot engages the plate edge. At the front end of the two jaws of the die mouth, there are sealing ledges movable at right angles to the plate surfaces, which are supported on the latter during the extrusion process.

Abstract:
Source: JP4066307A PURPOSE: To prevent both tire slip and road damage by moving metal bars outward and inward through movable plates in response to rotation of a cam provided on a wheel, so that spikes can project from and retreat in a tire tread. CONSTITUTION: When a vehicle is to run on a snow–covered or frozen road, a cam 3 provided on a wheel 18 is rotated by a predetermined angle so as to push outward several movable plates 2 and to push out spikes on the tips of metal bars 1 housed inside a tire 17, thus allowing the tire 17 to exhibit its drive and control performance which is similar to that of a conventional spike tire. When a vehicle is to run under road conditions which do not require spikes, the cam is rotated by a predetermined angle while a pin 11 is pulled. Since each movable plate 2 and metal bar 1 are equipped with each compressed coil spring 9, which applies pressure toward the central port of a wheel 18 at the time the movable plate 2 and the metal bar 1 automatically move toward the central part of the wheel 18 when they are released from the force of the cam 3, withdrawing the spikes from the surface of the tire.

Abstract:
Source: US5350035A This invention relates to a vehicle comprising an antihydroplaning system, particularly for improving the wheel adhesion despite the presence of a sheet of water on the road. Output signals from sensors for detecting body and chassis vibrations, ambient temperature and other parameters are analyzed to determine when hydroplaning is occurring or about to occur, and to activate antihydroplaning measures.

Abstract:
Source: US5692267A A fiber processing apparatus includes a plurality of serially−arranged fiber processing components for forming and advancing a fiber web and for gathering the web into a sliver. Some of the components are spaced by a clearance from one another such that the fiber web, while passing from one of the components to an adjoining, spaced component has a length portion unsupported by either of the adjoining components. There are further provided an imaging apparatus which has an illuminating device directing a light beam onto a surface area of the unsupported length portion of the running web; and a camera for sensing the light of the surface area lit by the illuminating device. An electronic image processing unit is connected to the camera for examining signals received therefrom.

Abstract:
The object of this invention is to provide a large scale but low cost windmill by maximizing wind–contact out of the least cost of materials with least cost of maintenance. This is attained by making the sails (100) as large as possible using light materials such as framed fabrics or aluminum sheets, by arranging the large sails (100) to form a long line of parading sails in one direction transverse to the wind and another long line of the same kind parallel to the first line but moving to the opposite direction with which the first line makes a closed loop, by using a strong light weight cable chain (101) that is tugged by the large sails and which also turns the terminal gears (102) located at the two ends of the loop, by using light weight vehicles to carry the large sails.

Abstract:
Source: DE3411088A1 The invention relates to a vehicle wheel which is specially developed for winter use and which permits special brackets to be plugged into the wheel in the event of ice and snow and thus to offer protection against slipping. The brackets engage around the tyre as far as the tread and consist of plastic, metal or a combination of the two. The handling of the brackets is characterised by the greatest possible degree of simplicity and can be performed in seconds. The bracket is plugged in and locks automatically. It is unlocked by pressing a lever. Bolts or tools are not necessary.

Abstract:
Source: BRPI0700324A MAQUINA CONFORMADORA GRAMPEADORA SEQUENCIAL DE RECIPIENTES LAMINADOS DE MADEIRA PARA MUDAS DE VIVIEIROS. Refere–se a uma maquina para a execucao automatica do processo de fabricacao de recipientes laminados de madeira para mudas de viveiros florestais e agricolas. Atualmente esta conformacao e manual, o operador pega o laminado de madeira e com as maos da ao laminado a forma de tubo e o grampeia. Uma tarefa dificil, dado ao enorme volume de producaoe pode causar problemas como: de saude, repetibilidade e outros, atrapalhando os processos produtivos do cultivo. O ciclo de funcionamento da maquina e definido em duas etapas paralelas que atuam de forma simultanea e sincronizada: etapa de alimentacao e etapa de conformacao. o motor (01) aciona o eixos (04) e (20), e aciona o excentrico (07) que avanca o carro aumentador (09) que empurra o ultimo laminado de madeira da pilha do carregador (11) deslocando o laminado pelo trilho guia (13) ate a base de retencao (14), os eixos (04) e (20) acionam tambem os carros (16) (23), (24) e (28) de forma sequencial, moldando o laminado de madeira contra o macho central (18) dando a forma de tubo cilindrico ao mesmo, grampeando–o e sequeencialmente o braco extrator (32) avanca a camisa extratora (35) que se desloca fazendo a extracao do recipiente laminado de madeira pronto para o uso.

Machine translation: STAPLER SEQUENTIAL MACHINES IN COMPLIANCE PACKAGE LAMINATED WOOD FOR SEEDLINGS VIVIEIROS. Refers to a machine for automatic execution of the process of manufacture of wooden containers rolled seedling nurseries and agriculture. Currently this conformation and manual, the operator picks up the wood laminate and the hands of the rolled tube form and staples. A difficult task, given the enormous volume of producaoe can cause problems such as healthcare, repeatability and others, disrupting the processes of cultivation. The duty cycle of the machine and set in two parallel steps that act simultaneously and synchronized: step step power supply and conformation. the motor (01) drives the shaft (04) and (20), and drives the eccentric (07) which brought the car increases (09) which pushes the last wood laminate battery charger (11) the laminate moving by rail guide (13) to the base retention (14), axes (04) and (20) also trigger the cars (16) (23) (24) and (28) sequentially, shaping the laminated wood against the male central (18) giving the form of cylindrical tube to it, tapping it and sequeencialmente the extractor arm (32) advances the shirt extraction (35) that moves making the extraction of container laminate wood ready for use.

Abstract:
The transport trailer has a loading area, a rubber spring axle and a guide (20), where the loading area is movable with the guide from a driving position to a storage position with respect to the rubber spring axle. The rubber spring axle has similar orientation in both the driving position or the storage position with respect to the loading area. The loading area is movable by the guide in a manual manner or by using tools.

Abstract:
Source: DE20200997U1 (Claim 1) 1. Vorrichtung zur Fahr– und Anfahrhilfe bei Schnee– und Eisglaette an Kraftfahrzeugen, vorzugsweise an LkW, dadurch gekennzeichnet, dass das Kraftfahrzeug mit wenigstens einem Behaelter (1) fuer Streugut, insbesondere Sand, ausgeruestet ist und mit zugehoerigen, vom Fahrzeuginneren steuerbaren Foerdermitteln (2, 3) zur Befoerderung des Streugutes auf die Fahrbahn in Streubereiche, die unmittelbar vor und hinter den Antriebsraedern liegen.

Machine translation: (Claim 1) 1. Device to the driving and starting assistance with snow and ice smoothness characterized in motor vehicles, preferably in truck, by the fact that the motor vehicle is equipped with at least one container (1) for grit, in particular sand, and with associated conveyances controllable of the vehicle inside (2, 3) for the transport of the grit on the roadway into scattering ranges, which lie directly before and behind the drive wheels.

Abstract:
Source: BRPI0901148A 1 Resumo A "Trava de Engate Rapido" e um invento para ser colocado rapidamente no setor da industrializacao, devido a sua utilidade, necessidade atual de diminuicao de custos, por sua rapidez na fabricacao, utilizacao e 5 manutencao de equipamentos de varios setores da Industria e Comercio. – A "Trava de Engate Rapido" e de facil manuseio, para travar e so encaixa–la nos pinos frisados de engate rapido (8) nos orificios de entrada (9) na estrutura (5) e empurrar a "Trava de Engate Rapido" ela se travara automaticamente e para soltar e so apertar e ficar apertando o botao de liberacao (1) da estrutura (5) que a 10 "Trava de Engate Rapido" se destravara automaticamente soltando o que o sistema foi instalado e depois puxar a "Trava de Engate Rapido" liberando–a do pino frisado de engate rapido (8), depois sim, soltar o botao de liberacao, abrangendo assim uma infinidade de itens para sua utilizacao. 15 1 Summary The "Lock Quick Hitch" and an invention to be placed quickly in the industrialization sector, due to its usefulness, the current need for lessening costs for its speed in manufacture, use and 5 maintenance of various sectors of industry equipment and Trade. – The "Lock hitch Rapido" and easy handling, to lock and so fit it in beaded pin quick coupler (8) in the inlet holes (9) in the structure (5) and push the "Hitch Lock Rapido" it automatically had fought and drop and so tighten and be pressing the release button (1) of the structure (5) to 10 "Lock Quick Hitch" to unlock automatically releasing what the system was installed and then pull the "Lock Quick hitch "releasing the beaded pin quick coupler (8), then yes, release the button release, thus covering a multitude of items for their utilization. 15

Abstract:
Source: BRPI0903232A EQUIPAMENTO E METODO PARA COMPOSTAGEM. Que consiste num equipamento para compostagem que faz a mudanca automatizada de uma leira para a outra, compreendidos por uma estrutura basica similar a uma ponte rolante, que contem um sistema de entrega de dejetos e um sistema de agitacao do substrato; sendo que estrutura basica similar a uma ponte rolante e constituida por duas barras tubulares(1) dispostas paralelamente uma em relacao a outra, onde e posicionado um carro(2) de agitacao, com pas agitadoras(21), parte do sistema de agitacao, e outra barra tubular(8) disposta paralela as barras tubulares(1); e cada uma das extremidades das barras tubulares(1 e 8) estarem fixadas numa base(1O) que possui rodas(1O1) e sao posicionadas sobre trilhos(1 10) dispostos sobre as paredes longitudinais externas(1 1) das leiras(1 15 e 117); compreendendo ainda um meio para armazenar os dejetos antes de serem despejados sobre as leiras(115 e 117) e realizar deslocamento longitudinal e transversal ao longo das leiras(1 15 e 117) por meio de cabos de aco.

