Title: DYNAMICALLY ROUTING TELEPHONE CALLS

Abstract: A system and method automatically route telephone calls to a substitute telephone number that may differ from the dialed telephone number. The substitute telephone number is obtained from a call management module which determines the number based on various factors including, for example, modes, filters, schedules, and the like. A dynamic number portability database may be used to implement the call routing functionality.

Title: METHODS, SYSTEMS, AND COMPUTER READABLE MEDIA FOR TRANSACTIONAL FRAUD DETECTION USING WIRELESS COMMUNICATION NETWORK MOBILITY MANAGEMENT INFORMATION

Abstract: Methods, systems, and computer readable media for detecting transactional fraud can involve, for a **transaction** associated with a first **transaction** location and account holder, receiving a request for mobile location information associated with the account holder. Mobile location information associated with the account holder may then be obtained, wherein the mobile location information is derived from mobility management signaling **messages** or other data associated with a mobile communication device used by the account holder. The mobile location information associated with the account holder can then be provided to the requestor. The mobile location information may be compared against the first **transaction** location to determine, at least in part, whether the **transaction** is fraudulent.
