Abstract

(EP2519132)

The invention relates to a removable **handle** (4) for a **kitchen** object (1), having a lateral wall (2) extending upwardly by a part (3) that is curved back towards the outside, the **handle** (4) comprising an inner jaw (6) and an outer jaw (7) to be respectively brought against the inner (11) and outer (12) surfaces of the lateral wall (2), the two jaws (6, 7) being mobile in relation to each other between an open position and a closed position wherein they pinch the lateral wall (2). According to the invention, the outer jaw (7) comprises a groove (15) that can receive the free end (16) of the curved part (3) of the lateral wall (2) in abutment when the jaws (6,7) are in the closed position thereof.

**Abstract**

(EP2731482)

The invention relates to a kitchenware item (1) for cooking food, comprising a **pan** (2) provided with a side wall (3), a **handle** (5, 5b) comprising attachment means for attaching said **handle** to the side wall (3), and a removable **accessory** (4) of the kitchenware item (1), said **accessory** (4) comprising an electromechanical device. According to the invention, the **handle** (5, 5b) comprises an electrical energy source (6) and the electrical energy source (6) feeds the electromechanical device arranged on the **accessory** (4) by means of an electrical circuit (24, 25) comprising electrical connection-disconnection means (26, 28).

Simple detachable **pan handle****Images**

Publication data including kind & date

CN101947066	A	2011-01-19	CN101947066
CN101947066	B	2012-01-11	CN101947066B

Abstract

(CN101947066)

The patent refers to the field of 'kitchen equipment; coffee mills; spice mills; apparatus for making beverages'. The invention relates to a simple detachable pan handle, belonging to accessories of cooking utensils in a kitchen, which comprises a handle, an open-close button, a cover board, a fixed clamp block and a connecting rod, wherein the front end part of the handle is provided with a clamping claw, the middle part is provided with an open-close slot and the cavity of a hinge pin seat and the bottom is provided with a clamping slot and a lug clamping slot; the open-close button is arranged in the cavity of the hinge pin seat and in the open-close slot and connected to the handle; the upper part of the open-close button is provided with an upper cover, and the lower part is provided with a lug and the hinge pin seat; the middle part of the lug is provided with a first empty cavity; the cover board is fixed at the bottom of the handle; the middle part of the cover

board is provided with a fixed clamp block sliding cavity, the upper end part is provided with a clamping lug and the back end part is provided with a clamping block; the fixed clamp block is arranged in the open-close slot of the **handle** and forms sliding fit with the fixed clamp block sliding cavity; the front end part of the fixed clamp block is provided with a clamp block, the middle part is provided with a second empty cavity and the back end part is provided with a groove face; and one end of the connecting rod is arranged in the first empty cavity and connected with the open-close button, and the other end is arranged in the second empty cavity and connected with the fixed clamp block. The invention has the advantages of simple and convenient use, sanitation, firm connection with a **pan**, and difficult detachment.

Abstract

(EP1660819)

Kitchen furnishing **accessory**, for outdoor or indoor use, provided with an interchangeable hob for cooking food and with a modular support structure of the interchangeable hob composed of tubular uprights, where, at the lower end, a bottom is fitted, surrounded around the edge by side panels, also anchored to said uprights, and a door, hinged at the side, said panel and said door being curved. At the upper part of the modular structure, the hob is fitted onto the upper ends of said uprights, comprising essentially a circular plate, the heating and cooking means, and the respective controls for controlling the working temperature of the heating and cooking means, positioned along the front of the hob assembly. The furnishing **accessory** may consist of one, two or more support structures which are fitted together. Different kinds of household appliances may be located in them: e.g. refrigerators, dishwashers, ovens.

Simple detachable **pan handle****Images**

Publication data including kind & date

CN201822714

U 2011-05-11 CN201822714U

Abstract

(CN201822714)

A simple detachable **pan handle** belongs to the accessories of kitchenware, and comprises a **handle**, an open-close button, a cover plate, a fastening clamp block and a connecting rod, wherein a clamping jaw is arranged at the front end part of the **handle**, an open-close groove and a pin shaft base seat cavity are formed in the middle of the **handle**, and a clamping groove and a projection clamping groove are formed at the bottom of the **handle**; the open-close button is arranged in the pin shaft base seat cavity and the open-close groove and is connected with the **handle**, an upper cover is arranged at the upper part of the open-close button, a projection and a pin shaft base are arranged at the lower part of the open-close button, and a first cavity is formed in the middle of the projection; the cover plate is fixed at the bottom of the **handle**, a fastening clamp block sliding cavity is formed in the middle of the cover plate, a clamping projection is arranged at the upper end part of the cover plate, and a clamping block is arranged at the rear end part of the cover plate; the fastening

clamp block is arranged in the open-close groove of the **handle** and is in slide fit with the fastening clamp block sliding cavity, a clamp block is arranged at the front end part of the fastening clamp block, a second cavity is formed in the middle of the fastening clamp block, and a groove surface is arranged at the rear end part of the fastening clamp block; and one end of the connecting rod is arranged in the first cavity and is connected with the open-close button, and the other end of the connecting rod is arranged in the second cavity and is connected with the fastening clamp block. The **pan handle** is convenient and handy to use and sanitary, can be tightly connected with a **pan**, and is prevented from falling off the **pan**.

T3 2003-07-01 ES2189369

**Abstract**

(EP0974297)

The device has positioning units allowing the container to pivot between a cooking position and a pouring position. The units for locking the container on the support, has adjusting elements for adapting to the various heights and diameters of the containers. The device comprises inner and outer leg supports (3,4) with articulation point (6), housing bar (10) to support the base of the container (1). The container top is secured with lip clip (21) height-adjustable on upright (11b), itself adjustable within a base support (11a) to accommodate diameter variations. Adjustable side jaws (13) are used to further secure the container. The inclination is effected using lever (16) and locking mechanism (17) to permit adjustment from vertical to horizontal (and beyond by up to typically 300) for emptying and cleaning. The locking mechanism is released by applying pressure to the button (19) to compress internal spring (19a) and allow sliding freedom of the pin (18a) in the guide (18). A spring (20) provides an opposing couple to counteract off-centre container weight during lever actuation.

Abstract

(EP1959804)

This is a system of one or more handles for an item of **kitchen** equipment for cooking on a cooker or a hob. A number of items can be stacked together. Each **handle** has at least one stud (125) and/or at least one housing (131) for keeping the superposed items in the form of a stack, the housing and/or the stud therefore being designed, respectively, to receive another stud and/or to be received in another, complementary housing. Each **handle** further comprises a locking projection (162) and a receiving zone (162) designed, respectively, to be engaged with another receiving zone provided on another **handle** and to receive the engagement of another locking projection provided on this **handle** intended for the other item.

