Abstract:
1,143,662. Stud and socket fasteners. T. C. JUCULANO. 23 June, 1966 [30 June, 1965], No. 28180/66. Headings E1S and E2B. A connector for detachably securing an apertured end portion 12 of a brace 7 to a post 8 comprises a pin 14 fixed to the side of the post and projecting substantially perpendicularly therefrom to enter and pass through the hole in the apertured end of the brace, a sleeve 16 slidable axially on the post and a bifurcated arm 17 fixed to the sleeve with its bifurcated end portion 20 spaced from the post to accommodate the apertured end portion of the brace when the latter is impaled upon the pin, so that upon movement of the sleeve into a position at which the bifurcated end portion of the arm embraces the pin, the brace is secured to the post. In the construction shown the sleeve has a longitudinally extending slot 18 to receive the pin and thereby hold the sleeve against rotation about the post, the slot being in line with the bifurcated end portion of the arm. The distance between the arm and the sleeve can be sufficient to accommodate the apertured ends of the two braces. In a modification a bridging member is secured to the sleeve across the open end portion of its slot 18 and a clamping screw is threaded into the bridging member so that it can bear against the adjacent side of the post and thus prevent movement of the sleeve.

Abstract:

28,140. Hunnable, W., and Hunnable, A. Nov. 30. **Scaffolding**.-Fig. 1 shows a perspective view, and Fig. 4 an elevation, of one form of connection for **scaffolding** poles, and Fig. 2 shows a modification. A forked bracket A provided with pivoted hooks H, H is secured to an upright pole M by a spiked band K and chain L, and supports a horizontal pole N. Knuckles G of the bracket bear against the pole M and act as a lever fulcrum, and spikes G' are forced into the pole by the weight of the staging. Two horizontal poles may be secured end to end in the bracket A by the clamping-screws D. In the modification shown in Fig. 2, two segmental bands P, P are pivoted together and connected to the chain L by a screwed hook S and a hook R. The bands and chain are tightened on the pole by a nut f on the screwed hook. A segmental socket V is fixed or pivoted to the band P so as to support a horizontal or inclined pole. To connect two vertical poles together two of the compound clamping-bands P, P', L are fixed rigidly together, and for connecting poles at an angle the bands are pivoted together.

Abstract:
1461. Kruse, M. Jan. 18. **Scaffolding** and staging.-Two movable platforms are fixed to brackets t, u adapted to turn on vertical bolts r, s between crossbars p, q, and can be raised and lowered on a hollow post a by levers 5, 6. The post, with the platforms, can be moved sideways, on a horizontal rope c stretched along the wall, by winding-drums f and ropes g, h. To allow for the adjustment of the platforms on the bolts r, s, they are formed with a number of holes y to receive bolts passing through the cross-bar p. The cross-bars p, q are fixed to a channel-iron bar o carrying rollers m, n which run on a guiderail h fixed to the post. Hooks 1, 2, carried by the lever pivot and bar o, engage with pins l projecting from the bar k, and are raised and lowered alternately when the platforms are raised and lowered. The levers are connected to the bolts r, s by links 8, 9, and the pivots of the hooks 1, 2 are connected by flanged semicircular plates 12, 13, hooked rods 14, 15 pivoted to the plates, and a vertical rod 16 which is pivoted to the rod 15 and is slotted to receive the end of the rod 14. A spring 18 on the rod 16 is attached to the rods 14, 15, and causes the hooks to engage automatically with the pins l when the levers are moved to raise or lower the platforms. In lowering the platforms, the rods 14, 15, 16 are swung over to the left to cause the spring to disengage the hooks from the pins, and in raising the platforms, the rods are moved to the right, as shown in the Figure. The core within the post a is formed of two wedge-shaped parts connected by iron bands, and carries a hook x which fits over the rope c. A bracket or strut adapted to bear against the wall is secured to the post by a bolt i.

Abstract:
23,237. Tuck, W. D. Nov. 13. No Patent granted (Sealing fee not paid). **Scaffolding** and staging.-Relates to means for raising and lowering **scaffolding** upon chimneys. The **scaffolding** consists of putlogs 1, Fig. 2, fastened to the chimney by upper and lower bolts 3 passing through brackets 2, and by cross - bolts 4 fitted with oppositely-threaded screws at each end which engage with angle-pieces 5 held by the brackets 2. To adjust the height of the **scaffolding**, the upper portion 8 of a bracket 7, Fig. 4. is inserted under the up er bolt 3 t e bracket being retained by a block 9 inserted under the lower holt 3 and held by a clip 10. The bracke s 7 carry toothed wheels 11 dapted to engage with packing or toothed racks 20, Fig. 2, attached to the sides of the chimney, the engagement being effected by tightening the bolts 4. On rotating the shaft 14, Figs. 2 and 4, the wheels 11 are both caused to rotate in the same direction, raising or lowering the **scaffolding**. To prevent the **scaffolding** from falling, when loose, the brackets 7 and blocks 9 are formed with inclined faces 8, 8, against which the bolts 3 bear to force the brackets tightly against the chimney.

