(57) Abstract: Disclosed is a column value-based separate authorization method for statistical list operations, said method comprising a step of authorizing a statistical list operation and a step of selecting an authorized party, said step of authorizing a statistical list operation comprising the following steps: S1: selecting a statistical list needing authorization; S2: selecting a column needing authorization in the statistical list, the selected column being a column determined by selection or determined automatically; S3: authorizing the operation for statistical data corresponding to all the column values in the selected column. The present invention enables separate authorization of the operation rights for the statistical data in the statistical list according to the column values; one statistical list can meet different actual usage requirements after the authorization of different statistical data operation rights. Thus, the present invention is able to control the statistical data of the statistical list more strictly, improving the precision of management, meeting the usage requirements of enterprises and institutions in actual operations.