**Abstract**

(CN208535228)

The utility model relates to an integrated fuel air door valve that stove burns with air defense, including air door ejector pin, throttle setting, dryer and fuel valve, wherein in the inner chamber of throttle setting setting between dryer air intake and air outlet, include the pivot that runs through dryer both sides wall and can revolute the wind door leaf that the installation of rotation of axes ground is used for the dryer switching, in air door ejector pin lower extreme ran through the upper wall between dryer air intake and the air outlet and stretches into the dryer, the air door ejector pin got into the interior one end setting of dryer in wind door leaf top, lower wall and fuel valve button that the fuel valve runs through between dryer air intake and the air outlet set up in wind door leaf below, and air door ejector pin and fuel valve lie in same one side of pivot. The utility model discloses an air door valve simple structure, degree of automation are high, easy and simple to **handle**, close fuel valve and air door as an organic whole, and the action process of only operating the frying **pan** through the **cook** will be touched and opened or close oxygenation air door and fuel valve, stops the empty fever of stove totally, after turning off the big fire, only keeps somewhere kindling material among the furnace.

Abstract

(EP3035836)

A dual medical endoscope system can be constructed including a first and a second medical endoscope, where the first endoscope comprises an **accessory** channel with a proximal mounting port providing access thereto, and where the second endoscope comprises a **handle** body that is securely and removably attached to the proximal mounting port. An endoscope, which may be the second endoscope, can include an elongate, manipulable shaft with a distal-end visualization element and a **handle** body comprising at least one control surface for manipulating a distal region of the

shaft, where the **handle** body includes a passage through which a length of the shaft is passable, and where the **handle** body includes a connection structure configured for securely and removably mounting the **handle** to a channel of another endoscope in a manner axially aligning the passage with the channel to provide a path of communication for the shaft.

Abstract

(FR2602660)

The slicer **accessory** for the container of a **kitchen** appliance, which has a central drive-shaft and lid has an adjustment-plate (100) crosswise to the axle of the drive shaft. The adjustment-plate has an eccentric hole for a circular blade (68) whose cutting-edge (70) is parallel to the adjustment-plate. A hub (62) preferably rests on the drive-shaft and is coupled to it. The adjustment has an operating piece (300) on the lid-side of the adjustment plate.

Abstract

(EP2306876)

The present invention relates to a **handle** fixture device (1) for attaching a **handle** (2) to a cooking vessel (3) or the like, such as a cooking pot, or a frying **pan**, having a retaining element (4) that is preferably attached to the cooking vessel (3) in a non-detachable manner. For this purpose it is essential to the invention that an exclusively point and/or line-shaped contact is provided between the retaining element (4) on one side and the retaining device (7) on the **handle** side.

Abstract

(US4575897)

Handle attachment for a hollow **accessory** sheet-metal **handle** on dishes. A support bar is provided which is fastened to the dish and has a locking recess into which extends a spring fastened in the interior of the **handle**, particularly during a moving of the **handle** onto the support bar to thereby effect a holding of the **handle** pressed against the wall of the dish alone through the spring tension. A one-piece constructed guide and spring element is provided for receiving the support bar and is inserted into the interior of the hollow metal **handle** for receiving the support bar.

Abstract

(EP0329065)

Vessels, in particular cooking vessels, which are heated on a stove must be provided with suitable handles. On the other hand, such vessels cannot be used in microwave ovens. <??>A vessel with a detachable **handle** is provided, a positively engaging detachable suspension device being provided at the end face of the **handle** (2) and the assigned attachment region (4) of the vessel (1), which suspension device comprises at least one essentially vertically extending recess and a vertical suspension part which can be inserted in the recess, the recess and the suspension part being arranged in the region of the upper region of the end face of the **handle** (2) and a locking device, which connects the **handle** (2) detachably to the vessel (1), being provided in the region of the lower region of the end face of the **handle** (2). <??>The vessel can be used both in microwave ovens and on customary stoves. <IMAGE>

Abstract

(EP0566777)

In the case of **handle** fixtures on cooking vessels or frying pans or the like, which are effected non-positively and possibly also in a positive-locking manner without separate connecting elements being required which hold the **handle** fixture releasably, it is sometimes desirable for the already fixed **handle** to be able to be released again from the rigid anchoring element on the cooking vessel. For this purpose, an arrangement is proposed, in which, by means of suitable apertures in the **handle** fixture, a suitable separating tool (3) can be engaged between two mutually facing surfaces of the two fixture pieces, with the aid of which tool a smooth release of the **handle** (2) can take place. A commercially available screwdriver is used as the separating tool (3).

Abstract

(EP2158218)

The invention relates to anti-VEGF polypeptides and antibody single variable domains (dAbs) that are resistant to degradation by a protease, as well as antagonists comprising these. The polypeptides, dAbs and antagonists are useful for pulmonary administration, oral administration, delivery to the lung and delivery to the GI tract of a patient, as well as for treating cancer and inflammatory disease, such as arthritis.

HK1205894	A1	2015-12-31	HK1205894				

Abstract

(EP2887851)

The invention relates to a **kitchen** appliance (10) for placement on vessels (30; 30') having a substantially circular opening edge (31; 31'), comprising a plate-shaped base body (15) made of a first material having a recess (13) into which at least one type of functional unit (20; 20') can be temporarily introduced. According to the invention, the base body (15) is formed to have a shell-like shape, wherein a base body (15) is formed having a concave and a convex side. At least on the convex side of the shell-shaped base body (15), a contact surface (40) made of a second material is attached at least in sections, wherein the second material of the contact surface (40) effects a greater frictional force in contact with the material of the vessel (30; 30') than the first material of the base body (15).

**Abstract**

(EP1876935)

The invention relates to cooking utensils (1, 10) which can be stacked on top of one another, each utensil comprising a body (3, 30) for receiving food and at least one **handle** (5, 50). The **handle** is equipped with at least one pin (9, 90) and/or at least one housing (11, 110) which is at least partially defined by a hollow zone in the **handle**, such that the utensils can be securely stacked.

Abstract

(EP3493509)

A uniform protocol can facilitate secure, authenticated communication between a controller device and an **accessory** device that is controlled by the controller. An **accessory** and a controller can establish a pairing, the existence of which can be verified at a later time and used to create a secure communication session. The **accessory** can provide an **accessory** definition record that defines the **accessory** as a collection of services, each service having one or more characteristics. Within a secure communication session, the controller can interrogate the characteristics to determine **accessory** state and/or modify the characteristics to instruct the **accessory** to change its state.

Abstract

(EP1972243)

Handle fixing device for use with e.g. casserole, has protrusions that are contact in with two sides of stud in transversal lateral axis, and positioning unit for positioning base against stud and **handle** in transversal vertical axis

The device has a stud (5) comprising a front end (14) fixed to a cap (6) of a culinary article (2), and a rear end (15) provided with an opening. A **handle** (3) has an end (30) with protrusions (31, 32) forming a housing (33) that receives the stud. A base (8) surrounds the stud and the protrusions, and longitudinally connects the **handle** with the cap. The protrusions are in contact with two sides of the stud in a transversal lateral axis (42). The base includes a positioning unit for positioning the base against the stud and the **handle** in a transversal vertical axis (41).

