Abstract:
A power connector comprises a central terminal and at least three peripheral terminals distributed around the central terminal, the peripheral terminals being substantially equally spaced from the central terminal. This configuration may allow a smaller footprint for such a connector, thus enabling better sealing, lower cost and/or greater flexibility of application, while avoiding safety problems such as tracking.

Abstract:
Source: US2004059212A Support structures for positioning sensors on a physiologic tunnel for measuring physical, chemical and biological parameters of the body and to produce an action according to the measured value of the parameters. The support structure includes a sensor fitted on the support structures using a special geometry for acquiring continuous and undisturbed data on the physiology of the body. Signals are transmitted to a remote station by wireless transmission such as by electromagnetic waves, radio waves, infrared, sound and the like or by being reported locally by audio or visual transmission. The physical and chemical parameters include brain function, metabolic function, hydrodynamic function, hydration status, levels of chemical compounds in the blood, and the like. The support structure includes patches, clips, eyeglasses, head mounted gear and the like, containing passive or active sensors positioned at the end of the tunnel with sensing systems positioned on and accessing a physiologic tunnel.

Abstract:
Source: US2007074720A An endotracheal intubation device having a curvable portion and internal optics or a viewing device which facilitate the insertion of an endotracheal tube into a patient. The device has a handle and a trigger. When the trigger is squeezed the curvable portion curves in a controlled manner from a fully straight configuration.

Abstract:
Source: US2003085621A A power supply detects power requirements of an electrical device and configures itself to provide the correct power to the device. By using a connector that isolates the device from its battery, the power supply can provide power to the device, recharge the battery, recharge the battery while at the same time providing power to the device, or provide power to the device while preventing the battery from being recharged. A switch used with the connector creates various circuits and is controllable by the power supply, the electrical device, by signals from the electrical device, or by a third device. The power supply may provide power to a plurality of devices and may be used with other power supplies to form a power grid. A master control unit receives inputs from each of the power supplies and controls the delivery and supply of power being the power supplies.

Abstract:
Source: US2007028780A A cooking device include an outer housing and a cooking cavity disposed within and separate from the outer housing. The cooking cavity accommodates a volume of cooking liquid therein. The device includes a heater positioned adjacent the cooking cavity to heat the cooking liquid. A lid is movably attached to the device and is used to form a seal with the cooking cavity. The lid includes a transparent portion positioned along a top surface to enable viewing inside of the cooking cavity. A controller can be used to heat the cooking fluid for an amount of time designated by user input. A moving mechanism can be used to move a food article into and out of the cooking liquid. The moving mechanism can be automated. The device can include a drainage system for removing the cooking liquid.

Abstract:
Source: US2006089633A Methods and apparatus are provided for selective surgical removal of tissue, e.g., for enlargement of diseased spinal structures, such as impinged lateral recesses and pathologically narrowed neural foramen. In one variation, tissue may be ablated, resected, removed, or otherwise remodeled by standard small endoscopic tools delivered into the epidural space through an epidural needle. Once the sharp tip of the needle is in the epidural space, it is converted to a blunt tipped instrument for further safe advancement. A specially designed epidural catheter that is used to cover the previously sharp needle tip may also contain a fiberoptic cable. Further embodiments of the current invention include a double barreled epidural needle or other means for placement of a working channel for the placement of tools within the epidural space, beside the epidural instrument. The current invention includes specific tools that enable safe tissue modification in the epidural space, including a barrier that separates the area where tissue modification will take place from adjacent vulnerable neural and vascular structures. In one variation, a tissue abrasion device is provided including a thin belt or ribbon with an abrasive cutting surface. The device may be placed through the neural foramina of the spine and around the anterior border of a facet joint. Once properly positioned, a medical practitioner may enlarge the lateral recess and neural foramina via frictional abrasion, i.e., by sliding the abrasive surface of the ribbon across impinging tissues. A nerve stimulator optionally may be provided to reduce a risk of inadvertent neural abrasion. Additionally, safe epidural placement of the working barrier and epidural tissue modification tools may be further improved with the use of electrical nerve stimulation capabilities within the invention that, when combined with neural stimulation monitors, provide neural localization capabilities to the surgeon. The device optionally may be placed within a protective sheath that exposes the abrasive surface of the ribbon only in the area where tissue removal is desired. Furthermore, an endoscope may be incorporated into the device in order to monitor safe tissue removal. Finally, tissue remodeling within the epidural space may be ensured through the placement of compression dressings against remodeled tissue surfaces, or through the placement of tissue retention straps, belts or cables that are wrapped around and pull under tension aspects of the impinging soft tissue and bone in the posterior spinal canal.

Abstract:
Source: US2005216302A Some embodiments of a method for premises management networking include monitoring premises management devices connected to a gateway at a premises; controlling premises management devices connected to the gateway at the premises; receiving, at the premises, an uplink–initiation signal associated with a network operations center server; and in response to the uplink–initiation signal, initiating, from the gateway at the premises, communications between the gateway and the network operations center server; and communicating, during the communications between the gateway and the network operations center server, information associated with the premises management devices.

Abstract:
Source: US2009156926A An integrated catheter placement system for accurately placing a catheter within a patient'vasculature is disclosed. In one embodiment, the integrated system comprises a system console, a tip location sensor for temporary placement on the patient's chest, and an ultrasound probe. The tip location sensor senses a magnetic field of a stylet disposed in a lumen of the catheter when the catheter is disposed in the vasculature. The ultrasound probe ultrasonically images a portion of the vasculature prior to intravascular introduction of the catheter. The ultrasound probe includes user input controls for controlling use of the ultrasound probe in an ultrasound mode and use of the tip location sensor in a tip location mode. In another embodiment, ECG signal−based catheter tip guidance is included in the integrated system to enable guidance of the catheter tip to a desired position with respect to a node of the patient's heart.

Abstract:
Source: US2002135374A A repair device for fixing a malfunctioning shunt across a failed filament in a light bulb in a group of series−connected miniature decorative bulbs includes a piezoelectric pulse generator producing one or more pulses of a magnitude greater than the standard AC power line voltage. A connector receives the pulses from the pulse generator and supplies them to the group of series−connected miniature decorative bulbs.

Abstract:
Source: US2012065729A A quick−connect heart valve prosthesis that can be quickly and easily implanted during a surgical procedure is provided. The heart valve includes a substantially non−expandable, non−compressible prosthetic valve and a plastically−expandable frame, thereby enabling attachment to the annulus without sutures. A small number of guide sutures may be provided for aortic valve orientation. The prosthetic valve may be a commercially available valve with a sewing ring with the frame attached thereto. The frame may expand from a conical deployment shape to a conical expanded shape, and may include web−like struts connected between axially−extending posts. A system and method for deployment includes an integrated handle shaft and balloon catheter. A valve holder is stored with the heart valve and the handle shaft easily attaches thereto to improve valve preparation steps.

Abstract:
Source: US2005078274A Tethered electrical components coupled to electrical components in or attached to a pair of eyeglasses are disclosed. The tethered electrical components can allow a user to communicate with a communication device in a wireless and hands−free manner. The tethered electrical components may also include and/or control one or more operation indicators to signal operational status of the electrical components. In addition, the tethered electrical components may also include and/or control one or more sensors to monitor and signal conditions of users of the tethered electrical components.

Abstract:
Source: US2014112828A A drain cassette for a dialysis unit has a fluid channel between venous and arterial connection ports, and a valve may controllably open and close fluid communication between a drain outlet port and the venous connection port or the arterial connection port. A blood circuit assembly and drain cassette may be removable from the dialysis unit, e.g., by hand and without the use of tools. A blood circuit assembly may include a single, unitary member that defines portions of a pair of blood pumps, control valves, channels to accurately position flexible tubing for an occluder, an air trap support, and/or other portions of the assembly. A blood circuit assembly engagement device may assist with retaining a blood circuit assembly on the dialysis unit, and/or with removal of the assembly. An actuator may operate a retainer element and an ejector element that interact with the assembly.

Abstract:
Source: US2005085813A There is shown a system and method for reducing the difficulty in percutaneous placement of a spine stabilization brace by coupling the brace to a pedicle screw in a single assembly. The brace−screw assembly is delivered along with an anchor extension through a cannula for anchoring in the vertebrae pedicle. The anchor extension becomes a cannula for working on the brace from the exterior of the patient, as constructed with a slot opening along two sides. Once the screw portion of the brace−screw assembly is locked in place with respect to the first vertebra, the proximal end of the brace is below the skin line. The brace is then repositioned so that the proximal end leaves the cannula through one slot and is captured by a corresponding slot positioned in a second cannula coupled to a second anchor. Once captured, the proximal end of the brace is guided by the second cannula to a receptacle positioned in the second vertebra.