Machine translation: EQUIPMENT AND METHOD FOR COMPOSTING. What is a composting equipment for making the change to an automated windrow to the other, understood by a basic structure similar to a crane, which contains a slurry delivery system and a system of agitation of the substrate, which is basically similar structure a crane and consisting of two tubular bars (1) parallel to one another in relation to, and positioned where a car (2) of agitation, with paddles (21), part of the system of agitation, and other tubular bar (8) disposed parallel tubular bars (1), and each end of the tubular bars (1 and 8) are fixed basis (1O) having wheels (1O1) and are positioned on rails (1 10) arranged on the walls longitudinal external (1 1) the windrows (January 15 and 117), further comprising a means for storing the wastes before being dumped on the ridges (115 and 117) and perform longitudinal and transverse ridges along the (1 15 and 117) by means of steel cables.

Abstract:
Source: US3951194A Anti−skid means for front or rear vehicle tires comprising shoes of pliant material around the tire held in place by lengthwise chains terminating in hooks lying against the outer and inner side walls, which shoes are one−piece with a ribbed and textured central portion for the tread and sides and means for removably holding the shoes and associated shackles in place during rotation of the wheel of the vehicle. The parts are specially designed to give good traction and comfortable riding qualities on icy and snowy surfaces with reduced wear.

Abstract:
Source: DE2620525A1 PATENTANS PRUE CHE 1 Gleitschutzvorrichtung offener Bauart zum Anbringen an einem Reifen eines Motorfahrzeuges, ohne es zu heben oder schieben, mit zwei zueinander parallel verlaufenden Seitentraegern (1, 2), an welchen ein Laufnetz (3) aus Greifelementen aufgehaengt ist, wobei der eine Traeger (2), der beim Verlegen des Gleitschutzes ueber dem Reifen (9) zum Anliegen an der Aussenseite des Rei fens kommt, auf einem seiner Enden eine Oese (7) und auf dem anderen Ende einen in die Oese einhaengbaren Verschlusshaken ring (8) traegt, dadurch gekennzeichnet, dass die beiden Enden des anderen Traegers (1), der beim Verlegen der Vorrichtung ueber dem Reifen (9) zum Anliegen an der Innenseite des Reifens kommt, mit je einer Spannschlaufe (4, 4a) versehen sind, in welcher ein Verlaengerungsstueck (5, 5a) mit einem Endhaken (6, 6a) ein gesetzt ist, welche Verlaengerungsstuecke (5, 5a) mit den Endha ken (6, 6a), nachdem die Vorrichtung von oben ueber dem Reifen (9t gelegt ist, gegenseitig durch die Spannschlaufen (4, 4a) des jeweils anderen Traegerendes an der Innenseite des Reifens (9) durchfuehrbar und zusammenziehbar sind, um an der Aussenseite des Reifens (9) durch die Oese (7), in welcher der Verschluss hakenring (8) eingehaengt ist, durchgefuehrt und mit ihren End haken (6, 6a) an dem einen Traeger (2) verschlauft und abnehm bar befestigt zu werden 2. The snowchain is fitted with fastening strands (2) on both sides, with the side away from the car on the outside of the wheel having simple hoops (7) and clips (8) to secure the chain. The inside edge has extended fitting lengths (5, 5a) with hooks (6, 6a) at the ends. The chain is draped over the wheel and the inside lengths threaded through open loops (4, 4a) near the ends of the chain pattern, and tightened, and with the hooked ends taken to the outside of the wheel. The chain can be fitted rapidly without having to reach behind the wheel. The long lengths are thrown past the rear of the tyre and threaded through the hoops at the tyre edges. With all the hooked ends on the outside of the wheel, fitting is a simple operation.

Abstract:
Source: DE2556263A1 Patentanspr ue c 12 e: 9 Gleitschutzeinrichtung fuer Fahrzeuge, insbesondere tuer die Raeder von Strassen– oder Schienenfahrzeugen, dadurch gekenn zeichnet, dass am Fahrzeug (1) ein oder mehrere Aufnahmebe haelter (11, 12) fuer die Aufnahme von Streugut angeordnet sind und dass zumindest jedem Fahrzeugrad (15) einer Fahrzeug achse eine das Streugut zwischen die Radlaufflaeche (65) und die Fahrbahn (F) einstreuende, steuerbare Vorrichtung (45, 461 48) zugeordnet ist 2. Grit reservoirs are mounted in front of each wheel and have a double skinned construction. The space between the walls is heated by coupling it to the cooling water circuit or by passing some of the exhaust gases through it. The grit can also be heated by heating coils in the grit to prevent it clogging. The release of the grit is automatic, linked to the operation of the brake pedal, with a main control switch to prevent release in normal driving conditions. The system provides good wheel grip on roads where spiked tyres are banned, without having to fit snow chains.

Abstract:
Source: US4127434A A hand operated dry wall taping machine includes an elongated tubular body, to be held by the operator, having a tape applicator head portion at the end thereof adjacent the seam being taped. A supply roll of tape is carried from the tubular body. The applicator head includes a dry wall cement dispensing box through which the dry wall tape is fed. Cement is dispensed onto the side of the tape which is to face the wall being taped. A rotary tape shear is disposed up–tape from the cement dispensing box. A thumb actuated pneumatically operated cylinder actuates the rotary shear at the end of the seam being taped and advances a short length of tape through the cement dispensing box in readiness to commence taping of the next seam. A whisker valve in an air line is actuated by the pneumatically operated cylinder for delivering a momentary blast of air into the cement dispensing box for feeding mud onto the advanced leading end of the sheared tape. A second thumb actuated pneumatically operated cylinder controls operation of a cornering wheel for folding the cement laden tape into corner seams. A third thumb actuated pneumatically operated cylinder controls the supply of dry wall cement to the cement dispensing box from a tank of mud carried from the body of the operator, such tank being pressurized with air from an air compressor. The tank is connected via an air line to the air compressor which is carried from a hand truck. The air line is payed out from a spring loaded reel also carried from the hand truck.

Abstract:
Source: US6159127A PCT No. PCT/DE99/00314 Sec. 371 Date Oct. 29, 1999 Sec. 102(e) Date Oct. 29, 1999 PCT Filed Feb. 6, 1999 PCT Pub. No. WO99/50572 PCT Pub. Date Oct. 7, 1999A drive train (10, 10a, 10b) for a motor vehicle is proposed, in which an interruption in the traction force transferred by an internal combustion engine (12) to a transmission (36) dictated by disengaging at least one clutch (16, 42) is bypassed. This purpose is served by a device (21, 21a, 21b), which has an electrical machine (22, 22a, 22b) that is connected to a power takeoff side, in particular an output shaft (36) of the transmission (38). Thus when the traction force is interrupted by a clutch (16, 42), a traction force is transferred, which increases driving safety and comfort.

Abstract:
Source: US4463989A A device for cutting a receptacle in pavement to receive a reflector designed to reflect automobile lights, which reflector is contained in a housing so that it is protected from a snowplow mold board during normal plowing operations. Such reflectors are becoming standard in separating traffic lanes and are embedded in the pavement in epoxy. The device simultaneously cuts a receptacle of a shape such that the reflector and its protective cast iron housing may be readily inserted in the pavement. The device enables the receptacle to be cut at right angles to a tangent to the curved portion of the crown of the road, permits rapid exact positioning of the receptacle location and enables the receptacle to be formed in approximately five seconds.

Abstract:
Source: GB245202A Skid.–Vehicle brake mechanism of the kind comprising scotch blocks or skid pans adapted to be lowered into engagement between the wheel and the track, to prevent the vehicle running downhill comprises, according to one construction, Fig. 1, a transverse shaft provided with a pair of crank arms 2 carrying blocks 1 and rotatably mounted in vertically slotted guides 5 secured to the chassis. Springs 7 are interposed between blocks 8, 9 disposed in the slots, the block 8 bearing on the shaft, which is thus able to move upwardly against the springs to compensate for variation of load or inequalities of the track when the blocks are applied. The blocks are normally held raised by a hand or foot controlled rod 13 connected to an arm on the shaft. The blocks are adapted to fall into engagement with the wheels by their own weight, which is, however, partly counterbalanced by weights 13a on arms extending from the shaft. Fig. 4 shows another construction in which the arms 37 carrying the blocks 1 are slidable against the action of springs 39 in the tubular end parts 36 of the shaft 34 mounted in brackets 35. The blocks are normallv held raised bv cables 41 connected to arms 42 on the shaft. Two pairs of blocks and operating mechanism therefor are provided in this case, adapted respectively to check forward or rearward movement of the vehicle. Skid pans may be used instead of blocks of the form shown. The blocks may be formed as an aluminium casting lined with friction fabric. For snow covered or frozen roads the under surface of the blocks may be serrated, such blocks being interchangeable with those for ordinary use. Blocks may be arranged for engagement with either the front or rear wheels. According to one of the Provisional Specifications, the blocks may be operated by electrical means and may be brought into engagement automatically whenever the vehicle is stopped.