Fume Hood of frying **pan****Publication data including kind & date**[ES1140657](#) U 2015-06-30 ES1140657U[ES1140657](#) Y 2015-09-21 ES1140657Y**Abstract**

(ES1140657)

1. Fume Hood of frying **pan**, characterized to include a base composed by two plate walls (2 and 4) lateral, a back (3) of 325 mm basic by 200 mm of height and one plate frontal wall (1) of the same measurement with an opening (16) for the passage of the **handle** of the frying **pan** and a **handle** (17) to be able to take this frontal wall (1), that go above assembled by eyelashes (11) and screws (12) that are inserted by hollows (13) to the base of a troncopiramidal figure (5) finished off by above in hoop (6) on which two semicylinders are assembled (9 and 10) united vertically by eyelashes (11) and screws (12) to form a tube or chimney of exit of smoke. 2. ; Fume Hood of frying **pan**, according to claim 1, characterized because between the hoop (6) and the chimney a motor is placed like **accessory** element (7) fume hood with its able tube (8). 3. Fume Hood of frying **pan**, according to claims 1 and 2, characterized because the frontal wall (1) counts on some drills (15)

by where the base to the troncopiramidal piece by means of projections is maintained (14).

Abstract

(EP2020182)

The bracket has two molding chambers whose longest sides are installed side by side, where biggest deepness of each molding chamber is 20-50 millimeters and proportion of length and width of each molding chamber is 3.5 centimeters. An end of a board is fixed with an aperture with direction to a ground. Four transverse boards are symmetrically installed on the molding chambers to form two supports of the bracket. A grab **handle** is provided in an upper part of an **accessory**. A container is installed in a preparation room and cooperated with a knead device for paste.

Abstract

(US20090078247)

A flame heat transfer regulating apparatus including an inner hollow shell and outer wall incorporated with a burner having improved burner ports for a gas stove to increase the flame heating efficiency in cooking. The shell is an ascending wall including a smaller sized bottom opening and a larger sized top opening. A plurality of air passages are through the shell, wherein the air passages are more densely distributed onto a lower part, and are less densely distributed onto an upper part of the shell. The outer wall includes a plurality of air passages therethrough and multiple extensions projecting upwardly spaced on a top of the wall, wherein one extension is served to prevent undesirable heating of a **handle** of an utensil. The inner shell and outer wall are positioned on the gas stove cooktop. The shell is positioned to surround an upper section of the burner, where the improved burner ports are positioned. The outer wall is positioned to surround the inner shell. Each identical improved burner port includes a smaller section having a smaller sized inlet connected to an expanded larger section having an ascending interior surface and a larger sized outlet for forming a stable kernel of the flame.

Abstract

(EP0870991)

A heat cooker includes a generally box-like cooker body (1) having ventholes at a bottom board (12) thereof, a heating room (2) disposed in the cooker body (1), a heat source (31) disposed in the cooker body (1) for heating foods in the heating room (2) and an **accessory** storage section (4) disposed under the bottom board (12) of the cooker body (1), characterized in that the **accessory** storage section (4) comprises a pair of leg bodies (41) which support the cooker body (1) are attached on both sides of the bottom board (12) and a plate-like **accessory** storage body (46) which is supported by the leg bodies (41) and inserted between the leg bodies (41) to be capable of being pulled out forward, and in that the leg bodies (41) are further provided with ventilation slits (43a,44a) that form an airway between an inside of the cooker body (1) and an outside through the ventholes of the bottom board (12) and an area above the plate-like **accessory** storage body (46).

Abstract

(EP3449189)

The present invention relates to a new glass-ceramic plate for use, in particular, as a furniture surface and/or a worktop, and comprising, on at least one of its faces, in particular its underside, at least one connection element that is less than 10 cm in height, the cross-section of which can be inscribed in a circle of less than 3 cm in diameter, said connection element being composed of a material that is resistant to at least 70°C and having at least one attachment system enabling

attachment along at least two axes and/or via at least two movements, in particular via at least two different translational and/or rotational movements, and/or capable of exerting a force directed towards the glass-ceramic plate. The invention also concerns a furniture and/or household equipment, in particular a worktop or a piece of furniture incorporating said plate, as well as a method for mounting accessories or components to be fitted to said plate.

Abstract

(FR2341294)

1506364 Cooking vessel lids SEB SA 18 June 1976 [19 Feb 1976] 25399/76 Heading A4A A lid 1 for a cooking vessel 2 is formed with a central opening 4 around which are two rings 5, 6 one ring being on each of the upper and lower surfaces of the lid. The two rings 5, 6 are secured to each other in direct contact and are provided with means for removably supporting an **accessory** such as a filter 7 in the opening. As shown, the lid is metal with a circular array of slots (16) around the opening 4, the rings 5, 6 being of a thermoplastic and being welded to each other through the slots. The **accessory** comprises a charcoal filter cartridge (9) in a casing 8, the casing having lugs (36) which can be locked into the gap between the two rings 5, 6 against tongues 27 projecting inwards from the the lower ring 6. The upper ring 5 includes a perforated covering disc 25 and the casing 8 has a perforated base 33, gases from cooking only reaching the outside atmosphere after passing through the perforated base and disc and the charcoal filter. In an embodiment Figures 8, 9, (not shown) the **accessory** comprises a perforated plate (50) able to be rotated so that its perforations are in alignment or otherwise with the perforations of the disc 25 to control the venting of cooking gases, or in an alternative embodiment Figure 10 (not shown) the **accessory** is a baffle plate (63) which defines an exhaust passage (67) for the cooking gases (H) such that any fat is deposited in the passage. A further embodiment Figure 11, (not shown) provides a stirrer (71) driven by a motor (72) on the lid. In each embodiment the lid has a **handle** 19 pivoted to the lid about pins 20 so that the **handle** may be folded across the lid when not in use.

Abstract

(EP3108784)

This invention involves with a kind of dismountable hand grip, comprising a connection block, a hand grip, two locking pieces, elastic component and two pins; Wherein: There is the connection chamber at the front end of the mentioned hand grip; The two locking pieces are both provided inside of the connection chamber and symmetrically connected to the front end of the hand grip through a pin respectively, in order to enable themselves to rotate around the pin inside of the connection chamber; There is a clip unit at the front end of the mentioned locking piece, compression unit is at back and connected with the hand grip through the elastic component; and wherein the back part of the connection block is provided with a connection unit which can be inserted into connection chamber, wherein the connection unit is provided with a clip slot, which matches with the clip unit. The technical problems to be solved are the following: 1) The current dismountable hand grips cannot be assembled and disassembled with single hand. 2) The current dismountable handgrips only feature single connection point after being assembled and therefore it waggles easily during usage. The product of the present invention is featured by simple structure, convenient operation, secure and stableness, high durability and so forth.

Abstract

(EP3385661)

A portable articulated arm coordinate measuring machine (AACMM) having an integrated camera captures 2D images of an object at three or more different poses. A processor determines 3D coordinates of a smoothly continuous edge point of the object based at least in part on the captured 2D images and pose data provided by the AACMM.

**Abstract**

(DE102011115109)

The device has connection units provided at a frame (1) in such a manner that box elements are detached or fixedly connected together. The box elements are moved or fixed at a bond by rollers. An upper side of the box elements comprises a carrier plate i.e. steel plate (7), for devices and/or units required at a **kitchen**-and event region, where the carrier plate is removed without a tool. The carrier plate is not anchored with the box elements and is connected with the box elements in a freely movable manner. The carrier plate lies on a sealing band of a rubber- or plastic sealing.