Abstract:
Source: US2002103486A A method and apparatus is disclosed for mechanically−assisted liposuction treatment. The apparatus includes a hand−holdable housing, an electro−cauterizing cannula assembly, and a reciprocation mechanism. The hand−holdable housing has a cavity adaptable for receipt of a portion of the electro−cauterizing cannula assembly. The electro−cauterizing cannula assembly includes an inner cannula and an outer cannula, each having a distal end and a proximal end and at least one aspiration aperture about the distal end. The inner cannula is disposed within the outer cannula and the inner and outer aspiration apertures are in at least partial registration to form an effective aspiration aperture. The reciprocation mechanism is disposed within the housing and is operably associated with either the inner or outer cannula so that one of the cannulas can be selectively caused to reciprocate relative to the housing while the other is stationarily disposed relative to the housing. As one of the cannulas is caused to reciprocate relative to the other the effective aspiration aperture formed through the distal end of the cannula assembly, is caused to undergo periodic displacement. During aspiration of tissue, high−voltage RF power signals are supplied to the inner and outer cannulas to effect hemostasis about the reciprocating aspiration aperture. Such hemostasis is achieved by causing protein molecules within aspirated tissue to coagulate in response to the high−voltage RF signals being supplied across the reciprocating cannulas. In the preferred embodiments, the amount and rate of such aspiration aperture displacement is controllably adjustable. The cannula assembly is releasably detachable from the hand−holdable housing to facilitate cleaning and sterilization of the cannula assembly and the housing.

Abstract:
Source: US2009259107A Methods and devices are disclosed to reduce the tissue trauma that occurs when a physician retracts or otherwise deforms a patient's tissues for surgery or other medical procedures. In one part, methods and devices are disclosed for controlling the force and pace of retraction to reduce tissue trauma. In another part, methods and devices are disclosed for applying an oscillating load when opening. In another part, pads that cool the tissue around the incision are disclosed. In another part, pads that elute drugs into the tissues of the tissue margin are disclosed. In another part, methods and devices are disclosed that self−align components of the retractor and engage hard tissues directly to avoid soft tissue damage. In another part, pads that engage tissues to cushion, to sense tissue state, and to modulate tissue state are disclosed.

Abstract:
Source: US6842987B A brake triggering device with a pivotably mounted trigger arm (1) located in connection to a handheld working tool's, mainly a chain saw's (2), rear handle (3), with a throttle control (4) and a handle opening (5) located below the handle (3), so that the trigger arm (1), when the saw changes inclination in relation to the operator's forearm, e.g. at the event of kickback or fall, is actuated by the operator's hand or arm, whereby the trigger arm (1) via a transfer mechanism actuates a brake (9) so that this stops the movement of the saw chain. The pivot (10) of the trigger arm is located in connection to a front (11) or a bottom (12) side of the handle opening (5).

Abstract:
Source: US2013345718A A medical robot system, including a robot coupled to an effectuator element with the robot configured for controlled movement and positioning. The system may include a transmitter configured to emit one or more signals, and the transmitter is coupled to an instrument coupled to the effectuator element. The system may further include a motor assembly coupled to the robot and a plurality of receivers configured to receive the one or more signals emitted by the transmitter. A control unit is coupled to the motor assembly and the plurality of receivers, and the control unit is configured to supply one or more instruction signals to the motor assembly. The instruction signals can be configured to cause the motor assembly to selectively move the effectuator element and is further configured to (i) calculate a position of the at least one transmitter by analysis of the signals received by the plurality of receivers; (ii) display the position of the at least one transmitter with respect to the body of the patient; and (iii) selectively control actuation of the motor assembly in response to the signals received by the plurality of receivers.

Abstract:
Source: US2003216792A A method and apparatus for treatment of heart failure, hypertension and renal failure by stimulating the renal nerve. The goal of therapy is to reduce sympathetic activity of the renal nerve. Therapy is accomplished by at least partially blocking the nerve with drug infusion or electrostimulation. Apparatus can be permanently implanted or catheter based.

Abstract:
Source: US2004092892A Apparatus and methods are described for treatment of morbid obesity using minimally invasive techniques. The apparatus includes a system of components that may be used separately or in combination for effectively reducing stomach volume, bypassing a portion of the stomach and/or small intestines, reducing nutrient absorption in the stomach and/or small intestines and/or depositing minimally or undigested food farther than normal into the intestines, thereby stimulating intestinal responses. The components described include an artificial stoma device, a gastric sleeve device, an intestinal sleeve device, a combined gastrointestinal sleeve device and permanent and detachable attachment systems. Also described are devices for delivering and deploying the components of the system.

Abstract:
Source: US2009205643A An accelerated two−phase surgical procedure is disclosed for creating a pneumostoma to treat chronic obstructive pulmonary disease. The first phase includes creation of a localized pleurodesis. The localized pleurodesis is created using chemical agents and/or mechanical fasteners to secure the visceral membrane to the pleural membrane. The second phase includes introduction of a surgical instrument into the lung via the pleurodesis to create the pneumostoma. The first and second phases are performed as parts of a single surgical procedure. The formation of a stable pleurodesis is to prevent pneumothorax during the procedure.

Abstract:
Source: US2002018281A Coupling of anodic electrochromic compounds by a covalent bond or a bridge link which provides for electronic communication between the coupled electrochromic compounds results in coupled electrochromic compounds which exhibit greater stability as well as electrochromic activity that differs from the monomeric electrochromic compounds. Extension of the absorption spectrum into the near−infrared region of the spectrum is frequently observed. The coupled electrochromic compounds are highly suitable for use in electrochromic media used to produce electrochromic devices.

Abstract:
Source: US2014070957A An wearable communications garment that includes one or more user−selectable inputs integrated into the garment. A sartorial communications apparatus may include a flexible material that is worn (e.g., as an undergarment) by the user and includes one or more interactive sensors that may be manually activated by a user, even through one or more intervening layers of clothing. The apparatus may also include one or more additional body sensors configured to sense a user's position, movement, and/or physiological status. The sensor(s) may be connected via a conductive trace on the garment to a sensor module for analysis and/or transmission. Methods of manufacturing the garments as well as methods of using the garments are also described.

Abstract:
Source: US2011169447A An electric vehicle charging system includes a portable housing having an integral holder to hold a connector for an electric vehicle supply circuit. An electric vehicle supply equipment enclosure includes an integral chamber to store all or part of a cord. A mounting bracket for an electric vehicle supply equipment enclosure covers an open portion of the enclosure. A method for facilitating use of an electric vehicle

includes providing a prewiring kit for the electric vehicle. An electric vehicle supply equipment enclosure includes an integral disconnect switch. An electric vehicle supply circuit includes a grounding monitor circuit having automatic test functionality. Another electric vehicle supply circuit includes a contact monitor circuit to monitor the state of one or more of the contacts.

Abstract:
Source: US2013125772A A detonator system is provided for use with explosives that utilizes two subsystems. A first subsystem functions as a non−explosives based detonator, which does not contain any explosives. The second subsystem is an initiating subsystem, which includes an initiating pellet. To set off an explosive event, the non−energetics based detonator is coupled to the initiating subsystem and the non−energetics based detonator is commanded to provide a suitable signal to the initiating subsystem that is sufficient to function the initiating pellet. Further, the initiating subsystem can be integrated directly into an associated explosive such as a booster that has been configured to receive the initiator subsystem without changing the hazard class of the booster.

Abstract:
Source: US2015202456A Configurations are described for utilizing light–activated proteins within cell membranes and subcellular regions to assist with medical treatment paradigms, such as hypertension treatment via anatomically specific and temporally precise modulation of renal plexus activity. The invention provides for proteins, nucleic acids, vectors and methods for genetically targeted expression of light–sensitive proteins to specific cells or defined cell populations. In particular the invention provides systems, devices, and methods for millisecond–timescale temporal control of certain cell activities using moderate light intensities, such as the generation or inhibition of electrical spikes in nerve cells and other excitable cells.

Abstract:
Source: US2011034905A A method of and apparatus for safely removing visceral fatty tissue from the patient's mesentery is disclosed. In the preferred embodiment, the method involves using a novel minimally invasive or laparoscopic surgical procedure involving the inflation of the abdominal region with gas that creates a space between the wall of the abdomen and the organs inside. Using short incisions in the skin, narrow tubes are inserted through the abdominal wall so that a laparoscopically−guided electro−cauterizing and irrigating liposuction instrument can be passed through the incision to perform the maneuvers necessary for the operation. Removal of visceral fat from the mesentery is observed directly on a video monitor, which receives its picture from a video camera attached to the laparoscope. Using this technique, it is now possible to safely remove visceral fat from the patient's mesentery to treat abdominal obesity and/or metabolic syndrome in human patients.

Abstract:
Source: US2012089170A The present application provides intragastric devices for the treatment of obesity. The intragastric devices advantageously act as a volume−occupying device, and is able to survive implantation in a

patient's stomach for a year or longer. In addition, the intragastric devices may provide additional benefits. For example, the intragastric device may be configured to stimulate an inner stomach wall and/or temporarily block the pylorus to slow gastric emptying and/or be rotationally variant, thereby encouraging different stimulation points on the inner wall of the stomach and limiting the stomach's ability to adapt over long term implantation.

Abstract:
Source: US2011106019A Devices and methods for the effective clearing of artificial tubes, especially in−situ clearing of artificial tubes in a living being are covered in this disclosure. The devices and methods provide an elongated clearing member having a first end that is coupled to a driving mechanism and having a second working end that is subjected to repetitive motion for clearing blockages within the artificial tube. The elongated clearing member includes either a fixed or an adjustable element that selectively defines the portion of the elongated clearing member that is insertable within the artificial tube. The proximal end of the clearing member is releasably secured to the driving mechanism and the driving mechanisms may comprise a wide variety of repetitive motion drivers such as voice coil motors, piezoelectric actuators, pneumatic actuators, DC motors, etc. These devices/methods may comprise a free−standing console for hands−free operation or may comprise hand−held versions. The distal working end of the clearing member may comprise tips of differing functions, including an irrigation/aspiration feature.