Abstract:
The design has two booms arranged either alternatively or equilaterally, where the booms are temporarily connectable with each other in a pair as well as variable. Multiple sliding guides are fastened between the booms and a hull side, where the sliding guides are alternatively regulatable in a potential manner. The two booms are elongated and located opposite to a boom hull. A kite e.g. towing kite, is connected in a top deck of an e.g. ferry ship, in a distant height and range with a rope, where the rope is specifically adjustable in the length and force.

Abstract:
Source: US2014014424A The present "Advanced Propulsion Engineless Vehicle" invention is revolutionary land vehicle that operates without internal combustion engine that require fossil or other fuels to operate, nor uses "plug–in or hybrid" electric vehicle technology. It is powered by conventional off–the–shelve electric vehicle components and uses standard car batteries as primary or secondary power source. The invention's most revolutionary and important feature is its ability to automatically re–charge its batteries while the vehicle is in motion or not. This critical instantaneous re–charging ability is achieved through the deployment of redundant, radical on–board non–polluting power generating systems that may be used to re–charge batteries or used as primary power source to propel the vehicle. It utilizes a plurality of eco–friendly power generating/re–charging apparatuses allowing it to operate without practical driving limitations, capable of operating for thousands of miles plus, without stopping to re–charge, travelling at sustained, varied highway speeds, on almost all weather and road conditions, day or night, in full comfort, safety and style, permanently negating the use of plugged–in, hybrid vehicles or internal combustion engine technologies. The present invention is the most ideal, practical and cost effective non–ICE, non–plug or non–hybrid land vehicle that is simply called "Engineless", the vehicle that uses the most common of prior art/components assembled in most simplest way but achieving history–making breakthroughs that will forever change the way people of the world drive, work and play while helping Planet Earth get back to pink health. The new engineless vehicle power source technologies, concepts and principles are also applicable for select air and water crafts as well. The present invention is a "back to basic" approach to car manufacturing without the trappings of new, ultra high tech contraptions or gizmos, use of ear–busting and polluting internal combustion engine and astronomical components and production costs. Simplicity is pure beauty, the essence of Advanced Propulsion Engineless Vehicle invention that will usher a new dawn of healthy civilizations, a very green, clean, cool and peaceful Planet Earth, now and for centuries to come.

Abstract:
Source: KR20030075470A PURPOSE: A nonskid device for a vehicle is provided to restrict slip of the vehicle completely on a snowy or frozen road by mounting the slip preventive device in the tire wheel, and to use conveniently by automatically restricting the slip with operating a switch simply. CONSTITUTION: A nonskid device is composed of a wheel assembly(10) separably combined with a tire wheel and rotated; plural guide units(20) having plural guide cylinders radially formed in the wheel assembly, and guide shafts longitudinally installed in the guide cylinders with rotating and reversing; a slip preventive unit(30) having a slider combined spirally and reciprocated radially to the tire wheel along the guide cylinder in rotating the guide shaft, and a contact spike formed in the outer end of the slider; a driving unit installed in the center of the wheel assembly to rotate and reverse the guide shafts; a drive control unit(50) controlling operation of the driving unit; and an operating switch installed in the vehicle to adjust control of the drive control unit.

Abstract:
Source: US5259082A A mechanism is provided for dislodging a submersible cleaning device from a vertical wall after a predetermined time period on such wall. The mechanism includes an operating gear that engages when the cleaning device climbs the wall. Once engaged, the gear drives a cam mechanism which in turn engages a device for pushing the cleaner off the wall thereby breaking the suction of the cleaning device and causing the cleaning device to drop from the wall. A turning brush is used to break the suction but it will be appreciated that any lever or similar device can be employed.

Abstract:
Source: DE2836444A1 (Claim 1) Patentanspruch fuer Kfz – eigene – Streuvorrichtung bei Schnee und Eisglaette Gekennzeichnet durch Unter einem KFZ zu befestigender Streukopf mit Duesenoeffnungen zu allen vier Raedern. Der Streukopf ist mit einer Kunststoff oder Metall Leitung zu einem Sandvorratsbehaelter im Motorraum verbunden. The sand sprayer is fitted under a motor vehicle to spray sand on ice covered road under all four wheels. The sprayer head is connected by a tube to a sand storage box in the engine compartment. Engine heat dries the sand which is sprayed by a small compressor operated when required from the dashboard controls. The sand sprayer system can be connected to the brake light switch, and the compressor can be operated on actuating the brake pedal. The fine grain dry sand is entrained by the air stream and sprayed in front of individual wheels by the nozzles to ensure stable braking on ice covered road.

Abstract:
Source: US2004028907A Disclosed are weatherable multilayer articles comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) a substrate layer, wherein the coating layer is in contiguous superposed contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for making the multilayer article.

Abstract:
Source: US3669288A A system for handling large, heavy containers of relatively uniform shape at a shipping terminal including a vertical storage housing, a stacker crane for inserting containers into and removing containers from the storage facility, a carrier crane for loading containers into and unloading containers from a carrier at a terminal, conveyor units for transporting containers and being movable along a predetermined path into and out of transfer stations at the carrier crane and the stacker crane, a conveyer for moving containers between an input/output station for the terminal and the transfer station at the stacker crane, and a control center including computer means for coordinating the movement, storage, loading and unloading of containers by the cranes, conveyer units and conveyer.

Abstract:
Source: US4954085A A wiring structure for electric wirings in a vehicle or the like. A horizontal partition wall portion that is nearly horizontal is provided in a dashboard partitioning a car room from an engine room provided outside of that car room, and an end portion of an outdoor side harness within the engine room is positioned above the horizontal partition wall portion, while an end portion of an indoor side harness within the car room is positioned under the horizontal partition wall portion. And, one connector provided at the end portion of the indoor side harness and the other connector provided at the end portion of the outdoor side harness are joined with each other penetrating through the horizontal partition wall portion. The above–mentioned one connector is a waiting connector slidably supported from a connector guide mounted to the horizontal partition wall portion, and a nut directed in the sliding direction is fixed thereto. A bolt rotatably supported from the other connector is threadedly engaged with this nut, and by rotating that bolt, the respective connectors are brought close to each other and thus joined together.

Abstract:
Source: US3797446A A source of power drives the device on land or water. A pair of elongated handles extend forwardly of the device between which the operator is positioned. Water or snow skis, wheel skates or skis, a togobban platform and wheels and the like are worn or used by the operator depending upon the medium upon which the device is used. A travel surface activated assembly automatically shuts off the source of power and provides braking of the unit thus preventing the unit from running over the operator in the event that the operator falls. The actuator assembly operates either if the operator falls accidentally or, alternatively, if he lowers the handles so that the actuator engages the surface. The entire unit is designed to be easily folded or disassembled so that it can be carried in the trunk of a car or the like.

Abstract:
Source: GB1053361A 1,053,361. Making tyre bead cores. PIRELLI S.p.A. June 19, 1963 [July 9, 1962], No. 24342/63– Heading B7C. [Also in Division B8] An annular structure comprising a single or multistranded filament helically wound about an axis extending along a pitch circle, such as a tyre bead core, is made by repeatedly disposing the filament around a pitch circle which passes through a disc, which disc comprises an eyelet connected with its periphery and which rotates about its axis of symmetry, so that the filament is threaded into the eyelet each time it is disposed round the circle. Two arcuate sectors 15, 16 have a peripheral groove (26) (Fig. 2, not shown), and means 19, 24 serving to rotate them about their pivots 17, 18. The groove (26) extends almost round a pitch circle, broken by a box 47 which contains a disc (46) (Fig. 2). The disc (46) has an eyelet (49) and a crown gear engaging gears (44), (45) by which the disc is rotated. The whole is mounted for rotation about a vertical axis on a platform 5. Fig. 1 shows how wire 60 is fed into the rotating groove (26), each turn in succession dropping into the eyelet of the disc (46), which is rotated about a horizontal axis, tangential to the pitch circle, by the gear system illustrated in Figs. 2, 3, 9 (not shown). Fig. 1 shows a carriage 94, movable along guide 93, which clamps one end of the wire 60 and carries it forward to be attached to the disc (46), and also a cutter actuated by cylinder 107 (Figs. 5, 6 not shown). Fig. 3 (not shown) illustrates the arrangement for moving box 47 radially on disc 5 to make bead cores of different diameters. Figs. 4, 4a (not shown) illustrate a device for clamping one end of the wire to the disc (46) before winding begins. Wire is fed from a bobbin (61) (Fig. 5) mounted horizontally but also rotating about the vertical axis of its arm (62) to twist the wire the same way as the disc (46) will twist it. The wire is fed over a pulley 87 whose vertical position on supports (85) controls a rheostat (89^1) (Fig. 7, not shown) which controls the delivery speed. During winding successive turns, sectors 15, 16 are retracted to correct for wire build up in the groove 26. On completion, the sectors are further retracted, the two ends of the wire joined, and the bead core removed. The platform 5 may carry several discs, spaced around the pitch circle, and one disc may have several eyelets to keep successive turns of wire separate. Discs need not be radial to the axis of platform 5.

In place of the rotating platform 5, the disc or discs could rotate around their axes of symmetry only and the wire be fed by a rotating wire guide.

