Fig. 1/140

U.S. Patent May 24, 2005 Sheet 1 of 140 US 6,898,299 B1

FIG. 1

Diagram illustrating a biometric authentication system (FIG. 1). The system includes a hand (14) with a sensor (16) and a current generator (12) connected to the sensor. The sensor is connected to an amplifier (26) and a voltage detector (28). The voltage detector is connected to an analog/digital converter (30), which is connected to a micro-processor (32). The micro-processor is connected to a memory (36) and a display (34). The system is labeled as a COMPUTER SYSTEM (22).

Text description of the patent document:

PN - US6898299 B1 20050524

TI - Method and system for biometric recognition based on electric and/or magnetic characteristics

AB - A method and apparatus for authenticating an individual living organism by recognizing a unique internal electric and/or magnetic and/or acoustic characteristic, which comprises a biometric signature, involve presenting a body part to a sensing device that senses the signature. The sensed presented biometric signature is compared to a known biometric signature to authenticate the individual. This authentication can then be used to authorize any of a wide variety of actions by the individual, such as accessing equipment or an area, or to perform actions, such as conducting financial transactions. A card having sensors is used to sense the biometric signature which is read by a card reader and sent to a local or remote reader for biometric signature comparison.