Abstract:
Source: US2015082623A A method for constructing a stress−pliant physiological electrode assembly is provided. An electrode backing is formed from a stretchable woven textile material compatible to contact the skin on at least one surface. A pair of flexile wires is provided to serve as electrode circuit trace and electrode signal pickup. At least one of the flexile wires is sewn into the textile material which provides a stress−pliant malleability. Each of the flexile wires has an electrically−contacting area functioning for electric signal pickup. The electrically−contacting area may be sewn into the woven textile or affixed to the woven textile via conductive adhesives. The stress−pliant physiological electrode assembly is applicable for a wide array of physiological monitors, including ECG monitors, and especially is suitable for long−term wear. The method disclosed is both environmentally friendly and low−cost.

Abstract:
Source: US2011118766A A ventricular assist system and a method of implanting the system are disclosed. The system can have a pump, an inflow conduit, an outflow conduit, attachment ring, ring clamp, and a valvular structure. The attachment ring can be attached to the apex of the heart. The valvular structure can have a flexible, one−way valve in a rigid housing. The inflow conduit can be passed through the valvular structure and the attachment ring into a beating heart with minimal loss of blood. Devices such as slitting tool, coring knife, and/or C−clamp and use of the devices can form part of the system and method for implanting the ventricular assist device.

Abstract:
Source: US2013016020A A Guided Soft Target (GST) system and method provides a versatile test system and methodology for the evaluation of various crash avoidance technologies. This system and method can be used to replicate the pre−crash motions of the CP in a wide variety of crash scenarios while minimizing physical risk, all while consistently providing radar and other sensor signatures substantially identical to that of the item being simulated. The GST system in various example embodiments may comprise a soft target vehicle or pedestrian form removably attached to a programmable, autonomously guided, self−propelled Dynamic Motion Element (DME), which may be operated in connection with a wireless computer network operating on a plurality of complimentary communication networks. Specific DME geometries are provided to minimize ride disturbance and observability by radar and other sensors. Computer controlled DME braking systems are disclosed as well as break−away and retractable antenna systems.

Abstract:
Source: US2004097881A A releasable mechanism such as a cap is adapted for use with an access sheath having an elongate tube and a handle structure disposed at a proximal end of the tube. The releasable mechanism is sized and configured to fit the handle structure, which is shaped like the bell of a horn, to further facilitate use with surgical instrumentation. The releasable mechanism may operate as a separate cap that snaps onto the handle structure to provide access pathways to the sheath. The releasable mechanism may also be disposed at a proximal end of a surgical instrument to be introduced into the access sheath such that it may be interlocked with the sheath. In a method of manufacturing a kink−resistant sheath, a wire is initially coated with a plastic material, the coated wire is then wrapped around a mandrel forming a plurality of windings, and the wound coated wire is heated until the plastic material melts and bonds the windings to form a wire−reinforced sheath. The plastic material is preferably polyurethane but may be a thermoplastic, a thermoset or any plastic material having hard and/or soft durometer. The wound coated wire may be heated by capturing the windings within a shrink tube or compressing the windings in a mold and heating the windings until the sheath is formed. In another aspect of the invention, a mandrel is used as part of an extrusion process. In another aspect of the invention, another coating or outside layer could be formed over the spring reinforcement by dipping in a solvent based solution. In yet another embodiment of the invention, a braid such as a polyester braid may be used instead of or in addition to the coil spring to form a kink−resistant sheath.

Abstract:
Source: US2002022846A A method of fusing or welding bone in vivo and in a fluid medium, comprising: harvesting a piece of autologous implant bone; treating the implant bone and/or a receiving bone to expose organic component; treating the implant bone and/or the receiving bone by de−fatting; combining the implant bone with other compounds to create an interfacing agent; adding the interfacing agent between receiving bone segments to be fused or welded; and fusing or welding in vivo, in a fluid medium, utilizing electromagnetic energy.

Abstract:
Source: US2001001122A A system for performing an end−to−side vascular anastomosis, including an anastomosis device, an application instrument and methods for performing a vascular anastomosis. The system is applicable for performing an anastomosis between a vascular graft and the ascending aorta in coronary artery bypass surgery, particularly in port−access CABG surgery. A first aspect of the invention includes a vascular

anastomosis staple. A first configuration has two parts: an anchor member, forming the attachment with the target vessel wall and a coupling member, forming the attachment with the bypass graft vessel. The anastomosis is completed by inserting the coupling member, with the graft vessel attached, into the anchor member. A second configuration combines the functions of the anchor member and the coupling member into a one−piece anastomosis staple. A second aspect of the invention includes an anastomotic fitting having an inner flange over which the graft vessel is everted and an outer flange which contacts the exterior surface of the target vessel. A tailored amount of compression applied by the inner and outer flanges grips the target vessel wall and creates a leak−proof seal between the graft vessel and the target vessel. A third aspect of the invention has a flange to which the graft vessel attaches, by everting the graft vessel over the flange, and a plurality of staple−like members which attach the flange and the everted end of the graft vessel to the wall of the target vessel to form the anastomosis.

Abstract:
Source: US2002165589A A device, system and method for diagnosing and treating gastric disorders is provided. A functional device resides within the patient's stomach and is secured to the stomach wall by an attachment device. The functional device may be a sensor for sensing various parameters of the stomach or stomach environment, or may be a therapeutic delivery device. The functional device in one embodiment provides a device, system and method for gastric electrical stimulation where stimulating electrodes are secured to the wall of the stomach by the attachment device or otherwise. A preferred device includes: at least one stimulating electrode in electrical contact with the stomach wall; an electronics unit containing the electronic circuitry of the device; and an attachment mechanism for attaching the device to the stomach wall. The functional devices may be programmed to respond to sensed information or signals. An endoscopic delivery system delivers the functional device through the esophagus and into the stomach where it is attached the stomach wall. The endoscopic instruments attach or remove the attachment devices and functional devices from the stomach and may be used to assist in determining the optimal attachment location.

Abstract:
Source: US2006020241A A laparoscopic port assembly includes a cannula unit including three cannulas each extending at an acute angle relative to a base. The cannulas are flexible for receiving respective angulated laparoscopic instruments. The cannula unit is rotatingly received in a port holder for rotation about a longitudinal axis of the holder, the holder being disposable in an opening in a patient's skin.

Abstract:
Source: US2005151067A A liner sheet lines at least a portion of an interior surface of a shipping container or box and defines an optical path extending across at least a portion of the sheet, such that a breach of the interior surface also alters an optical characteristic of the optical path. For example, an optical fiber can be woven into, or sandwiched between layers of, the liner sheet. The optical path is monitored for a change in an optical characteristic. If the container or box interior surface is breached, one or more portions of the optical fiber are severed or otherwise damaged, and the optical path is altered. The detected change in the optical path can be used to trigger an alarm, such as an annunciator, or to send a message that includes information concerning the container's contents or time or location of the container when the breach occurred to a central location, such as a ship's control room or a port notification system.

Abstract:
Source: US2003035917A The invention relates to an image support medium for creation of an aesthetic image that is an work or object for display. This support medium includes a polymer in an amount sufficient to enable the image to have at least one aesthetic element. In different embodiments, the image support medium is an image support stabilizer, the polymer is a synthetic absorbent or conductive polymer, or the polymer is a transparent or synthetic translucent polymer and a property of this transparent or translucent polymer is enhanced to facilitate the creation or preservation of the image by at least one stabilizer. The invention also relates to a method for preparing this image support medium. The method includes forming a reaction mixture comprising a monomer in an amount sufficient to provide or enable the image to have an aesthetic element, and processing the reaction mixture into a 2– or 3–dimensional shape.

Abstract:
Source: US2009270888A A rotating cutting head catheter for passage through chronic total occlusions or other refractory atherosclerotic plaque from diseased arteries is disclosed. The catheter's rotating cutting head is designed to reside safely within an outer protective sheath when not in use. The outer protective sheath contains one or more helical groves or slots, and the cutting head contains protruding blades or projections that fit into these helical groves or slots. Application of torque to an inner catheter or wire attached to the cutting head applies spin to the cutting head, and the force of the sheath's helical groves or slots against the cutting head's protruding blades or projections advances the cutting head outward from the protective sheath. Once extended, the cutting head may now rotate freely. The device may use a guidewire to direct the cutting head to the desired position.

Abstract:
Source: GB2531911A The assembly comprises head and bottom rails, blind material, a lift cord and a safety device attached to the blind material proximal the bottom rail and arranged to clamp the lift cord and release it when the force upon it exceeds a predetermined amount. The safety device may comprise a plunger 25 and socket 23 with complementary openings 57, [35, fig 5] defining a clamping sleeve through which the cord extends. A biasing spring 27 may provide the clamping force. The safety device may have a structure 31 for attachment to the blind material. The structure may be a loop or hook for respectively sewing or clipping to the blind material. The loop may have teeth 43 for retaining the sewn thread. Also claimed separately is the safety device, a kit of parts for constructing the blind assembly, and a method of improving the blind assembly using the safety device.