Abstract

(EP3066058)

The invention relates to a body comprising at least one brittle material, in particular a glass ceramic, a glass, or a ceramic and comprising a metallic material, characterized in that the brittle material, together with the metallic material, forms a high-temperature resistant integral connection for temperatures of more than 250°C, in particular more than 300°C, preferably more than 400°C, in particular more than 500°C, and the connection of brittle material and metallic material comprises an intermediate layer between the brittle material and the metallic material, and the intermediate layer consists of a ductile material, preferably a ductile metal, in particular a ductile material, preferably a ductile metal, having an elongation at tear $\geq 1\%$, preferably $\geq 2\%$, in particular $\geq 4\%$, quite preferably $\geq 10\%$, in particular in the range 1% to 20%, especially in particular preferably in the range 2% to 15%.

AT233061	T	2003-03-15	ATE233061

Abstract

(EP1003401)

The invention concerns a twinned **kitchen** furniture system (10), in particular to be wall-mounted with or without bottom support, comprising lower, upper and hanging cupboards (18, 30), shelves (23) and special zone elements, and fixing elements and a base (15). A wall-mounting system (34, 45, 48, 29, 14) fixes the twin-assembled lower, upper and hanging cupboards, and the shelves (23), at a certain distance relative to a wall (13), and transfers the load taken from the wall (11) and/or from the base (15) system independent of the lower cupboards (18). In the space between the cupboards and the wall is located part of a door-rail system (29, 65, 66, 67, 69, 70) required for the complete vertical opening of the doors (27) above the work top (22).

**Abstract**

(CN206771455)

The utility model discloses an outdoor movable **kitchen**, including box upper cover, box lower cover, oil burner, tea set dish, oil tank, gas pitcher, gas -cooker, gas -cooker roll -over stand, box landing leg, barbecue net, charcoal brazier, upset support and landing leg dispenser, the both ends of landing leg dispenser are all articulated with the upset support through the rotation axis, and the both ends of upset support are articulated with the both ends of landing leg dispenser respectively, and the charcoal brazier is placed on the upset support, the charcoal brazier top is equipped with the barbecue net, and a plurality of barbecues net support mounting is crossed on the upset support by barbecue netcom. This outdoor movable **kitchen** reasonable in design, compact structure saves space, has multiple functions, application method is simple, has the good effect of preventing wind, can satisfy different food demands, the oil burning provides enough firepower, can satisfy the specific demand of people's culinary art, liquefied gas stove fire power suitably can satisfy other demands.

Abstract

(CN208404106)

This paper discloses a practice thrift fried dish machine in space, including the pot body and pot cover, the pot cover includes the swing arm and is located the lid of swing arm below, the lid middlepart is equipped with heavy platform, the

platform internal **fixation** that sinks there is drive assembly, the lid passes through that drive assembly is fixed to be arrived in the swing arm. The utility model relates to a machine for **kitchen** use field provides a practice thrift fried dish machine in space, and its heavy platform provides the assembly space for the **accessory** to reduced the shared space of the machine of cooking, the platform that sinks moreover is stable with the **accessory** assembly, does benefit to the production equipment.

DE3433164	C2	1992-06-11	DE3433164

Abstract

(FR2569971)

The appliance has the safety device preventing the electromotor being switched on and located in the casing of the appliance. The tools (e.g. citrus press) fit into the key when the cover is removed. Each tool has an arm that engages the safety device. The arm may or may not be removably linked to the tool. The edge of the key has coupling devices (e.g. a bayonet link) to cooperate with the cover. The arm has locking devices (e.g. a bayonet piece to cooperate with the locking devices of the key. The arm is sited at the side of the tool facing the bottom of the key.

Brush type device for use by e.g. plumber, to collect and clean waste in building site, has brush comprising multifunctional shovel case that contains brush and provides function of dust-**pan** shovel on which dustbin bag is stowed

Images**Publication data including kind & date**

FR2958527	A1	2011-10-14	FR2958527
FR2958527	B1	2012-03-30	FR2958527

**Abstract**

(FR2958527)

The device has a **handle** (A) folded by fitting tubes i.e. nestable tubes, on one another, where the tubes are folded on a top of a wood (1) of a brush (B1) when the brush is not used. Stowing of the **handle** on the brush is realized by machining two holes formed on the wood of the brush and by clips on each tube. The brush comprises a multifunctional shovel case that contains the brush and provides a function of a dust-**pan** shovel on which a dustbin bag is stowed. A stowing clip stowing the **handle** on the brush is unbolted by a captive pin assembled on the wood of the brush. The multifunctional scoop case is made of plastic material or cardboard.

Abstract

(US4161260)

A cover effective to be applied to pots, casseroles and similar **kitchen** containers is described, which is of such size and structural characteristics as to allow use as part of a "pressure pot." The cover comprises an outwardly projecting edge, a cup-like portion which is provided with a rim which extends downwardly to a level lower than said outwardly projecting edge; an essentially annular component, for instance a gasket, located about the rim and capable of contracting or shrinking. The annular component has preferably a segmented perimetral outline, alternately of smaller and larger diameter, the small diameter parts circumscribing, as the component is in the contracted condition, a circle having a diameter lesser than that defined by the projecting edge.

Publication data including kind & date

JP2005265295

A 2005-09-29 JP2005265295

Abstract

(JP2005265295)

PROBLEM TO BE SOLVED: To provide a cooking apparatus with heater for system **kitchen** capable of securing the cooking space etc. sufficiently by decreasing a dead space generated between the top plate of the cooking apparatus and its walls or the like.

SOLUTION: The cooking apparatus with heater for the system **kitchen** is configured so that a spatial margin can be given to the top plate in its area as dead space conventionally ranging from a range installing hole to the end in the width direction of a counter, the easiness in handling the cooking apparatus and its surrounding area can be enhanced, and that **kitchen** utensils such as deep pans etc. be placed thereon. A design with a sense of consolidation can be established by covering the area from the front extremity of the counter to its rear end, and everyday care may be facilitated.

Abstract

(EP2142053)

This is a culinary article comprising a metal dish (1b) defining locally a base where the dish is lined with an added insert (1a) made of a harder metal than the metal of the dish and typically fixed to the dish by perforations or teeth defining male/female engagements (231, 310). Around the perforated or toothed area (231) of the insert (1a) is a peripheral contact surface area (25) lower down, continuously solid, in the shape of a crown, in said harder metal. The insert is inserted from a shape in the form of a flat plate or cap.

**Abstract**

(EP2785228)

The invention relates to an attachment for a bowl of a **kitchen** machine. The invention further relates to a **kitchen** machine having such an attachment. The attachment has an opening for pouring foods in. The attachment has a drive, which enables a compact construction. Because the attachment has an opening, foods can enter the associated bowl, on which the attachment has been placed, through the attachment by means of the opening at any time during operation. A tool by means of which a food can be processed can be a component of an add-on part, which is placed on the attachment during operation. Foods that can be processed by means of said add-on part can enter the bowl through the opening of the attachment after the processing.