Probable Assignee:	WEIGHTMAN WILLIAM THOMAS
Assignee(s):(std)**:**	WEIGHTMAN WILLIAM THOMAS
Assignee(s):	WILLIAM THOMAS WEIGHTMAN
Inventor(s):(std)**:**	WEIGHTMAN WILLIAM THOMAS
Inventor(s):	WILLIAM THOMAS WEIGHTMAN

Abstract:
610. Weightman, W. T. Jan. 10. [Application for Patent of Addition to No. 3185, A.D. 1904.] No Patent granted (Sealing fee not paid). Scafolding.-Relates to the chimney **scaffolding** described in Specification No. 3185, A.D. 1904. In this **scaffolding**, the upper and lower frames are alternately clamped to and unclamped from the chimney, and are alternately raised and lowered so that the **scaffolding** is made to move step by step up or down the chimney. The object of this invention is to arrange the clamps and lifting-apparatus so that the **scaffolding** can be worked by two men instead of four. The upper and lower frames each comprise two oppositely-arranged girders a, and two beams b at right-angles to the girders. The girders and beams are connected together at the four corners by shoes c. Parallel with each girder a is a shaft d, Figs. 2, 3, and 4, which has right and left handed screw-threads. Each threaded end of the shaft works in a nut e formed on the shoe. A toothed wheel d' on the shaft d meshes with another wheel f slidingly mounted on the shaft f, which has at each end a bevel-wheel g meshing with another bevel-wheel i, which for the lower frame is fixed on a sleeve h, Fig. 3. The ends of the shaft h work in nuts h mounted in the shoes c. The nut h' has an extended portion h', over which the sleeve h is placed. The bevel-wheel i is held in gear with the wheel g by the engagement of a spring catch i on the sleeve h with grooves h in the nut extension h, the catch itself being held in engagement by a slip-ring i. By throwing the bevel-wheels i, g into gear and rotating the sleeve, the nut h' and shaft f are rotated. The shaft h being unable to rotate, the nut h and shoe c move along the shaft h, and at the same time the shoe also moves along the shaft f, so that the shoes become released from the chimney sides. For the upper frame, the bevel-wheel i is mounted as a rotating nut on the screwed shaft h, the sleeve h and nut h' being dispensed with, and by rotating either the shaft d or shaft f, the corner shoes are moved to unclamp or clamp against the chimney sides, as desired. The upper frame is connected to the lower frame by rods k, pivoted on the shoes of the lower frame and working through sockets l supported in bearings pivotally mounted on the upper shoes c. Each socket l is threaded to mesh with screw-threads on the corresponding rod k, and carries a bevel-wheel n, which meshes with a pinion o on a shaft actuated by a rope-wheel q. A rope q passes over two of these wheels on the same side of the chimney, and thence by intermediate guidepulleys r to the lower platform, or to the ground. When the **scaffolding** is to be raised, the lower frame is first loosened about the chimney, and the rope-wheels q are rotated to raise the lower frame, which is then clamped about the chimney. The upper frame is then loosened and the pulleys q are rotated in the opposite direction, whereby the upper frame is raised and is then clamped about the chimney. When the appliance is used for circular or polygonal chimneys, brackets are employed, each comprising two arms u, v, Fig. 6, between which are secured the shoes c. A third arm w serves to support the bracket. The arms are connected to a member s bearing against the chimney by ball-and-socket joints, and a roller x serves to facilitate the upward movement of each bracket when raising the frames.