Abstract:
Source: US5657799A A safety device for a reinforcing bars binding machine which includes a wire feed device for feeding out a wire used to bind reinforcing bars together, a guide arm for guiding the fed–out wire such that the wire is wound around the intersecting portions of the reinforcing bars in a loop manner, a twisting device for holding part of the loop–wound portion of the wire and for twisting and rotating the same to thereby tighten the wire, and a cutting device for cutting off the loop–wound portion of the wire from the portion of the wire existing on the wire feed device side, wherein the guide arm is movable in the wire feeding direction, and wherein the safety device comprises: a spring normally energizing the guide arm in the opposite direction to the wire feeding

direction; and detector for detecting that the guide arm is moved in the wire feeding direction against the energization force of the spring, wherein the wire feeding device is operated in accordance with the detection of the movement of the guide arm by the detector.

Abstract:
Source: US2013068226A An inhalable cold plasma mask device for generation of a breathable cold plasma for delivery to a patient. A biocompatible gas is received in a dielectric barrier discharge (DBD) device that is energized by an electrode that receives energy from a pulsed source. The DBD device can be grounded by a grounding structure. A grounding screen can be used prior to inhalation of the cold plasma. The inhalable cold plasma mask device includes the use of a single−layer or a two−layer approach to its construction. The inhalable cold plasma mask device can have one or two DBD devices. Such a device and associated method can be used to treat upper respiratory tract infections, as well as reducing inflammation, sinus and esophageal polyps in both size and frequency of occurrence.

Abstract:
Source: US2009024072A Interventional procedures on the carotid arteries are performed through a transcervical access while retrograde blood flow is established from the internal carotid artery to a venous or external location. A system for use in accessing and treating a carotid artery includes an arterial access device, a shunt fluidly connected to the arterial access device, and a flow control assembly coupled to the shunt and adapted to regulate blood flow through the shunt between at least a first blood flow state and at least a second blood flow state. The flow control assembly includes one or more components that interact with the blood flow through the shunt.

Abstract:
Source: US2005125020A The present invention relates to an anchor configured for minimally−invasive implantation and sized to remain securely positioned within at least a portion of the gastrointestinal tract of an animal. The anchor includes a radial spring formed from an elongated resilient member shaped into an annular wave pattern about a central axis. The anchor defines a central lumen and provides an outward radial force, while allowing for substantial flexure about its perimeter. The anchor is generally removable, but can include fasteners, such as barbs, to further secure it to the surrounding anatomy. In some embodiments, the anchor includes a connector coupling a fixed portion to a removable portion. Further, the anchor can be used to secure a medical device within the body, such as a flexible sleeve within the intestine.

Abstract:
Source: US2011277756A A personal vapor inhaling unit is disclosed. An electronic flameless vapor inhaler unit that may simulate a cigarette has a cavity that receives a cartridge in the distal end of the inhaler unit. The cartridge brings a substance to be vaporized in contact with a wick. When the unit is activated, and the user provides suction, the substance to be vaporized is drawn out of the cartridge, through the wick, and is atomized by the wick into a cavity containing a heating element. The heating element vaporizes the atomized substance. The vapors then continue to be pulled by the user through a mouthpiece and mouthpiece cover where they may be inhaled.

Abstract:
Source: US2008135579A A hand held dispenser system with associated dispensed material supply assembly as in separate source chemical foam precursor feeding into, for example, streamlined chemical passageways preferably each comprised of, in series, a castellated swivel hose filter, a valve assembly housing, a wing extensions of a manifold, which manifold supports a high efficiency drive system and is supported by a handle that provides for a compact assembly and receives a rugged trigger assembly. The manifold design provides for elongated filter and, temperature controlled cartridge heater insertion. There is further provided in a preferred embodiment a readily releasable electric source feed line plug connection at the butt end of the dispenser. The dispenser is well suited for the dispensing of methane foam as in a product packaging setting.

Abstract:
Source: US2004127981A Devices, systems and methods retain a native heart valve leaflet to prevent retrograde flow. The devices, systems, and methods employ an implant that, in use, rests adjacent a valve annulus and includes a retaining structure that is sized and shaped to overlay at least a portion of one or more native valve leaflets. The retaining structure retains the leaflet or leaflets it overlays, to resist leaflet eversion and/or prolapse. In this way, the implant prevents or reduces regurgitation. The implant does not interfere significantly with the opening of and blood flow through the leaflets during periods of antegrade flow.

Abstract:
Source: US2003073908A A method and apparatus for delivery of genes, enzymes and biological agents to tissue cells, including a method and apparatus wherein treatment fluids, including genes, enzymes and biological agents, are injected into a target area of a body providing selective attachment to the specific target cells without affecting normal tissue cells. The method is used to treat prostate cancer, breast cancer, uterine cancer, bladder cancer, stomach, lung, colon, and brain cancer, etc. A hollow core needle is inserted into a body, the needle being visually guided by a selected imaging technique. A first embodiment utilizes an endoscopic instrument, wherein a probe is inserted into the body, guided by the endoscope to the vicinity of the target area. The hollow core needle is guided to the vicinity by a channel through the probe. A needle adjustment apparatus is used to extend or retract the needle and adjust needle tip orientation toward a target area. The endoscope provides a view to an operator for adjustment of the apparatus to extend the tip of the needle into and through tissue, interstitially, to a target area for deposit of the specific treatment fluid. A non−invasive imaging technique is used either alone, or in addition to the endoscope, to give an operator a view of the needle for guiding the needle tip to the precise target area. Typical non−invasive techniques include CT scan, MRI, ultrasound, etc.

Abstract:
Source: US2011105877A An apparatus and method are disclosed for detecting the disconnection of a vascular access device such as a needle, cannula or catheter from a blood vessel or vascular graft segment. A pair of electrodes is placed in direct contact with fluid or blood in fluid communication with the vascular segment. In one embodiment, the electrodes are incorporated into a pair of connectors connecting arterial and venous catheters to arterial and venous tubes leading to and from an extracorporeal blood flow apparatus. Wires leading from the electrodes to a detecting circuit can be incorporated into a pair of double lumen arterial and venous tubes connecting the blood flow apparatus to the blood vessel or vascular graft. The detecting circuit is configured to provide a low−voltage alternating current signal to the electrodes to measure the electrical resistance between the electrodes, minimizing both the duration and amount of current being delivered. Detection of an increase in electrical resistance between the electrodes exceeding a pre−determined threshold value may be used to indicate a possible disconnection of the vascular access device.

Abstract:
This invention is a device (500) for sealing a hole in a blood vessel, comprising a ring (504); a plurality of spikes (506) extending from said ring towards a center of said ring, and to first direction along an axis of said ring, said spikes being adapted for engaging a blood vessel; a plurality of tabs (502) extending substantially radially from said ring, wherein rotating said tabs around said ring distorts said ring such that said spikes are rotated in a same direction as said tabs.

Abstract:
Source: US2011308137A One embodiment comprises a wall–less trap that includes a base, vertical supports, an upper cage, one or more guides connected to the upper cage, and a trigger. The base is positioned on a horizontal surface. The vertical supports extend upward from the base. The upper cage is movable between a raised position, in which the upper cage is suspended above the base, and a lowered position, in which the upper cage rests on the base or the horizontal surface. The guides are connected to the upper cage and slide on the vertical supports to guide vertical travel of the upper cage. The trigger can be either engaged to hold the upper cage in the raised position, or disengaged to allow the upper cage to fall downward from the raised position. The trigger is movable from the engaged position to the disengaged position by an animal positioned under the upper cage.

Abstract:
Source: GB552587A [Classes 9 (i) and 9 (ii)] An anti–aircraft shell of the type containing a parachute mine constructed to form the forward one of two separable sections of the shell which are adapted during the flight of the shell, and at a predetermined altitude, to be automatically separated, and wherein the explosion of the charge embodied in the mine is controlled before and after said separation, is characterized in that the charge is detonated by a firing device including a slidable primer actuated by a percussion plunger or the like, the primer being held in a rear operative position during the flight of the shell and being again rendered operative only after the shell sections have separated and the mine is suspended from the parachute. If the parachute floats to earth with its mine unexploded, the mine is rendered harmless by the weight thereof being taken off the parachute. The shell explodes before separation if impact with an aeroplane occurs. The fuze may be such that the shell may be converted into a timed high–explosive shell. The shell comprises two separable parts 31a; 31b, the front part 31a constituting the mine and containing high explosives 43, while the rear part contains the parachute 41. when the shell is fired from the gun, a consussion plunger 96 breaks away (by inertia) from its retaining ring 97 and strikes a firing pin 98 which ignites a primer in the plunger. The flash from the primer ignites a powder train contained in adjustable rings 92, 93, 103, which train burns around to a detonator 67 which, via a conduit 66, fires a parachute–releasing charge 47 of black powder, the explosion of which separates the two parts 31a, 31b which have hitherto been joined by a shear wire 35. The charge 47 blows rearwardly a two–part piston 49a, 49b, which is secured to a sleeve 159 sliding freely on a tube 132; the sleeve has fixed thereon a head 167 which, via a sliding ring 163, compresses a heavy spring 161 which limits the rearward movement of the piston. When the part 49a stops, the part 49b travels on, the consequent relative movement (which is limited, e.g. by pin and slot 207, 208) resulting in the cocking of a series of angularly–spaced devices 51, each comprising links 187, 188 pivoted to each other and to the parts 49a, 49b. A spring 199, disposed betweel links 187, 188 tends to separate the parts 49a, 49b, The construction is such that the links 188 form struts which just resist the forward pull of the heavy spring 161. A slight tripping force applied forwardly on the part 49b or laterally inward on the links 187 trips the devices 51, whereupon the spring 161 thrusts forward the sleeve 159, and spring strips 171, secured to the sleeve, strike an extension 145 of a Semple centrifugal firing plunger 76 which fires a primer 75 which, via a booster charge 72, fires the high explosive 43. Trigger notches may be formed in the links 187 to engage with the edge 213. A spring 215 may supplement or replace the springs 199; if the springs 199 are omitted, the links may be flung outwards by centrifugal force, or the pivots 202 may be located inwardly of a line joining the pivots 189 and 197. The spring strips 171 are initially disposed within the extension 145, but, on opening: of the shell, spring outwardly into slots 172 in the extension and bear against right–angled shoulders 172b so that on impact of an aeroplane with the wire 42 the plunger 76 is retained in the rearward position; in a modification, the shoulders may be bevelled, as at 172c or omitted, so that on said impact inertia throws the plunger forward. The sensitivity may be graduated, an impact near the bomb firing it and an impact remote from it not firing it. In this sensitized modification, the wall 54 of the explosion chamber may be made weak so that it, with shrapnel balls placed inside it, may be blown out. The primer 75 is contained in a thimble 115 secured to rods 128 fixed on the head 131 of the tube 132 which houses a spring 133 surrounding a plunger 134 having a head 137 to which is secured one end of