Abstract:
Source: US2013201316A A system and method in a building or vehicle for an actuator operation in response to a sensor according to a control logic, the system comprising a router or a gateway communicating with a device associated with the sensor and a device associated with the actuator over in−building or in−vehicle networks, and an external Internet−connected control server associated with the control logic implementing a PID closed linear control loop and communicating with the router over external network for controlling the in−building or in−vehicle phenomenon. The sensor may be a microphone or a camera, and the system may include voice or image processing as part of the control logic. A redundancy is used by using multiple sensors or actuators, or by using multiple data paths over the building or vehicle internal or external communication. The networks may be wired or wireless, and may be BAN, PAN, LAN, WAN, or home networks.

Abstract:
Source: JP2001088520A PROBLEM TO BE SOLVED: To solve problems such as danger and much time and labor required to mount and dismount a tire chain presently in use for the slip prevention of an automobile on a deep snow–covered road. SOLUTION: This slip preventer for a double tire is previously installed at an intermediate part of the double tire and constituted to put all spikes in and out of the holes of a wheel only by operating one part at the time of use. The unmovable part spikes abutting on the ground surface can be automatically put in and out by spring force when released from the ground surface by the rotation of the tire. Changeover work is therefore completed easily, safely, positively and rapidly in a single operation to solve problems of requiring much time and labor, and the like.

Abstract:
Source: US2013293652A Disclosed is an apparatus for handling a sheet of substrate media in a marking assembly. The apparatus includes a rail support track, a first marking zone and a first platen cart. The rail support track forms a closed path. The first marking zone marks a sheet of substrate media. Also, the first platen cart moves along the rail support track. The first platen cart recirculating around the closed path. The first platen cart conveying the sheet of substrate media in a process direction along at least a portion of the closed path through the first marking zone.

FIELD: railway transport; track machines. SUBSTANCE: proposed sweeper has mounted equipment and its control systems. Machine is made on base of truck on rear driving shafts of which rail way wheels are installed. Front part of base chassis is connected with two–axle railway bogie on which platform is mounted. Platform is furnished with blades installed for turning in vertical plane, and manipulator for loading and unloading operations. Automatic coupler, rotary auger snow remover and manipulator for loading and unloading operations are mounted on rear part of chassis. Brush gear is installed in wheel space. EFFECT: enlarged range of railway cleaning machines. 20 cl, 3 dwg

Abstract:
Source: CA2818475A I am the founder of the Ultimate Martial Art (UMA) which has upgraded the Mixed Martial Art (MMA) in many aspects, especially in the aspect of emotion control because only UMA has been qualified to completely free any UMA fighters from fear, anger, anticipation, nervousness, anxiety, stress, and other emotions–that often hinder MMA fighters from applying their skills effectively, let alone harnessing their maximal potential of both the mind and body– particularly during and prior to their fights, and also in the aspect of ultimate speed because only UMA has been qualified to so overcome the challenge and problem of becoming possible to hit the opponents/adversaries prior to their biological reaction time of about 1/2 of a second (consisting of 1/4 of a second needed to perceive a threat and 1/4 of a second needed to react to the threat) to the hits that any fighter mastering UMA can always hit opponents/adversaries prior to their biological reaction time capability to react to the hits. It is because the damaging kinetic energy = 1/2 x (the mass of the objected used) x (speed of the object used)2 that any increase of the speed of the object used with its mass unchanged can exponentially increase the damaging kinetic energy to be inflicted upon the target. Hence, UMA fighters effectively have become technically invincible over any MMA and other fighters of the same or similar weight categories. For example, because by and large the biological reaction time of most wild animals is faster than that of normal human beings, it is almost impossible for people to catch wild animals without assisting instruments even at a very close distance, considering that the reaction time of a gopher, say, is only about 1/10 of a second comparing with the reaction time of 1/2 of a second of a normal human. For another example, even one of the MMA top fighters and UFC current light–heavy weight champion Mr. Gorge St. Pierre had publicly admitted in magazines and TV news that he had been scared prior to one of his championship belt defending bouts against a challenger whose name may be spelt as Mr. Carlos Condit. This is because MMA has never ever been qualified to disencumber its MMA fighters from fear or other emotions, especially during and/or prior to fights. On contrast, only UMA has been qualified to enable its UMA fighters to apply, embody, and exhibit their human potential to the maximum by living, fighting, and performing devoid of fear, anger, anticipation, nervousness, anxiety, stress, or other emotions, especially during or prior to any fights. UMA had also completely cured my serious shoulder joint pains that cortisol injection by the doctor at Miramichi Hospital in the Province of New Brunswick in Canada had failed to cure, and physical therapist had also failed to cure, and medication had also failed to cure. And only UMA can sustain a person's constancy, consistency, desire, interest, motivation, and penchant for exercise for life while people pursuing any other systems of exercise often give up sooner or later. Many MMA fighters have lost their bouts to ground pound whenever and if their opponents/adversaries wrestle grapple them down and then atop pound them, just as the Russian fighter whose name is probably spelt as Mr. Fedor Elemencko had lost one of his bouts to Antonio "Bigfoot" Silver due to ground pound only because he is nescient of UMA. On the contrary, UMA fighters can take the advantage of being more stable underneath the opponents/adversaries, so that a UMA fighter can execute reversed ground pound against his or her opponents/adversaries upward while from underneath them by so rock shaking his or her own body in redundancy as to destabilize the opponents/adversaries atop in order to facilitate pound striking them. To more effectively train martial art fighters, I have invented life–like and various weight–and–size–category mannequins that resemble real individuals as much as possible, or a trainee's specific opponent or adversary, and that are used for the trainee to so drill strike as to effectively hone skills including punches, kicks, elbow strikes, knee strikes, wrestling, grappling, locks, submissions, take– downs, spinning strikes, etc. Ever since the invention of nuclear weapons, nuclear wastes have been threatening the human race as a whole. Furthermore, nuclear accidents have also actually demonstrated mankind the detrimental effect of nuclear wastes. Therefore, instead of hiding dangerous nuclear

wastes indefinitely in canisters to wait disasters to bear down on us, I have invented the De−radiation Processes both enabling any nuclear wastes to be transformed into harmless materials and enabling nations to de−radiate the already radiation−poisoned vast territories such as the ones in Japan's Evacuation Zone and Russia's Chernobyl. The Law of No Largest, or Smallest, or Any Other Absolute Limit established by me states that throughout the universe nothing can be the smallest or the largest. There is never either upper or lower physical limit to anything throughout the universe. There is perpetually something smaller than the smallest particle that can ever be found; there likewise is perpetually something larger than the largest bound and expanse that can ever be found. Therefore, Higgs Boson (or God particle) sought in the Hadron Collider in Switzerland, or any other particle can never ever be the smallest particle because there perpetually is something even smaller than the smallest particle that can ever be found according to this Law; therefore, any effort attempting to seek the smallest particle or the largest bound is but foolish wastes of life. The Law of Time Delusion established by me states that in fact time is but a delusion because there is no reality in any time. It is only because time is but a delusion that other animals live in perpetual non relativity with no concept or sense of time. And it is also only because time is but a delusion that the selfsame number of hours or any other periods of time to the selfsame person are felt and perceived differently whenever and if he or she falls asleep and whenever and if he or she is troubled. And it is also only because time is but a delusion different people can agree on an arbitrarily set or assigned time. Albert Einstein and a plethora of other scientists are absolutely wrong about the nature of time. Because time is but a delusion, any attempt to seek any form of time travel is foolishness, failure, and waste of life in the making. Time travel, Einstein's Rosen Bridge, wormhole, Higgs singlet, time travel portal, and any other form of time manipulation are absolutely impossible though people can always so fantasize, just as a lot of people would always waste lives fantasizing immortality though it is impossible. It is likely foolish for anyone to believe that the Nazi Bell could somehow manipulate time by spinning red mercury, etc because of the fact that time is but a delusion. And then the Law of Uniqueness likewise established by me states that, at the level and scale tending to either infinitely large or small and no matter how adamantly a person desires otherwise, everything throughout the universe must be and can only be unique; accordingly, there cannot be another planet or any other heavenly body which sustains lives in the way by which Earth does. There has not been, and is no, and will not be any life anywhere throughout the countless centillions of galaxies of the universe except Earth. The Law of Inevitable Randomness established by me states that only by involving randomness in one fashion or another rather than regulated or calibrated actions and/or processes any ultimate state can be attained. For example, in order to polish any mirror to its ultimate resolution possible, random polishing process must be implemented. To expand this law to other realms, according to this law Albert Einstein's Spooking Communication Theory is also a fraud because it is but random coincidence by which two distant objects sometimes exhibit entanglements, same behaviors, etc, not any dictating law or regularity. But Einstein had mistaken the random coincidence between two distance objects for the act of law or regularity. Furthermore, ultimately on the one hand anything must encompass an element of randomness; on the other hand, only randomness can cause anything or state to achieve the culmination thereof, much as only hand−polished or random−action−polished lens can attain the ultimate resolution of their sizes. And smooth surfaces can be achieved from randomly−distributed rough grits on sand papers. The Law of Uncertainty also established by me states that there perpetually exists an element of uncertainty in any human affairs (especially whenever and if relatively great interest becomes at stake), any phenomenon, and any existence. The quality of uncertainty is one of the integral qualities of all things in the universe where we exist. For example, albeit parasite faith predators Popes have always done their best to conceal their secrets from their donor faith victims for decades, these laws had not long ago dictated a unique butler of one of the Popes to have just divulged few unimportant Vatican secrets against all their ardent desires to hide the truth from their faith victims. Their unrevealed ultimate secret is that they are but deceit−based frauds whose ultimate effect and result are only to brainwash and defraud more and more faith victims off their money, materials, children, and−most important of all−the opportunities to ever enjoy any truly happy and fulfilled lives. And it is the noblest duty, obligation, and calling for me to wake up and save the human race from the spiritual plague of ubiquitous delusional faiths. I am proud of my selfless and fearless courage and action to expose the human race the truth about the deceptiveness and fraudulent nature of faith predators without being concerned about selfish interests or the harm to be done to me by those powerful faith predators. For another example, it is impossible to predict exactly when and where tornadoes will strike because the uncertainty in their being formed. It is because the inherent qualities of randomness and uncertainty that nothing in the universe can strictly conform to laws and regularity except probability. Though in fact there is no reincarnation in any shape or form, faith predators Dalai Lamas have successfully fooled and defrauded the human race into believing their falsified reincarnations from preceding Dalai Lamas in order to justify their theft of power and control lorded it over their faith victims, and they have also successfully radicalized some of their faith victims into committing self− murder by killing themselves ablaze, and then they have also successfully befooled and defrauded the Nobel Prize Committee off the Noble Prize of Peace though they are but frauds only dragging out existences from their delusional fakery of reincarnation that in fact does not exist. Instead of lying against true reality when things do not go their ways, people of any true honor and dignity should acknowledge and certify it as it is, especially whenever and if it goes against their personal desire or penchant. By and large faith predators are conniving and accomplished frauds who are highly skilled at adapting, embellishing, smoothing over, and amending their lies according to ever changing situations, circumstances, events, etc once their old lies become untenable or unconvincing. For example, whenever and if their faith victims' desperate prayers are of no avail or not fulfilled, they may adapt, embellish, smooth over, and amend their old lies into fresh ones that God works in mysterious ways beyond human's capacity to comprehend. But whenever and if their prayers coincide with the occurrences or happenings prayed for, they may then adapt, embellish, smooth over, and amend their old lies into different new ones that God does answer grant faith victims' prayers. The correct truth always is just as independent and unchangeable as space that is omnipresent in everything and everywhere but can never ever be altered or corrupted by anything or anywhere. A truly correct and hence functional belief system−the ultimate faith−is not only integral for any individual to live any suffering−free and hence happy and fulfilled life, but also integral for world peace. For example, the USA and some other countries have been wasting thousands of human lives of