Anordning til Ophejsning og Fordeling af Murmaterialier. Patent udstedt den 9. December 1910, beskyttet fra den 11. Februar s- A. (Klasse 37: Husbygningsvsesen, Stilladser m. m.) I Almindelighed bliver Murmaterialier lige- frem baarne op ad Stiger og fordelte med pas- sende Mellemrum paa det Stillads, der som en interimistisk Altan omgiver Bygningen under Opfoerelsen. For at lette dette yderst anstrengende Ar- bejde har man paa mange Maader forsoegt at udfoere det enten med mekaniske Hjaelpemidler, hvorved Arbejderen fik en nemmere Maade at afgive sin Kraft paa, eller i Forbindelse med Motorer eller andre Kraftmaskiner, Fordelingen af Murmaterialierne har ved de forskellige Anordninger dog stedse voldt Vanskeligheder, idet Materialierne som Regel hejses op eet Sted og derfra fordeles paa for- skellig Maade, det vaere sig nu ved Hjaelp af Haandkraft eller ved Hjaelp af Vogne, Boere, Slaeder eller lignende, der foeres enten umiddel- bart paa Stilladset eller paa en Loebeskinne i Forbindelse med dette. Man har ogsaa forsoegt stadig at flytte Op- haengningsapparatet til de Steder, hvor Materi- alierne skulde laesses af. Derved sparede man Transporten paa selve Stilladset, men den ofte gentagne Flytning af Ophaengningsstedet voldte Vanskeligheder. Det karakteristiske ved den foreliggende Opfindelse er, at man samtidig paa flere Steder foretager Ophejsningen, medens den noedvendige Kraft afgives af en enkelt central Kraftkilde, der gennem passende Anordninger overfoerer Kraften til de forskellige Byrder. Baa Tegningen, der skematisk fremstiller en Udfoerelsesform for Opfindelsen, viser Fig. 1 et lodret og Fig. 2 et vandret Billede af An- ordningen. a er de lodretstaaende Stolper til Stilladset, og b er drejelige Konsoller eller Svingkraner, anbragte paa Stolperne, c er Bommen paa et Spil, hvorfra i dette Tilfaelde fire Tove gennem Fodblokke d og f samt Taljer eller Loebehjul g staar i Forbindelse med de Byrder /z, der skal haeves. De fire Fodblokke f er anbragte lodret under Konsollerne og Taljerne eller Loebe- hjulene g paa den yderste Ende af disse. Samt- lige Fodblokke, Taljer eller Loebehjul er paa Tegningen maerkede med en lille Cirkel. Arbejdsgangen er foelgende. En Mand an- bringer i de fra de oevre Taljer nedhaengende Tovender de Murmaterialier, der skal hejses op. Naar dette, er udfoert, saettes Spillet i Gang. Herved loeftes Byrderne samtidig og lige hurtig. Naar Byrderne er naaede tilstraekkelig hoejt op over den vandrette Bro paa Stilladset, hvorpaa dc skal aflaesses, standses Spillet, Konsollerne svinges ind, og Byrderne udtages. Ved en tilstraekkelig langsom Loeftning kan man med en forholdsvis svag Kraftmaskine samtidig haeve et betydeligt Antal Byrder. Der opnaas ved denne Anordning cn stor Besparelse af Mandskab, idet der kun behoeves to Mand» een paa Jorden og een paa Stilladset, til at be- tjene Apparatet. Patentkrav, Anordning til Ophejsning og Fordeling af Murmaterialier, karakteriseret ved, alt flere Byrder ophejses samtidig og lige hurtig paa forskellige Steder ved Hjaelp af Tove, der foeres over smaa flyttelige Svingkraner b, gen- nem Fodblokke f, anbragte under disse, og hen til en faelles Bom c paa et Spil. Kobenhavn 1910. Trykt hos J. H. Schultz A/S. **Machine translation:** [Source: Claim 1] PATENT 14012. Description and drawings, ANNOUNCED ON 19. DECEMBER 1910. Walls Champion Christian Johannes Andreas Nielsen, Horsens. Device for hoisting and distribution of Murmaterialier. Patent issued on 9. December 1910, protected from 11. February s- A. (Class 37: Husbygningsvsesen, **Scaffolding** etc.) in general will be Murmaterialier straight-forward baarne up ladders and distributed with passport send intervals of the **scaffolding**, as a interimistisk Balcony surrounding the building under construction. In order to facilitate this extremely tiring ar- cooperation has in many ways attempted to perform the either by mechanical means whereby the worker was an easier way to give its force on, or in connection with engines or other power machines, the distribution of Murmaterialierne has on the various devices, however, always caused difficulties since Materialierne as a rule is being hoisted up one place and away shall be distributed on the front skellig way, be it now by means of Direct Force or by means of wagons, Boere, carriages or similar, which is maintained either umiddel- Bart on **scaffolding** or on a Serial Rail in connection with this. We have also attempted still to move up- hanging the appliance to the places where Materi- alierne should unloaded. This saved you transport on the **scaffolding**, but it often repeated the movement of the suspension rather than there were difficulties. The characteristic of the present invention is that at the same time on several sites make Ophejsningen, while the necessary force of a single central power source through appropriate devices transmits power to the various burdens. Baa drawing schematic produces a Performance Form to the invention, shows the Fig. 1 a vertical and Fig. 2 a horizontal image of an- scheme. A is the vertical standing posts to the **scaffolding** and b is pivoting consoles or swing cranes, fire on the pillars, c is the boom in a game from which in this case four cables through Fodblokke d and f and a hoist or rennet Wheel g are related to the burdens /z to be highlighted. The four Fodblokke f is placed vertically in the brackets and pulleys or order the wheels g of the outer end of these. As well as the just-Fodblokke, hoists or rennet wheels are in the Drawing labelled with a small circle. The workflow is the following. A man an- brings in the from the upper hoists overhead Ropes Na The Murmaterialier to be being hoisted up. When this is completed, put the game in progress. This lifted the burden at the same time and equal express. Where the burden is reaching sufficiently high above the horizontal bridge on the **scaffolding** in which dc must be unloaded, stop the game consoles swung into, and the burden be removed. At a sufficiently slow lifting it may be a relatively weak Force machine at the same time raise a significant number of burdens. Obtained by this device cn large savings of crew, taking only needed two Man" one on the ground and one of the **scaffolding**, to be- serve the appliance. Patent requirements Device for hoisting and distribution of Murmaterialier, characterised by more burdens ophejses at the same time and equal express at various places using ropes kept over small flyttelige Swing Cranes b, re- easy Fodblokke f, fire in these and to a common Boom c on a game. Pry Bar Harbor 1910. Printed from J. H. Schulz A/S.