the parachute wire 42. A spring 126, bearing against a flange 117 on the thimble, tends to urge the thimble forwardly into a position in which its explosion ports 121 will register not with ports 109 (in the ring 103) leading o the booster charge 72 but with a chamber 84a leading to vents 89, 91 which may vent outward or inward. During the flight of the shell, the tube 132 (and hence the thimble 115) is retaine din the rearward (firing) position by a split wire ring 138 engaging in a groove 139 in the tube, so that if the shell strikes an aircraft the plunger 76, moving forward by inertia against the action of the spring 126, fires the primer. During the opening of the shell, when the ring 138 has been displaced, the spring 126 forces the thimble to the forward (non−firing) position. When the shell has opened, and the bomb 31a hangs from the parachute, the weight of the bomb compresses the spring 133 and the thimble is returned to the firing position. When the shell reaches the ground, the weight of the bomb is taken off. the spring 133, and the spring 126 moves the thimble to the non−firing position. The third powder train ring 103 has two angularly spaced grooves 265, 266, which may be flash passages or may be packed with black powder. The ring may be rotated relatively to the ring 93 so that (a) (Fig. 24) the groove 265 registers with a flash passage 196 leading from the ring 93; in this position the flash will pass through the passage 108 and the fuze is set for opening the shell to release the parachute, (b) (Fig. 25) the groove 266 registers with the flash passage 106; in this position the flash will pass through ports 109 and passage 74 to the booster charge 72 the fuze being thus set to fire the high explosive 43, or (c) the ports 109 are out of registry with passages 122 in the rings 118 in which the thimble 115 slides; in this position neither of the grooves 265, 266 registers with the port 106, and more over, the primer is cut off from the booster charge, so that accidental firing of the primer will not be transmitted to the latter. The parachute wire 42 is in two or more reel sections 42a, 42b, the wire being unwound from each section simultaneously. The wire is embedded in resin, pitch or rubber, which offers resistance to the unwinding and enables the sections to be packed as units, e.g. in cardboard containers 221. The rear section 42b may function as a plug having a flange engaging behind a ring 181, so that the parachute is retained in place until most of the wire has been unwound.

Abstract:
Source: US2011079453A Methods and apparatus may augment the utility of an electrically powered vehicle. A first electric motor (110a or 110b) may be provided with a first effective gear ratio, a second electric motor (111a or 111b) may be provided with a second effective gear ratio, and additional electric motors may be provided additional effective gear ratios. An electrically powered vehicle may be differentially powered by said electric motors at said different effective gear ratios. A transdisciplinary electrical diagnostic processor (440) may process electrically recondite operation parameters of one or more electrical components to provide transdisciplinary diagnostic output to a user. A standardized modular interface (540) supported on a trailer chassis (510) may be configured to accept multipurposed modular interchangeable trailer tops (560) at an interchange position (550) of said trailer chassis (510). A hand actuated accessory mount may be provided with a quick release interface (322).

Abstract:
Source: US2001000886A A vehicle crush detecting device including an electrically conducting tube with an electrically conducting rod positioned within the tube along with insulating means positioned at at least two points between the rod and tube to insulate the rod from the tube. The electrically conducting tube is deformed during a vehicle crash causing the tube to contact the rod in response to crush of the vehicle. A header/connector assembly seals a space between the rod and tube at one end while a space between the rod and tube at the opposite end is closed. The header/connector assembly includes electrical connector pins electrically coupled to the rod and tube and having an exposed portion for connection to a wire harness. The device is used to sense crashes for the deployment of automobile passive restraint systems such as airbags.

Abstract:
Source: US2011138587A One embodiment of the present invention relates to an automatically locking carabiner system including a frame, a gate, a gate biasing system, and a gate locking system. The frame and gate form a continuously enclosed inner region in a closed configuration with respect to the frame. When in an engaged state, the gate locking system is configured to automatically lock the gate in the closed configuration with respect to the frame. The gate locking system may include a trigger coupled to the frame such that the position of the trigger corresponds to the state of the gate locking system. The trigger may be positioned on an opposite side of the frame from the gate with respect to the inner region. The force required to disengage the gate locking system may be substantially opposite that which is required to transition the gate to the open configuration with respect to the frame.

Abstract:
Source: US2003102185A A device to retract cams of spring–loaded camming devices (SLCD) used in rock climbing protection. The device includes a retraction mechanism operable on the SLCD and a control interface to receive input from a climber's hand. A linkage of variable length is disposed between the retraction mechanism and the control interface. The linkage may be adjusted between a longer deployed length for cam retraction and a shorter length to facilitate transportation and storage of the device.

Abstract:
Source: US2007060454A The invention includes the method and apparatus of attaching exercise equipment, such as various lengths and configurations of elastic resistance tubing, to athletic footwear. Among the many configurations of the invention is whereby the elastic tubing and handle assembly is permanently connected to the sneaker. Another configuration of the invention is the use of the elastic tubing and handle assembly being equipped with an end clip fastener that can be easily and quickly fastened to and/or unfastened from a sneaker or other type of footwear. Other improvements include a reinforcement ring that may be attached to one or more laces of the shoe and/or other components such as VELCRO strips that can be attached to the body of an athletic shoe to make the attachment, stowage and use of the elastic cord and handle assembly more secure and safer during use.

Abstract:
Source: GB2136043A A bucket holder for removably mounting a bucket 38 on a gate, sheep hurdle or similar barred support structure having a U–shaped bucket holding portion 14, and two feet 24 joined to and extending at an acute angle from the bucket holding portion, the feet being configured to hook onto a horizontal bar of the support structure so that the bucket holding portion can be positioned projecting outwardly from the structure to receive a bucket therein.

Abstract:
Source: US2001029750A Fire prevention and suppression systems and breathable fire−extinguishing compositions are provided for rooms, houses and buildings, transportation tunnels and vehicles, underground and underwater facilities, marine vessels, aircraft, space stations and vehicles, military installations and vehicles, and other human occupied objects and facilities. The system provides a low−oxygen (hypoxic) fire−preventive atmosphere at standard atmospheric or slightly increased pressure. The system employs an oxygen−extraction apparatus supplying oxygen−depleted air inside a human−occupied area or storing it in a high−pressure container for use in case of fire. A breathable fire−extinguishing composition, being mostly a mixture of nitrogen and oxygen and having oxygen content ranging from 12 percent to 17 percent for fire−preventive environments. The fire−suppression system is provided having fire−extinguishing composition with oxygen concentration under 16 percent, so when released it creates a breathable fire−suppressive atmosphere having oxygen content from 10 to 16 percent. A technology for automatically maintaining a breathable fire−preventive composition on board a human−occupied hermetic object is provided.

Abstract:
Source: US2002032102A A pipe or conduit labeler includes a saddle leg having an inside diameter equal to or slightly smaller than an outside diameter of a pipe or conduit to be labeled. The saddle leg is molded to a saddle stem which in turn is molded to a sign plate. A user either writes useful information directly on the sign plate or affixes a pre−made label to the plate. The sign plate optionally includes raised lettering or information such as an arrow pre−molded on the plate, or Braille characters. The labeler resiliently clips onto the pipe or conduit being labeled. More complex variations of the labeler include extending arms and moveable joints, enabling the identification of pipes or conduits which are at difficult angles or out of direct sight of a user. The labeler provides a means for quickly and clearly labeling pipes, conduit, tubes, and rods. The labeler can be mass produced as a single mold or in parts with different sign plates of varying size and construction. The sign plate provides a flat surface for writing. The labeler can be temporary, removable, or made permanent simply by applying an adhesive to the saddle portion prior to affixing the labeler.