**Abstract**

(EP2226568)

The module (4) has a lower face i.e. concave cup (8), placed in a convex spherical bowl (3) of a container support plate. The spherical bowl is provided on a hot plate (2) or an induction type cooking table of an induction cooking apparatus (1). A flat upper face i.e. circular plate (9), and the concave cup are integrated with one another. An electric heating element (10) e.g. induction type heating element, is arranged under the circular plate. An independent claim is also included for an induction cooking apparatus comprising an interface module.

Abstract

(DE1130537)

846,310. Making electrically heated devices; stamping; working at specified temperatures. SUNBEAM CORPORATION. Aug. 19, 1957 [Nov. 19, 1956], No. 26154/57. Classes 83 (2) and 83 (4). [Also in Group XI] In a method of making an electrically heated device a pattern of weld-preventing material is placed between a pair of superimposed metallic sheets, the sheets are welded together and the areas covered by weld-preventing material are expanded by fluid pressure to form a passageway in the composite welded sheet, a flexible electric heating element being inserted in the passageway. Sheets

21a and 21b of two different aluminium alloys are degreased, deoxidized and secured together by welding or crimping the edges, a pattern of stop-weld consisting of graphite and waterglass having been included between. The stop-weld may be applied by using a masking die or a stencil or may be squeezed through a silk screen. The sheets are then first hot-rolled in a reducing atmosphere at a temperature of approximately 1000° F., e.g. 925°-950° F. to pressure weld them and form a unitary sheet, then cold-rolled to gauge and annealed at 660° F. The unbonded areas are then inflated by water under pressure the passageways 33a, 33b, 33c, 33d being formed by expansion of the sheet 21b only into the die 32, the die 31 having a plane face. After steamcleaning the passageways the branch 33d is closed by rolling. Several unitary blanks may be simultaneously made by bonding and inflating two large sheets having a number of separate stop weld patterns between. Heating elements 36 consisting of a resistor wound on a glass fibre core and covered by glass fibre insulation are mounted in the passageways 33a and 33b prior to or after the deep-drawing of the unitary sheet to form the container 21 of an electric frying **pan** 20. If the elements are in the passageways during the deep-drawing the metal is pressed into contact with the elements. One of the projecting ends of the heating elements which are in series is connected to a conductor 51 mounted in the **handle** 22 which is attached to a watertight housing 40 welded to the body of the **pan**. The **handle** 22 is adapted to receive a power lead in its remote end to which the conductor 51 and a slidable rod 45 operated by a control knob are attached. The other end of the heating element is attached through a switch 42 operated by a bi-metal thermostat 46 to the rod 45. In a modification the housing may be detachably secured by screws which engage tapped lugs welded to the container. The invention may also apply to a coffee maker, egg cooker, saucepan or deep-fat fryer. Specification 810,728 is referred to.

Abstract

(EP2222212)

The invention proposes a modular method of manufacturing a set of beverage production machines with different

beverage-related functions. The beverage production machines are designed for producing a beverage on the basis of pre-portioned ingredient packages. The method comprises the step of: providing a plurality of identical core units (2,2A,2B), the core units being provided with control circuitry (23) and a beverage production module (11) for housing an ingredient package and feeding a liquid to the interior of the ingredient package, - providing a plurality of different base platforms (1,3,4), the base platforms differing as to beverage production functions, and manufacturing a set of different beverage production machines by mounting respectively at least one of the core units on the top surface of one out of the plurality of differing base platforms and by mounting water reservoirs (7) on the base platforms.

Abstract

(EP0590315)

At least one radiant heating resistor (10) consisting of a corrugated flat material strip has projections (28) which project in different directions from a corrugated longitudinal edge (14), on the one hand engaged in insulation (3) for retention and on the other hand form longitudinal sections (39) of slightly reduced electrical resistance, which longitudinal sections (39) appear dark in comparison with the interposed visibly glowing longitudinal sections (38) at the normal operating power. In consequence, when brought into use, this results in the corresponding longitudinal sections (38) illuminating in a manner which starts very quickly, is in the form of a point and then spreads to form a corrugated line, as well as the heating resistor (10) being anchored very reliably.

Abstract

(EP1005633)

A process and apparatus for rapid, continuous flow histological processing of tissues is disclosed. The steps of **fixation**, dehydration, clearing and impregnation are performed in less than one hour; this allows a pathologist to evaluate samples shortly after receipt, perhaps while the patient is still in the operating room. Rapid and continuous processing is accomplished by decreasing the thickness of tissue sections, use of non-aqueous solutions composed of admixtures of solutions, solution exchange at elevated temperature and with agitation, and impregnation under vacuum pressure. The patient in surgery is thus provided with point-of-care surgical pathology.

Abstract

(EP1884179)

The cooker (1) has a **handle** (4) that is laterally distant from the cooker and including an operating unit with a rotating staff. The rotating staff extends from an area within a cooking chamber. The staff is arranged with an actuating unit (5) that is provided at a grip end. A cam is provided at the staff and mechanical units of the cooker that are adjusted with the cam. A rocker unit is provided with the cam, where maximum threshold pressure of the cooker is adjusted by rotating the staff. An opening is opened or closed for depressurization by rotating the staff.

Abstract

(EP1426003)

The electrical cooking apparatus includes a container (2) fixedly mounted in a casing (1), the container having a top edge (12), the casing having a peripheral lateral wall (5) surrounding the container, with a support element (14) and a retainer element (15) made of a material resistant to the temperature of the top edge of the container. The top edge of the container rests on support elements (14), the top edge of the container being held by the retainer elements, the support elements being mounted on the peripheral lateral wall. The retainer elements support the top edge of the container and are assembled with the lateral peripheral wall.

Abstract

(CN208973336)

The present utility model discloses a water-proof smart pot, the pot comprises a pot body and secured in the **handle**, is provided with a receiving cavity of the **handle** and the electrical components with electrical components are connected to the liquid crystal panel, the liquid crystal panel corresponding to the observation window is provided on the liquid crystal panel of the **handle**, the **handle** includes a lower cover, an upper cover and lower cover mounted on top of the lower cover mounted on the outer end of the tail cap, the upper cover and the lower cover jointly enclose and form electric part accommodating chamber, the tail cap and the lower cover jointly enclose and form battery accommodation chamber, on the lower cover closed pressure between mating faces of the upper cover is provided with an upper cover ring, sealing pressure between mating faces of the lower cover the tail cover is provided with a tail cap seal. Through the upper, between mating faces of the lower cover, and the tail cap and the lower cover mating surfaces of the press-fitting ring between separately sealed, achieving horizontal abutting surface and the rear end of the butting surfaces butting a reliable seal, the mating surface into the electronic part accommodating chamber and prevent the liquid from the battery accommodating chamber, for all-direction abutting surface water-repellent.