Abstract:
5279. Goebel, F. March 2. Lazy-tongs load-handling appliances. - Portable wheeled **scaffolding** of the lazy-tongs type operated by screwed rods, consists of sets of lazy-tongs i, having the lowest members respectively connected to fixed nuts or blocks d, g and to sliding blocks h, all of which are mounted on a threaded rod f. The pivots l of the lazytongs are tubular with or without sliding extensions r and the **scaffold** boards m are secured to the pivots or to the extensions by pins s. The carriage may be made with telescopic parts t having slides v adjustable on guides u, which are provided with a projecting block y for supporting the fixed block or nut g, and with a support z carrying a castor at the lower end. The screwed shaft w consists of tubular pieces connected by perforated rods r adjustably secured by bolts.

Abstract:
20,239. Frankland, J. Aug. 30. **Scaffolding** and staging.-Single or multiple U-shaped brackets are formed with rightangled screw - threaded extensions b which are passed through holes in the poles and are secured by nuts. Sloping boards or poles are provided with stops to engage the brackets and prevent longitudinal movement of the boards. According to the Provisional Specification, the brackets may be secured by bands passed round the poles and tightened by bolts and nuts.

Abstract:
8619. Fock, J. April 6. No Patent granted (Sealing fee not paid). Lazy-tongs platform load-handling appliances. -Lazy-tongs **scaffolding** or fire-escapes, mounted on a wheeled carriage, is raised by chains o wound on a ratchet drum k, and is provided with platforms d, and ladders e hinged to the undersides of the upper platforms. The top platform carries a winch and is provided with hand-rails f. The lazy-tongs are maintained in the extended position by a pawl engaging the ratchet-drum, and by clamps n engaging in holes m in the levers of the lazy-tongs. The structure is adjusted to be horizontal by screwed spindles b. Reference has been directed by the Comptroller to Specification 1856/68.

Abstract:
6250. Arndt, O. March 13. Centering for floors and ceilings staging, suspended.- A trussed centering for floors and ceilings is suspended from the floor girders or the walls, and is constructed of a middle portion 1 consisting of two angle-irons, and two end portions 2, each consisting of two angle-irons, sliding within the middle portion, the three portions being connected to a bar 6 by adjustable struts 4, 7 and ties 3, 5 respectively. The centering is suspended from the floor girders by hooks 12, having perforated shanks to receive pins engaging sleeves 14 sliding on, and embracing, the end portions 2. The hooks are secured on the girder flanges by forks 17 having clamps 19 engaging the girder flanges. The strut 4 for the middle portion is provided with a screw-threaded part 25 carrying a wing- nut to engage a stirrup on the angle-irons. The struts 7 for the end portions are provided with screw - threaded parts secured to the angle-irons and carrying wing nuts engaging stirrups, which are provided with plates engaging and clamping the ends of the angle - irons of the middle and end parts. The staging can be used for decorating or repairing ceilings by suspending it from drop hangers 20, having upper clamping - jaws 21 engaging the floor girders, and the lower ends 22 forked and perforated to receive pins for engaging the sliding sleeves 14. In a modification, the centering is constructed to allow bending due to load being corrected. The end parts slide between guiding plates riveted to the middle part, the struts 4, 7 are provided with screw adjustable upper parts 27<1>, and the ties 3' are formed with slots at the lower ends engaging a pin. The struts are connected together by a bar having hinged portions 30 with slots 38, through which the shouldered ends of the struts 7 pass and are secured by pins. The ties 5 are slotted at the lower ends to engage over the shouldered ends of the struts. The centering may be suspended from the girders or walls by hooks 43 with perforated shanks to receive pins engaging sliding sleeves 47 connected to the end portions by screw pins 45.