Abstract:
Source: DE3722200A1 A goal for football, especially a sports device which is designed to be transportable and to be especially suitable for games played as part of amateur and/or leisure sporting activities and/or for indoor training etc. is proposed which has a kit (1) composed of elements (2 to 5) which can be combined in a modular fashion, rapid connecting means (6 to 13) which can engage with one another being assigned to the said elements (2 to 5) for mutual connection and for fastening to the floor. The elements (2 to 5) of the kit (1) comprise an overhead goal bar (2), two lateral post parts (3a, 3b), two supporting rods (4a, 4b) and a net (5). In contrast to the dimensions of a goal used in professional football, the basic configuration of this transportable amateur sports device preferably has an inside height (H) of 0.9 m and an inside width (W) of 1.5 m (see Figure 1).

Abstract:
Source: US4452161A PCT No. PCT/AU81/00109 Sec. 371 Date Apr. 12, 1982 Sec. 102(e) Date Apr. 12, 1982 PCT Filed Aug. 11, 1981 PCT Pub. No. WO82/00448 PCT Pub. Date Feb. 18, 1982.A quick release–hook to be secured to the chest harness of the rider of a board sailer. The hook helps in bracing the sail of the board sailer by engaging a loop of a rope attached to the boom–like rail of the board sailer. The hook (9) pivots from hooking to release position when the rider moves the rope through the hook so that thicker portions of the rope can press abutment members (21), forcing resilient tongue (17) out of engagement with the hook which then pivots, passing through slot (25) between members (21) to release the rope.

Abstract:
Source: US2010067331A Underwater communications apparatus and methods are presented using iterative correlation−based equalization in which initial estimated symbols of a current data block are produced using a correlation−based equalizer (CBE) based at least partially on the received sound transmissions of the current data block and an estimated channel impulse response (CIR) of a previous data block, the CIR of the current data block is estimated using the initial estimated symbols, and re−estimated symbols of the current data block are produced using a CBE based on the estimated CIR, and the estimated symbol having the lowest error is selected as the received data.

Abstract:
Source: US2013075047A The invention provides a mounting system for holding one or more affinity displays upon a window in an exceptionally stable manner. The apparatus comprises a drape that is capable of being wrapped around the edge or frame edge of a window, and the drape is also attached to a plurality of surface mounting components. The drape is further linked to the affinity display.

Abstract:
Source: US2013074294A An adjustable jaw table clamp apparatus for quickly and easily attaching table cover and skirting to a table. The disclosed apparatus provides a lightweight, easy to manufacture clamping device that is adjustable. There is disclosed a clamping apparatus that is adjustable and can fit various table thicknesses with a design that is universal and can accommodate the thicknesses of different table top sizes. The apparatus comprises a variably adjusting clamping device that is easy to use and may be reusable.

Abstract:
Source: US2006012024A A semiconductor chip assembly includes a semiconductor chip that includes a conductive pad, a conductive trace that includes a routing line, a metal containment wall and a solder terminal, and a connection joint that electrically connects the routing line and the pad. The metal containment wall includes a cavity, and the solder terminal contacts the metal containment wall in the cavity and is spaced from the routing line.

Abstract:
Source: US2015077999A A reinforced wire for decorative lighting, the wire defining a central longitudinal wire axis and including: a longitudinally−extending reinforcing strand, the reinforcing strand comprising one or more fibers comprising a polymer material and defining a reinforcing−strand axis; a plurality of conductor strands wound about the reinforcing strand, each of the plurality of conductor strands defining a conductor strand axis; and an outer insulating layer adjacent to, and covering, one or more of the conductor strands. The reinforcing strand in cross section normal to the wire axis defines an asymmetrical shape.

Abstract:
Source: US2003063867A A relatively small fiber optic plug is provided to facilitate pulling of the fiber optic plug and an associated fiber optic cable through small passageways. The fiber optic plug may include a shroud that protects the fiber optic connector and that may further define at least one opening, and preferably a pair of openings. The openings are sized to receive portions of an adapter sleeve once the fiber optic plug is mated with a fiber optic receptacle. The fiber optic plug may also include a cap mounted upon and adapted to swivel relative to the remainder of the fiber optic plug to serve as a pulling grip during installation of the fiber optic cable. Further, the fiber optic plug may include a crimp band that is mechanically coupled to both the fiber optic cable and the plug body in order to isolate the fiber optic connector from torque otherwise created by forces to which the fiber optic cable is subjected.

Abstract:
Source: US2001043777A Fiberoptic connector and adapter assembly includes a fiberoptic connector received within an adapter. The connector has a cover on the connector housing. The cover pivots between open and closed positions to expose or cover, respectively, a optical fiber contained within the connector. Longitudinal guides of the connector are received cooperating with longitudinal guides of the adapter to direct the connector into the adapter in a prescribed alignment. A cam pin is carried on the adapter to engage a cam pin receiving slot on the cover to urge the cover to the open position as the connector is inserted into the adapter.

Abstract:
Source: US2012324911A Disclosed are methods and apparatuses for cooling a work piece surface using a dual−loop cooling system. The system includes a vapor−compression loop and a liquid−evaporation loop. The loops are configured to prepare a coolant at or approximately at saturation for delivery into a chamber for cooling the surface. A preferred liquid−evaporation loop includes a chamber, a phase separator, a liquid pressurizer, and a vapor mixer that heats the coolant to or near its saturation temperature. A preferred vapor−compression loop includes the phase separator, a compressor, a condenser, an expansion valve, and a return line. The vapor mixer preferably heats the coolant by mixing liquid coolant with vapor coolant derived from the vapor−compression loop. A two−phase flow detector may be disposed downstream of the vapor mixer and be in communication with a vapor valve disposed upstream of the vapor mixer to ensure that an appropriate amount of vapor is fed into the vapor mixer to induce evaporation. Methods include cooling a surface by cycling a coolant through the liquid−evaporation loop and preparing the coolant at saturation with vapor derived from the vapor−compression loop.

Abstract:
Source: US2012125513A A spin weld apparatus for spin welding a prepared end of a coaxial cable with a coaxial connector includes a cable clamp dimensioned to grip the coaxial cable and a drive collet dimensioned to enclose and rotationally interlock with a lateral surface of the coaxial connector. The drive collet is dimensioned to rotationally interlock with an interlocking portion of a spin welder. The spin welder is dimensioned to axially align the coaxial connector with the coaxial cable for spin welding when the drive collet is rotationally interlocked with the spin welder.

Abstract:
Source: US2004120662A An optical tube assembly and methods of manufacturing the same include a tube, at least one optical waveguide, and a dry insert. In one embodiment, the dry insert generally surrounds the at least one optical waveguide and forms a core that is disposed within the tube. In one embodiment, the dry insert is compressed at least about 10 percent for coupling the at least optical waveguide to the interior surface of the tube.

Abstract:
Source: US2004059212A Support structures for positioning sensors on a physiologic tunnel for measuring physical, chemical and biological parameters of the body and to produce an action according to the measured value of the parameters. The support structure includes a sensor fitted on the support structures using a special geometry for acquiring continuous and undisturbed data on the physiology of the body. Signals are transmitted to a remote station by wireless transmission such as by electromagnetic waves, radio waves, infrared, sound and the like or by being reported locally by audio or visual transmission. The physical and chemical parameters include brain function, metabolic function, hydrodynamic function, hydration status, levels of chemical compounds in the blood, and the like. The support structure includes patches, clips, eyeglasses, head mounted gear and the like, containing passive or active sensors positioned at the end of the tunnel with sensing systems positioned on and accessing a physiologic tunnel.

Abstract:
Source: US2013075149A A dual orientation connector having a connector tab with first and second major opposing sides and a plurality of electrical contacts carried by the connector tab. The plurality of contacts includes a first set of external contacts formed at the first major side and a second set of external contacts formed at the second major side. The first plurality of contacts are symmetrically spaced with the second plurality of contacts and the connector tab is shaped to have 180 degree symmetry so that it can be inserted and operatively coupled to a corresponding receptacle connector in either of two insertion orientations.

Abstract:
Source: US2015024612A A plug connector includes a connector tab connected to and extending longitudinally away from a rear body, the tab includes opposite first and second major surfaces. A first plurality of contacts is carried by the tab on the first major surface and a second plurality of contacts is carried by the tab on the second major surface. The contacts include differential signal pairs. Each pair of the differential signal pairs is consisting of two individual contacts and said two contacts are located adjacent to each other but at the first and second main surface respectively.

Abstract:
Source: US2009148101A A fiber optic connection system includes a ruggedized fiber optic adapter and a ruggedized fiber optic connector and can further include a standard fiber optic connector (e.g., an SC connector), a pre−existing ruggedized fiber optic adapter, a first converter for converting the standard fiber optic connector to be compatible with the ruggedized fiber optic adapter, a second converter for converting the ruggedized fiber optic connector to be compatible with the pre−existing ruggedized fiber optic adapter, and a standard fiber optic adapter (e.g., an SC adapter). The ruggedized fiber optic connector is compatible with the ruggedized fiber optic adapter and with the standard fiber optic adapter. To retain the various connectors within the various adapters, various retention members and features (e.g. threaded retention members and latches) can be included in the fiber optic connection system. The first converter includes a converter housing that is sized to fit over a connector body of the standard fiber optic connector and retention shoulders of the connector body engage the converter housing.

Abstract:
Source: US2014005683A A highly articulated robotic probe comprises an outer sleeve and an inner core. The outer sleeve and inner core include a plurality of links. The links of the outer sleeve and inner core are configured to pivot relative to one another. Various characteristics of the links determine the overall pivot angle of the articulated probe. Each of the plurality of links may have one or more channels. The channels form a semi−continuous passage from link to link and are configured to receive an elongated member such as an inner core, tool or cable. One or more cables may be used to control the outer links of the outer sleeve and the inner links of the inner core. Various characteristics of the cables determine the overall performance of the articulated probe.