American troops and trillions of US dollars killing people who have radicalize become terrorists exclusively by delusional faiths around the world, but they will always fail to kill them off because no one else has been qualified to solve the problem of terrorism and crime at their root causes. In reality, the ultimate root cause to both terrorism and crime is exclusively delusional faiths which are incorrect and hence dysfunctional belief systems. Any truly correct faith must function and work; otherwise, it must be and can only be fraud or error. Without the ultimate faith, these delusional faiths will always rear new and young terrorists and criminals that can never ever be killed off as long as these delusional faiths keep indoctrinating and brainwashing everyday normal people into becoming new terrorists and criminals. By striking lasting fear into the hearts of its victims, terrorism is the ultimate weapon of lasting devastating insecurity against its victims because–at the lowest costs for the terrorists–it can not only mangle its victims' sense of security, happiness, etc, but it also can bankrupt nations' and/or its victims' financial resources being wasted on chase killing something like ghosts. Conventional systems of government have only been qualified to attempt to retaliate and punish those who are responsible for criminal acts but have never ever been qualified to prevent ordinary people from radicalize becoming terrorists and/or criminals. Conventional Reward and Punishment Way of treating people has often failed because it has never ever been qualified to resolve issues at their root causes. For example, some years ago according to the news of Canadian Broadcasting Corporation, a Canadian father had taken away the X–Box video game system from his very own son with a high hand in an attempt to control and stop his son's video game addiction/obsession, but instead of having his video game addiction/obsession cured, his son had run away from home and ultimately ended in death. Apparently, this is a foolish and even deadly way to cultivate or educate children. For another example, the late USA singer and movie actress Miss Whitney Houston had been addicted to drugs prior to her death though she had attempted to save herself by attending conventional rehab centers and by resorting to being baptized by a famous faith predator in the real Jordan Rive into the popular conventional delusional faith of Christianity. Notwithstanding her genuine desire to attempt to extricate and redeem herself from suffering in her addiction she had never ever been able to salvage herself from her drug addiction which had ultimately contributed to her famous and sensational death at very young age. And there are countless such examples demonstrating the failures of conventional Reward and Punishment Systems and delusional faiths. In such or similar cases, only the ultimate faith has ever been qualified to cure and resolve any additions at their root causes. So long as the root cause rearing terrorists and/or criminals has not been eradicated by any correct and hence functioning belief system, it is impossible to kill them off no matter how much money of nations and how many human lives of the troops are wasted simply because it is impossible to kill off ordinary people who–exclusively by delusional faiths–have always been continuing being radicalized or self–radicalized to become terrorists and/or criminals. It is because the root cause to terrorism and crime is delusional faiths that they always linger so long as these delusional faiths are not superseded by the truly correct and hence functional belief system–the ultimate faith. In the long run, delusional faiths can but render all their faith victims' lives ruined, and their money ripped off, and above all their opportunities to have any fulfilled and happy lives stolen and deprived. Faith predators' any acts of "kindness" equate any pedophiles' acts ensnaring children with candies, etc, or equate any drug dealers' acts ensnaring their addicted customers with free drug samples. Their ultimate common aim is to harm and exploit their faith victims with deceptive "kindness" in aid. Delusional faiths are analogous to exquisite counterfeit goods. Though they can easily defraud and befool all victims ignorant of the goods into dumping money for their fakes, they cannot defraud or befool anyone of true qualification and insight. About 600 billions of US dollars are wasted every year in the USA on addiction related problems, such as addictions to morphine, Fentanyl, heroin, cocaine, nicotine, gambling, sex, video games, etc, and about 300 American addicts die each and every day in the USA alone. All these deaths and wastes only root in the misleading counseling and teaching of psychologists and other so–called addiction therapists because none of them has been qualified to resolve addictions at their roots. In fact, the only root cause to addictions is conventional delusional faiths and hence the addicts' incorrect perceptions, beliefs, choices, decisions, and living their lives by their state of mistaking apparent reality for true reality. Human lives with no correct faith are likened to floating debris adrift in the ocean with no aim and hence they can become radicalized in countless ways and corners at random. The noblest human life is the one that bestows upon others the true insight and wisdom for them to become qualified to enjoy fulfilled lives, not the ones that selfishly aggrandize and secure their own wealth, fame, power, social strata, mates, ego–extensions, vanity, and other selfish gratifications. Since the emergence of the human race on this planet, trillions of people have been falling faith victims to faith predators always disseminating their delusional and hence dysfunctional faiths. Delusional faiths have been inflicting the human species as worldwide pandemic spiritual plague from which billions of people have been enduring tremendously. Ultimately, all delusional faiths are racket–based and deceit–based frauds no matter how holy, sacred, divine, and sacrosanct their facades, veneers, pretenses, or make–believes are; hence, in one fashion or another they shall malfunction and/or foil to liberate or deliver any faith victims from their suffering. In reality, all the followers (faith victims) of any delusional faiths have been betraying their very own faith, allegiance, fealty, human dignity, and humanity for none other than lies, deceits, pretenses, and frauds. It is because the life compass of such faith victims always misleads them by delusional faiths into malfunctioning paths that all their beliefs and actions are harmful or sometimes even detrimental to themselves, their loved ones, and/or others in one way or another. Then why the trillions of people would always both dump their hard–amassed money and squander their limited lives in order to pursue delusional faiths and to bankroll the expansion of pandemic spiritual plague and the fraud racket of delusional faiths ensnaring, victimizing, ruining, and plaguing more and more unsuspecting and inscient people into fresh faith victims? This is mainly because of two factors. On the one hand, people experience sufferings as integral components of living: as, the gradual losing the unsalvageable youthful appearances, diseases and pains, losses of the treasured and the beloved, unavoidable interactions and/or associations with the repulsive against their will, failures to gain the craved, mind vexations, the powerlessness and hopelessness over inevitable and unstoppable aging and death, etc; on the other hand, they have been inscient as how to correctly liberate and emancipate themselves from their pains and/or sufferings. And hence their desperation arising from pains and/or sufferings propels them to clutch at a straw fantasized and hoped as potential to salvage and extricate themselves from these pains and/or sufferings, just as sex addicts or maniacs would trash their money on strippers with whom they fantasize sex though not