Abstract:
4172. Arndt, O. Oct. 20, 1911, [Convention date]. [Addition to 6250/11.] Centering for floors and ceilings staging, suspended. -. The end hangers H, for trussed centering and staging described in the parent Specification, are guided in inclined sleeves M, which rotate about horizontal pins 23 and are connected to members S sliding along guides 17, 17<1> on the angle-irons 3 of the centering and c. The members S consist of double channel-irons with parts of the web removed, and having plates 20 recessed at 21 to fit over the pins 23, engaging in holes in angle-irons 22, 22<1> carrying the sleeves M. The remaining parts 18 of the webs of the double channel-iron are provided with holes 19 through which pass bolts 27, having heads 28 sliding on the guide-plates 17, 17<1> and being provided with sleeves 24 with pivoting pins 25, 25<1> engaging in holes in the angle-irons 22, 22<1>. Pins 29 are passed through holes in the bolts 27 and help to support the members S. Nuts 32 on the bolts can be screwed up or down to vary the inclination of the sleeves for the hangers. The hangers are of #-shape, and the heads 34 are formed with flat bearing-surfaces 35, 36 so that they can be reversed.

Abstract:
Source: DK17426C [DA] [Source: Claim 1] 1. Stilladset kan enten haenges paa en Lofts- bjaelke eller anbringes paa Murkanter. I begge Tilfaelde kan den i Fig. 6 og 7 fremstillede BAE- reindretning anvendes. Ligesom ved andre kendte Forskallingsstilladser anvendes der ogsaa her en op og ned bevaegelig Krog 83 som anbringes paa Loftsbjaelken p's Flange og er bevaegelig op og ned i en Styremuffe 10. Denne er i dette Til- faelde i eet Stykke med en anden Styremuffe y, som skydes paa Enden af det anvendte Spraeng- vaerks oevre Baand og cr forskydelig paa langs ad dette Baand. Krogen 8's Forskydeligheder, lodret i Muffen ro og vandret i Muffen y3 skal uafhaengigt af hinanden muliggoere en fin Ind- stilling af Stilladset baade efter Spaendvidden og efter Hoejden. I det foreliggende Tilfaelde er desuden Dob- beltmuffen iot y forsynet med et udefter rettet Fremspring, en Fodplade n, som tjener til, hvis der ikke anvendes Loftsbjaelke og altsaa heller ingen Krog 8, at Stilladset kan anlaegges paa en Mur. Til Befaestelse af Krogen 8 paa Loftsbjael- ken g tjener en Gaffel 12 3 hvis Ender 13 omslut- ter Krogen samt er krummede hageformet ind- efter og paa Enden forbundne med hinanden ved en paa den indre Bjaelkeflange stoettende Skinne 14, som gaar ind i selve Krogen. Paa Gaflen 12's Skaftende er bevaegeligt anbragt en Sko 13, som tjener til Ophaengning og Fastklemning af Gaflen paa Bjaelkeflangen. Patentkrav. 1. Adskilleligt Forskallingsstillads, ka- rakteriseret ved, at det bestaar af hver for sig anvendelige og i Forhold til hinanden forskydelige Spraengvaerker I og II, der ved Indskydning i hinanden danner et enkelt, som Spraengvaerk formet Stillads med variabel Spaendvidde, idet Finindstilling med Hensyn til saavel Spaendvidden som Hoejden gives ved Hjaelp af en forskydelig Muffe 10 med en Baereindretning 8 af kendt Art. **Machine translation:** [Source: Claim 1] 1. The **scaffolding** can either be hung in a Lofts- bar or placed on Murkanter. In both cases, as in Fig. 6 and 7 produced BAE- reindretning used. As with other known Formwork **Scaffolding** used also here a up and down moving Hook 83 placed on ceiling beam p's flange and is moving up and down in a pilot sleeve 10. This is in this To- trap in one piece with another Pilot Sleeve y which slides on the end of the used Burster approach upper strip and cr sliding on along this strip. Hook 8's offset the similarities, vertical in the sleeve calm and horizontal in the sleeve y3, independently of each other permit a fine Check-in position of the **scaffolding** both after range and after the height. In the present case is also Dob- belt sleeve iot y provided with a directed outwards protrusion, a platform n which serve to, if not using ceiling beam and therefore no Hook 8 that the **scaffolding** can be built on a wall. For the attachment of the Hook 8 at Loftsbjael- ken g serves a fork 12 3 if the ends 13 omslut- ter Hook and is curved hage shaped Check-in after and at the top related to each other by a on the internal Beam Flange supporting Rail 14, which is in favor of the Hook. On the fork 12's Skaftende is moving placed a Shoes 13 which serve to Suspension and clamping of the yoke on the Beam Flange. Patent requirements. 1. Separate the strange Formwork **Scaffolding** Ka- rakteriseret know that it is composed of each applicable and in relation to each other retractable Blast Works I AND II by fitting into one another form a single, as explosive Craft shaped **scaffolding** with variable Span, Fine Tuning with regard to both the range as the height shall be made by means of a sliding sleeve 10 with a Carrier Decor 8 of known Art.