Abstract:
Source: US2007278376A Devices, systems, and methods for reinforcing a traffic control assembly are provided. In some embodiments, a retrofitted traffic control assembly configured to reinforce a traffic signal assembly in high wind conditions is provided, where the assembly includes a clamping assembly having clamping members that at least partially surround an existing traffic signal disconnect hanger, and bar members positioned substantially perpendicular to the clamping members. In certain embodiments, stiffening members may be placed in, on, or adjacent to a traffic signal and/or a traffic signal disconnect hanger to further reinforce the traffic signal assembly. Also provided are connection assemblies for reinforcing the portion of a traffic control assembly positioned between a traffic signal disconnect hanger and an upper span wire, for example.

Abstract:
Source: US2009239977A A self−leveling cementitious mixture with excellent flow properties and which hardens with a controlled rate of strength development to an ultra−high compressive strength composite composition for use in making articles such as cementitious armor panel with ballistic and blast resistant properties including: a continuous phase resulting from the curing of an aqueous mixture, in the absence of silica flour, of inorganic cement binder, inorganic mineral filler having a particle size of about 150−450 microns, pozzolanic mineral filler, polycarboxylate based self−leveling agent and water. The cementitious mixture may include alkanolamine, such as triethanolamine, and acid or acid salt, such as tartaric acid. The cementitious composition may be reinforced with reinforcing fibers, e.g. glass fibers, in an amount of about 0.5−6.0 percent by volume of the overall cementitious composition. The fibers are uniformly dispersed in the cementitious composition before it is cured to form a final cementitious armor panel.

15) Family number: 29543494 (US2004131834A) © PatBase

Title: ALUMINUM CONDUCTOR COMPOSITE CORE REINFORCED CABLE AND METHOD OF MANUFACTURE

Abstract:
Source: US2004131834A This invention relates to an aluminum conductor composite core reinforced cable (ACCC) and method of manufacture. An ACCC cable has a composite core surrounded by at least one layer of aluminum conductor. The composite core comprises a plurality of fibers from at least one fiber type in one or more matrix materials. The composite core can have a maximum operating temperature capability above 100 degrees centigrade or within the range of about –45 degrees centigrade to about 230 degrees centigrade, at least 50 percent fiber to resin volume fraction, a tensile strength in the range of about 160 Ksi to about 370 Ksi, a modulus of elasticity in the range of about 7 Msi to about 37 Msi and a coefficient of thermal expansion in the range of about –0.7x10<–6>m/m/ degrees centigrade to about 6x10<–6>m/m degrees centigrade According to the invention, a B–stage forming process may be used to form the composite core at improved speeds over pultrusion processes wherein the speeds ranges from about 9 ft/min to about 60 ft/min.

Abstract:
Source: US2007250020A Implantable devices, instruments, kits and methods for treatment of obesity. One or more devices can be implanted adjacent to or in contact with the stomach to occupy a space to prevent the stomach from expanding into that space as food is taken into the stomach. Alternatively, one or more devices may be implanted and expanded to displace at least a portion of the wall of the stomach to decrease the internal volume of the stomach that is available to receive food. Devices may be anchored to one or more internal structures at one or more locations without piercing through the wall of the stomach. Devices can be implanted using minimally invasive methods, such as percutaneous or laparoscopic methods. Delivery instruments are also provided. An intra−gastric sizing device is provided to facilitate implantation of an extra−gastric device in some method embodiments.

Abstract:
Source: US2009180737A Optical fiber interconnection devices, which can take the form of a module, are disclosed that include an array of optical fibers and multi−fiber optical−fiber connectors, for example, two twelve−port connectors or multiples thereof, and three eight−port connectors or multiples thereof. The array of optical fibers is color−coded and is configured to optically interconnect the ports of the two twelve−port connectors to the three eight−port connectors in a manner that preserves transmit and receive polarization. In one embodiment, the interconnection devices provide optical interconnections between twelve−fiber optical connector configurations to eight−fiber optical connector configurations, such as from twelve−fiber line cards to eight−fiber line cards, without having to make structural changes to cabling infrastructure. In one aspect, the optical fiber interconnection devices provide a migration path from duplex optics to parallel optics.

Abstract:
Source: US2003080604A An oil shale formation may be treated using an in situ thermal process. Fluid migration into and/or out of a treatments area in the formation may be inhibited. In some embodiments, a barrier may be used to inhibit migration of fluids into and/or out of the treatment area. Heat may be provided to the treatment area and subsequently, hydrocarbons, H2, and/or other formation fluids may be produced from the formation.

Abstract:
Source: US2005213921A A fiber access terminal for mounting to the end of a fiber distribution cable and configured to be extended through a buried conduit. The fiber distribution cable may include a plurality of optical fibers and enters a housing of the terminal through a base. The terminal also includes a plurality of fiber optic connectors or adapters extending through the housing in generally the same direction as the fiber distribution cable for connecting to optical fiber customer drop cables. The terminal includes a cover and the housing defining an interior and the interior includes a cable slack storage arrangement providing bend radius protection for the optical fiber cables within the interior. A method of assembling a fiber access terminal. A fiber access terminal assembly including a pedestal mounting arrangement.

Abstract:
Source: US2012257859A A connector includes a ferrule assembly having a ferrule, a hub and a spring, the ferrule having a distal face accessible at a distal end of the connector housing, the ferrule being movable in a proximal direction relative to the connector housing. The distal and proximal positions are separated by an axial displacement distance. The ferrule proximal movement is against the spring's bias. The cable of the assembly includes an optical fiber contained within a jacket and also a strength layer between the fiber and the jacket that is anchored to the connector housing. The fiber extends through a fiber passage from the proximal end of the connector housing to the ferrule. The fiber has a distal portion potted within the ferrule. The fiber passage has a fiber take−up region configured to take−up an excess length of the fiber corresponding to the ferrule axial displacement.

Abstract:
Source: US2014130930A An extendable and retractable pressure hose can be constructed comprising an input connector, an output connector, an elastic inner hose, an outer cover, and one or more portions of the elastic inner hose engaged with the outer cover and disposed between the first and second ends of the hose. In such a hose, the input connector and output connector can be connected to each end of elastic inner hose and outer cover.

Abstract:
Source: US2008049949A A lightweight radio/CD player for vehicular application is virtually "fastenerless" and includes a case and frontal interface formed of polymer based material that is molded to provide details to accept audio devices such as playback mechanisms (if desired) and radio receivers, as well as the circuit boards required for electrical control and display. The case and frontal interface are of composite structure, including an insert molded electrically conductive wire mesh screen that has been pre−formed to contour with the molding operation. The wire mesh provides EMC, RFI, BCI and ESD shielding and grounding of the circuit boards via exposed wire mesh pads and adjacent ground clips. The PCB architecture is bifurcated into a first board carrying common circuit components in a surface mount configuration suitable for high volume production, and a second board carrying application specific circuit components in a wave soldered stick mount configuration. The major components and subassemblies are self−fixturing during the final assembly process, eliminating the need for dedicated tools, fixtures and assembly equipment. The major components and subassemblies self−interconnect by integral guide and connection features effecting "slide lock" and "snap lock" self−interconnection. The radio architecture includes improved push buttons employing 4−bar living hinge linkage and front loaded decorative trim buttons.

Abstract:
Source: US2003196655A A respiratory mask assembly for delivering breathable gas to a patient includes a frame having a main body and a side frame member provided on each lateral side of the main body. Each side frame member includes an integrally formed first connector portion. A headgear assembly is removably attachable to the frame. The headgear assembly has a second connector portion adapted to be removably coupled with the first connector portion provided on the frame. The second connector portion is manually movable to a releasing position to detach the headgear assembly from the frame. The headgear assembly is rotationally adjustable with respect to the frame.

Abstract:
Source: US2011284283A A cable routing system formed from a tray with a plurality of transverse wires and a plurality of longitudinal wires. The transverse wires form a generally flat top portion with downwardly extending sidewalls. The longitudinal wires are positioned underneath the top portion, side longitudinal wires are positioned adjacent the downwardly extending sidewalls and bottom longitudinal wires are positioned at an end of each of the downwardly extending sidewalls. The transverse wires and the longitudinal wires form a grid with a plurality of openings for routing a plurality of cables. The cable routing system also includes a sidewall removablely secured to the tray to retain cables routed thereon and a corner radius device removablely secured to the tray to provide bend radius control to cables routed along intersecting cable trays.

Abstract:
Source: US2008071200A Aspects of this invention relate to an adjustable bed that may include a motor, including a housing with a flange, an adjustable mattress support having a lateral surface, and an opening with a perimeter disposed within the lateral surface; at least one bracket coupled to the mattress support providing a lateral support surface inside the perimeter of the opening, the lateral support surface shaped and sized to laterally support the flange such that the motor is positioned to impart vibration to a mattress on the mattress support; and a resilient material disposed between the flange and the lateral support surface to provide mechanical insulation therebetween.