Abstract

(EP3449187)

The present invention relates to a new glass-ceramic plate for use, in particular, as a furniture surface and/or a worktop, and comprising, on at least one of its faces, in particular its underside, at least one connection element that is less than 10 cm in height, the cross-section of which can be inscribed in a circle of less than 3 cm in diameter, said connection element being composed of a material that is resistant to at least 70°C and being bonded to said face with a thermosetting adhesive. The invention also concerns a furniture and/or household equipment, in particular a worktop or a piece of furniture incorporating said plate.

KR101160241	B1	2012-06-26	KR101160241

Abstract

(JP2006097408)

PROBLEM TO BE SOLVED: To provide a drainage trap for a washing machine capable of easily and visually confirming drainage trap equipment, whether or not a joint state of piping is in a good condition and a stain.

SOLUTION: The drainage trap body 1 is detachably equipped with a seal water cup 2 achieving a trap function, a seal water cylinder 3 fitly inserted in the seal water cup 2 at a flowing water interval and communicated with the lower end opening section 3₁ and a guide cylinder 4 fitly inserted in the seal water cylinder 3 at the flowing water interval and mounted on the seal water cup 2 through a wing piece 8, at the same time, a perforated plate 6 equipped with a hose joint 5 for mounting a drainage hose including an elbow connecting the drainage hose B to the drainage trap body 1 is formed of an object detachably screwed or fitly disposed through a perforated plate receiver 7, a horizontal pulling or a vertical pulling connecting section 11 capable of connecting a drain pipe A to the drainage trap body 1 is integrally formed, and the drainage trap body 1 or/and the hose joint 5 and furthermore a lid body 23 of a waterproofing pan are so visibly constituted that the inside can be made to see through by a transparent and colorless, colored transparent or translucent synthetic resin.

Abstract

(EP1481200)

The invention relates to a filter system for extracting particles and/or drops of liquid from the air flowing through the filter device. Said filter system consists of a filter layer arranged in a plane and a cyclone collector which is arranged in the edge region of the filter layer. Said cyclone collector is provided with means which, compared with the filter layer, create a higher flow speed and stronger vortexing of the circulating air. The cyclone collector can be produced from horizontal cyclone elements, curved, horizontal elements or from expanded metal.

Abstract

(EP2847392)

The present invention provides an electronic plumbing fixture fitting. In an exemplary embodiment, the electronic plumbing fixture fitting comprises a discharge outlet, an electronic valve, a parameter sensor, and a user interface. The discharge outlet is operable to deliver water. The electronic valve is operable to permit flow of water through the discharge outlet when the electronic valve is activated and to prevent flow of water through the discharge outlet when the electronic valve is deactivated. The parameter sensor includes an emitter and a detector. The parameter sensor is operable to detect an intensity of energy transmitted from the emitter to the detector and provide information to set at least one parameter of water flowing through the electronic valve.

Abstract

(EP0757532)

The invention concerns a food processor (1) with a mixing vessel (6) and a drive mechanism (8) for an agitator (10) in the mixing vessel (6), the lower region of which can be heated. As an improvement on a food processor (1) of this type, it is proposed that a weighing device (16) should be provided and that the weighing device (16) should determine the weight of a mixing pot support (7) including a heating unit (40).

Abstract

(EP0108913)

The invention relates to a cooking vessel comprising a cooking **pan** and cover, especially a steam pressure cooker, to which a temperature-dependent resistor is attached as a temperature sensor with an attached computing device for the determination of the temperature inside the cooking pot, and for the transmission of electrical signals corresponding to the temperature detected. In order for the cooking vessel to be equipped for an exact measurement of temperature without greatly increasing costs, a measuring point covered by the **handle** is provided, to which a temperature sensor is attached. One of the handles of the cooking pot or cover carries a plug accommodation with connection contacts, which mechanically accommodates a computing device formed as a plug unit, and connects electrically with the temperature sensor.

Abstract

(EP3449188)

The invention relates to a novel glass ceramic plate, intended in particular for use as a furniture surface and/or worktop, and comprising, on at least one of the faces of same, in particular the lower surface of same, at least one connection element having height less than or equal to 10 cm, said connection element comprising at least one magnetised portion or at least one portion made from a material capable of being attracted by a magnet. The present invention also relates to an item of furniture and/or household equipment, and in particular a worktop or an item of furniture incorporating said plate.

Abstract

(EP0165891)

The invention relates to apparatuses for preparing food in a **kitchen** and for distributing food. It comprises a base (2) topped by at least one column having a vertical slot (4), an endless screw (6) driven by control means (7), a nut (8) engaging with the endless screw (6) and immobilized in terms of rotation by a stud (10) passing through the column slot (4), this stud ensuring the displacement of the accessories; at least one tube (15) fits on the column (4); slides (9), at least one of which is equipped with a locking screw (16), slide around and along the column (4) and, if appropriate, the tube (15) which can be placed on top of the column (4); this said tube permits release or locking of the upper part of the various accessories, each

having the same system for rapid fixing and release. The lower part is composed of an identical system, but remains free for all translational movements on the column (4). The accessories of the support (1) are a series of superposed distribution plates, storing, preserving and distributing units, a rolling plate, a cooking support, a round portioning **accessory**, a rectangular portioning **accessory**, a can-opener, a metering **accessory**, a sandwich-preparation **accessory**, a moulding, mould-release and quartering **accessory**, and a transmission cable for tools including a whisk, blender, bottle brush, mixer and draining and shelling basket. The device is particularly intended for mass catering. <IMAGE>

Abstract

(EP0687154)

A set (10) of stackable pots has a plurality of pots that can be space-savingsly nested into each other, in particular cooking pots (12, 14, 16, 18, 20) of various sizes. At least some of the cooking pots are provided with handles (56), and their diameter and height decrease from the lowest (12) to the uppermost pot (20) of the stack. When the pots are placed into each other, each pot is directly or indirectly supported on the upper edge of the underlying pot by its diametrically opposed handles (56) located in the area of its upper edge.

CN104545428	B	2017-07-11	CN104545428B

Abstract

(KR101506497)

The present invention relates to a cooking pot equipped with a valve for controlling the pressure of a pot and blocking the inflow of external air, wherein the cooking pot is composed of: a valve housing which is assembled on an air exhaust hole of a pot lid and has an accommodation space; and a valve body which is assembled on a mount hole of the valve housing to be able to move upward or downward, and has a pressing plate inserted into the accommodation space. The valve housing has an exhaust hole and a penetration hole, which are formed in an upper side and a lower side to form steam discharge passages, respectively, and thus while the valve body moves upward or downward according to the internal pressure of the pot, the passage is opened or closed by the pressing plate. Therefore, when cooking food, the pot is used as a pressure pot by restricting the discharge of steam until the internal pressure increases to a predetermined value due to the weight of the valve body itself, and when the internal pressure of the pot decreases due to the reduction of heat after cooking food, the inflow of external air into the pot is prevented and thus the inner portion of the pot is in a vacuum state. As such, when cooking food, the pot is used as a pressure pot by restricting the discharge of steam until the internal pressure increases to a predetermined value, and the internal pressure of the pot decreases due to the reduction of heat after cooking food, the inflow of external air into the pot is prevented and thus the inner portion of the pot is in a vacuum state, and as a result, the food cannot be easily spoiled in spite of long period of storage.