Abstract:
6108. Erikson, C. G. A. March 12. No Patent granted (Sealing fee not paid). **Scaffolding**.-**Scaffold** poles connected together vertically by hooked arms A, A' engaging respectively the upper and lower ends of the poles and joined together by pivoted links C embracing the poles. The bearing-ends of the arms A, A<1> are split, and the parts bent in opposite directions, the free ends A<2> of the arms being bent outwards to accommodate horizontal timbers E. The members of the links are curved to increase the rigidity and the grip upon the poles. In a modification, the arms A, A<1> are formed to embrace partially the poles and engage the ends of the poles either by the pivot pins F of the links, or by integral parts G. The arms may be provided with teeth H for engaging the poles. In another modification, the links C are formed with bearing-ends C<2> engaging the ends of the poles, and are connected together by plain links.

Abstract:
28,912. IndustrieUle Maatschappij van F. J. Stulemeijer and Co., and Stulemeijer, C. Dec. 16. Moulding in situ.-Relates to the inner moulds for use in casting concrete structures such as silos and cooling-towers. The inner mould b, with the working platform v, is independent of the outer mould, and is supported by a wooden framework a connected to a central post.: The mould boards are carried by wooden bars c, or by metal strips e secured to wooden bars d, the bars c, d being displaced to expand the mould by wedges f, g engaging blocks h, i on the framework a, and blocks k on the mould. The gaps between the mould boards are filled by wedge-shaped boards l. The metal strips e are adjusted to different curvatures by angle bars m, formed with slots to engage bolts n screwing into the bars d, and by screws o mounted in the bars d. The mould is supported on a finished section by bolts p sliding in guides q, r, or is suspended by loops s, or the framework a is connected to a hollow post sliding on a central post t and supported by pins inserted in holes in the central post. Boards are fixed to the framework for supporting the workmen during the adjustment of the mould.