actually performing it. It is because of this perpetual state of desperately fantasizing and hoping for solutions and cures–to their pains and/or sufferings–which can never ever be actually materialized or realized by any conventional faiths due to their deceitful and sham premises, forms, substances, and accidents that the trillions of people having been continuing dumping their money and squandering their limited lives for those delusional faiths. Delusional faiths are but the states of constantly breaking promises. It is because all conventional faiths are but, ultimately, delusions that it is never ever possible for them to deliver what they always promise except their continuing defrauding, victimizing, and exploiting their faith victims off their money, properties, and even their innocent in–between children. It is because trillions of people for thousands of years have always been accustomed to compulsively lying that there is reincarnation, soul, ghost, God, or other supreme beings that they have brainwashed themselves into losing sense and sanity which may enable them to distinguish lies from the truth, just as the people of North Korea are brainwashed into their delusional faith that they are certain to win a new Korean war against the USA and South Korea though their actual military power proves the contrary. Actually North Korean people's lives would become meaningful for North Korea to lose a new war, so that these brainwashed people can become able to wake up into lives of sanity with fewer delusional faiths. Though those people's delusional faiths can serve them as honest lies, unintended frauds, mistaken–for–wisdom stupidity, etc, ultimately their delusional faiths must malfunction and fizzle out in one way or another in being unable to liberate themselves from pains or sufferings. The difference between faith predators and robbers is that the former steal from people by lies, persuasions, pretenses, make–believes, etc; the latter steal from people by telling the truth yet by violence. The only way to avoid falling faith victims to the former is to live the correct faith–the ultimate faith which is the trailblazer of correct belief system and spirituality for the humankind; the only way to avoid falling victims to the latter is to establish unbreachable security. Those faith predators' acts of kindness: as, wash kissing faith victims' feet, etc are but pretenses and shows designed to draw in their faith victims deeper and deeper: any predators can pretend to be kind and merciful to their victims. On the other hand, anyone living the ultimate faith is even qualified to unconditionally forgive and be kind to the most hated person whom no other individual on the planet is able to forgive. In reality, Jesus Christ had never ever been resurrected because his corpse was probably cannibalized by his faith victims at the time; therefore, even today at communions his faith victims still share eat bread and drink wine to symbolically mimic the cannibalization of Jesus Christ. His faith victims must fraudulently claim his resurrection in order to conceal the repulsive act of the cannibalism of Jesus Christ and to continue batten on newly preyed–on faith victims by brainwashing them and pretending holy, though at that time the act of cannibalism was not considered as repulsive as it is today. And his so–called healing power actually is selfsame as internal energy (termed chi, qi, or taich'i in China) whose control can be acquired by anyone who practices esoteric arcanum. The ultimate motive for the faith predators to always lie that he had been resurrected is so that they can continue defrauding their faith victims off their money and properties, and even exploiting the in–between innocent children of the faith victims. The most evident of the truth is that truly correct faith must work and function in delivering any followers from their sufferings; otherwise, all faiths and their proponents must be and can only be delusional and hence dysfunctional frauds. All conventional faiths/belief systems with their delusional and hence dysfunctional faiths have always been predicated on the diffusions of lies, frauds, deceits, misinformation, deceptions, make–believes, and brainwashing that are devised to batten on, defraud, and abuse their parishioners, other followers, their very own innocent children, and other faith victims. Ever since the split second on such a birthday when the human species had emerged onto Earth, people have killed and harmed one another to establish empires, wealth, power, predominance, social strata, fame, successes, etc for selfish aggrandizement; but none of such lifetime have been wisely spent because all conquerors and/or winners have died, much as all ordinary people and losers do. Therefore, all their cunning, brutal, and hell–for–leather rampages, campaigns, maneuvers, intrigues, duplicities, chicaneries, deceptions, escapades, etc eventually have been but foolish and meaningless dissipations of lifespan in vain at the pursuing for anything but that which can last. Furthermore, with their delusional and hence dysfunctional faiths endless faith predators have been defrauding, deceiving, brainwashing, victimizing, and inflicting billions of innocent people dragging their innocent children along in respect to the authentic and genuine truth and true reality of universe containing life, mind, and other existences. And as the faith frauds these faith predators have defrauded, batten on, and exploited these misled innocent faith victims and the victims' children off their money, properties, innocence, and opportunities for true happiness. Even as recent as December 2012, delusional faiths in the country of India of multiple dysfunctional faiths had driven many Indian men into gang–raping and/or murdering women in their country in the most uncivilized manner. Moreover, according to CTV news on or about 22 April 2013, the delusional faiths in India have even rendered some men in India kidnap raping and killing their fellow citizen girl of only five years old. All people's any uncivilized conducts and inner sufferings can only ultimately root in delusional faiths because only their deceptive faiths, beliefs, and hence mindsets drive them into their behaviors of foolish way of life. Conventional faiths are delusional and hence dysfunctional, just as the wrong medication; on contrast, just as the correct medication, the correct and hence functioning belief system–the ultimate faith–never ever malfunction under any circumstances or situations. Perpetually motivated and controlled by their lifelong laziness, ignorance, and inability in making any honest living; and hence by their lifetime subsequent compulsion and greed to batten on, take advantage of, and victimize their fellow inscient human beings, faith predators plaguing humankind with their delusional and hence dysfunctional faiths have always been defrauding, victimizing, and brainwashing countless faith victims and even their innocent in–between children into believing that the universe and its existences have been created by a Big Bang singularity, God, or other supreme beings; into believing killing many tigers, sharks, bears, etc only to eat their penises, fins, pawls, etc to hallucinate attaining virility, longevity, etc; into insist claiming that they have been abducted by aliens or witnessed aliens; into lying that they have experienced deaths only to have returned from their near death experiences; into believing that the Earth is hollow with aliens living inside; into believing that the world would end on a certain day though I know that it is impossible to accurately predict future events with certainty from the perspective of the totality of the universe; into believing that lives have been integrated with and associated with recyclable souls, afterlives, reincarnations, hells, heavens, ghosts, selves, egos, and innumerable other delusional beliefs and concepts; into even committing mass suicides as the 39 brainwashed faith victims of the Heaven's Gate cult in California of the USA had actually dumped their

very own lives together; into becoming suicide killers as the 19 brainwashed hijackers' delusional faith had engineered their act of 9/11 Event, etc; into lying and canonizing someone's coincidental events as interceding miracles, etc; and–above all–into forever mistaking apparent reality for true reality, and hence acting on living, suffering, and squandering their entire lives in the self–deceit of such a state of mistaking apparent reality for true reality. And some years ago at a 1996 press conference NASA had even deceived and defrauded our human species for enthusiasm and government founding by having fraudulently claimed that a piece of rock–containing evidence of life and arriving from Mars–had been found on Earth, but in fact it can never ever be probable for any life to ever exist or to have ever existed anywhere else throughout the entire universe. And it can never ever be probable for anyone to find any evidence of life on Mars or anywhere else except Earth. In the history, churches used to employ the trickery of crying statues, lactating statues, magnetic force levitated chariots, fake sounds of thunders, etc in order to intimidate and defraud their faith victims into dumping their hard–earned money, properties, etc for their delusional and hence dysfunctional faiths. Of course, all these faith predators plaguing their faith victims can for life box themselves in delusional faiths and blind themselves from true reality, but by so doing they can never ever become qualified to tap into their human potential to the maxima. And one of the most practical potentials is to enjoy lifelong true happiness, peace, etc. It is because faith predators and their faith victims have lied so much with their ingrained delusional faiths that their deceptive mindset gradually strikes root in their entire being so much so that they can only redeem and salvage themselves with indomitable resolve and effort to seek the truly correct belief system–the ultimate faith. Ultimately, it is because it is impossible for any delusional faiths to function except perpetually fantasizing and dreaming about extricating, delivering, or redeeming anyone from pains and/or sufferings (such as stress, anxieties, compulsion, depression, PTSD, mind vexation, insomnia, obesity, addiction, vainness, emptiness of aim, anger, figment, vanity, powerlessness and hopelessness over the inevitable and unstoppable aging and death, etc) that certainly the faith predators plaguing their faith victims and even their innocent in–between children choose to become diehard frauds till the end of life by enduring them, living them, and boxing themselves up with them, much as billions of their ancestors had already suffered and died in ignorance. But while they are alive it is impossible for them to lie away their inner sufferings, just as no patients suffering from mental retardation can lie and pretend enjoying any life of intellectual or joy. About 7 March 2013 a doctor on Dr. Oz TV show has just deceived the world public with his delusional theory and book: women are more intelligent than men. He has shored up his delusional theory with his claim of thousands of brain scans. But in reality, it cannot be more obvious to me that the deceptiveness of his delusional theory ultimately roots in the fact that intelligence is inherently invisibile, and that intelligence is more than the physical brains. To qualify or quantify invisible intelligence with visible brain scans is bound to fail. In addition, he is totally ignorant about the human internal energy (termed chi, qi, or taich'i in China) that is the main driving force and energy in any living beings despite of its invisibility. The invisible can be more powerful than the visible: though radiation is invisible, it can kill any living creatures on Earth. The only ground why more men are incarcerated than women are is not that men are less intelligent than women, but that conventional men have always been indoctrinated and brainwashed by mainstream yet delusional faiths so that they have never ever lived the truly correct and hence functional faith securing mind freedom including emotional freedom. The flux intensity and induction distribution of the internal energy in the human body and outside human body can be most easily felt by me or anyone else who has mastered the manipulation of his or her internal energy. As I had felt for days, any true masters of internal energy can also feel what I had felt for days as an invisible belt of about 5 cm wide of internal energy had flow pulled down from the crown of my head to my face, down along my chest, and then down along my abdomen, and then back up from my lower back, and up from my upper back, and up from the back of my neck, and then back to the crown of my head. This pivotal experience of watershed juncture in internal energy practice is termed as opening up small circle (in Chinese, Datong Xiaozhoutian). And the internal energy can be stored and accumulated in the region about 5 cm below the belly button (in Chinese, Dantian). And internal energy if radiated by any master can be very easily felt by anyone else. Though ft is invisible to the naked eyes, the internal energy is visible via infrared camera, etc. In fact, women are never more intelligent than men. This has been repeatedly demonstrated by the facts that most advancements for human civilization have been contributed by men instead of women, and most Nobel Prize laureates have been men instead of women. It is but 100 percent stupidity for any doctors or any scientists to determine human intelligence by brain scans simply because human intelligence is invisible. And it is also but 100 percent stupidity for anyone to claim that women are more intelligent than men for any reason because the fact is not so. In addition, Dr. Oz had also misled the world as to the optimal way to treat migraine. The optimal way to cure migraine is to practice the manipulation of internal energy instead of medication, etc, unlike his misleading the world. After anyone acquires even some extent of control of internal energy and if and whenever he or she experiences headache or migraine, all he or she needs to do is to sit still for about 10 minutes to allow the internal energy to flow reset itself, and then the headache or migraine always disappears after such a sitting session of stillness. Therefore, the optimal way to cure headache and migraine is not medication but is to acquire certain extent of freedom and control of one's internal energy by practicing manipulating the internal energy so as to let the body's very own already existing internal energy cure the body itself. My internal energy at about 10 minutes of sitting session of stillness has always consistently cured my any headaches whenever and if they occur; therefore, I have never ever ingested any medication for headache or migraine in my life. On the other hand, for decades, Dr. Phip with his TV shows, other psychologists, Oprah Winfrey OWN shows, etc have always been misleading and deceiving the whole world into believing that anger, addictions, and many other human sufferings root in what happens externally to a subject. It is because their beliefs and faiths are predicated on falsehood, fraud, and delusional faiths that their audience and believers have continued suffering. But in fact, it cannot be more evident to me that any anger, addictions, and any other human sufferings do and only can internally root in faiths, beliefs, perceptions, information, knowledge, conventions, etc that ultimately are incorrect and hence dysfunctional, considering that no one living the truly correct and hence functional faith–the ultimate faith– suffers no matter whatever he or she is subjected to, and considering the fact that the selfsame occurrences, circumstances, situations, events, etc do not drive or cause anyone else to experience the same except the subject. These public misleaders also detrimentally advise divorcing and breaking couples to cut off communications by restraining orders, etc; hence, they have