(FR2328436)

Combination frying **pan** and cooking oil filter - has shape which is swept by filter attached to rotary frying basket of semicylindrical form

Publication data including kind & date

FR2328436	A1	1977-05-20	FR2328436
FR2328436	B3	1978-07-28	FR2328436

**Abstract**

(FR2328436)

The frying **pan** is designed to accommodate the regular filtering of cooking oils. An open-fire pedestal with temperature controls, and a condenser type vapour extractor are also incorporated. The **pan** may include a frying basket, and the geometry of the combination be such that the **pan** volume may be swept by rotation of the basket about a horizontal axis. The basket is fitted with a screen in order to carry out the filtering operation. A 180 deg. rotation of the basket then lifts the oil into a position above that occupied during cooking. The oil passes through the screen (20) to return below and be filtered in the process.

Abstract

(EP1052055)

A process for the manufacture of cooking vessels, in particular pots and/or pans in a relatively soft metallic material, with a plate in a metallic material of high hardness applied to the bottom of the vessel, performs a stable connection among said parts with no mechanical and/or thermal trauma for the materials and comprises the steps of: providing a plate (1) provided with a plurality of points (6) projecting from a surface (4) thereof; inducing, by compression, the penetration of said points (6) and the adhering of said surface (4) at the bottom (20); and stretching said bottom (20), thereby causing the deformation and the clutching of said points(6). <IMAGE>

Abstract

(EP0549781)

The present invention provides absorbent articles, especially sanitary napkins, containing a fluid transport layer. In-use, the transport layer directs menses to a storage layer, thereby minimizing product failure and staining of undergarments. The transport layer can protrude into, or through, a topsheet to provide very aggressive transport of vaginal discharges. Preferably, the transport layer is a layer of fibers having external capillary channels.

Abstract

(FR2440180)

The electric grill comprises two pans one of which contains a cooker plate to which is fixed an electric heating element. The first **pan** is connected to the second pany by the insertion of a grill plate. The cooker and grill plates touch only along the flat outer edges of the two plates. One edge of the cooker plate has a notch in to contain the electric heating element. The flat outer edges of the movable grill plate take up between one quarter and one third of the total surface of the plate. The

grill plate can have fixed to it, a **handle** made of heat-proof material. The **handle** has a cavity in.

Multifunctional gas range for burn and roast food

Images**Publication data including kind & date**

CN2101826	U	1992-04-15	CN2101826U
CN91223560	Y	1993-02-03	CN91223560U

**Abstract**

(CN2101826)

The utility model belongs to a gas range, particularly a special purpose multifunctional gas range for burning and roasting food with low energy consumption. The utility model is composed of a roasting plate, a range ring, a range box, a liquid receiving tray, a range frame combustion system, range feet and a fitting support frame, wherein, the combustion system comprises an ejector, a fire cover, a rotary plug, a nozzle, an air regulating plate and a universal connecting nozzle. The utility model has the advantages that the multifunctional gas range for burning and roasting food has multifunction and can be used for multiple purposes and collects a plurality of cooking methods such as burning, roasting, swilling, boiling, etc. into one machine; the utility model has the advantages of reasonable structure, economy, durability, and portability, and is suitable to be used indoors and outdoors; the utility model is suitable for three gas sources, and has the characteristics of complete combustion and no air pollution; the utility model has simple operation, and adds a new species for gas implements.

**Abstract**

(EP2764826)

A fastener cartridge assembly includes a plurality of fasteners and a layer (1000) configured to be captured by the fasteners (1002). In addition, the layer includes a tissue contacting surface which includes a plurality of cleats (1030), and/or any other suitable structures, configured to reduce slippage between the layer and the patient tissue. In various embodiments, the layer can include traction features extending therefrom.

Abstract

(EP2673073)

The specification discloses a portable dialysis machine having a detachable controller unit and base unit. The controller unit includes a door having an interior face, a housing with a panel, where the housing and panel define a recessed region configured to receive the interior face of the door, and a manifold receiver fixedly attached to the panel. The base unit has a planar surface for receiving a container of fluid, a scale integrated with the planar surface, a heater in thermal communication with the planar surface, and a sodium sensor in electromagnetic communication with the planar surface. Embodiments of the disclosed portable dialysis system have improved structural and functional features, including improved modularity, ease of use, and safety features.

Kitchenware **handle** connection anti-release strengthening structure

Images

Publication data including kind & date

CN107997639

A 2018-05-08 CN107997639

Abstract

(CN107997639)

The invention discloses a kitchenware **handle** connection anti-release strengthening structure. The kitchenware **handle** connection anti-release strengthening structure comprises a structure body, a **handle** cap, a **handle** and a connecting bar, wherein the **handle** cap is arranged at the top of the structure body, the bottom of the **handle** cap is fixedly provided with a screw, the top of the **handle** cap is welded with a hanging ring, and the middle of the hanging ring is provided with a hanging ring hole in a penetrated mode; a gasket is arranged between the **handle** cap and the **handle**, and the center of the gasket is provided with a screw hole in a penetrated mode; the surface of the **handle** is fixedly provided with a plastic layer, the surface of the plastic layer is embedded with a semi-circular groove, the inner side of the plastic layer is fixedly provided with a thermal isolation layer, and the inside of the thermal isolation layer is fixedly provided with a steel frame.

According to the kitchenware **handle** connection anti-release strengthening structure, the gasket can connect the **handle** cap and the **handle** tightly during connection to effectively avoid release of the **handle**; the steel frame can improve the firmness of the **handle** to avoid damage of the structure body and prolong the service life of the structure body. The kitchenware **handle** connection anti-release strengthening structure is applicable to production and application and has a good development prospect.

Abstract

(EP3003885)

The invention relates to a packaging body (13, 131, 132) having an outer shape which can roll. Said packaging body (13, 131, 132) comprises a chamber for the content or a cavity, the shape of which is adapted or can be adapted to the shape of the contents of the packaging (11) which are to be received in the packaging body (13, 131, 132). Said claimed packaging body (13, 131, 132) enables a packaging unit (10), which is easy to transport by rolling, to be produced in a particularly simple manner.

Abstract

(EP1689944)

A building module has an exterior shape generally of a cuboid having side, end, top and bottom faces, and fabricated from metal, the module being hollow and defining a space of a size suitable for occupation by a person. The module includes fastening elements (21, 69) to allow the module to be fastened to another adjacent module and to allow for engagement by standard load handling equipment for handling freight containers. The module has an overall exterior width greater than 2700 mm and includes a first set of fastening elements (21, 69A, 69B, 69C, 69D) in the region of a first end of the top of the module and a second end of the top of the module. The fastening elements of each set include two fastening elements (e.g. 21 and 69C) spaced apart from one another at a centre-to-centre spacing (D) of about (2260) mm.