Abstract:
Source: DK18935C [DA] [Source: Claim 1] DANSK PATENT Nr 18935. B E S B BIVE E 8 E MRD TILHOERENDE TEGNING, BEKENDTGJORT DEN 22. JUNI 1914. Bygmestcr Otto Arndt, Liegnitz, Tyskland. Endeleje til Forslcallingsstilladser. 2. Tillaegspatent (til Patent Nr. 17426) udstedt den 10. Juni 1914, beskyttet fra den 15. August 1913. Varigheden regnes fra den 3. Juni 1913. (Klasse 37: Husbygningsvaesen, herunder Stilladser og Hegning m. m.) I Tillaegspatent; Nr. 17629 er i Fig. 7-9 fremstillet et Endeleje for de i Patent Nr. 17426 omhandlede Forskallingsstilladser, hvilket Leje for at kunne forandre Stilladsets Laengde cr indstilleligt i Laengderetningen og for at kunne forandres i Hoejden er drejeligt om en Tvaeraksel, hvorhos Drejeindstillingen sker ved Tiltraek- i ning eller Loesnen af en Skrue. Dette Endelcje fordrer et paa Stilladset forskydeligt Mellem- stykke, der som en Art Sadel hviler paa en af Endelejets Tappe. E11 simplificeret Udfoerelses-! form for dette Endeleje er kendt, men ogsaa i denne Bygningsmaadc er i mange Tilfaelde; kostbar, navnlig hvor det ikke gaelder en fin ' Laengdeindstilling af Stilladset. Den foreliggende Opfindelse angaar et yder- ligere simplificeret Endeleje, der heller ikke fordrer ct saerligt Mellemstykke paa Stilladset. Endelejet er nemlig forsynet med flere, i Stil- ladsets Laengderetning efter hinanden dannede Huller for en Stikbolt, paa hvilken Stilladset er drejeligt. For Laengdeindstillingen flyttes blot denne Bolt fra det ene Hul til det andet. Drejeind-] stillingen sker ligesom ved de kendte Endelejer ved Hjaelp af cn Spaendeskrue. En Udfoerelsesform for Opfindelsen er frem- ' stillet paa Tegningen, hvor j Fig. t viser Lejet set fra Siden og j Fig. 2 samme i Perspektiv og i stoerre Maale- stok. Endelejet A har en nedre Anlaegsfiade b \ og en ovre skraat opefter gaaende Anlaegsflade c, saa at det kan forbindes med Forskallings- stilladset B's Ender, og man benytter efter de foreliggende Tilfaelde den ene eller den anden Anlaegsflade. Hullerne d tjener til Optagelse af en Stikbolt e, der tillige forbinder Endelejet A med Stilladset B. 1 Forhold til, om Bolten e indsaettes i Hullet ri1, d2 eller 3, Fig. 1, kan Stilladset B's Laengde forandres. Stikbolten e tjener desuden som en Aksel, om hvilken Stilladset B drejer sig, naar det ved Hjaelp af Spaendeskruen f haeves eller saenkes. Endelejet kan ogsaa benyttes til andre Byg- ningsdele, f. Eks. til Tagspaer, Telte, Skur og lignende. Patentkrav. 1. Endeleje til de 1 Patent Nr. 17426 om- handlede Eorskallingsstilladser, som for at kunne forandre Stilladsets Laengde er indstilleligt i Laengderetningen og for Hoejdcio randringen kan drejes om cn Tvaeraksel, karakteriseret ved, at Endclejet A i Stilladset B's Laengderet- ning har Huller d for cn efter Behov i det ene eller det andet Hul anbringelig Bolt e, paa hvilken Stilladset er drejeligt anbragt. 2. Ved det i Krav i angivne Endeleje den Anordning, at det er forsynet med to skraat til hinanden rettede Anlaegsflader b og c. Koebenhavn 1914. Trykt hos J. H. Schultz A/S, **Machine translation:** [Source: Claim 1] Danish Patent No 18935. B E S B BIVE E 8 E MRD BELONGING TO THE DRAWING, ANNOUNCED ON 22. June 1914. Bygmestcr Otto Arndt, Liegnitz, Germany. Endeleje to proposed calling **scaffolding**. 2. Additional patent (to Patent No 17426) issued on 10. June 1914, protected from 15. August 1913. The duration shall be calculated from the 3. June 1913. (Class 37: Husbygningsvaesen, including **scaffolding** and Hegning etc.) in Appendix Patent; No 17629 is shown in Fig. 7-9 produced a Endeleje for in Patent No 17426 Formwork referred to **scaffolding**, which bearing to be able to change the length of the Cradle cr adjustable longitudinally and to be able to change during the height is rotating on a cross shaft, hvorhos Turn The setting is made by attract- in withdrawal or Loesnen by a screw. This Endelcje requires a on the **scaffolding** retractable Medium-piece that as a kind of saddle is based on one of the fin Jets studs. E11 simplified Udfoerelses-! The form of this Endeleje is known but also in this Bygningsmaadc is in many cases; costly, in particular where it does not apply a fine ' length setting of the **scaffolding**. The present invention of an outer- ligere simplified Endeleje which does not require ct special spacer on **scaffolding**. Fin-owned is fitted with several, in the style- ladsets longitudinal direction after the other formed holes for a connector bolt on which the **scaffolding** is rotating. For the length setting moved just this bolt from one hole for the second. Drejeind-] still takes place as well as by the known end bearings using the CN Clamping Screw. A performance form for the invention is forward and ' produced in the Drawing where j Fig. t shows the bearing side view and j Fig. 2 the same in perspective and in larger measuring stick. Fin-OWNED A has a lower Anlaegsfiade b \ and an over inclined upwards bill Shoulder c, so that it can be connected with Forskallings- **scaffolding** B's ends and you use in accordance with the present case the one or the other mating face. The holes d is used to record a connector pin E are also connects the fin-OWNED A with the **scaffolding** B. 1 Relation to whether the bolt e shall be inserted into the hole ri1, D2 or 3, Fig. 1, **Scaffolding** B's length changes. Connector pin e also serves as a shaft, on which the **scaffolding** B case when it by means of the clamping screw f is raised or lowered. Fin-owned may also be used for other barley seal parts, e. For example. To Tagspaer, tents, shed and similar. Patent requirements. 1. Endeleje to the 1 Patent No 17426 on- Eorskallingsstilladser acted as to be able to change the Cradle Length is adjustable longitudinally and for Hoejdcio peripheral ring can be rotated on cn cross shaft, characterised by the Endclejet A of the **scaffolding** B's Laengderet- withdrawal has holes d for cn as needed in one or the second hole position avoidable Bolt e, on which the **scaffolding** is rotating. 2. At the requirements of the specified Endeleje the device that it is equipped with two oblique to each other informed mating surfaces b and c. Copenhagen 1914. Printed from J. H. Schulz A/S,

Abstract:
108,417. Branson, G. Dec. 2, 1916. Brackets.-**Scaffolding** is supported by a bar B inserted in the wall at B' and pivoted to a bent bar A inserted in the wall at A' and having a a flattened end pressing against the wall at A<2>. Additional bars C, D, Fig. 2, may be provided to support a wider **scaffold** which rests on the bar C.

