TI - METHOD FOR PERFORMING SIMULATED STOCK TRADING OVER INTERNET

AB - PURPOSE: A simulated stock trading method is provided to enable a user to perform a

simulated stock trading in a state of connection to a server of a security corporation making a **real time** update of stock information offered by KSC(Korea Securities Computer Corp.). CONSTITUTION: The method comprises several steps. A user executes a simulated stock trading program at a user PC(S1), then the PC is automatically connected to a server of a program provider and a database server, and an HTS(Home Trading System) is executed(S2). The user logs in the server by inputting a virtual account number, a user ID and a password(S3, S5). The server checks whether the user makes the first access(S6), and offers an initial virtual fund setting screen to the user in a case that the user makes the first access. The user sets conditions for necessary initial virtual fund, and transmits them to the server(S7, S8). The user selects one among various menu like selling or buying stocks(SS1), browsing a transaction specification (SS2), browsing an owning item(SS3), assessing an account remainder(SS4), and browsing a profit ranking(SS5).