actually deteriorated these couples' situations and even have brewed murders in some cases. In reality, the Principle of Defusing Hostile Tension by Civilized Communication established by me states that it is because divorces/break−ups between couples are one of the greatest, drastic, and sudden shifts in humans relationships, interdependences, and emotions that they are best to be done by secured gradual divorces/break−ups where the couples can still communicate in any secured settings−such as a police station or a court house where the tendency of violence is usually stifled−so as to gradually become accustomed to their new lives detached from their accustomed interdependence and bond already foster grown in each others until they feel confident that their divorces/break−ups will not end up in abuse, violence, or even murder. Moreover, the Principle of Defusing Enmity by Civilized Communication also established by me states that enmity, hostility, animosity, hate, and other antagonistic emotions are best deescalated by civilized communication. Therefore, hostile countries can prevent wars by pre−active and productive communication. Even sham communication is far better than no communication. These public misleaders and psychologists have also been further misleading and deceiving the world into believing that PTSD, stress, etc root in the activating events, situations, circumstances, etc; but in reality, they exclusively root in people's delusional faiths−the state of mistaking apparent reality for true reality and hence acting on apparent reality instead of true reality. In fact, conventional love is fraud because it is predicated upon the deception that the quality and/or reason of love originate from the side of a subject receiving love instead of observers giving love. Why so? The fact is that different people often love and dislike the same subject simultaneously. If the quality of loving or disliking had rooted in the subject, all different observers must love or dislike the selfsame subject in one accord. In fact, true love must be a subjective conscious or unconscious choice from the side of an observer giving love instead of any subject receiving love. Therefore, conventional love is misguided self and mutual deception and discrimination rooting in delusional faiths and hence wrong perceptions. As a result, over 50 percent couples actually end up in family disharmonies and/or breakups. There has never ever been true love in conventional sphere, domain, and realm because conventional people always mistake self and/or mutual deception for true love. Moreover, conventional lovers always mistake for love their good feelings induced by hormones like dopamine and endorphin and so on, just as drug addicts always mistake for happiness their brain excitements induced by electrochemical brain stimuli induced by drugs so that they would sell their dignity and everything else for deceptive happiness−drugs. To summarize, conventional people are accustomed to deceiving themselves into mistaking for love and happiness their fleeting brain excitements induced by hormones like adrenalin, endorphin, dopamine, etc. Only by living the ultimate faith anyone can become qualified to attain and enjoy true lifelong love and happiness−mind freedom including emotion freedom and omniscience in the expanse of true reality beyond apparent reality. Only the correct knowledge, insight, and faith about mind, life, and universe can be qualified, on all terms for anyone, to harness and/or manifest−to the ultimate maxima−the human potential of the mind and/or the body; otherwise, all talents, knowledge, knowing, faculties, etc are perpetually limited and confined within the spheres of apparent reality without ever becoming qualified to be expanded to, upgraded into, or evolved into true reality transcending apparent reality. Only by living true reality guided by the ultimate faith (the truly correct and hence functioning faith/belief system) anyone can become qualified for life to enjoy mind freedom−including emotional freedom, etc−and omniscience in the sphere of true reality beyond apparent reality, resulting in becoming qualified to harness to the maxima of his or her human potential of both the body and mind. To live true reality is selfsame as to live genuine 'Virtual paradise/heaven" without the requirement of deaths that must be required for all people plagued by conventional and mainstream delusional religion/belief/faith systems to fantasize their delusional paradise, heaven, resurrection, reincarnation, etc. Had these inventions not come to fruition, and so long as the human race can still endure the living conditions on this planet, people will continue enduring countless faith predators that will continue defrauding, brainwashing, victimizing billions of faith victims with their delusional and hence dysfunctional faiths, as since the emergence of humankind on this planet they have always battened on their faith victims throughout the world and even have sexually exploited/molested the innocent children of their faith victims in none other than the places of worship. The places of worship are also sometimes used as their bases for other crime: as, some faith predators have actually been charged for selling child pornography, etc in none other than the places of worship. My qualification cannot manifest it clearer that the effective ways and strategies to prevent or reduce the sufferings of innocent lives from continuing being misled, brainwashed, victimized, and/or harmed are to live the correct faith−the correct belief system. As a member of true integrity and righteousness of the human species, we are stumbling across one another on the universal yet against−our−will−journey of aging towards inevitable death instincts, I am behooved and honor−bound to provide the humankind with these inventions to upgrade the human thought, culture, intellect, intelligence, knowledge, vision, sphere, perception, faith, and capability in totality about the universe, mind, life, etc−so as to dispel the worldwide spiritual plague and precipices of delusional faiths, misled beliefs, misled perceptions, misled preconceptions, misled information, misled knowledge, misled science, etc that have been deluding, victimizing, and/or afflicting the humanity since its emergency tens of thousands of years ago. Only in so doing, said deceits, frauds, whoppers, delusions, etc against humankind can be so lifted and dispelled that mankind will no longer suffer in ignorance, delusion, deceit, pseudo−science, etc. Therefore, these inventions are of unprecedented and historic significance, practicality, and value since they can help to prevent future billions of innocent human beings from continuously being defrauded, brainwashed, victimized, and/or harmed by faith predators with their delusional and hence dysfunctional faiths, and they revolutionize and upgrade the human thought, culture, intellect, intelligence, knowledge, vision, sphere, perception, faith, and capability in totality about the universe, mind, life, and other existences. In conclusion, it is impossible to eradicate human sufferings by delusional faiths because only the correct knowledge, insight, and faith about universe including mind, life, and all other existences can deliver true happiness, peace, joy, etc. Delusional faiths can only draw their faith victims in and then inevitably inflict upon them unending sufferings and hopeless deceptions no matter where they are or who they are: even if they are princes, princesses, etc their sufferings and deceptions can only be embellished with more deceptive facades. No sufferings can convalesce with delusional faiths in aid, no matter whichever popular kahuna faith predators have disseminated them. Delusional faiths can only plague and sink their faith victims into deeper and deeper snares and precipices of deception and suffering in the long run. Only the truly correct and hence functional belief system−the ultimate faith−can be qualified to deliver any believers

mind freedom (the ultimate happiness) and omniscience in the sphere of true reality beyond apparent reality. Some inventions that qualify to materialize and bring to fruition the rarest opportunities which can correct and upgrade humankind's thought, culture, intellect, intelligence, knowledge, vision, sphere, perception, faith, and capability in totality about the universe, mind, life, and other existences are to be articulated in the specification hereinbelow.

Abstract:
Source: DE3537826A1 A discovery relating to the creation, structure and decay of the long–known charge particles known as electrons and positrons, both of which, as is known, are not structure–resistant nucleons, led to a "method for the economical production, detection and utilisation of S gravitinos in accordance with the expanded S transformation". After the discovery of the 6 infranuclear quarks, the new electron and positron structure teaching is probably the most important one. It is rounded off in that, in a particle accelerator hard–vacuum tube, when the electron or positron strikes the anode, not only does the particle mass weight become heat in a known manner, the "energy weight" become a Planck photon and the charge become anode current, but – and this is a discovery of primary importance – the particle mass, relieved of its charge, is radiated in an annihilating manner as gravitation energy to produce a gravitino having an energy of Eg = m x c = 5 x 10 electronvolts. This discovery was the starting point for gravitino technology in the sense of modulated and bundled gravitino transmitters and receivers based on the red–shift effect for S gravitino telecommunications which, as a result of their much less stressful technology, will now replace S neutrino telecommunications, which have scarcely been born. At the same time, this discovery according to the invention leads to heat production technology which – without becoming perpetual motion – will have an efficiency level of between 1,000 and 10,000 percent and whose instrumentation conceivably simple... Original abstract incomplete.