Abstract

(EP1871545)

A kitchenware washing assembly (100) can include at least one wall (122) defining at least a portion of a tank (102) for holding fluid for washing kitchenware. The kitchenware washing assembly (100) can also include at least one pump (104) and at least one chamber (146) in fluid communication with the tank (102). The kitchenware washer assembly (100) can be formed such that at least part of the chamber (146) is formed unitary with the wall (122) of the tank (102). The kitchenware washing assembly (100) may include a control system (212) with a consolidated removable control module (214) having electronic components (214, 218, 220) for substantially controlling at least one operation of the washing assembly (100). The kitchenware washing assembly (100) may include at least one intake cover (150) for separating an intake chamber (134) from the tank (102), and having inlets (152) and at least one projection (154) that extends into the tank (102). An outlet chamber (146) and/or intake chamber (134) can be configured to have positive drainage from the chamber (134, 146) into the tank. One or more detachable out covers (160, 162) may be configured to cover an outlet chamber (146), and have outlets (108) for directing fluid into the tank (102). A heater (416, 420) may be releasably secured within the tank (102) by at least one securing device (250) having a releasing portion that allows the securing device to be released solely from within the tank.

Abstract

(EP2731475)

The present invention relates to a culinary article (20) compatible with induction heating and to a process for manufacturing a recipient. The article comprises: a metal recipient (3) suitable for receiving foodstuffs and including a metal substrate comprising a base (9) compatible with induction heating, and a side wall (4); an electrical and/or electromechanical device (5); and at least one coil (16) for generating electricity, from a magnetic flux produced by the induction heating means (15), in order to power the electrical and/or electromechanical device. According to the invention, the coil is placed either on the internal surface (14a) or external surface (14b) of the base (9), or embedded in said substrate, either within a moulded metal or a plurality of metal layers that are joined together, at least some distance away from the electrical resistance and without adhesive bonding, by direct metal-metal contact and interlacing and/or physico-chemical metal-metal bonding.

**Abstract**

(CN108814316)

The invention relates to the technical field of heat-preservation splash-proof **accessory** devices, in particular to a broadside-reinforced glass cover. The glass cover can provide convenience for treating steam generated during steaming and cooking, and the situation that after the steam is discharged into a room, the room temperature is correspondingly raised and users feel uncomfortable is reduced. Moreover, convenience can be provided for taking and placing the glass cover after use, and damage caused by high temperature to other substances is reduced. The glass cover includes a main body, an annular broadside cover body, a **handle**, an air outlet pipe, a connecting pipe, a conveying hose, a fixing head, a fixing plate, a cooling box and a spiral condensation pipe. A sealing ring is arranged at the bottom of a communicating pipe, and a liquid inlet pipe and a liquid outlet pipe are communicated with the left and right ends of the top of the cooling box respectively. The glass cover also includes a group of fixing rings, a group of limiting plates, a group of winding shafts, a group of pulling ropes, a group of rotating plates and a group of rotary handles; a group of baffles are disposed at the rear ends of the winding shafts respectively, and a group of fixing hooks are disposed at the other ends of the pulling ropes respectively. The glass cover also includes a group of supporting rods, a group of limiting rings and a group of positioning rings.

**Abstract**

(EP3236813)

An attachment (60) for a spout (140) of a food processing apparatus (10), including a housing (70) with a liquid inlet (80), a front face (160), and a liquid outlet (100). The housing defines a posterior cavity (110) that removably receives the spout and position the liquid inlet next to the spout. The attachment also includes a drip-stop flap (150) which is attached to and covers the front face of the housing. The drip-stop flap reversibly pivots about a horizontal pivot axis between a closed position where the liquid outlet is blocked by a sealing element on the flap, and an open position where the liquid outlet is exposed.

Lock catch structure for slow cooker

Images

unlocking button extends out of the unlocking window, so that a user manually presses the unlocking button for enabling the lock catch body to retract and separate from the lock head body, and therefore, unlocking between the cooker cover and the cooker body is realized. The lock catch structure is simple in structure, is stable in locking force, enables the cooker cover)not to be liable to drop, has the characteristics of long service life and convenient operation, and can be widely applied to various cooking cookers.

Abstract

(CN87209583)

The utility model discloses a multi-functional safety pressure cooker which is characterized in that the diameter of a limiting valve is big, about 20-30 millimeters, and thus the limiting valve has a slagging ability and can avoid exploding. A combined spring is used to limit voltage. A valve flap liner is made of specially made rubber or plastics. An o-ring seal has an inner cavity which can store mixed liquor of water and alcohol, and expands when heated and forms a sealed self-locking. The height of a cooker lid is 30%-70% of the depth of a cooker body that enables to **cook** full kettle of mung beans or seatangle soup, and the using method is simple and safe. The utility model is provided with a suspended hand-held frame sieve for steaming cookers and a steaming sieve, a steaming disk, a steaming blouse and various steaming basins. Thus cooking various foods is convenient and the installing and teardown of the cooker is easy. The utility model can be consecutively

combined used. The area of the table top occupied by the matching steaming basins reduces one time compared with using the existing soup basins and dishes, and the dishes capacity increases 80%. All parts and components of the utility model can be put in one kettle overlapped with each other. The steaming capacity of one multi-functional safety pressure cooker is better than two existing pressure cookers.

CH688964	A5	1998-06-30	CH-688964

Abstract

(FR2692244)

Apparatus usable to transfer different liquids and concentrates comprises a liquid-tight collecting tank 1 for placement on the lid 3 of a large barrel or container 2. The collecting tank 1 has an exit 5 which is arranged and constructed to correspond to an inlet orifice 4 in the lid 3 of the large container 2. A pump 33 connects at 35 to a lance introduced into the large container 2 and via hose 29 to an outlet 19 with a **cook** 18 engagable into a small vessel 16 to dispense the liquid. The outlet is raisable and lowerable on guide 20. The pump 33 is arranged in or over the tank 1 so that the liquid issuing in the case of leakages may always be reliably collected without polluting the environment. The apparatus allows circulation in

large containers which do not have to be emptied continuously but only after several circulations, and this protects the environment to a considerable extent. A further advantage is that cost advantages are achieved because the user may now draw large quantities of liquid and concentrate, the large containers serving as transportation containers simultaneously serving as safe storage containers at the position of use. <IMAGE>

Abstract

(EP2731474)

The invention relates to a kitchenware item comprising a pot comprising a metal substrate (31), and a power supply source (7) connected to a heating electrical resistance (9) with which the pot is provided. The electrical resistance is arranged in the region of the side wall (300) of the pot: either outside the metal substrate, or embedded in said substrate, within either a moulded electroconductive metal material or a plurality of electroconductive metal layers that are interconnected, without adhesive, by deformation and/or physicochemical metal connection.

Abstract

(EP0935754)

The invention relates to methods of agglutinating or capturing cells comprising providing a mixture comprising a population of cells and a population of bacteriophage expressing a first antibody on the surface of the bacteriophage, the first antibody being specific for an antigen-bearing moiety expressed by at least a portion of the cells in the cell population, wherein the first antibody binds to the portion of the cells causing the bacteriophage to also bind to the portion of the cells, adding to the mixture a second antibody specific for the bacteriophage, wherein binding of the second antibody to bacteriophage bound to the portion of the cells causes the portion of the cells to agglutinate or be captured.