Abstract:
116,056. Jones, D. Palmer-, and Patent Rapid **Scaffold** Tie Co. Feb. 12, 1918. **Scaffolding**. - The tubular or solid members 1, 12 of **scaffolding** or like temporary erections are connected by a U-shaped clamp 3 and a plate 7 with one or more set-screws 9. The clamp is formed with hooks 4, 5 to hold the plate, and with a portion cut away to receive the cross-member 12. The plate 7 may be formed with recesses 13 to receive the hooks 4, 5, and with bosses 8 for the set-screws. Two parallel members of **scaffolding** may be connected in a similar manner, and one member may be divided and the adjacent ends be brought together and clamped by the bracket. Specification 11700/14 is referred to.

Abstract:
117,541. Bornand, F. V. Oct. 5, 1917. **Scaffolding** and staging.-A tie for **scaffolding** comprises an unbendable s h o e or bracket f of U- shape, the bottom of the U having a hole through which an eye bolt g passes. Chains a, c a r e carried by hook connexions d, c, and in tightening the tie by means of a nut g<2>, the stresses are borne by the connexions d, e bearing upon the edges of the shoe f so that bending of the bolt g is prevented. According to the Provisional Specification, a differential screw, or two screws may be used, so that both chains are tightened, and the connexions d, e may be provided with packing-pieces to keep the sides of the shoe apart.

Abstract:
118,369. Thompson, W. B. Nov. 10, 1917. **Scaffolding** and staging.-A portable footing for the uprights of **scaffolding** in shipyards consists of a concrete base 1 intended to rest on the ground and having one or more pairs of holes or sockets 2 to receive the uprights. The holes do not extend completely through the base, but a small hole 5 is provided for drainage purposes. The base may be reinforced and is also provided with a beading 6 to retain loading material such as scrap iron. The bosses may be inclined to the base so that the uprights may be perpendicular when the base is placed on an inclined slipway.

Abstract:
128,868. McLeod, D. Feb. 13, 1919. **Scaffolding**.-An adjustable and hinged platform is provided in **scaffolding** especially for ship construction. To the transverse members 3 of the frame work 1, 2 are attached angle-irons 4 extending to or just past the uprights and similar angle-iron members 9 are hinged thereto by means of a bar 6 and spacer 7 which may be integral therewith. The spacer and angle-iron 9 are bevelled to:form an horizontally butting hinge. The flange 11 affords a surface for the planking. To provide for broader platform the member 9 is fixed to the frame and the longer angle-iron 4 is used for the platform.

Abstract:
131,766. Muir, A. E. Sept. 20, 1918. **Scaffolding** and staging.- **Scaffolding** for ship building and c. comprises a series of single uprights composed of angleirons a and braces b, each upright having two vertical channel ways formed by angleirons c and a #-iron d and two brackets e sliding independently in said channels with guides f engaging the bracket flanges. Staging planks are bolted before elevating to plates p riveted to angle-irons m which are secured to the brackets by bolts n in the brackets passing through slots o in the angle-irons. The brackets are then hoisted by ropes or tackle and secured by a chain j and cleat or hook k, the tackle being then removed. The angle-irons m and plates p may be made to slide outwards to give greater outreach of staging and additional bolts may be used to secure the angle-iron to the bracket.

Abstract:

138,005. McMillan, J. May 28, 1919. **Scaffolding** ironwork, constructional.-A **scaffolding** consists of any desired number of sections, each section comprising steel tubes, iron or steel fittings, and wire stays with means of securing same to the fittings. Each section consists of two parallel series of tubular frames 9, 20, 12, 17 jointed by tubes at each of the four corners and braced by wire stays 22. Fig. 2 shows two sections, one superimposed on the other. The **scaffolding** is supported by plates 24 and screws 23. The fittings 2, Fig. 5, are provided with three socket arms 25, 26, 27 to support the horizontal tubes, one of which 14 is shown. These tubes are provided with flanges 30 which take into grooves 32 and are provided with slots 31 to accommodate the shackle 21, which is also housed in a hook-shaped part 28 in the socket arm. The vertical tubes 10 rest on a ledge 37 and are provided with pins which take into the bayonet slots 38, 39. Intermediate platforms are secured, if desired, by means of rods and clamps attached to the vertical and horizontal rods by means of the holes shown therein. Handrails of tubular form may be secured to the tubes by cleats.