Abstract:
Source: US5964059A A safety pole is comprised of a strip of plastic material having a normal elongated hollow cylindrical condition with overlapping longitudinal edges. A motor driven drum is mounted within a canister adapted to be recessed in the ground in spaced relation to a loading dock with the strip of plastic material connected at one end to the drum whereby the strip of plastic material may be wound on the drum in a flattened condition or extended vertically upwardly to form a pole. A loading dock is provided with a door and the operation of the motor driven drum is coordinated with the operation of the door so that when the door is open, the pole will be in the extended visible condition to warn a truck driven not to approach or leave a loading dock.

Abstract:
Source: DE2338268A1 Patentansprueche 1 Vorrichtung zum Stapeln gepresster Fliesen und zur Umladung fertiqer Fliesenstapel auf einen Tunnelofenwagen, dadurchgekennzeichnet, dass jede aus der Presse (1) ausgestossene Fliesenserie auf je einem Foerderriemenpaar (6) so gefuehrt wird, dass jede einzelne Fliese (59) jeder Serie elne–Schwenkung um 900 erfaehrt, wobei die Schwenkung abwechselnd im?jhrzeigersinn und gegen den Uhrzeigersinn ausgefuehrt wird, dass am Ende eines jeden Foerderriemenpas– res (6) eine Einrichtung (12 bis 3Qj zum Stapeln einer jeden Fliesenserje tworgesehen ist, wobei die als Boden dienende Platte (88 greater than jedes Stapels (11) jeweils vor Ein treffen jeder neuen Fliese (59 greater than um die Fliesenstaerke ge senkt wird, dass ferner eine anhebbare und absenkbare Umla devorrichtung vorgesehen ist, die in Laengsrichtung und Querrichtung zur Gesamtachse der Vorrichtung hin– und her bewegt werden kann und in der Lage ist, saemtliche vorzugs weise gleichhohen Fliesenstapel (11) gruppenweise auf den Tunnelofenwagen (32) unzuladenf bis dieser durch wiederhol te Umladung gleichgrosser Fliesenstapelgruppen vollstaendig mit Stapeln boden ist, wobei er jeweils nach Beladung mit einer Stapelgruppe entsprechend vorgerueckt wird, dass Einrichtungen (80,82,84,86) vorgesehen sind, die die erwaehnte Schwenkung ermoeglichen, sowie eine Einrichtung (12,76,77,78) zur Vertikalausrichtung der zu stapelnden Fliesen, sowie Einrichtungen, die die Stapelgrundplatte 4senken und wieder anheben und dafdr sorgen, dass die Plat te(88) vor der Aufnahme eines neuen Stapels zwecks Saeube rung gestuetzt wird, und die ermoeglichen, dass die fertigen Stapel seitlich eingefasst werden,– um die Umladungder Stapel zu bewerkstelligen, sowie Einrichtungen (29,30,79), die die verschiedenen Bewegungen der Umladevorrichtung steuern und das schrittweise Vorruecken des Tunnelofenwagens (32) bewirken und die saemtliche Bewegungen miteinander ab stimmen und steuern 2. An apparatus for stacking pressed tiles and for transfering the stacks onto a tunnel furnace trolley is as follows: each series of tiles from the press is guided on a pair of endless belts in such a way that each individual tile is rotated alternately through 90 degrees clockwise, then anti–clockwise, while at the end of the belts a stacker device produces a stack of tiles. The plate supporting the stack is lowered by one tile thickness at each feed operation. A charging device transfers the stacks onto the tunnel furnace wagon until this is fully loaded. This wagon is advance progressively during loading.

Abstract:
Source: US2003005634A A method for producing clean energy from coal by feeding the coal in a reactor which is sealed to the atmosphere and moving the coal in the reactor while injecting oxygen to combust a portion of the coal in a substoichiometric mode to devolatilize the coal and yield a pressurized hydrogen rich raw gas which contains coal–derived cancer causing distillates and hydrocarbons together with a hot char. The distillates and the hydrocarbons are cracked to result in a cracked gas of essentially 2H2 and 1CO which after desulfurization becomes an ideal synthesis gas that can be synthesized to a liquid fuel for heating and transportation as an alternate to petroleum. The hot char is gasified in an air blown gasifier to produce a fuel gas and a molten slag which are jointly directed out of the gasifier through a common port which is maintained open for the free flow of both. The fuel gas and the molten slag separate from each other by flowing both gas and slag through a molten bath in a submerged manner in order to effectively scrub the fuel gas in the molten bath while it bubbles out of the bath. After separation the fuel gas is treated for sulfur removal and is in condition for use as an efficient gas turbine fuel for power generation by virtue of its mass, while producing very low NOx emissions when combusted. This fuel gas can also be used for raising steam and for clean burning in industrial heating. The method is capable of making coke and/or activated carbon.

Abstract:
Source: US2005003208A Methods to reduce the inherent color contribution of a top layer in a multi–layer article (10) are disclosed. The articles produced thereby have reduced yellowing and thus lower amounts of color compensating pigments and dyes must be added in order to achieve the desired color of the article. The multi–layer material (10) includes a surface film (12), a substrate (14) and an intermediate layer (13) therebetween.

Abstract:
Source: FR2383267A L'invention concerne un moyen d'amelioration de la traficabilite des sols par la confection sur un vehicule et la mise en oeuvre par ce vehicule d'une route metallique a 2 composants. Cette route est fabriquee a partir d'un stock de tole en bobines portees par le vehicule, transformee, assemblee, et posee par un ensemble de machines synchronisees, elles–memes disposees sur le vehicule. La fabrication peut intervenir aussi bien sur le vehicule en mouvement que sur le vehicule a l'arret La route proprement dite est composee, d'une part d'une fondation comportant des nervures transversales et des rabats lateraux entre nervures faconnes au deroulement de la tole et d'autre part, d'une chaussee comportant des creves antiderapants confectionnes au deroulement de la tole. Les deux composants seront assembles entre eux en leur point de juxtaposition et par une succession de creves sertis transversaux. The lorry–mounted machinery both fabrication and lays a continuous traffic–bearing pavement of transversely corrugated metal sheet. The pavement is partic. useful as a temporary access road over snow or boggy etc ground. The pavement or mat leads the lorry, thus, affording support for the lorry as it advances. Rolls of sheet–metal are mounted on the lorry together with the machines for the automatic and continuous fabrication of the mat. The mat may be formed of two sheets which constitute the sub–structure and the running surface respectively. A primary set of rollers with reciprocally formative surfaces may form 'V' section anti–skid transverse grooves at regular intervals in a primary sheet.

Abstract:
Source: EP2799645A1 L'invention concerne un dispositif de renfort specialement adapte aux caracteristiques du vent, concu pour renforcer les structures verticales. Ce dispositif agit dans un angle limite mais grace a sa possibilite de pouvoir tourner autour du pylone qu'il renforce et grace a un aileron (6) qui le positionne dans la direction optimale en fonction du vent son action est toujours maximale. L'action e renfort du dispositif se fait par soutient grace a une structure rigide type bequille (2) et par traction grace a une structure pouvant etre souple type hauban. La poussee du vent exercee sur la partie haute du pylone est transmise par la bequille (2) ou le hauban soit directement au sol, soit au socle du pylone, plusieurs versions etant possibles. Pouvant etre profile il convient particulierement aux pylones d'eolienne. A reinforcing device specially adapted to the characteristics of the wind, designed to strengthen the vertical structures. This device comes in a limited angle but thanks to its opportunity to be able to turn around the pylon and it strengthens thanks to a spoiler (6) which positions in the optimal direction depending on the wind's action is always maximum. The action e reinforcement device is supported by a crutch thanks to rigid type structure (2) and traction thanks to a flexible structure that can be kind guy. The thrust exerted on the upper part of the pylon wind is transmitted by the crutch (2) or the guy either on the ground or at the base of the pylon, several versions being available. Profile can be should particularly to wind turbine towers.

Abstract:
Source: US4493677A A cooling fan is provided on at least one of the drive pulley and the driven pulley on which the drive belt is wound. A substantially closed casing in which the pulleys and the belt are accommodated has its interior partitioned in two chambers. With rotation of the fan, the air inside the casing is circulated within the casing where one of the chambers acts as a going passage and the other as a return passage, respectively, to thereby cool the pulleys and the belt. The two chambers are communicated with each other by communication means which are arranged at the pulleys and adapted to allow smooth movement of the air through the pulleys. Further provided are means for enhancing the efficiency of cooling the driven pulley by the circulating air and means for radiating heat generated within the casing through the casing walls.

Abstract:
Source: IN03873DN2006A Disclosed is a multilayer article assembly comprising (i) a coating layer comprising a block copolyestercarbonate comprising structural units derived from at least one 1,3–dihydroxybenzene and at least one aromatic dicarboxylic acid, (ii) a second layer comprising a polymer comprising carbonate structural units, (iii) an adhesive layer comprising a polyurethane, and (iv) an uncured thermoset or uncured cyclic oligomer substrate layer, wherein the coating layer is in contiguous contact with the second layer, and the adhesive layer is in contiguous contact with the second layer and the substrate layer. Also disclosed is a method for preparing said multilayer article assembly.