Abstract:
Source: US2015027204A A humidification system comprises a first sensor and a second sensor. The first and second sensors are adapted to sense flow characteristics within the system. The first and second sensors are isolated from the flow by barriers formed by respective first and second sealing members. The sealing members extend through apertures formed in the system and have a portion that contacts the sensing elements of the respective first and second sensors. A cartridge can hold the sensors and provide repeatable penetration depths into a flow passage of the system. A medical tube has a composite structure made of two or more distinct components that are spirally wound to form an elongate tube. One component can be a spirally wound elongate hollow body; the other component can be an elongate structural component spirally wound between turns of the spirally wound hollow body.

Abstract:
Source: US2011131914A Methods are provided for repairing an existing structure to cover at least a portion of the existing structure with a repair structure. Such methods comprise mounting one or more standoff retainers to the existing structure; coupling one or more standoffs to the standoff retainers such that the standoffs extend away from the existing structure; coupling one or more cladding panels to the standoffs such that the panels are spaced apart from the structure to provide a space therebetween; and introducing a curable material to the space between the panels and the existing structure, the panels acting as at least a portion of a formwork for containing the curable material until the curable material cures to provide a repair structure cladded, at least in part, by the panels. Corresponding apparatus for effecting such methods are also provided.

Abstract:
Source: US2008175541A The present disclosure relates to a fiber optic connector for use with a fiber optic adapter. The fiber optic connector includes a connector housing having an end defining a plug portion. A ferrule assembly is mounted at least partially within the connector housing. The ferrule assembly includes a ferrule

located at the plug portion of the connector housing. A sealing member is mounted about an exterior of the connector housing for providing a seal between the connector housing and the adapter. The fiber optic connector further includes first and second separate retaining mechanism for retaining the fiber optic connector within the fiber optic adapter.

Abstract:
Source: US2006280408A A connectorized fiber optic cabling assembly includes a loose tube fiber optic cable and a connector assembly. The cable has a termination end and includes: an optical fiber bundle including a plurality of optical fibers; at least one strength member; and a jacket surrounding the optical fiber bundle and the at least one strength member. The connector assembly includes a rigid portion and defines a fiber passage. The connector assembly is mounted on the termination end of the cable such that the optical fiber bundle extends through at least a portion of the fiber passage. The plurality of optical fibers of the optical fiber bundle have a ribbonized configuration in the rigid portion of the connector assembly and a loose, non−ribbonized configuration outside the rigid portion. The plurality of optical fibers undergo a transition from the ribbonized configuration to the loose, non−ribbonized configuration in the rigid portion of the connector assembly. According to some embodiments, the rigid portion of the connector assembly includes a rigid connector housing.

Abstract:
Source: US2005189130A A method for enhancing the dielectric properties of an electrical cable segment having a central stranded conductor encased in a polymeric insulation jacket and an interstitial void volume in the region of the conductor, including filling the interstitial void volume with a dielectric property−enhancing fluid at a pressure below the elastic limit of the polymeric insulation jacket, and confining the fluid within the interstitial void volume at a residual pressure greater than about 50 psig, with the pressure being imposed along the entire length of the segment but below the elastic limit of the polymeric insulation jacket. Preferably, the residual pressure is sufficient to expand the interstitial void volume along the entire length of the cable segment by at least 5 percent.

Abstract:
Source: US2012026573A Methods of manufacturing electrochromic windows are described. An electrochromic device is fabricated to substantially cover a glass sheet, for example float glass, and a cutting pattern is defined based on one or more low−defectivity areas in the device from which one or more electrochromic panes are cut. Laser scribes and/or bus bars may be added prior to cutting the panes or after. Edge deletion can also be performed prior to or after cutting the electrochromic panes from the glass sheet. Insulated glass units (IGUs) are fabricated from the electrochromic panes and optionally one or more of the panes of the IGU are strengthened.

Abstract:
Source: US2009156926A An integrated catheter placement system for accurately placing a catheter within a patient'vasculature is disclosed. In one embodiment, the integrated system comprises a system console, a tip location sensor for temporary placement on the patient's chest, and an ultrasound probe. The tip location sensor senses a magnetic field of a stylet disposed in a lumen of the catheter when the catheter is disposed in the vasculature. The ultrasound probe ultrasonically images a portion of the vasculature prior to intravascular introduction of the catheter. The ultrasound probe includes user input controls for controlling use of the ultrasound probe in an ultrasound mode and use of the tip location sensor in a tip location mode. In another embodiment, ECG signal−based catheter tip guidance is included in the integrated system to enable guidance of the catheter tip to a desired position with respect to a node of the patient's heart.

Abstract:
Source: US2012123322A A medical treatment system, such as peritoneal dialysis system, may include control and other features to enhance patient comfort and ease of use. For example, a peritoneal dialysis system may include patient line state detector for detecting whether a patient line is primed before it is to be connected to the patient. The patient line state detector can also the ability to detect whether a patient line has been properly mounted for priming. Both patient line presence/absence and fill state can be determined using an optical system, e.g., one that employs a single optical sensor.

Abstract:
Source: US2010159829A Tightly−coupled near−field transmitter/receiver pairs are deployed such that the transmitter is disposed at a terminal portion of a first conduction path, the receiver is disposed at a terminal portion of a second conduction path, the transmitter and receiver are disposed in close proximity to each other, and the first conduction path and the second conduction path are discontiguous with respect to each other. In some embodiments of the present invention, close proximity refers to the transmitter antenna and the receiver antenna being spaced apart by a distance such that, at wavelengths of the transmitter carrier frequency, near−field coupling is obtained. In some embodiments, the transmitter and receiver are disposed on separate substrates that are moveable relative to each other. In alternative embodiments, the transmitter and receiver are disposed on the same substrate.

Abstract:
Source: US2015190155A The invention relates to systems for removing obstructions and other objects within a blood vessel or other interior lumen of an animal. The system may be deployed in the lumen from a catheter and includes a pull wire having a proximal end and a distal end, and a distal body having a proximal hub, a basket, and a distal hub. In some embodiments, the distal body includes a plurality of proximal strips that form a closeable claw that is used to capture the obstruction. In other embodiments, the basket includes an enlarged opening that allows the object to enter the basket. Optionally, the basket includes x–ray markers adjacent to the enlarged openings to allow the operator to locate the openings, as well as twisting strips that connect the basket to the proximal hub. The present invention also relates to methods of making and using such systems.

Abstract:
Source: US2005272975A Several embodiments of the present invention are generally directed to medical visualization systems that comprise combinations of disposable and resuable components, such as catheters, functional handles, hubs, optical devices, etc. Other embodiments of the present invention are generally directed to features and aspects of an in−vivo visualization system that comprises an endoscope having a working channel through which a catheter having viewing capabilities is routed. the catheter may obtain viewing capabilities by being constructed as a vision catheter or by having a fiberscope or other viewing device selectively routed through one of its channels. The catheter is preferably of the steerable type so that the distal end of the catheter may be steered from its proximal end as it is advanced with the body. A suitable use for the in−vivo visualization system includes but is not limited to diagnosis and/or treatment of the duodenum, and particularly the biliary tree.

Abstract:
Source: US2014064665A A fiber optic cable and connector assembly including a fiber optic connector mounted at the end of a fiber optic cable. The fiber optic connector includes a ferrule assembly including a stub fiber supported within a ferrule. The stub fiber is fusion spliced to an optical fiber of the fiber optic cable at a location within the fiber optic connector.

Abstract:
Source: US2004042849A A concrete lid for an in−ground utilities box includes a plastic reinforcement structure filled with concrete. The plastic reinforcement structure includes one or more plastic sidewalls that protect the edges of the lid from damage. The upper and lower surfaces of the lid are exposed concrete (with the exception of the upper and lower edges of the one or more plastic sidewalls). The one or more plastic sidewalls laterally surround a plastic reinforcement grid, which is centrally located between the upper and lower edges of the one or more plastic sidewalls. The one or more plastic sidewalls can be integrally formed with the plastic reinforcement grid. The plastic reinforcement grid reinforces the concrete lid, eliminating the need for separate reinforcement material. Support struts can be used to support the plastic reinforcement grid while wet concrete is being poured into the plastic reinforcing structure.

Abstract:
Source: US2011212633A A connector housing includes a plurality of wafers containing terminal dedicated to either ground signals or differential signals. Terminals in adjacent wafers can be arranged to provide broadside coupled differential signal pairs. Terminals dedicated for use as ground terminals can be wider than the signal terminals to provide shielding between adjacent differential signal pairs. The signal terminals of each differential signal terminal pair can a constant width from their contact portions to a location proximate their tail portions and the terminals diverge from broadside alignment and increase in their width until they end at the terminal tail portions.

Abstract:
Source: US2007193828A A stepladder having a front side, a rear side and a top. The stepladder can include a conduit holder attached to the front side for holding conduit. The stepladder can include a first wire spool holder attached to the front side and a second wire spool holder attached to the rear side though which a conduit having a wire spool extends. The stepladder can include a hacksaw hook attached to the front side. A method for cutting a conduit. A method for using a hacksaw. A method for obtaining wire.

Abstract:
Source: US2008002345A An external expanding apparatus or "docking station" operable with a portable computer device of a type having a display unit having a display screen on an inner surface thereof and a hard shell backing surface opposite thereof and pivotally mounted on a substantially rigid casing having a pair of locating holes adjacent to opposite corners of a substantially planar bottom surface thereof, and an input/output (I/O) connector positioned on a back plane thereof with a pair of positioning apertures provided on opposite sides thereof.
